of water (sea) effect on detergent efficiency, 2003c.
of waters (natural), calcd. and experimentally detd., 3121d.
in wine making, 3560e, 8606e.
in wool during combination with acids, 3202d, 6820c.
ytterbium polarography and, 6523h.

**Hydrogen nuclei.** See *Deuterons; Hydrogen ion; Protons*.

**Hydrogenolysis.** (See also *Hydrogenation.*)
of alkyl halides by $LiAlH_4$, 1311h.
of amino alc. (acetylenic) esters to amine salts, 131c, 6977g.
of bibenzyl to toluene, P 3454a.
catalyst for, P 6762g.
of esters, 572b.
of esters, velocity of, 573f.
of methylcyclopentane, 6567a.
motor fuel manuf. by Fischer-Tropsch process and, P 4834i.
of nitriles (aromatic), 7916f.
of oxygen heterocycles, 4640d.
of thiol esters, P 3445c.
of 2,2,3-trimethyl-1-butanol, 1312i.

**Hydrogen peroxide.** (*Simple hydrogen peroxides are indexed under their own headings, as* Ethyl hydroperoxide. *Complex hydrogen peroxides are indexed as inverted entries at* Hydroperoxide. *See also* Bleaching agents; Hydroperoxides.)
alc. oxidation with, 5269h.
as antibacterial principle produced by *Micrococcus X*, 4327e.
in bacterial inhibition by saliva, 5079i.
bactericidal action and effect on enzymes in milk, 3115a.
bactericidal action on oral spirochetes, 9159e.
bactericidal efficiency of, 9159h.
biol. effect of ionizing radiations and, 3058b.
bleaching with—see *Bleaching*.
as catalyst in prepn. of β-thiocyanoalanine from cystine and KCN, 1014h.
cellulose oxidation by, 8672b.
in chlorine (excess) destruction in water, 3121f.
coconut fiber damage by, 5595g.
compds. with catalase, 260g.
with peroxidases, 3859i, 9121b.
with $Na_2CO_3$ ($2Na_2CO_3.3H_2O_2$), P 369d.
cornea tolerance to, 771c, 3110h.
corrosion by, of Al-alloy sheets, 98d.
in dairy industry, 778h.
in dairy-product preservation for phosphatase test, 3942c.
decompn. by heat and explosion ignition in, in vapor phase, 8139e.
decompn. of, at anodes, 5677c.
by catalase, effect of peroxide concn. and other factors on, 6260b.
by catalase, ferrous and ferric ion, hemin and ferrous phthalocyanine, 2753i.
catalytic structure for, P 6096f.
by colloidal Pt, effect of $D_2O$ on, 8829a.
by Fe salts, 4087a.
by light, 5313c.
$MnO_2$ as catalyst in, 7313e.
on Hg, 927a.
on metals, 6028e.
on Pt catalysts, 6062c.
by $K_4Fe(CN)_6$, photochem. aftereffect in, 6087i.
by $KMnO_4$, rate of, 8250c.
in presence of $Fe(NO_3)_3$, kinetics of, 25b.
detection of, 8307i.
detection of, in fats, spoilage detection by, 5205i.
detection of residual, in catalase test on meat, 1120a.
detn. of, 2121h, 3315f.
detn. of, and reaction with I, 2121i, 8307i.
detn. of concn. of, in drugs, 7639b.
detn. of, in per acid solns., 2124f.
diffusion of vapor of, into air, 2056i.
in *N, N*-dimethyl-*p*-phenylazoaniline demethylation, 5756f.
disinfectants contg., 9364i.
distn. of, after removal of org. peroxides, P 3159i.
effect on amino acids in milk, 3115c.
on autodisplacement of Pb, 2846e.
on desoxyribonucleic acid, 8415b.
on electrodes of Cu and Fe, 47f.
on enzymes in fig latex prepn., 6327d
on exchange between cobaltous ion and $Co(OH)_3$, 8820i.
on N fixation by *Azotobacter*, 8591h.
on respiration of sea-urchin eggs and sperm, 9272eg.
on wool digestibility by pancreatin and x-ray pattern, 2778i.
explosives from glycerol and, P 1190f.
in ferrous-metal passivation, P 6144a.
as fertilizer, 5142d.
formation and decompn. during slow combustion of hydrocarbons, 3696h
formation of, from air and $H_2O$ with ultrasonic waves, 8779i.
from at. H and $O_2$, rate of, 2079i.
during corrosion of Al and Zn, 6140a
from F and $H_2O$, 6793f.
from H ion and O, limiting current of, 6052c.
by O adsorbed by C, 4075i.
photochem. activity of Zn oxide pigment in aq. soln. in, 5604i.
in reaction between I, AgOAc and HOAc, 8249i.
from reaction of hydroxyl radical with hydrocarbons, 6149i.
*in vivo*, folic acid deficiency and anemia syndrome in relation to flavine-contg. enzymes in, 2207e
glycerite of, effect on bacteria in mouth, 6698i
in glycerol, bacteriotoxic effect of, 4533i
heat of ionization, ionization and pH of, 5651c.
heat of reaction with ferrous ions, 5658
hydrogenation of oils in presence of, to inhibit oxidation of contained γ-tocopherol in white soaps, P 6437g
manuf. from alkali metal amalgams, P 2380g.
from alkylated anthraquinone, P 1929e
from $NH_4HSO_4$, refining electrolyte for, P 6528d.
as milk preservative, 9279g.
mixt. with $NH_4OH$ in Cu-oxide rectifier treatment, P 4590b.
org.-compd oxidation by, 7311d
in oxidation of α-oxo carboxylic acids, 6979i.
in photochem. degradation of cotton sensitized by oxides and vat dyes, 412b
in photochem. degradation of dyed nylon, rayon and silk, 1102cd.
in photography, 1668b, 6097h.
in photography of α-rays, 4109i.
photoreaction with $I_2$, 499g.
polymerization by, kinetics of, 7310f.
pyrrole oxidation by, 4257b.
reaction with $Ac_2O$, P 3444f.
with 2-chloro- and 2-ethoxypyrazine derivs., 3005g.
with cycloalkenes in presence of $HCO_2H$, 2173d.
with α-diketones and α-keto acids, 6061f.
with ferrous and ferric ions, 6895c.
with Fe salts, 6895b.
with methylcyclopentenes in presence of $HCO_2H$, 2172d.
with $KMnO_4$, 4594i
with $Na_2[Fe(CN)_5NO]$ activated by light, 2495d.
with tertiary alcs., 6180d.
with urea-HCHO resins, 7745i.
reduction at cathode, effect of catalase, peroxidase, cytochrome c, hematin and hemoglobin on, 3052h.
reduction at Hg electrode, 8912h.
refractive index of aq., and detn. of $H_2O_2$, 6049d.
in rice-oil decolorization, 5611b.
as rocket fuel, 9449i.
scission of C-C bonds by, 7434c.
spectrum of, 3724f, 8884f.
stability of concd., 5558g.
in stabilization of solns. of polythionates and polythionic acids, P 7651h.
system: $HIO_3$-I⁻, 7799b.
in thermal H-O reaction and its decompn. by heat, 7305h.

vitamin C oxidation in milk by, 3941*h*.
whey preservation with, 6326*i*.
**Hydrogen persulfide.** See *Hydrogen sulfides*.
**Hydrogen phosphide.** See *Phosphine*.
**Hydrogen selenide,** oxidation of, kinetics of photochem., 8895*e*.
phase transitions in, 4136*i*.
reaction with $NH_3$, equil. in, 6053*a*.
**Hydrogen sulfide.** (See also *Hydrogen sulfides*.)
absorbent for, P 8623*g*.
absorption of, nomograph for NaOH solns. for, 3157*a*.
addn. to 2-phenyl-2-oxazoline and to benzoylaziridine, 3014*c*.
addn. to vinyl ketones, 2944*h*.
adsorption by solids, 7288*d*.
in air, max. allowable concns. of, 4400*i*.
binding energy of, 6895*f*.
in Black Sea, 8761*g*.
in Black Sea, origin and upper limit of, 3324*d*.
carbonyl compd. hydrogenation in the presence of, P 2629*h*.
in cigaret smoke, 7645*f*.
citronella oil treated with, flotation by, P 6964*e*.
corrosion by, in petroleum cracking and distg. unit, prevention by $NH_3$, 6401*h*.
as corrosion inhibitor for $H_2CO_3$, P 5730*f*.
corrosion of gas pipes by, 1169*d*.
detn. of, 64*i*, 3745*g*.
in air, 971*e*.
and Brit. standards for, 1527*e*.
in $CS_2$, 6944*c*.
in fuel gas, 6394*a*.
in gases, methylene blue method for, 7375*b*.
in gasoline, 6943*i*.
in natural gas, 835*e*.
diacylation of, 8353*a*.
effect of, and oxidation products on succinic dehydrogenase, 256*e*.
effect on aerosols, 7290*a*.
on combustion of cyanogen, 6053*i*.
on concrete, 2346*g*.
on corrosion resistance of Cr-Ni alloys, 2918*d*.
on N fixation by *Azotobacter*, 8591*h*.
on oxidation rate of ferrous ions, 1246*c*.
on Ag mirrors, 2387*i*.
on water-gas reaction, 1945*g*.
formation of, from hydrolysis of $CS_2$, 7429*e*.
in hard-rubber vulcanization and deterioration, 2011*d*.
in lubricants contg. org. S compds., inhibition by $\alpha,\beta$-unsatd. ketones, P 8132*b*.
in manufd. gas by bacterial action, 8045*h*.
in rubber, effect of compounding with CuO on, 5620*g*.
formation of hexahydrate of, antifreeze-agent effect on, 1672*g*.
in fuel gas, S recovery from, 4833*e*.
in fuels for motors, testing corrosiveness to Cu, 9426*b*.
generator for, 6869*d*.
heat of adsorption by active C, 7317*c*.
hydrogen (free) in, from FeS, 5319*i*.
manuf. from CaS, P 4822*g*.
from hydrocarbons and S, P 7201*i*.
from H and S, P 7201*h*.
oxidation (partial) of, P 4822*i*.
partition between liquid hydrocarbons and $H_2O$, 7297*g*.
from petroleum refining, health hazard of, 5931*a*.
phase transitions in, 4136*i*.
prepn. by hydrogenation of org. S compds. and detn. in gases, 6112*f*.
prepn. of, thermodynamics of, 2847*a*.
purification of, P 9396*i*.
reaction (addn.) with double bonds, 1722*f*.
reaction products with adiponitrile and 1,8-dichloro-2,7-octanedione for rubbery fibers, P 7745*f*.
with cellulose acetate *p*-toluenesulfonate, 3610*h*.
with high-mol. polyunsatd. compds., P 2804*d*.
with 1,3,5-triacrylylhexahydro-*s*-triazine, 5405*g*.
reaction with 5-alkyl derivs. of 1-methoxy-4-hexen-3-one, 2163*d*.
with alkyl halides, P 6646*e*.
with 9-aminoacridine derivs. and with 9-chloroacridine, 6495*b*.

of peptides, effect of β-hydroxyl group on, 2943*h*.
of 3-phenylphthalide and its Me derivs., velocity of, 7463*h*.
of phosphoric acid esters and $H_4P_2O_7$, 147*f*.
of 2,5-piperazinedione, 5403*i*.
of polyallyl alc. esters, P 6219*a*.
of polymers of ketene cyclic acetals, 1404*h*.
of polyose from tamarind seed, 785*i*.
of polyoses in sprucewood, 395*f*.
of polysaccharides in acids, rates of, 5980*c*.
of polyvinyl esters, P 5413*b*.
of proteins—see "decompn." under *Proteins*.
of reaction product of chloral and 5,5-dimethyl-1,3-cyclohexanedione by alkalies, 2964*i*.
of resinenes, 3597*i*.
of Scharinger dextrin, 6986*h*.
of selenium hexafluoride, 6793*f*.
of silanes (di- and trichloro-) and their mixts. in waterproofing of leather, 8185*h*.
of silicon halides, 561*g*.
of silicon (org.) compds., 562*i*.
of soap solns., 8179*e*.
of sodium aluminate, 2077*c*, 5274*h*.
of sodium carbonate, effect on elec. cond., 6050*h*.
of sodium chloride, effect of $SiO_2$, its mixt. with $Al_2O_3$ and $2SiO_2.Al_2O_3$ on, 2077*b*.
of sodium cyanide, 8821*c*.
of starch—see *Glucose* (*the sirup and its dried products*); *Starch*.
of steroid esters, 1428*g*.
of sucrose—see "inversion" under *Sucrose*.
of sulfides and of thiol acid esters, 1753*h*.
of sulfochloride group in aromatic compds., kinetics of, 926*f*.
of sulfurized olefins, P 7501*c*.
of sydnones, 7479*i*.
of tetraethyl pyrophosphate, rate of, 2077*f*.
of 6,7,8,9-tetrahydronaphth[1,2]oxazol-2(1*H*)-one derivs., P 3040*b*.
of thio amides, 5027*g*.
of titanium salt solns., P 1579*c*.
of triarylmethanephosphonates, 1347*c*.
of 1,2,3-trichlorobutane in the presence of $K_2CO_3$, 6567*h*.
of uranium (sexivalent), 8940*i*.
of vesicant treated insulin, 707*h*.
of vinyl ester polymers, P 1609*i*, P 5230*g*
of vitamin A esters, kinetics of, 5372*a*.
of wood, app. for continuous, P 1187*i*
reaction products of partial, 5945*b*.
reductic acid from, 6821*h*.
resinous material from lignin from, P 1980*b*.
of wool, acidic peptides formed by partial, 9105*i*.
wool damage by, 7092*b*.
zinc-HCl, of urine, 8430*d*.

**Hydrolysis number**, of cement, 3588*g*.
**Hydrolytic adsorption**. See *Adsorption*.
**Hydrometers**, calibration of standard, 4522*g*.
Casagrande, in detn. of particle size, 4923*h*.
**Hydromica**, montmorillonite change into, 2549*e*.
reaction with K salt solns. in salt clay, polyhalite formation by, 8995*d*.
in Utah ancient soil, 5708*g*.
**α-Hydromuconic acid** (*2-hexenedioic acid*).
——, **2-butyryl-3,4-dihydroxy-**, γ-lactone—see *Carlosic acid*.
——, **α-cyano-β,γ-dimethyl-**, diethyl ester, 3796*h*.
——, **β-hydroxy-**(?), γ-lactone Et ester, 7909*d*, 7910*a*.
——, **γ-hydroxy-β-methyl-**, γ-lactone, effect on heart, 7138*h*.
**β-Hydromuconic acid** (*3-hexenedioic acid*).
——, **β,γ-bis(*p*-methoxyphenyl)-**, 3402*g*.
——, **β,γ-diphenyl-**, *cis-* and *trans-*, 3402*f*
——, **γ-hydroxy-α-methoxy-**, methyl esters, 6981*i*.
**α-Hydromuconononitrile**, P 5796*a*.
*cis-* and *trans-*, P 6647*e*.
**β-Hydromuconononitrile**, P 4280*d*, P 5796*a*.
α-hydromuconononitrile from, P 6647*e*.
reaction with α,β-unsatd. aldehydes, P 3847*h*.
——, **α,δ-bis(*p*-dimethylaminobenzylidene)-**, P 3848*a*.
——, **α,δ-bis(*o*-methoxybenzylidene)-**, P 3848*a*.
——, **α,δ-bis(*p*-methylbenzylidene)-**, P 3847*i*.
——, **α,δ-bis(*m*-nitrobenzylidene)-**, P 3848*a*.
——, **α,δ-dibenzylidene-**, P 3847*i*.
——, **α,δ-di-2-butenylidene-**, P 3848*a*.
——, **α,δ-dicinnamylidene-**, P 3848*a*.
——, **α,δ-difurfurylidene-**, P 3848*a*.
**Hydronephelite**. (See also *Ranite*.)
apoanalcite relationship to, 8314*b*.
**Hydronephrosis**. See *Kidneys*.
**Hydronitric acid**. See *Hydrazoic acid*.
**Hydronium ion**. See *Hydrogen ion*.
**Hydronopic acid***, P 1807*g*.

**1-(7-carboxyheptyl)-2-decenyl**, methyl ester, 3357*d*.
——, **10-carboxy-1-heptyl-2-decenyl**, methyl ester, 3357*d*.
——, **1-(6-carboxyhexyl)-2-hendecenyl**, methyl ester, 3357*d*.
——, **9-carboxy-1-octyl-2-nonenyl**, methyl ester, 3357*d*.
——, **cyclohexenyl**. See *Cyclohexenyl hydroperoxide*.
——, **decahydronaphthyl**, effect on polymerization of styrene, 8736*d*.
——, **1,1-diethylpropyl**, 6189*f*.
**(9,10-dihydro-10-oxo-9-phenyl-9-anthryl)**, 620*ad*.
——, **α,α-dimethylbenzyl**, P 3459*e*.
as initiator and modifier in oxidation reduction polymerization of butadiene and styrene, 5987*g*.
as oxidizer in GR-S rubber polymerization in org. compds. forming complexes with Fe, 8727*f*.
as oxidizing agent in polymerization of butadiene with styrene in reduction oxidation systems with Fe salts, 8723*f*.
——, **1-ethylcyclohexyl**, and derivs., 6189*g*.
——, **2(and 3)-methyl-2-butenyl**, P 5033*a*.
——, **1-methylcyclohexyl**, and derivs., 6189*f*.
——, **octahydro-4a(2*H*)-naphthyl**, and derivs., rearrangement of, 6188*e*
*trans-*, 6189*g*, P 6437*g*.
——, **tetrahydronaphthyl**, detn. in oxidized gasoline, 1952*h*.
——, **1,2,3,4-tetrahydro-1-naphthyl**, P 3848*c*.
as activator in polymerization of rubber, P 5625*f*.
decompn. of, 2196*g*.
effect on polymerization of isoprene, 5621*f*.
——, **(1,1,6,6-tetramethylhextramethylene)di-**, 6190*a*.
——, **1,1,2,2-tetramethylpropyl**, and sodium deriv., 6189*f*.
——, **(1,1,4,4-tetramethyltetramethylene)di-**, 6190*a*.
——, **1,1,2-trimethylpropyl**, and derivs., 6189*f*.
——, **triphenylmethyl**, compd with pyridine HCl, 6190*a*.
**Hydroperoxides**. (See also *Peroxides*.)
as activators in polymerization of rubber, P 5625*f*.
alkenyl, manuf. of, P 5032*i*.
in autoxidation, 4574*c*.
decompn. of, of linoleic acid by naphthenates, 9488*f*.
detn. of org., 8829*g*.
effect on vitamin A utilization in chicks, 290*h*.
formation of 9- and 13-conjugated and unconjugated, in autoxidation of Me linoleate, 3634*h*.
formation of, in oxidation of Me linoleate, 5365*i*.
in oxidation of methyl linoleate and oleate, 3358*b*.
in oxidation of unsatd. oils, 6840*e*
hydrogenation of oils in presence of, to inhibit oxidation of contained γ-tocopherol in white soaps, P 6437*g*.
manuf. of, P 669*c*.
in polybutadiene seed, popcorn growth by butadiene reaction with free radicals formed by decompn. of, 1598*c*
prepn. and esterification of tertiary, 6189*d*.
**Hydroperthiocyanic acid**, detection of, 971*a*.
**Hydrophilus piceus**, inorg. compn. of blood plasma of, 4388*e*.
**Hydrophobing**. (See also *Swelling*; *Waterproofing*.)
of cotton, 6829*h*.
of fibers, flotability and, 6421*e*.
**Hydropolymerization**. See *Polymerization*.

on vitamin A destruction in shark liver oil, 9385*c*.
esters, Fries rearrangement of, 2187*i*.
fluorescence of, structure and, 7829*c*.
formation (photochem.) from quinone, 6515*e*.
in furan stabilization, P 5805*c*.
heat of ionization of, 477*i*.
histidine decarboxylase inhibition by, 9107*a*.
hydrogen (active) detn. in, 3316*g*
identification of, and distinguishing from pyrocatechol and resorcinol, 6944*f*
as isoprene-polymerization inhibitor and mutuator, 5621*e*.
lead-alkyl-pptn. inhibition in stored gasoline by, P 4003*e*.
manuf. by electrolysis, P 6528*a*.
manuf. of, and inhibition of polymerization of vinyl aromatic compds. with, and its alkoxy derivs., P 2806*c*.
in methemoglobin formation, 757*e*.
methylation of, 7412*d*.
monoalkyl ethers of, 3386*g*.
orange rhodulin phosphorescence-quenching by, 7828*c*.
and its oxidation products, effect on intestines, 5863*d*.
oxidation-reduction potential of, 3301*b*, 7355*h*.
oxidation-reduction potentials and resonance of, and derivs., 6893*g*.
in peach-X-disease control, 9347*g*.
phosphorescence of, 4957*h*.
for photographic use, specifications for, 6930*b*.
polymeric polyhydric alcs. from, and chloro alcs., P 1996*d*.
as polymerization inhibitor in reaction of anethole, isoeugenol or isosafrole with maleic anhydride, 1757*e*.
as polymerization stopping agent, 8727*i*.
prepn. of, 3386*i*.
prepn. of, from *p*-quinone, 1312*d*.
quantum-mech. energy of electrons in, 6824*g*.
reaction with 5-chloro-3-methyl-4-pentyn-2-ol, $H_3PO_4$ and $P_2O_5$, P 4284*f*.
with collagen, H bonding in, and effect on shrinkage temp., 7736*b*.
with $(PhCH_2)_2Hg$, 1740*h*.
with epichlorohydrin, P 5421*h*.
*reaction* with $SeO_2$, 7539*a*.
resonance energy of, 8221*c*.
spectrum and mol. diagrams of, 2512*e*.
spectrum of, 2512*h*, 5665*i*.
as styrene-polymerization inhibitor, 8736*e*.
surface tension of, 8797*f*.
thromboplastic lipide stabilization by, 5431*f*.
titration (potentiometric) of, 5263*h*.

**Hydroquinone, amino-**, azo dyes from, P 9463*i*.
——, **(2-aminoethyl)-**, and derivs., 6599*d*.
enzymic formation of, 8061*b*.
——, **[*p*-(2-aminoethyl)phenylsulfonyl]-**, hydrochloride, 7450*e*.
——, **(α-amino-*p*-tolylsulfonyl)-**, bacteriostatic action of, 9376*e*.

——, *N*-*p*-**tolyl-**, oxidative nitration of, 5013*e*.
**Hydroxylamine-*N*,*N*-disulfonic acid**, sodium salt, P 3440*i*.
**Hydroxylamine-*N*-sulfonic acid**, sodium salt, P 3440*i*.
**Hydroxylation**, of 3-alkenyl-2-hydroxy-1,4-naphthoquinones, 1381*i*.
of cyclohexene, 1730*c*.
of 17-ethylene steroids, 1428*h*.
of 3-halo derivs. of 2-methylpropene, P 5421*a*.
of methylcyclopentenes, 2172*d*.
of org. compds., 5731*f*.
of tall oil, P 805*g*.
**Hydroxyl group**, in beech and spruce lignin, 6408*i*.
bond (intramol.) formation by, 4627*e*.
bond with carbon, free energy of, 3276*g*.
calcn. of free energy function, heat content, heat and free energy of formation of, 5658*e*.
in carbon black, 2068*g*.
cuprammonium complex formation and position of, 3368*e*.
detection in lubricating oils, etc., 1173*f*.
detn. in alcs., fats and oils, 66*i*.
in fatty materials, 8177*h*.
in fatty materials and Me oleate hydroperoxide, 6841*b*.
in humic prepns., 66*c*.
detn. of phenolic, in tan liquors, 1205*e*.
effect of β-, on hydrolysis of peptides, 2943*h*.
effect on color of aurins, benzaurins, and fuchsones, 9451*c*.
on fungistatic activity of $C_6H_5$ derivs., 4803*h*.
on ionization consts., 2074*i*.
on miscibility of org. liquids with asphaltic bitumens, 6817*c*.
on reduction of nitro compounds, 2520*f*.
foaming-inhibiting action in lubricants and, 6815*e*.
formation of, and dehydration of compds. contg., in conjugated double bond production in drying oils and fatty acids, 4025*h*.
of imino-carbonyl linkage reaction with OH group of tannin, 9510*c*.
isomorphous replaceability with Cl in $C_6Cl_5$ group, 7803*h*.
mineralizer action of, 8936*a*.
mol. assocn. and, 5246*e*.
optical rotation due to, 4680*e*.
protection of, in reactions in basic media, 2203*h*.
reaction with oleoyl chloride, 5368*h*.
rotation temp. of, in $C_2H_2$ flames, 4958*c*.
on soil minerals, 1131*h*.
soybean oil-stabilizing and proöxidant metal-scavenging activity relation to no. of, in polycarboxylic acids and polyhydric alcs., 882*e*.
spectrum of, in flames, 5312*g*.
stereochemistry of, in cholesterol, 245*h*.
in thiolignin, 7225*i*.
**Hydroxyl ion**, detn. in industrial waters, 4399*d*.
effect on arrangement and double refraction of soap sols, 8793*h*.
on oxide films on Fe, 9005*a*.
on photolysis of peroxydisulfate, 4144*i*.
exchange on Amberlite IRA-400, 6489*f*.
halide-ion substitution by, in basic salts, and OH ion substitution by halide ions, 5266*d*.
labilization of trans-group in complex by, 2854*g*.
pos. ($OH^+$), in comets, 2510*b*.
reaction with ethylene halohydrins in water and mixed solvents, kinetics of, 2848*c*.
**Hydroxyl number**, detn. of, of alkyd resins, 6459*g*.
detn. of, of fats, 423*a*.
detn. of, of unsatd. fat acid autoxidation products, 126*e*.
**Hydroxyl radical**. See *Hydroxyl group*.
**Hydroxymethyl group**, parachor of, 2057*g*.
**8-Hydroxyquinoline**. See *8-Quinolinol*.
**Hydrozincite**, from Japan (Nakatatsu Mine), 6543*h*.
tungsten-contg. fluorescent, in Darwin, Calif., 6124*c*.
**Hydryllin**, pharmacology of, 3938*c*.
**Hygiene**. (See also *Public health; Sanitation.*)
books: Industrial, 789*b*; Industrial, and Toxicology, 1882*h*; Trattato di chimica applicata all'igiene, 3548*g*; Gewerbehygiene, 8074*i*.
in chill casting, 981*f*.
in ferrous foundries, 8997*i*.
industrial, 6759*h*.
detection of noxious gases and volatile vapors in relation to, 4602*c*.
max. allowable concn. of toxic substances in, 6759*i*.
journal: Industrial Health Review, 6761*h*.
in petroleum (high-S) recovery and refining, 5931*a*.
in phosphate industry, 1534*h*.
in pickling of metals, 8326*g*.
of swimming pools—see *Swimming pools*.

**Hygrometers**, cobalt chloride as, 5516*c*.
for drying systems, 7272*d*.
elec., for shelled yellow corn, 4783*g*.
for hair swelling study, 414*e*.
from invar strip coated with gelatin compn., P 5237*b*.
**Hygroscopicity**. (See also "of water" under *Absorption.*)
of cellulose ethyl ether, 876*a*.
of fibers (synthetic) for tires, 1209*d*.
of glass, for containers, 4435*i*.
effect of heavy-metal ions on, 2069*e*.
for electrodes, 827*e*.
of humectant mixts., 3542*e*.
of monolayers, 8798*e*.
of peanuts and attaining hygroscopic equil., 2000*c*.
of soils, effect of $(NH_4)_2SO_4$ on, 8503*f*.
of viscose, effect of stretching on, 9434*g*.
of wood, 8638*b*.
**Hygroscopic substances**, aerosols, 4076*e*.
coating soap powder particles with, to inhibit dust formation, P 6438*a*.
dry box for handling, 8216*c*.
water detn. in, P 6114*h*, P 8760*c*.
**Hygrostats**. See *Humidity*.
**Hylastinus obscurus** and(or) **Clover root borer**, control of, 8599*d*.
**Hylemya brassicae** and(or) **Cabbage maggot**, control of, 3136*i*.
**Hylemya cilicrura** and(or) **Seed-corn maggot**, control on beans, 5806*h*.
**Hylotrupes bajulus** and(or) **Old house borer**, control in wood, 4418*b*, 8603*g*.
**Hylurgopinus rufipes** and(or) **Native elm bark beetle**, control in elm wood, 4417*c*.
**Hymenia fascialis**. See *Hymenia recurvalis*.
**Hymenia recurvalis** and(or) **Hawaiian beet webworm**, control of, nicotine synergists for, 5894*a*.
**Hymenoxys floribunda**. See *Actinea rychardsoni*.
**Hyodesoxycholic acid**, biliary excretion of, after administration of hog bile, 7572*d*.
**Hyoscine**. See *Scopolamine*.
**Hyoscyamine**, detection of, 713*d*.
detn. in solanaceous drugs and prepns., 1908*d*.
in henbane (Indian), 9379*g*.
localization in *Hyoscyamus muticus*, 9381*a*.
oleate, permeability of skin to, 2699*e*.
**Hyoscyamus**, identification of fluidexts of, 1908*c*.
*muticus*, botanical and phytochem studies on, 9380*i*.
*niger*—see *Henbane*.
thromboplastic action of, 5533*h*.
tincture, folic acid prepn. contg., 356*e*.
**Hyperazotemia**. See *Azotemia*.
**Hyperbilirubinemia**. See *Bilirubinemia*.
**Hyperchloremia**. See *Chloremia*.
**Hypercholesterolemia**. See *Cholesterolemia*.
**Hyperconjugation**. See *Conjugation*.
**Hyperemesis**. See *Vomiting*.
**Hyperemia**, compds. causing, effect on estrus, 1098*f*.
intestine contracting substance in lymph during, 7108*i*.
ovarian, gonadotropic and lactogenic hormones and, 8487*e*.
trafuril in production of, 9254*e*.
**Hyperglycemia**. See *Glycemia*.
**Hypericum**. See *St.-John's-wort*.
**Hyperleucocytosis**. See *Leucocytosis*.
**Hyperlipemia**. See *Lipemia*.
**Hyperparathyroidism**, of alimentary origin, 6708*g*.
with nephrolithiasis, 9231*a*.
**Hyperpeptidemia**. See *Peptidemia*.
**Hyperplasia**. See specific organs such as *Thyroid gland*.
**Hyperpnea**. See *Respiration, animal*.
**Hyperpyrexia**. See *Fever*.
**Hypersalemia**, and azotemia therefrom, 4776*b*.
**Hypersensitiveness**. See *Allergy; Anaphylaxis*.
**Hypersorption**, of propane from natural gas, 8654*c*.
**Hypersthene**. (See also *Pyroxenes.*)
from volcanic rocks from Haruna, Japan, 6119*d*.
**Hypersusceptibility**. See *Allergy; Anaphylaxis*.
**Hypertensin**, blood constrictins and, 302*e*.
in blood of animals with renal hypertension, 754*a*.
effect on oxytocin inactivation by serum of pregnancy, 3482*h*.
inactivation by fibrinolytic enzyme from blood plasma, 2260*i*.
intestinal response to, effect of tetraethylammonium ion on, 1110*f*.
**Hypertensinase**, from kidneys, effect of amino acids on inactivation of vasopressin by, 2260*h*.
oxytocin inactivation by kidney, effect of amino acids on, 2260*g*.
**Hypertensinogen**, in blood in hemorrhage hypotension, 6305*f*.
fibrinolysin effect on, 2321*c*.
-renin reaction, effect of acetone and ether on, 1860*h*.
**Hypertension**. See "high" under *Blood pressure*.

**Hyperthermia.** See *Fever.*
**Hyperthyreosis.** See *Hyperthyroidism.*
**Hyperthyroidism.** (See also *Goiter.*)
adrenal cortex in, 8043*a*.
antithyroid compds. in treatment of, [illegible]
basal and N metabolism in, 5484*e*.
chemotherapeutic agents and, 2704*i*.
chick coccidiosis and, 9330*a*.
cholinesterase in blood serum in, 6722*i*, 9244*i*.
effect on response to pregnant mare's serum, 8492*b*.
egg production in, 294*g*.
in felt-hat factory, 8689*a*.
glutathione in blood and basal metabolism in, 5119*g*.
growth and survival in, effect of liver on, 4308*i*.
growth-promoting materials in, vitamin $B_{12}$, liver and antianemic liver exts. as, 5833*h*.
hypovitaminosis from, 9217*g*.
iodine and thiourea in remission of, 6740*g*.
iodine excretion in urine in, 8039*g*.
iodine in saliva in, following administration of KI and effect of 2-thiouracil and 4-methylthiouracil thereon, 317*e*.
iodine involution in, 8047*c*.
iodine (radioactive) in treatment of, 8533*d*.
metabolic rate in, effect of dietary cholesterol on, 6709*b*.
protein-bound radioactive I in blood serum in diagnosis of, 1477*c*, 5851*a*.
protein fractions of bone marrow in, 4359*h*.
therapy of, 1864*b*.
from thyroprotein, effect of energy intake on heart rate in, 293*h*.
**Hypertonic solns.**, cardiac effects of, 1490*ef*.
effect on O consumption by frog skin, 3530*a*.
**Hyperventilation.** See *Respiration, animal.*
**Hypervitaminosis.**
A, 9180*c*.
iodine distribution in animal organism and, 8486*c*.
$D_2$, in children, 5836*f*.
$D_3$, effect on tuberculosis, 5097*f*.
effects of, 5097*e*.
E, thyroid gland in, 737*c*.
F, from Me linoleate and sunflower oil, 7561*h*.
**Hypholoma capnoides**, carbohydrates of, 5827*g*.
**Hypnone** See *Acetophenone.*
**Hypnosis**, from pentobarbital sodium in normal, castrated and fasting rats, effect of vitamin $B_1$ on, 2315*f*.
**Hypnotics.** (See also *Anesthetics; Narcotics; Soporifics;* and *Barbituric acid* and its various derivs.)
biuret derivs. and related compds., 5369*i*.
effect on blood sugar and insulin action, 8055*h*.
2 (2-naphthoxy)ethanol, P 8105*b*.
solubilities in isopropyl alc., 3147*h*.
surital Na, 1483*c*.
urea derivs. as, P 2229*a*.
**Hypo.** See *Sodium thiosulfate;* and "fixing material" under *Photography.*
**Hypobromites**, reaction with sulfanilamide, 7450*g*.
**Hypobromous acid**, esters, bromination with, 4658*f*.
free energy of ionization of, 2075*b*.
**Hypocalcemia**, in cows, 4736*h*.
tetany of, neuronal changes associated with, 5489*e*.
**Hypochloremia**, with anuria, 7127*h*.
in carbon tetrachloride poisoning, 5500*a*.
in fish, downstream migration and, 7565*c*.
renal function in, 7127*g*.
uremia with, during pregnancy and puerperium, 5110*d*.
**Hypochlorhydria.** (See also *Achlorhydria.*)
in hypothyroidism, 9233*c*.
**Hypochlorites.** (See also *Bleaching agents; Carrel-Daikin solution; Disinfectants.*)
for air disinfection, 4797*f*.
bleaching with—see *Bleaching.*
detection of, in presence of other oxidizing agents, 5700*d*.
detn. of, 3316*d*, 8907*a*.
in presence of chlorites, chlorates, chlorides, NaOH and $Na_2CO_3$, 2892*d*.
Quinoline Yellow as internal indicator in, 7861*d*.
disinfectant, 8099*a*, 9364*i*.
disinfecting action of quaternary $NH_4$ compds. and, 724*c*.
effect on albumin of blood serum, 7568*d*.
for food-utensil sanitation, evaluating, 323*e*.
formation of, solid mixts. for, P 8110*cd*.
hydrogen-ion-concn. control in solns. of, for shrink-proofing, P 4022*d*.
manuf. from starch, P 428*d*.
in oxidation of methylene groups (in fluorene compds.), 1367*h*.
reaction with $NH_3$, seaweed soln. in, P 7652*b*.
reaction with bromides, kinetics of, 7799*b*.
treatment of fruits and vegetables with, prior to nonrefrigerated storage, 9288*g*.
wool damage by, detection of, 7690*h*.
**Hypochlorous acid**, aerosol, P 1532*h*.
in air disinfection, 4797*g*.
chlorine dioxide exchange with, 8821*a*.
decompn. of aq. solns. of, by light, 6515*g*.
detn. in air, 4798*i*.
formation from *N*-chloroacetanilide in chlorinations, 6992*h*.
formation of, solid mixts. for, P 8110*cd*.
free energy of ionization of, 2075*b*.
manuf. of, for waterworks operation, 7612*i*.
reaction of, with $NH_3$, $Me_2NH$ and $MeNH_2$, kinetics of, 6896*e*.
with chlorobutenols, 6976*b*.
with olefins, P 4687*c*.
**Hypochloruria**, in kidney disturbances in pregnancy, cause of, 8517*b*.
**Hypocrita jacobaeae**, toxicity of S compds. to, 4415*c*.
**Hypoderma bovis** and(or) **Northern cattle grub**, control of, 1520*dg*.
transplantation and control of larvae of, 1867*g*.
**Hypoderma lineatum** and(or) **Common cattle grub**, control of, 1520*dg*.
transplantation and control of larvae of, 1867*g*.
**Hypoepistephanine**, in protozoa-infection therapy, 1485*c*, 8528*b*.
**Hypofluorous acid**, trifluoromethyl ester, 2833*c*.
**Hypoglycemia** or **Hypoglucemia.** (See also *Blood sugar.*)
alloxan, 301*e*, 1864*c*.
from copper, 3515*g*.
effect of glutamic acid and other amino acids in, 6313*e*.
effect of liver antitoxic principle on, 1860*e*.
encephalogram of epileptics in, 9224*e*.
encephalopathy after, in Sakel's insulin treatment, 3937*e*.
gastric secretory impulses induced by, origin in central nervous system, 8514*h*.
insulin, kinetic study of, 6741*i*.
in insulin micromelia in chick embryos, 3872*b*.
insulin, prevention by glyceraldehyde, 6306*i*.
shock in, from synthalin, effect of dextrose on, 8527*g*.
spontaneous, 6725*i*.
**Hypogonadism**, testicles in, 6716*i*.
**Hypolodites**, polarography of, 64*h*.
**Hypoiodous acid**, decompn. of, kinetics of, 8249*g*.
formation and decompn. of, kinetics of, 8249*h*, 8250*a*.
free energy of ionization of, 2075*b*.
**Hypomagnesemia**, in cows, 4736*i*.
**Hypomycin.** See *Vitamin T.*
**Hyponitrous acid**, esters, as polymerization catalysts, P 5041*c*.
**α-Hypophamine.** See *Oxytocin.*
**β-Hypophamine.** See *Vasopressin.*
**Hypophorin.** See *Pituitary extracts.*
**Hypophosphatasia**, 5853*c*.
**Hypophosphites**, detn. of, 5339*d*.
mixts. with nitrates or nitro compds., flameless gas-producing, P 5190*d*.
**Hypophosphorous acid**, exchange of $P^{32}$ among $H_3PO_3$, $H_3PO_4$ and, 7815*a*.
oxidation by iodate ion, kinetics of, 5267*i*.
potassium chlorate reduction by, 1672*h*.
reaction of, aldehydes or ketones and amines, 5377*h*.
reaction with diazo compds., 9046*i*.
**Hypophysectomy**, adrenal cortex after castration and, effect of testosterone on, 8492*f*.
alloxan diabetes after, 5851*d*.
androgen effect on growth of os penis after, 740*g*.
body compn. after, effect of adrenocorticotropic and growth hormones on, 8489*c*.
body wt. and compn. and survival after, diet and, 8468*h*.
dentition of monkeys after, 6715*f*.
effect of growth hormone and proteins after, 1092*i*.
fat content of liver after, and effect of choline thereon, 7580*cd*.
glucose and N in urine in, in diabetes, effect of pituitary growth and adrenocorticotropic hormones on, 2692*b*.
glucose uptake and glycogen synthesis by diaphragm after, effect of insulin on, 9255*g*.
glycogen deposition in muscle after, 3506*a*.
glycogen in liver after, daily rhythm in, 6302*g*.
hair cycles after, 8036*d*.
hyaluronidase in testicles after, 8035*c*.
phosphatases in tissue after, and after replacement therapy, 8489*f*.
prolactin effect on ovary after, 5470*i*.
renal function after, 5480*g*.
serum and tissue iron after, 8032*g*.
sex hormone effect after, 7565*f*.
sulfamethazine effect on testes and accessory glands after, 759*i*.
thyrotropic hormone effect on thyroid gland after, 5438*b*, 8563*c*.
**Hypophysin.** See "of posterior lobe" under *Pituitary extracts.*
**Hypophysis.** See *Pituitary gland.*
**Hypoproteinemia**, in anaphylactic shock, 3510*h*.
antibody response in diabetes in relation to, 4759*h*.
blood-sugar regulation in, 7563*f*.
dietary effects on anemia plus, 3500*c*.
electrophoresis of blood serums in, 2293*g*.
extracellular- and intracellular-fluid phases of tissue during water diuresis in, 3919*c*.
after fractures, 3511*h*.
γ-globulin disappearance from blood after transfusion in, 9102*a*.
nephrogenic, blood-plasma transfusions in, 9225*h*.
nutritional, effect on extracellular fluid phase and plasma colloid osmotic pressure, 3899*g*.
proteins in blood serum and, 7570*c*.
uric acid in blood in, 3511*h*.

**ψ-Indole**. See *Pseudoindole*.
**3-Indoleacetaldehyde**, conversion to indoleacetic acid in coleoptile, enzyme system for, 3071*c*, 4348*d*.
synthesis by pineapples, 7096*e*.
**3-Indoleacetamide**, 1397*d*.
**3-Indoleacetic acid** (*heteroauxin*). (See also *Auxins;* and "-forming substances" and "growth substances" under *Roots*.)
caffein prepn. contg., P 5909*d*.
detection and detn. of, 72*b*.
effect on *Avena* coleoptile, effect of various substances on, 5831*b*.
on bud development on sugar cane stems after hot water treatment, 725*h*.
on callus formation in plants, 2286*b*.
on cress root, 5893*a*.
on flowering, 2357*i*, 5456*c*.
on fungi, 6704*h*.
on geotropism of *Thuja orientalis*, 280*g*.
on germination of *Bacillus subtilis* spores, 1460*i*.
on germination of *Pinus maritima*, 5451*e*.
on germination of seeds, 7095*a*.
on growth and respiration in pea, 2290*e*.
*effect* on growth, effect of 2,3,5-triiodobenzoic acid on, 2678*f*.
on ion absorption by roots, 804*h*.
on *Lactobacillus arabinosus* response to nicotinamide, 6697*g*.
on laminar nodes of *Phaseolus coccineus*, 5828*e*.
on malting and compn. of malt, 3142*h*.
on N fixation by *Azotobacter*, 7173*a*.
on plants grown for production of alc., 1839*f*.
on potato growth and size of starch granules, 4734*h*.
on rat growth, 7556*g*.
on respiration in *Avena* coleoptile, 7555*c*.
on respiration of plant tissue, 5456*i*.
on root elongation in germinating barley, 8015*g*.
on root growth, effect of Na 3-indolemethanesulfonate on, 3817*h*.
on salsify root tissue (normal, crown gall and heteroauxin accustomed), 1461*h*.
on sprouting of potatoes, 8460*b*.
on sunflower crown gall, 8597*g*.
on vegetables, 1839*a*.
on water absorption by potatoes, 282*i*.
effects in man, 2203*e*.
formation by pineapples, 7096*e*.
formation during respiration and auxin activation, 5089*d*.
formation from indoleacetaldehyde in coleoptile, 3071*c*, 4348*d*.
in fungi parasitic to trees in relation to their action, 9177*c*.
gall formation in sugar cane in response to, 7090*h*.
as growth substance, 8017*f*.
inactivation by enzymes, 1465*c*.
labeled with C$^{14}$, 8379*h*.
melanin formation from, by vegetable tissues, 278*a*.
pellagragenic activity of, 2292*b*.
from penicillin (clinical), 2184*g*.
photooxidation of, sensitization by vitamin B$_2$, 3887*i*.
plant-growth material, synergists for, P 5151*e*.
in potatoes, 3194*f*.
prepn. of, 1397*c*.
sodium salt, soil retention of, 3958*f*.
synergism of, 5525*g*.
**3-Indoleacetic acid, 2-methyl-**, as growth substance, 8017*f*.
**3-Indoleacetonitrile** (*3-indolylacetonitrile*), 3818*a*.
manuf. of, P 2236*g*.
**3-Indolebutyramide**, *N*-**2-hydroxyethyl-**, in penicillin production, 2273*i*.
**3 - Indolebutyric acid** (*γ - 3 - indolylbutyric acid*), P 5424*f*.
as carnation-rooting agent, 9338*e*.
effect on potato growth and size of starch granules, 4734*h*.
on respiration of plant tissue, 5456*i*.
on sunflower crown gall, 8597*g*.
on transplanted plants, 804*i*.
on wound healing in trees, 9173*g*.
fig maturation by, 2726*g*.
in lettuce-seed production, 1893*e*.
parthenocarpy in figs from, 2288*a*.
photooxidation of, sensitization by riboflavin, 3888*b*.
in scald reduction on fruits, P 330*h*.
**4-Indolecarbonitrile**, and picrate, 4255*f*.
——, **3 - (dimethylaminomethyl)-**, 4255*g*.

constitution and effect of, 345*c*.
copper compds. as, for soil-cement mixts., P 5568*g*
from copper salts and thiourea, P 5529*e*.
for corn borer, 6354*d*.
for corn earworm and fall armyworm on corn, 3136*cf*.
for corn flea beetle, 4416*h*.
for cotton bags for control of flour beetle, etc., 7180*c*.
for cotton fleahopper, 1143*f*.
for cotton insects, 1142*i*, 1143*bd*, 3137*b*, 7183*d*.
for cotton insects, diluents for, 1142*h*.
crystn. of DDT or analogs from aq. emulsion, P 6358*e*.
for culture mite, DDT and hexachlorocyclohexane as, 2361*h*.
cuprammoniacal petroleum mahogany sulfonates, P 2424*i*.
for cutworms on apricots and peaches, 1522*b*.
cycloalkyl nitrites, P 4694*f*.
cyclohexane chloro derivs., P 2732*b*, P 8090*e*.
from cyclohexane chloro derivs. and thiocyanate, P 8604*i*.
cyclohexyl and norcamphanyl derivs. of butanediols, P 1058*g*.
from cyclohexylphenol, dinitrocresol, dinitrophenol, etc., P 9356*e*.
*N*-cyclohexyltetrahydrothiophenine 1,1-dioxides, P 3851*c*.
1 - cyclopropyl - 3 - (2 - furyl) - 2 - propen-1-one, P 5530*d*.
for darkling ground beetles, DDT as, 3139*e*.
for dates, 4417*d*.
from DDT and amides or imides, P 350*b*.
DDT and analogs as, speed of action of, and effect on respiration of insects, 9342*g*.
DDT and hexachlorocyclohexane as, 2729*e*, 4805*b*.
DDT and hexachlorocyclohexane as, persistence in soils, 9343*f*.
from DDT and methylated naphthalene, P 1902*e*.
DDT and other contact, review on, 6353*a*.
DDT and related compds. as, 2359*g*, 2360*f*, 7628*f*.
DDT as, 807*g*, 5146*b*, 9344*f*.
anticholinesterase action and, 2359*e*, 3964*h*.
for apples, red-banded leafroller increase and, 809*i*.
cyclohexyldiphenyl ether as synergist for, P 812*h*.
droplet size of oil sprays and, 3138*i*.
effect of moisture and temp. on residual effectiveness on, 7628*h*.
effect on citrus, 7631*a*.
effect on honeybees, 8361*a*, 2729*b*.
effect on Lima beans, 4805*g*.
effect on rats, 7185*i*.
inactivation by light, 7183*f*.
in mists, 807*i*.
review on, 2727*i*.
toxicity of, 9344*a*.
DDT-contg., chlorine detn. in, 9331*c*.
DDT detn. in, 9354*d*.
detection on sprayed surface, 2359*f*.
stabilization of, P 7634*a*.
storage of conditioned and wettable powders of, 807*d*.
toxicity to birds and mice, 7628*g*.
toxicology of, for warm-blooded animals, 3556*c*.
translocation in plants, 1521*b*.
in wettable powders, particle size and, 7628*e*.
DDT deposits or residues as, 808*f*, 2728*a*.
DDT deposits or residues as, effect of sun on, 5895*e*.
DDT, E-605 and hexachlorocyclohexane as, 6776*g*.
DDT for, purification of, P 3970*a*.
DDT, its analogs and isomers of hexachlorocyclohexane as, 9343*a*.
from DDT or its analogs with polyhalogenated hydroaromatic compds., P 6358*f*.
DDT related compds. as, 199*c*.
DDT residues from, on alfalfa hay and seed chaff, 1898*d*.
in milk from pea-vine silage, 6356*a*.
removal from apples, 5895*i*.
on strawberries and vegetables, 1898*c*.
DDT-sabadilla mixts. as, synergistic action of, 7628*i*.
DDT soap, P 4808*c*.
DDT spray powders as, effect of dispersing and spreading agents on, 8087*h*.
DDT-xanthone, P 350*f*.
for dermestids in insect boxes, DDT as, 7631*b*.
*Derris* and *Lonchocarpus* as, 5150*c*.
*Derris* and *Lonchocarpus* roots as, testing with guppies, 2730*i*.
derris as, effect of drying on, 7631*f*.
from derris, pyrethrum and cyclohexanol, P 6778*d*.
derris root as, detn. of toxicity of, 1522*d*.
from *tert*-diacylamines, P 4421*b*.
for diamond-back moth and imported cabbage worm on cabbages, 2358*d*.
1,1 - dibromo - 1 - chloro - 2,2 - bis(*p*-chlorophenyl)ethane for, or their intermediates, P 3970*a*.
from *o*-dichlorobenzene, P 6778*e*.

*p*-dichlorobenzene and $C_{10}H_8$ as, 1142*b*.
from dichlorophthalic anhydride-deriv. esterification, P 5529*f*.
1,2-dichloropropene and 2,2-dichloropropane as, 5898*e*.
1,2 - dichloro - 4 - (1,2,2,2 - tetrachloroethyl)benzene as, P 7960*a*.
for dicky-rice weevil, leafroller and mealy bug on citrus, 7185*b*.
from dinitro-*o*-cresol, P 9356*d*.
dinitro *o* cresol as, 2728*f*.
dinitro-*o*-cresol Na deriv. as, for *Aphelenchus olesiscus*, *Heterodera schachtii* and *Melolontha vulgaris*, 9354*b*.
dithiobis[thionoformic acid] esters as, 6983*g*.
dithiocarbamates of *β*-hydroxy acids and their derivs., P 7506*g*.
dithiocarbamic acid salts, P 5224*e*.
for durra stem borer, 2727*i*.
dusts, detn. of particle size of, 2357*c*.
in Dutch-elm-disease control, 9350*a*.
E-605 as, alkali stability of, 1139*h*.
for eastern tent caterpillar, effect on egg masses, 2730*d*.
effect on fish and wildlife, 1523*i*.
on orchard-biol. balance, 5893*e*.
on peach scab, 2356*f*.
on soil microörganisms, 1139*d*, 1896*h*.
for elm-bark beetle for Dutch-elm-blight control, 7629*h*.
for elm-leaf beetle, 1897*g*.
emulsifiable oils for, P 2733*a*.
from esters of bicyclo dicarboxylic acids, P 7633*d*.
from esters of ether-dicarboxylic acids, etc., P 5152*e*.
esters of (hydroxyalkoxy) compds., P 6663*g*.
esters of unsatd. tricarboxylic acids, P 7634*d*.
2 - ethylhexyl *N* - octadecyltetrachloro phthalamate, P 3558*h*.
ethyl phenethyl sulfone derivs., P 5801*f*
α-ethylpiperonyl ethers, P 2639*d*.
for European apple sawfly, 8106*e*.
for European corn borer, 1896*d*, 6354*e*.
org. compds. as, 7182*f*.
phenylhydrazides as, 7182*g*.
for soil treatment and absorption by corn, 9336*d*.
for European fruit lecanium on peaches, DDT as, 5895*i*.
for European red mite, 5898*a*.
for European red mite and Pacific mite in orchards, 1523*a*.
of European red mite on apple trees, 8600*b*.
evaporator for liquid, P 7273*i*.
expt. station reports on, 2725*c*, 6775*b*, 9313*b*, 9314*b*, 9328*fi*, 9329*dg*, 9330*c*.
from exts. of pyrethrin and rotenone, P 5529*c*.
for fall armyworm and green June beetle, 1899*a*.
for fall armyworm on corn, 3136*e*.
for fibers, etc., P 9478*h*.
films of, on building materials, gelatin and size, 9330*f*.
for filter fly, 5894*i*.
for fire ant, 1897*e*.
for flea beetles, DDT as, 9313*e*.
for fleas and ticks in clothing, 9349*c*.
for fleas, etc., 6356*h*.
for flesh-fly larvae, As as, 806*h*.
for flies— see *Flies*.
for flowering and ornamental plants, parathion as, 8088*h*.
fluorine compds., P 6357*i*.
fluoroacetamide, P 351*c*.
for food crops, DDT as, 8598*d*.
for forests, DDT as, 810*a*.
for fruit trees, triethanolamine salt of dinitro-*o*-*sec*-butylphenol as, 5897*h*.
for gladiolus thrips, 5418*gi*.
for gladiolus thrips, DDT as, 3961*h*.
goldenrod oil as, 2372*d*.
for grains, 9336*a*.
for grain weevil, 1900*c*.
for granary weevil on wheat, 6777*b*.
for grape berry moth, 9340*c*.
for grape mealy bug on yew, 5526*e*.
for grasshoppers or locusts, 3135*h*, 3136*b*, 3557*d*, 4806*c*, 6353*e*, 7185*efh*.
in citrus groves, 3136*a*.
use in aircraft, 3558*a*.
grease- and stain-removers, P 1146*c*.
in Greece, 9340*g*.
for greenhead fly, DDT as, 9344*e*.
for greenhouse pests, Se and Se compds. as, 1141*b*.
for greenhouse vegetables, 1141*a*.
for guava insects, 3135*b*.
for gypsy moth, DDT as, 347*b*.
halogenated-aromatic compds. as, chem. constitution and, 5894*c*.
halogenated derivs. of 1,2-dinitroethane, P 3025*b*.
halogenated ethane derivs., P 2236*d*, P 5899*b*.
halogenated-hydrocarbon, 9331*g*.
halogenated org. derivs. as, 1518*d*.
halogenated-unsatd. compds., P 5899*a*.
halogen compds., P 9358*c*.
halogen-P compds. as, 9353*f*.
halo-*sec*-octylphenoxyacetic acids, P 350*c*.
for harlequin bug, 1897*c*.
for hazelnut weevil, 6777*d*.
and their health aspects, 9352*i*.
heavy-metal-nicotine silicate, P 5900*ab*.
from hexachlorocyclohexane and acyloxy halo ethane derivs., P 7634*g*.
hexachlorocyclohexane as, 810*d*, 810*e*, P 1525*c*, P 4295*g*.
hexachlorocyclohexane-contg., P 2732*e*, P 6778*g*, P 7187*c*.
hexachlorocyclohexane detn. in, 2896*e*, 8601*i*, 9330*h*.
hexachlorocyclohexane isomers as, 1140*c*, 1898*i*.
1,2,3,4,5,6 - hexachloro - 1 - (trifluoromethyl)cyclohexane, P 4693*g*.
for hide beetles, 2725*h*
for *Hoplocampa brevis*, 6355*d*, 8600*c*.
for *Hoplocampa flava*, 3964*f*.
for horn fly, 9342*d*.
chlorinated hydrocarbons as, 3135*g*, 5895*g*.
chlorinated hydrocarbons in milk from, 6355*f*.
for horse louse, chlordan and DDT as, 1520*c*.
hydrazine-deriv. contg., P 9356*c*.
hydroxyaryl amines as, P 1062*a*.
2-hydroxyethyl thiocyanate as, for bed bugs and corn beetles, 2945*g*.
2-iminoöxazolidines as, P 252*d*.
1,3-indandione derivs., P 2732*c*.
inert materials as, 1139*g*, 1142*f*.
insect-cuticle permeability to, 6323*a*.
insect resistance to, 7181*g*.
*N*-isobutyl-2,4-dodecadienamide, 1719*f*.
for Japanese and oriental beetles in turf, 9345*i*.
for Japanese beetle, 2730*b*.
on plant balls, ethylene dibromide-chlordan dip as, 2361*i*.
in soils, arsenates as, 795*g*.
for Japanese weevil, 7628*d*.
for kalanchoes, 1898*a*.
ketonic, P 3442*a*.
for leaf miner on asters, 1522*g*.
for *Lecanium* on blueberries, 1524*h*.
legume-seed increase by, 346*a*.
for lepidopterous larvae, 2726*d*.
for lice, 1518*e*.
lime-S as, 8085*a*.
for *Lipoptena mazamae*, 6355*e*.
for little-fire ant, parathion as, 7627*g*.
for livestock, 5525*h*.
for long-tailed mealy bug on citrus, 4805*d*.
for *Loxagrotis albicosta*, 1142*g*.
for *Lymantria monacha*, 7626*c*.
magnesium cyanide, P 1537*f*.
for malaria control, DDT as, 9345*b*.
manganese arsenate, P 6358*a*.
manuf. in western U. S., 8577*c*.
for mealy bugs on pineapples, 4417*a*.
for *Melolontha melolontha*, 5526*e*, 8088*f*.
mercaptides, P 4807*d*.
(mercaptoethyl) biguanides, P 1799*c*.
mercury compd., P 9355*h*.
4,7-methanoindene hexahalo derivs. as, P 5797*c*.
α - methylbenzylidenemalononitrile, P 3461*a*.
3,4 - methylenedioxyphenyl - 1 - butylglycol mixts. with pyrethrins, P 4420*d*.
methylenedioxyphenyl compds. as, and pyrethrin synergist, P 1526*b*.
(3,4 - methylenedioxyphenyl)propylene compd. as, or insecticide synergist, P 1902*h*.
for Mexican bean beetle, 810*e*.
for mites, P 4808*b*.
on berry bushes and fruit trees, 1897*f*.
*p* - chloro - *N*, *N* - dimethylbenzenesulfonamide, P 6234*b*.
in DDT expts., 809*h*.
in lab. insect rearings, 1899*f*.
in orchard, 7630*a*.
in uniforms, 3554*i*.
in wool, 812*f*.
mixts. of, toxicity of, 3135*c*.
mixts. with fungicides and hormones, effect on tomatoes, 9337*e*.
mode of action of org., review on, 5146*d*.
for mosquitoes—see *Mosquitoes*.
for moths—see *Moths*.
for muck crops, 3964*e*.
for mushroom pests, hexachlorocyclohexane as, 7184*f*.
1-naphthylmethyl tetradecyl ether and PhCOBu, P 2732*c*.
from nicotine, P 7632*i*.
nicotine as, 757*d*, 6789*d*.
nicotine detection and detn. in, 4418*d*.
nicotine double salts, P 8005*b*.
nicotine-heavy-metal silicates, P 7634*b*
nicotine synergists, phthalonitrile as, P 351*d*.
nicotinium salts, P 3969*b*.
nitroalkylcyclic amines, P 813*a*.
*p*-nitrobenzamide *N*-derivs. as, 2357*f*, 7181*h*.
2-nitro-1,1-di-*p*-tolylethane, P 5803*e*.
2-nitro-1,1-di-3,4-xylylethane, P 5803*g*
from nitropolyhydroxy alc. polymers with polyamines, P 8209*e*.
octachlorobiphenylquinone, P 814*b*.
octyl - Ph - $OCH_2CO_2C_nH_{2n}(OC_nH_{2n})_mX$, where X is Cl, Br, I, SCN, or CN, P 350*a*.
for olive fruit fly, 9349*f*.
for olive moth, 4416*a*.
for onion thrips, 5896*i*.
on cotton, 1143*e*.
DDT as, 1897*i*.
on tomatoes, DDT as, 7184*b*.
orange small size and, 1135*e*.
for orange tortrix, 5148*b*
for orange tortrix and Willamette mite on raspberries, 3137*c*.
for orange tortrix on raspberries, 1521*i*
org., P 7187*f*.
org. compds as, 1896*b*, 7625*h*, 8086*c*
from org. polyphosphate, P 4845*a*
org. thiomercury compds., P 6648*b*
for Oriental beetle, hexachlorocyclohexane as, 1522*f*.
for oriental fruit moth, 7630*h*.
for oriental-fruit moth and plum curculio on peaches, 7630*g*.
for oriental fruit moth, DDT as, 5527*e*
for *Ornithodoros erraticus*, DDT as, 7629*c*.
for *Oscinosoma frit* on grain, 8088*c*
ovicide action, 5527*i*
for oystershell scale, DDT as, 3139*c*
for oystershell scale on apples, 7630*d*
paint or whitewash contg. dichloropropane-dichloropropenyl thiocyanate or other, P 5607*e*.
paints contg., 9345*h*
for paper, effect of hexachlorocyclohexane smoke on paper durability, 5896*c*
for *Paratetigena segrata*, 4,6-dinitro-*o*-cresol as, 3488*d*.
for greenhouses, parathion as, 810*g*
for pea aphid, 1897*b*.
for peach borer, 8088*e*.
for peach-cat-facing control, 8088*d*
for peach-deforming sucking bugs, 1143*i*
for peaches, 4417*a*.
for peach silver mite, 1523*d*.
for peach-twig borer, 5149*b*.
for pear midge, 9348*c*.
for pear psylla, 9348*e*.
for pea weevil, DDT as, 1521*g*.
for pecan-nut casebearer, 7630*i*.
for pecan weevil, 9330*a*.
pellitorine as, 2934*a*.
*sym* - (pentachloroisopropyl) - *p* chlorobenzene for, P 6231*c*.
for periodical cicada, 1899*b*, 7629*i*
for pest control in water-distribution systems, 2717*c*.
from petroleum oil and lecithin, P 4420*e*
pharmacy and, 6353*a*.
phenyl esters of octylphenoxyacetic acid, P 350*d*.
phenylhydrazides as, 5525*i*.
phenylmercury complexes, P 690*a*.
phenylsemioxamazide, P 5530*a*.
phenyl thionothiocarbonate salts, P 8604*g*.
phosphatic, nutritive value for plants, 1899*d*.
phosphorus-compd. and systemic, 5897*b*
phosphorus-contg., 3965*d*.
phosphorus-org. compds., 6776*e*.
from phthalic acid esters, tritolyl phosphate, etc., P 5529*f*.
phthalimide *N*-derivs. as, 7182*b*.
piperonyl butoxide in, irritation and toxicity to animals, 9266*h*.
piperonyl chrysanthemumate, P 2732*h*.
for plants, 6775*g*, 9339*h*.
from plants, 1140*h*, 3556*i*.
for plum curculio, 3139*h*, 6777*c*.

*for plum curculio*, effect on parasitization of oriental fruit moth, 1143*i*.
on peaches, 1143*g*, 5527*a*, 9348*g*.
polarography of, 5896*b*, 8602*a*.
for poll strike in rams, hexachlorocyclohexane as, 7184*g*.
polyhalo derivs. of alkyl sulfides, P 6645*i*.
for potato flea beetle, 8599*f*.
for potato leafhopper on apple nursery stock, DDT as, 1522*a*.
for potato-root eelworm, DD as, 9337*a*.
for potato tuberworm, 3964*i*, 6776*e*, 8599*e*.
propellants for, fluoro hydrocarbons, P 6645*d*.
pyrethrin concentrate for, P 5151*a*.
pyrethrin, concn. and purification of sesamin exts. for, P 5151*a*.
pyrethrins as, deterioration of, 2362*i*.
pyrethrin suspensions in Freon, spraying app. for, 5527*f*.
pyrethrin synergist, P 9356*b*.
pyrethrin synergist and solvent for DDT, P 9356*a*.
from pyrethrum, 5527*f*.
pyrethrum aerosols, P 351*e*.
pyrethrum synergists, 8604*a*.
pyrethrum synergists, amides as, P 351*e*.
for Queensland fruit fly, 7181*c*.
quinone-resorcinol polymers, P 6452*e*.
R. B. 1018 as, 4805*h*.
for red-banded leaf roller, 2729*eg*, 5527*c*, 7628*b*, 9347*d*.
for red-harvester ant, 7627*e*
for red spider, dinitrophenols as, 811*b*.
for red spider, testing of, 2730*e*.
as repellents, 2363*e*.
research on, coördination of, 1139*e*.
residual films of hexachlorocyclohexane mixts. with phenyl isocyanide, microscopic structure and, 7184*e*.
residues, testing of, 3554*h*, 9345*c*
reviews on, 344*i*, 1891*a*, 3964*e*, 6352*i*, 8086*h*, 9353*g*.
for root-knot in soil, 809*e*.
for root-knot nematode in soil, chloropicrin as, 3960*i*.
rotenoid, solvent for, P 350*e*.
rotenone detn. in, 7631*d*.
for rust mites, 8597*c*.
ryanodine as, 812*d*.
sabadilla as, 2363*b*.
for scorpions, 4416*c*.
screening of chem. compds. for use as, 5551*h*.
for seed-corn maggot on beans, 5896*h*.
selenium as, 2357*f*.
from selenium or S compds., P 6778*e*.
sesame-ext. synergized, P 3969*b*.
for sheep ectoparasites, 7631*g*.
for sheep tick, 6776*i*.
for sheep tick, chlorinated hydrocarbons as, 8598*i*.
silicon compds., P 8211*f*.
for sludge flies, 7629*g*.
for slugs, 9339*h*.
smokes for indoor use, 9342*a*.
smokes, generation of, 5146*e*.
sodium selenate as, for greenhouse soil, 1141*i*.
for soil, 7178*i*, P 9357*c*.
solvent or carrier for, from wood-tar oil, 6396*a*.
solvents (hydrocarbon) for, P 1883*f*.
South African tests on, 346*g*.
for southern corn rootworm in peanuts, 7182*i*.
species-specificity of, route of administration and, 9340*h*.
for spider beetles in cereal warehouses, 2729*a*.
for spiders on carnations, 9338*f*.
for spittle bugs, 1521*f*.
stability of hexaethyl tetraphosphate and $Et_4P_2O_7$, 5526*b*.
for sugar-beet nematode, 3134*d*.
for sugar beets in prevention of curly top, DDT as, 1897*i*.
for sugarcane borer and yellow sugarcane aphid, 3136*g*.
sulfones, 2593*a*.
sulfones (monochlorocyclic), P 5185*g*.
sulfonic acids for addn. to oil, P 396*b*.
sulfur formation on plants as, P 5899*e*.
sulfur nitride, P 4807*d*.
sulfur (stabilized insol.) for, P 3576*a*.
for sweet-clover weevil, 8599*c*.
for sweet-potato weevil, 1142*d*, 7183*b*.
synergism of pyrethrins and rotenone, 5525*h*,
synergists for pyrethrum and rotenone, benzenesulfonic acid amides as, P 351*d*.
synthetic, 6777*a*.
systemic, for plants, 6776*e*.
for tail louse and ticks on livestock, 8598*h*.
for termites in bamboo, 3553*i*.
for termites in soil, pentachlorophenol as, 4806*h*.
testing of, 1140*f*, 5893*e*, 7626*d*, 8602*d*.
by blood-stream injection, 1139*i*.
spray chamber for, 3554*h*.
as stomach poisons against leaf eating insects, 5893*e*.
tetra-alkyl phenyl triphosphates, P 9356*h*.
tetra-alkyl pyrophosphates, P 9357*a*.
tetrachloroethyl ethers of phenols as, P 7633*a*.
1,1,4,4-tetra(*p*-chlorophenyl)-2,2,3,3-tetrachlorobutane as, 7184*d*.
tetrachlorophthalic diesters, P 4513*g*.
tetraethyl pyrophosphate as, 3556*b*.
detn. in ethyl phosphate mixts., 2125*a*
poisoning by, 9330*f*.
tetrahydrothiazoles, P 9356*f*.
tetrahydro-3-thiophenecarbamic acid 1,1-dioxide derivs., P 6668*e*
tetrahydrothiophene-3-ol 1,1-dioxide esters, P 1441*e*.
from ω-thiocyanoalkyl esters, P 5152*h*.
6-(thiocyanomethyl)dehydroabietic acid, P 6665*g*.
thiones, P 350*a*.
thiourea derivs. as, toxicity to *Drosophila melanogaster*, 8089*a*.
for thrips on nectarines, 7184*c*.
for ticks and tsetse flies, DDT and hexachlorocyclohexane fed to cattle as, 5526*g*.
for tobacco, 2729*a*.
for tobacco flea beetle, 5895*d*, 9346*a*.
for tobacco stalk borer, 5147*f*.
for tomatoes, 4414*f*.
toxaphene, 5897*d*.
toxaphene residues on alfalfa and in cattle and sheep, 8600*f*.
toxicity of, 2728*e*.
to bees, 344*c*.
to fish and mosquitoes, 9345*g*.
toxicology of contact, 7627*g*.
*p,p'*-(2,2,2-trichloroethylidene)dibenzenethiol dicarbamate, 4657*i*.
trichloromethyldiarylmethanes, P 4420*d*.
*N*-(trihaloalkylidene) amines, P 7499*e*.
trihaloethane aryl derivs., P 350*h*.
trihaloethyl compds., P 6358*g*, P 6360*a*.
for tsetse fly, DDT as, 7629*h*.
for tsetse fly on cattle, 1140*i*.
for turf insects, residual activity of, 9346*f*.
for turnip aphid, 5897*a*.
for turnip aphid and foliage-feeding larvae on Chinese cabbage, 7628*a*.
for two-spotted spider mite, 1522*h*, 1523*c*.
for two-spotted spider mite, effect of dusts on parathion and $Et_4P_2O_7$ as, 2730*a*.
for vegetable weevil on potatoes, 5146*h*.
for velvetbean caterpillar, 1521*h*.
vinyl ethers for, P 9080*b*.
wax, P 4807*b*.
waxes contg., for floors, etc., P 5614*a*.
for western raspberry worm, 9341*f*.
for white-fringed beetle, 9347*i*.
adhesives for cryolite, 806*h*.
DDT as, 809*d*.
for white spring tail in mulch under fruit trees, 7184*i*.
for willows, $Et_4P_2O_7$ as, 1899*b*.
for wireworms, 347*h*.
hexachlorocyclohexane as, 348*c*.
in irrigated lands, DDT as, 2362*b*.
on potatoes, 8086, 2726*g*.
in soil, 3139*i*, 9346*d*.
on sugar beets, 8088*g*.
in sugar cane, 2726*i*.
in wheat, 5896*g*.
for wood—see *Wood*.
for wool, 9348*i*.
for wool, DDT and Mitin FF as, 8089*d*.
xanthic acid anhydrosulfides as, 144*d*.

**Insectifuges**. (See also *Sprays*.)
amides of α,β-unsatd. acids, P 5413*e*.
for bark beetles in elm logs, 4417*d*.
for bees, use with insecticide, 3455*b*.
from benzyl ether, P 5153*d*.
from benzyl ethers of $C_3H_4$ glycol, P 5153*e*.
for chiggers, 8599*g*.
for chiggers, punkies and red bugs, 7181*c*.
from conifer-heartwood exts., 7679*e*.
as cosmetics, 9335*g*.
dermatitis from pyrethrum-contg., 3557*b*.
detn. of Dimalone on clothing, etc., 1900*i*.
for European-corn borer for soil treatment and absorption by corn, 9336*d*.
fatty acid esters of the reaction products of 1,2-propanediol and ethylene oxide as, for cloth, P 3446*e*.
for fleas and ticks in clothing, 9349*c*.
for flies—see *Flies*.
from glycerol phthalate, Me phthalate and propanediol Me phthalate, P 8605*a*.
hydrogenated naphthols and hydroxydiphenyls and their derivs. as, 2363*c*.
ketonic, P 3442*a*.
lactic acid as intermediate for, 787*i*.
from methyl cellulose and pyridine, P 5899*d*.
for Mexican bean beetle, (3,4-methylenedioxyphenyl)propylene compds., P 1903*d*.
for mosquitoes—see *Mosquitoes*.
for moths—see *Moths*.
org. compds. as, 8086*g*.
paint or whitewash contg. dichloropropane-dichloropropenyl, thiocyanate or other, P 5607*e*.
phys. properties of, 5150*d*.
for plum curculio on peaches, 9348*h*.
for potato leafhoppers, Cu and Zn chromates as, 801*f*.
review on, 8086*h*.
stick for rubbing on skin, P 4420*i*.
storage effect on, 2362*h*.
for termites, 6356*d*, 9341*e*.
for tsetse fly, 1900*i*
wax, P 4807*b*.
for wood, 8603*f*.

**Insectine**. See *Vitamin T*.

**Insects**. (See also *Caterpillars; Entomology; Flies; Moths; Scale insects; Worms*; etc.)
bait for—see *Baits*.
balance of, in orchards, effect of nonspecific insecticides on, 5893*e*.
books: Biological Control of, 3558*d*; Directory of, control, 3558*d*.
boxes, dermestid control with DDT in, 7631*b*.
boxes, *p*-dichlorobenzene use in, 4806*i*.
cholinesterase system of, effect of DDT on, 5495*a*.
in corn-processing plants, 1518*d*.
cuticle, eggshell and pigment metabolism of, 9273*a*.
cuticle of, 3529*g*.
as living system, 6322*d*.
permeability to water, 6323*i*.
cuticles and egg shell of, wax layers in waterproofing of, 6322*g*.
3,4-dihydroxyphenylacetic and 3,4-dihydroxybenzoic acids in, and their relation to hardening of cuticle, 3940*c*.
effect of sublethal doses of poisonous gases on, 8603*d*.
egg shells of, penetration of, 5527*g*, 7594*d*.
embryos of, effects of cold on, 6748*a*.
enemies of flowers and shrubs, 3554*h*.
esterases and lipases of, 6677*c*.
hairs of, water-protecting properties of, 6324*f*.
hormones of, 8066*f*.
injection (blood-stream) of, 1139*h*.
leather industry and, 1204*e*.
lipases of, specificity of action of, 6677*d*.
as medium for physiology studies, 1850*e*.
metabolic rate in pupae of, P compds. and, 8561*a*.
metamorphosis of, free amino acids during, 9270*h*.
metamorphosis of, pH, buffer action and pH dependence of H-activating enzyme systems during, 2333*d*.
morphology and physiology of, 1139*f*.
in peanuts (stored), effect of refrigeration on, 3534*i*.
phosphatase (alk.) in, 8560*i*.
preservation of, P 3952*a*.
proteolytic enzymes of, 2332*a*.
rearing in lab., mite control in, 1899*f*.
resistance to benzene hexachloride and DDT, 8561*f*.
resistance to insecticides, 7181*g*.
respirometer for, 5124*d*.
rice infestation with, 9314*c*.
soil fertility and, 9322*i*.
veratrin effect on, 1490*b*.
vitamin C distributions in tissues of, 8561*d*.
vitamins in, 6321*i*.
wood preservation from—see "preservation" under *Wood*.

**Insect waxes**. See *Waxes*.

**Inspection**, quality control and amt. of,

**Instability constant** (of *ionisable complexes*). See *Ionisation, electrolytic*.

**Instabilometer**, for ceramic mixes, 3581*g*.
**Instrumentation**, in analysis, 2113*g*, 5645*c*.
of continuous chem. processes, 445*b*.
in dielectric industry, 2342*h*.
of distn., 2041*h*.
of distn. plant for butadiene manuf., 6873*b*.
education in, 2050*e*.
in fuel-gas manuf., 8645*f*.
in hydrogenation of coal, 6806*i*, 7664*e*.
of lime kilns, 1535*d*.
of natural gas gasoline plant fractionators, 7673*e*.
of open-hearth furnaces, 2908*c*.
in paper-drier control, 5949*g*.
in paper pulp and paper mills, 848*g*, 1184*efg*, 4465*c*.
in paper-pulp-liquor treatment to recover chemicals, 2773*i*, 4465*e*, 8677*b*.
in paper pulp manuf., 848*h*, 2773*h*,
in petroleum-hydrocarbon analysis and research, 7220*i*.
in phys. chemistry, 1619*d*.
in research lab., 5645*b*.
for superphosphate manuf., 7175*b*.
theory of, 6469*e*.
**Instruments**, for analysis, 3741*i*.
analytical, in automatic control systems, 8213*b*.
books: Scientific, 2047*g*, 3668*h*; Manual, 3248*i*.
in chem. industry, 6469*b*.
electronic, in pulp and paper industry, 7228*d*.
geomagnetic, magnets for, 541*h*.
metals for, 6958*i*.
metals in, 5233*c*.
in petroleum research, 6469*d*.
in waste treatment, 5890*d*.
**Insula**, the term, 920*h*.
**Insulation, electric**, of copper wire with resinous products, P 7611*a*.
of elec. resistors, P 6098*f*.
of magnetic sheets, P 4402*d*.
of polyethylene-insulated cable joint with polyethylene scarfing, P 4046*a*.
with tetrafluoroethylene polymers, P 2715*a*.
of wires with silicone compd. and polytetrafluoroethylene tape, P 2040*e*.
**Insulation, thermal**. (See also *Conductivity, thermal*.)
with asbestos by spraying, 7608*a*.
of electroplating tanks, 4583*c*.
of glass tank furnaces, 5913*h*.
of process vessels, expansion and, 5236*a*.
of tank furnaces in increasing output, 6381*f*.
**Insulators**. (See also *Sound*.)
leather waste-vinyl acetate plastic, P 4506*b*.
resinous products as, 8197*h*.
**Insulators, electric**. (See also *Dielectrics; Dielectric strength*; and insulating materials such as *Bakelite, Phenol condensation products, Porcelain, Resinous products, Sulfur, Varnish*.) P 2343*h*.
from acyl halides, castor oil, olefinic $\alpha,\beta$-dicarboxylic acids and vinyl compds., P 3656*c*.
alumina films as, 5250*h*.
on aluminum—see *Aluminum*.
from aryl polyoxy polycarboxylic acid and ethylene glycol, P 5998*a*.
from asbestos cloth or glass fiber and mica flakes with resinous binder, P 9536*g*.
from bamboo, P 6927*a*.
from bentonite and cement, P 1940*a*.
from benzylated PhOH condensation with HCHO, P 5229*a*.
boron sintered, P 3734*f*.
building materials, P 6390*d*.
Buna S X-392 and X-393 as cable and wire, 2017*d*.
from 1,3-butadiene mixed polymers with styrene, etc., P 2816*g*.
from butylene (poly-)-polyethylene blends, 9522*i*.
from Butyl rubber, for wires, P 3228*e*.
for cable and wires, 434*h*.
for cables carrying high frequency, P 1126*b*.
cable, thermoplastic, P 3657*d*.
from cellophane, P 5518*f*.
cellulose acetate tubing for, 8751*b*.
from cellulosic sheet impregnated with vinyl polymer, P 3242*a*.
ceramic compn. for, P 7658*c*.
ceramic, oil, paper, plastic and rubber,
from china clay, PhOH-HCHO condensation product and starch, 8075*e*.
chlorinated hydrocarbons as, neutralization of decompn. products of, P 2714*h*.
from chlorinated polythene, P 5642*h*, P 9534*be*.
coatings, 1993*f*.
for coating wires, etc., P 2344*a*.
for copper wire, 1993*a*.
for copper wire, Neoprene compds., 894*f*.
couplings for underground cable and pipe lines, 6090*d*.
from diallyl tetrachlorophthalate and unsatd. alkyd resin, P 3233*c*.
dielec.-loss angle and surface resistivity of, effect of humidity on, 2054*b*.
from $p,\alpha$-dimethylstyrene trimer, P 1224*h*.
from 4,4'-divinylbiphenyl polymers with styrene, P 4516*i*.
elec. conduction in, 2083*e*.
elec. properties of, app. for detn. of, 1125*e*.
electrodes from metal laminated with, P 5357*g*.
energy levels and work function in, 933*h*.
from esters of Diels-Alder adduct of maleic anhydride and poly-unsatd. nonconjugated compd. with allyl alc. or methallyl alc., P 2819*b*.
from ethylene polymers, P 906*d*, P 4515*c*.
failure of, 954*c*.
from fumaronitrile polymers with styrenes, P 4516*g*.
fungicidal corrosion-inhibiting lacquer for, P 6434*c*.
glass bushings, P 8633*c*.
glass, with low power factor, P 373*a*.
halogenated diphenylethylene polymers for, P 6866*a*.
halogenated gases for, 6337*f*.
halogenated-hydrocarbon mixts. with N heterocycles for, P 2217*e*.
halogenated-hydrocarbon, prevention of H halide formation in, P 4402*c*.
halogenated-hydrocarbon, stabilization of, P 5887*h*.
with heat cond. improved, P 3948*h*.
heating of, in electrostatic tar precipitators, 7211*g*.
hydrogenation product of dimeric $p,\alpha$-dimethylstyrene, P 4518*f*.
impregnating compn., P 2033*d*.
impregnation of porous refractory, with resinous dielec., P 9537*a*.
measurement of dielec. const. and loss factor of, 7763*h*
from melamine-HCHO resin and fatty acid ester alkyd resin, of high dielec. strengths and resistance to solvents and water, P 4873*f*.
methacrylate compns. contg. colloidal $SiO_2$ for, P 5634*h*.
from methyl methacrylate and methylvinylpolysiloxane, P 7262*g*.
mica, binder for, P 3232*a*.
from mica (bonded), P 1612*c*.
from mica (bonded) with styrene, etc., 8075*d*.
oils—see also *Transformer oils*.
oils, breakdown voltage of, and its testing, 8661*f*.
chem. and phys. refining of, 385*a*.
corrosion and oxidation inhibitors for, P 4008*b*.
costs of refining, 385*a*.
from naphthalene reaction with octenes, oxidation-resistant, P 3194*b*.
by polymerization of $C_4H_8$ in cycloparaffin solns., P 7223*c*.
sampling and testing, 4399*e*.
S detection in, 4787*d*.
panel (laminated), P 5644*h*.
paper for, impregnating oil and aging of, 4464*f*.
paper for, manuf. of, 3198*e*.
from paraffin wax and Zn salt of higher fat acid, P 6763*f*.
from phenol condensation products, P 4517*h*.
from pine tar, pitch and mica flakes on backing, 3544*a*.
plastic materials for, P 902*d*.
plastic waterproof, P 3235*a*.
polymers of unsatd. 1,1,2,2-tetrafluorocyclobutane derivs., P 4295*f*.
porcelain, Al powder use in clay mix for, P 3587*a*.
porcelain, casting of, 4437*b*.
properties at ultrahigh frequency, effect of water on, 2480*b*.
removal from elec. conductors, P 790*b*.
resin (alkyd) BuOH extn. residues, 8702*h*.
review on, 4525*i*.
rubber (cyclized) in, 1208*d*.
rubber, on cables and wires, continuous vulcanization of, 3649*f*.
on cables and wires, flame and mech. tests on, 3225*e*.
on cables, soil microörganism attack on, 9517*d*.
rubber (reclaimed) as, on telephone wires, 2021*b*.
rust protection of caps of, of temper castings, 6139*b*.
shales for manuf. of, 9404*g*.
silicone as, for magnet coils, 4048*g*.
from silicone (methyl) elastomers contg vinyl groups, P 5625*d*.
from silicone rubbers, 9516*f*.
silicon monoxide as, 6101*d*.
silicon org. compds. (silicones, siloxanes, etc.), 1211*h*, P 1607*i*, P 2036*g*, P 3237*f*, 3541*i*, P 4517*c*, P 4518*b*, P 4894*g*, P 5635*a*, P 5639*e*, P 6000*a*, P 6220*i*, P 6867*b*, P 8211*f*.
sintered, P 6388*b*.
spark-plug, sealing to metal shell, P 5166*h*.
standards for, 4399*i*, 4787*f*.
for steel, oxide coating as, 4201*c*.
for steel sheet and strip, P 6145*b*.
styrene-polymer plasticized compn., P 4518*d*.
from styrene polymers with 2,2',5,5'-tetrachloro-4,4'-divinylbiphenyl, P 6002*a*.
sulfur hexafluoride as, effect of elec. discharge on, 7354*i*.
synthetic-org., 1604*h*.
tank-lining, 6761*e*.
tetrafluoroethylene polymers, P 2714*i*
tube, for connecting cells with circulating electrolytes, P 2525*f*.
for ultra-short waves, 3118*h*.
united to metal, P 3164*g*.
urea-HCHO-polyester alkyd resin wire-coating, P 3216*f*.
vinyl chloride polymers (plasticized) as, testing of, 2465*e*.
from vinyl chloride polymers for cables, P 5231*a*.
from vinyl chloride polymers with vinylidene chloride, P 5638*b*.
vinyl chloride-polymer tape, P 3234*g*
vinylpyrrole polymers, P 907*d*.
**Insulators, thermal**. (See also specific thermal insulators such as *Brick, Fiberboard; Glass wool; Mineral wool; Paperboard; Refractory materials; Vermiculite*.)
aluminum finishes as, 874*g*.
from asbestos, cellulose, CaO and $SiO_2$, P 5918*e*.
from asbestos, rock fibers, Kieselguhr, etc., and peat, P 7163*f*.
from bentonite, fibers and saponin, P 8580*c*.
boards, from cedar bark, 6409*e*.
impact and load strength of, measurement of, 403*c*, 1187*d*.
preservation with chlorinated phenols, 1516*i*.
water absorption by, 9443*f*.
from wheat straw, 2769*b*
of boilers for sugar factories, 6815*f*
from boric acid and disintegrated newsprint, P 5518*g*.
from cellular glass, for low-temp. app., 371*h*.

phenobarbital effect on action of, 7137*i*.
phenylurea deriv. of, in diabetes treatment, 8533*g*.
potentiation by sulfones, 5491*f*.
prepns., 8618*c*.
for diabetes treatment, 6314*i*.
with polyvinylpyrrolidone, P 6791*g*
and protamine Zn insulin, polyvinylpyrrolidone as delaying substance for, 1863*f*.
protein detn. in, 8096*b*.
reaction with mustard-type vesicants, 707*b*.
requirement after pancreatoduodenectomy, 1470*h*.
residues from, carotene and vitamin A in, 9285*e*.
Sakel's treatment with, post-hypoglycemic encephalopathy after, 3937*e*.
secretion of, hormonal influences on, 5840*a*.
secretion of, in alloxan diabetes, 4362*d*.
sensitivity to, in alloxan diabetes, and effect of methylthiouracil thereon, 4377*fg*.
after desoxycorticosterone acetate administration, 8492*d*.
effect of diet on, 734*i*.
effect of thyroidectomy and thiouracil on, 4377*h*.
effect of vitamin $B_1$ on, 9183*h*.
after stasis of lymph in head, 5840*a*.
shock from, buffering capacity of brain tissue after, 9212*b*.
effect on blood glutathione, 2330*b*.
effect on protein metabolism and chloride elimination in schizophrenia, 2312*h*.
lymphocytic and biochem. responses to, in schizophrenia and affective disorders, 3924*d*.
in tuberculosis, effect of ascorbic acid on, 7101*d*.
standards for, 3561*h*.
and its substitutes, 5907*i*.
structure of, 16*d*, 2652*h*, 8843*f*.
teratogenic action of, effect of nicotinamide and $\alpha$-ketoglutaric acid on, 4776*h*.
-thiocyanate complex, 706*c*.
tolerance of normal and partially depancreatized rats for, 6734*h*.
trace element effect on, 742*e*.
trypsin action on, 6261*c*.
vesicant-treated, 707*e*.
vesicant-treated, hydrolysis of, 707*h*.
zinc, effect on *Trypanosoma hippicum*, 2270*a*.
**Insulinase**, and effect of fasting on liver content, 6252*fh*.
**Intarvin**, crystal structure and thermal analysis of, 134*g*.
**Integrals**, app. for calcn. of, 38*e*.
**Interatomic distances.** See *Ions, electrolytic; Molecules.*
**Interface-active substances.** See *Surface-active substances.*
**Interfaces.** (See also *Contact angles; Phases; Surface.*)
adsorption at, of paraffin oil activated by oleic acid, 16*h*.
adsorption at, of two liquids, 8250*g*, 8819*e*.
compn. and structure of, 5247*f*.
detergent adsorption at oil-water, 8796*h*.
electrolytic double layers at, of soln. and metal, 8814*b*.
energies in Al and Cu alloys, 9011*a*.
equil. at, thermodynamics of, 6887*g*.
films at oil-water, 2068*gh*.
forces at, 6040*h*, 8794*e*.
ion distribution at, 18*a*, 8411*h*.
liquid-vapor, distn. of mixts. by heating, 7297*i*.
phase rule for, 8795*i*, 8796*a*.
potential at—see *Potential, electric.*
radius of curvature of, surface tension and, 6040*a*.
reactions at, 8795*a*.
thermodynamics of, 8789*d*.
**Interfacial tension.** (See also *Surface activity; Surface tension.*)
adsorption effect on, 921*c*.
of blood serum in relation to flocculation and to compn. of lipoprotein complexes, 1823*c*.
calcn. of, 8794*e*.
between cholesterol-lecithin solns. in $C_6H_6$ and aq. solns. of gelatin, 8800*b*.
cohesive work and, in homologous series, 2060*d*.
in detergency and emulsification, 5976*a*.
of films at oil-water interfaces, 2068*g*.
of films of octanol mixed with Na dodecyl sulfate at $C_6H_6$-$H_2O$ interfaces, 2068*i*.
between foaming systems and foam inhibitors, 7161*b*.
between fuel oil-sea water emulsion phases, 2419*g*.
of insectifuges, 5150*d*.
of iron sulfide (fused FeS), 3257*b*.
in iron sulfide system with silicate, effect of C on, 7795*a*.
and its measurement, 1620*f*.
measurement of, between org. liquids heavier than water and water, 8255*i*.
measurement of, of oil against $H_2O$, 4787*b*.
between mercury and salt solns. or $H_2O$, 4922*i*.
between oil and water, lowering for chamoising, 1592*e*.
between olive oil and solns. of salts of *p*-aminobenzoate of diethylaminoethanol, 7290*c*.
of paraffin oil activated by oleic acid, 16*i*.
of paraffin oil against water contg. $\alpha$-monostearin and Na stearate, 7725*c*.
between paraffin oil and soda soln., effect of oxidation on, 2410*i*.
between paraffin oil solns. and $H_2O$, 8250*g*.
of petroleum deposits and theories of interfacial forces, 7671*d*.
review on, 1625*d*.
between rosin oil and water, 6431*h*.
of sodium dodecyl sulfonate solns. against $C_6H_6$, effect of impurities on, 3267*d*.
of sucrose solns. in org. solvents, 2845*b*.
between water and solns. of lauric, palmitic and stearic acids in hexane, 8819*f*.
of water-mineral oil mixts., lowering by alkyl naphthalenesulfonates, 4862*b*.
**Interferometers**, ultrasonic, 7283*h*.
**Intermediate phases**, the expression, 8029*e*.
**Intermediates.** (*Most entries are for dye intermediates.*)
acedianthrone bromomethyl and chloromethyl derivs., P 7709*d*.
acridine derivs., P 4703*d*.
from acrolein acetal polymers, P 5636*a*.
acrylic ester addn. products with unsatd. fat acids, for dicarboxylic acids, P 2034*d*.
4' - alkenyloxy - 4 - aminodiphenylamines, P 856*d*.
1 - alkyl - 5 - arylbiguanides, P 2229*f*.
amines (stabilized aromatic), P 251*f*.
2-(aminoalkyl)pyrimidines, P 3473*d*.
amino and nitro derivs. of satd. aliphatic sulfonic acids, P 5411*f*.
2 - amino - 4 - butylamino - *s* - triazine, for pharmaceuticals, P 6246*e*.
8-amino-6-methylergoline, for pharmaceuticals, P 6246*f*.
4-aminoquinolines, for medicinals, 8386*h*.
anilinomethylene and aryliminomethyl derivs. of cyclic compds., P 8692*g*.
anionic, in reduction by nascent H, 6058*b*.
aralkyl diamines, P 3455*i*.
aralkyl hydrocarbon condensation products with ketones, P 2037*a*.
from aromatic amines and CO, P 5639*g*.
for barbiturates, P 4201*i*.
benzanthrone 3-acyl derivs., P 868*b*.
7 *H* - benzo[*jk*]thiophanthren - 7 - one, P 9467*g*.
biphenyldiamine isomers, P 8174*c*.
biphenylsulfonanilide derivs., P 4297*f*.
4,4' - bis(acylamino)bis(carboxyalkoxy)-biphenyl derivs., P 2442*f*.

1,4 - bis(aroylamino) - 5 - (1 - nitro - 2-anthraquinonylcarbonylamino)anthraquinone, P 1576*d*.
3,4 - bis(*p* - hydroxyphenyl) - 3,4 - hexanediol, for hormones, P 6237*f*.
book: Tech. Analysis in Production of, 5597*a*.
bromo thiazoles, P 3042*c*.
4 - *tert* - butylphthalic acid and anhydride and 2 - benzoyl - 5(or 4)-*tert*-butylbenzoic acid, 8139*g*.
*p*-chlorophenyl dichlorovinyl ether, P 7966*b*.
chloro pyrenes, P 6812*d*.
2 - chloropyrimidines, for pharmaceuticals, P 8105*f*.
from coal extn., P 5602*b*.
for cyanine dyes, P 5602*e*, P 7844*g*.
1 - (1 - cyclohexen - 1 - yl) - 2 - oxocyclohexanepropionic acid, for pharmaceuticals, P 6230*g*.
cyclopentaphenanthrene derivs.—see *Cyclopenta[a]phenanthrene; Steroids*.
dialkyl mercaptals of dicyanoketene, P 6650*d*.
1,4 - diamino - 5 - nitroanthraquinone *N*-aryl derivs., P 1808*f*.
2,4 - diamino - *s* - triazine derivs., P 1814*c*.
5,7 - diamino - *s* - triazolo[4,3-*a*]-*s*-triazine derivs., P 7975*a*.
dianthrimideacridones, P 866*i*, P 7708*g*.
dianthrimides, P 5601*g*, P 7707*h*, P 7708*abc*.
dianthrimides and trianthrimides, P 1576*d*.
1,2-di-2-benzimidazolylethylene, for textile assistants, P 5217*b*.
1,1 - dibromo - 1 - chloro - 2,2 - bis(*p*-chlorophenyl)ethane for insecticides, P 3970*a*.
dicyanamide alkali metal salts, for dyes, pharmaceuticals, etc., P 1532*d*.
dienophilic adduct resin, P 5997*c*.
4,5-dihydro-3(2*H*)-furanone, P 5424*i*.
1,3-diketones, P 2634*c*.
ethers of hydrolyzed olefin-vinyl ester polymers, P 9471*c*.
fluoroacetamide, P 351*c*.
guanidine sulfate, P 4292*g*.
hydroxy aromatic acids, P 3040*f*.
hydroxyaryl amines, P 1062*a*
3-hydroxy-2-naphthamides, P 8151*h*.
hydroxynaphthoylaminobenzaldehydes and lower acetals, P 8169*d*.
2-iminoöxazolidines, P 252*d*.
ketones, from cyclammonium salts contg. reactive thio ethers, P 8167*b*.
lactic acid as, 787*h*.
leucoanthraquinone derivs., P 3205*i*, P 6832*e*.
for mercapto carbocyanine dyes, P 4160*b*.
mercaptocyclohexenones, P 6230*i*.
*N* - (1 - methyl - 4 - oxo - 2 - imidazolidylidene)salicylamide monohydrate, for pharmaceuticals, P 4431*g*.
2 - naphthol - 4 - sulfonic acid 7- and 8-amino derivs., P 5967*d*.
naphthoquinone imine, P 8166*i*.
naphthosultone derivs., P 2641*f*, P 4020*cde*, P 4488*b*.
from natural gas and petroleum, for chemicals, 6336*g*.
nitroalkyl sulfites, for amines, P 0223*a*.
*p*-nitroaniline, detn. in D&C Black No. 1, 7231*i*.
nitrophenyl ethers, P 688*a*.
octachlorodiphenoquinone, P 814*b*.
olefin cyclized polymer reaction products with P halides, P 8668*h*.
for organogermanium compds., P 2631*g*.
oxalic acid esters with 2,2′-(phenylimino)diethanol and its derivs., P 2634*g*.
oxalic acid ester with 2,2′-tolyliminodiethanol, P 1988*i*.
for penicillin manuf., P 9389*a*.
petroleum as source of, 1173*a*.
phenol condensation product with *N*-(chloromethyl) - *N*-methylstearamide, for textile assistants, P 1588*d*.
phenol condensation product with stearamide-$(ClCH_2)_2O$ reaction product, P 886*a*.
5 - phenylazo - 3 - sulfosalicylic acid derivs., P 7699*ef*.
for photographic sensitizers, P 4164*b*, 4262*e*.
phthalocyanine sulfonated aryl thio ethers, for pigments, P 4487*f*.
piperidine derivs., for pharmaceuticals, P 6241*e*.
polyhydric alc. surface-active reaction products with acids for, P 8712*d*.
prolamines, P 6466*g*
1,2,3 - propanetriamine derivs., P 2230*e*.
quinizarin, P 8692*e*.
resin, and their aldehyde condensation products, P 7751*h*.
review on, 4788*ei*.
silicone-resin, P 9533*b*.
from silk waste, for cosmetics, P 6793*b*.
siloxanes, P 6220*i*.
5 sulfoanthranilic acid, P 8692*a*.
*p*,*p*′-sulfonyldianilines, for pharmaceuticals, P 2637*g*.
*N*,*N*′ - sulfonyldi - *p* - phenylene)bis[amidophosphoryl chloride], for disinfectants, P 5156*g*.
terpene derivs. of phenols, for resinous products, P 6237*c*.
1,1,3,3-tetraalkoxypropanes, P 4291*c*.
5,6,7,8 - tetrahydro - 2 - naphthanilides, P 7512*c*.
tetramethine, for pentamethinecyanine dyes, 6928*e*.
1,2,4,2*H* - thiadiazine - 3,5(4*H*,6*H*)-dione *S*,*S*-dioxide and its derivs., P 4868*c*.
ω-thiocyanoalkyl esters, for bactericides, fungicides and insecticides, P 5153*c*.
thiones, for methine dyes, P 514*c*.
thiones, for org. syntheses, P 350*a*.
4,9 - thiophanthrenedione derivs., P 6668*i*.
thiophene derivs., for condensation polymers and photographic sensitizers, P 6238*d*.
*p* - toluenesulfonic acid esters of heterocyclic derivs. of ales , P 3466*f*
transient, study by chem kinetics, 5267*b*.
trianthrimide, P 7708*de*
tumors in industry of org., 8073*g*.
for vitamins, P 2237*c*.
xylyl trichlorothiolacetate, P 6664*e*.

**Intermedin**. See "hormones of intermediate lobe of," under *Pituitary gland*.

effect on tissue growth, 1099*g*.
**Intestinal intoxication**. See *Poisoning*.
**Intestinal juice**. (See also *Erepsin*.)
amidine hydrolysis by, 3790*f*.
secretion during hypercalcemia, 8050*e*.
secretion from duodenum, effect of sugar, fat and meat meals on, 8028*h*.
**Intestines**. (See also *Celsae disease; Digestive tract*.)
absorption by—see *Absorption (biological)*.
acidity of cecum and colon of rats, effect of apples and apple products on, 9313*g*.
adenosine triphosphate effect on, 2693*e*.
adrenaline effect on, concn. and, 3101*f*.
adrenaline effect on, effect of thyroxine on, 2318*ab*, 5115*g*, 5494*e*.
adrenaline effect on muscles of, 7106*i*.
adrenochrome effect on, 5864*e*.
amino acids in swine, 7061*h*.
anaphylactic reaction of, effect of antistine on histamine liberation in, 3512*e*.
antiseptics or disinfectants for—see *Disinfectants*.
antithyrotoxic factor in duodenum, 3913*a*.
arginine synthesis in, 2684*h*.
autolysis of, effect of acetylcholine on, 1074*g*.
bacterial action in relation to activity of, 1832*a*.
bacteria of—see *Bacteria*.
barium-K antagonism on, 2326*i*.
benzedrine effect on, 758*a*.
bile salt effect on motility of, 1865*e*.
bilirubin reduction in, 3082*b*, 6721*a*, 8497*f*.
biotin synthesis in, effect of oats, oat products and fat on, 5461*a*.
blood-group substance from mucosa of, 4315*b*.
cancer of, β-glucuronidase in tissues in, 303*f*.
carbon dioxide effect on motility of, 8041*f*.
carcinoma of, energy mechanisms in, 303*i*.
cellulose-decompg. bacteria from porcupine, 4336*f*.
chlorophyll degradation in, 5832*d*.
cholesterol esterase systems in, 3047*gi*.
coal-tar dye effect on, 1488*f*.
-contracting substance in lymph during hyperemia, 7108*i*.
cornification of mucous membrane of, in avitaminosis A, 3079*e*.
cupric ion effect on, 310*h*.
digitalis glycosides and, 5872*d*.
3,4-dimethoxybenzedrine effect on, 758*b*
effect of acetylcholine and Ba on phlorizin treated, 5872*e*.
effect of adrenaline and sulfonamides on, 1486*c*.
effect of adrenaline, arterenol and epinine on, 8542*c*.
effect of angiotonin, $BaCl_2$ and other compds. on, effect of tetraethylammonium ion on, 1110*f*.
effect of arsenic compds. and narcotics on, protective role of methemoglobin in, 316*h*.
effect of Ba and papaverine on, 5863*i*
effect of cardiac glycosides on, effect of atropine and papaverine on, 5872*f*
effect of citral and β-ionone on, 1488*g*
effect of compds. like α-fagarine on, 2320*e*
effect of $CuCl_2$ plus vitamin C on, 3903*e*
effect of glycosides of senna and their hydrolysis products on, 6308*i*.
effect of hydroquinone and its oxidation products on, 5863*d*.
effect of isomeric heptylamines on, 1110*b*
effect of local anesthetics and tubocurarine on, 7589*i*.
effect of Mg and Na sulfates on, 5120*b*
effect of substance P in blood on, 1071*e*
enzymes from pyloric ceca of fish, 1815*e*
ext of upper, P 8621*b*.
flora, nicotinamide synthesis by, 9191*e*
flora of hen, effect of carbohydrates and biotin-deficient ration on, 736*d*
garlic action on, 5114*g*.
gas compn. in, effect of gaseous transfer between colon and blood stream on, 298*b*
histamine-antagonizing and antispasmodic effect of various substances on, 3934*d*.
histamine effect on, 7128*i*.
hormone effect on, 7564*i*.
hydroxyphenyl compds. in, after consumption of tyrosine, effect of bactericidal agents and avitaminosis C on, 3989*h*.
hyperglycemic-glycogenolytic factor in, 744*e*.
interaction of autonomic drugs on, 3097*h*
intoxication—see "alimentary or intestinal" under *Poisoning* and *Intoxication*
incubation studies of small, 2684*a*
intussusception, fecal impaction and volvulus from pilocarpine, 7119*a*
lipogenesis from glucose in, 8509*h*
lymph from, phosphatase in, 4712*h*
magnesium effect on contractions of, 3102*e*.
mitosis in, effect of spleen ext. on, 5107*d*
morphine effect on duodenum, 761*f*.
motility of, substance stimulating, and effect of vagal stimulation on, 5470*a*
movement of villi of, and its hormonal regulation, 1850*i*.
muscle-nerve transmission in, 7564*d*.
neoplasm of, from motor lubricating oil, 8046*b*.
nicotine effect on, 757*d*.
nucleic acid in, after radiation, 1817*i*.
nucleic acids in, after neutron radiation, 5489*c*.
of *Oedemagena tarandi*, glycogenase and protease in, 1116*d*.
oxygen consumption by, 747*f*.
papaverine effect on, 7131*i*.
pervitin effect on, 2327*f*.
phosphatase activity of, effect of KCN on, 2649*d*.
phosphatase in, of adrenalectomized rat, effect of vitamin $B_2$ on, 3083*i*
after adrenalectomy, effect of steroid sex hormones on, 9201*f*
in alloxan diabetes, and effect of insulin thereon, 2318*c*.
effect of Mg and Co on amino acid inhibition of, 6743*d*.
effect of x-rays on, 9121*i*.
phosphatase secretion by, in frog, 7593*e*.
phosphate flow into, and absorption of glucose therefrom, effect of thiamine on, 5838*e*.
phosphomonoesterases and pyrophosphatases in, after adrenalectomy, and effect of desoxycorticosterone thereon, 1818*d*.

proteolytic activity of mucosa of, effect of albumin on, 4705*i*.
putrefaction in, in achlorhydria, 2687*c*.
relaxation of, adrenotropic receptors and, 298*g*.
removal of, effect on nicotinic acid deriv. formation, 3084*b*.
metabolism after pancreatectomy and, 1476*h*.
phosphatase in blood serum after, 4750*h*.
spasmogenic agent effect on, effect of lysolecithin on, 311*d*.
staining of duodenal mucosa following injection of tannic acid, 4764*f*.
survival of ileum, effect of acetylcholine, histamine and cholinesterase inhibitors on, 761*i*.
synergistic action of antihistamines and harmine on, 3102*d*.
thyroid feeding and, 6736*c*.
thyroxine effect on, effect of adrenochrome and cocarboxylase on, 7578*g*.
urecholine effect on, 8540*a*.
vitamin A formation from carotene in, 2682*b*, 3899*e*.
vitamin $A_1$ aldehyde conversion to vitamin $A_1$ in, 2294*g*.
vitamin B synthesis in, of horse, 8467*c*.
vitamin $B_1$ effect on, 9185*i*.
vitamin $B_1$ inactivation by ext. from carp, 9186*e*.
vitamin $B_6$ antihistamine effect on, 4351*f*
vitamin K synthesis in, effect of sulfonamides on, 8061*d*.
xanthine oxidase activity of, 8037*g*.

**Intocostrin.** See *Curare*.

**Intoxication.** See *Poisoning*

**Intramine***, effect on guinea pig, 7136*g*.
effect on lupine, 7136*d*.
effect on metamorphosis of tadpoles, 7136*f*.

**Intraocular fluids.** See *Eyes*.

**Intrinsic factor.** (See also "antianemic factor" under *Anemia*.)
enzyme systems as, 9196*d*.
inhibition of, 5462*j*.

**Introductor.** See *Feeding apparatus*.

**Inulase**, production by *Sterigmatocystis nigra*, 5449*a*.

**Inulin**, in blood serum, effect on *p*-aminohippuric acid clearance, 3090*h*.
as carbon source for *Bacillus subtilis* and its action in amylase formation, 2278*f*
detection of, 5704*a*.
detn. in blood and urine, 6686*a*.
distribution between 2 body-water compartments, kinetics of 5841*d*.
effect on growth of plant tissue, 4349*a*
fructose manuf. from sources of, 888*ac*
in Jerusalem artichoke-*Helianthus doronicoides* hybrids, 8460*f*
in Jerusalem artichokes, 1080*i*
renal clearance of, 1490*d*.
renal clearance of, detn of, 8418*e*.
in starch synthesis by plant, sucrose and, 278*i*.
suspensions (colored) of, 8801*b*.
tubers or roots contg., candy from, P 6334*d*.

**Invadine ME**, as wetting agent in mercerization liquors, 8141*g*.

**Invar**, elec. resistance of, effect of pressure and temp. on, 5679*a*.
magnetization of, temp. changes from, 3673*d*.

**Inventions**, protection (initial) of, 4790*h*.

**Inversion.** See *Heat of inversion; Isomerization; Sucrose; Walden inversion*

**Invertase**, 1817*b*.
action in grape vine, coördination with amylase activity, 8453*h*.
adsorption of, by plants, plant respiration and, 1084*c*.
by tissues of withering plants, 728*d*.
by yeast, 8003*d*.
in apple varieties, 278*g*.
in cabbage in relation to *Botrytis cinerea* action, 1840*b*.
in cells, protein content and, 7066*d*.
in *Cladosporium herbarum* and *Mucor* species grown in cold, 5825*g*.
in clover, winter hardiness and, 1084*b*.
in crop juice of *Helix pomatia*, 4778*b*.
in grape vine, 8069*b*.
inactivation by tyrosinase, 704*d*.
of plastids, 5061*i*.
specificity of, 4712*i*.
from sugar cane, 1466*b*.

**Invertebrates.** See *Animal organisms*.

**Invertin.** See *Invertase*.

**Invert sirups.** See *Sirups*.

**Invert soaps.** See *Soaps*.

**Invert sugar.** See *Sugar, invert*.

**Iodan**, tincture, bactericidal action of, 6363*g*.

**Iodates**, effect on acid production, growth and proteolytic properties of lactic acid bacteria, 4340*i*.
electric conductivity of, 1630*d*.
hypophosphorous acid oxidation by, kinetics of, 5267*i*.
reaction with thiocyanates in HCl soln., 8309*g*.
sepn. from nitrites, 6883*b*.

**Iodic acid**, α-, bifurcated H bonds in, 6479*c*.
constitution, mol. refraction, parachor and rheochor of, 4082*c*.
free energy of ionization of, 2075*b*.
reciprocal action of hydriodic acid and, 8095*i*
system: $H_2O_2$–I–, 7799*b*.

**Iodides.** (See also *Alkali metal iodides; Alkyl iodides; Halides; Iodine, analysis; Iodine compounds*.)
binding by lactoglobulin and serum albumin, electrophoretic study of, 3860*i*.
in blood plasma as thyroid-function regulator, 8036*g*.
bonding strengths of, in Co ammines, 2856*b*.
crystallochem. electronegativity of, 8231*b*
decompn by deuterons, γ-rays and neutrons, 8871*h*.
decompn. potentials in fused $AlI_3$, 6519*f*.
decompn. potentials in molten NaI, 4582*g*.
decompn. potentials of molten, 4581*i*
detn. of, 65*c*, 8961*c*.
alone and in mixts. with chlorides, 8967*e*
in I-iodide solns., 6111*h*.
effect on adhesion of alkali metal chloride melt to Pt and porcelain, 2062*i*.
on crystn. of $NH_4Cl$, 2483*c*.
on gelling and viscosity of solns. of gelatin, 4540*f*.
on isoelec. and isoionic points of serum albumins, 3690*c*.
on thyroid glands at low temp., 5497*c*.
on thyrotropic hormone, 9199*a*.
elec. cond. in various solvents, 7301*f*.
electrolysis in $Ac_2O$, 2876*h*.
electrolysis with high-frequency current, 6520*e*.
equil. consts. of mono- and tri-, during oxidation of cyanide by I, 2121*b*.
equil. with Hg, 7857*a*.
exchange on Amberlite IRA-400, 6489*f*.
heat of transport of, 8835*d*.
hydration of, activity and, 7302*a*.
hydration of ions of, 8244*b*.
lattice energies of, 8230*g*.
in mistura nervina, 816*j*.
reaction with persulfates, entropies and heats of activation of, 8236*f*.
skin eruptions caused by, 5492*b*.

**Iodination.** (See also *Halogenation;* and "reaction" under *Iodine*.)
of acetylene, 6568*a*.
catalysis of, by electrolytes in AcOH, 7408*h*.
of 4,5-dimethylfluorescein, 1984*f*.
of 2,4-dinitrophenol, 2184*a*.
of diphenylacetylene, 1755*c*.
of pituitary growth hormone, 2245*i*.
of proteins, thyroxine formation by, 1070*c*.
of pyrrole, kinetics of, 2849*i*.
of sodium acetate and propionate, 2932*h*.
of terpenes, 7190*i*.
of tissue proteins *in vitro*, 2647*h*.
of *p*-toluenesulfonates of monoethyl ethers of polyethylene glycols, 3784*c*.

**Iodine.** (See also *Halogens; Iodine number*.)
absorption and utilization under influence of goitrogens, 3918*a*.
absorption, excretion and physiol. effect of, 5846*i*.
accumulation by thyroid, 5471*f*.
adsorption by cellulose and viscose rayon, 9438*g*.
adsorption of ions of, on $Al_2O_3$ chromatographic columns, 8271*d*.
in algae (marine), 5450*e*, 8021*d*.
antibacterial efficiency in dil. solns., 9159*f*.
atomic wt. of, 5239*h*, 8764*h*.
atom, phys. consts. of, 2590*h*.
bactericidal efficiency in alkali, 360*g*.
bacteriotoxic action of tincture of, and other prepns., 5533*i*.
in blood, effect of sulfonamides and methylthiouracil on, 3527*g*.
post-operative Basedow reaction in relation to, 5852*b*.
during sexual stages in *Torpedo marmorata*, 8560*g*.
thyroid function and, 6300*h*.
in thyrotoxicosis, effect of thiosulfate on, 6312*e*.
in blood serum in psychiatric patients in relation to psychologic tension, 5852*g*.
bonds with Sb, As, C or P, elec. moments of, 5241*a*.
with I, energy of, 8763*b*.
with $CH_3$ group, dissocn. energy of, 4039*e*.
with N, energy of, 8764*c*.
book. Bibliography of the Literature on Na and, in Relation to Plant and Animal Nutrition, 3868*a*.
in brines from Krościenko oil field, Poland, 3995*c*.
bromine replacement by, rate of, 4628*e*.
butadiene (poly-) popcorn seed growth inhibition by, 1598*d*.
as catalyst in acylation of furans, P 3465*b*.
in acylation of thiophene, P 3465*g*.
in chlorination of (1-chloroethyl)benzene, P 680*f*.
in condensation of 2-furaldehyde with phenol, 5224*h*.
in polymerization of 2-ethylhexyl vinyl ether, 6896*c*.
in toluene manuf. from bibenzyl and H, P 3454*a*.
in chromatographic development, 5336*e*.
compn. for water decontamination from, P 9310*d*.
compds. with polyvinyl borate and starch, 4542*d*.
in cyanide oxidation, 2121*a*.
deficiency, endemic goiter and, 9238*d*.
diffusion from ointment, 8609*g*.
in disinfection of skin, 3525*c*.
dissocn. of, kinetics of, 5707*e*.
effect on adrenaline and insulin, 742*c*.
on cornea, 771*c*.
on deamination of amino acids by $HNO_2$, 6269*a*.
on enzymes in fig latex prepn., 6327*d*.
on goitrogenic properties of soybeans, 7557*h*.
on grasshopper eggs, 8087*d*.
on milk-coagulating enzyme of *Ficus carica*, 1119*c*.
on mitosis in root meristems, 9171*c*.
in photometric detn. of Ni, 8298*f*.
on recrystn. of black Se, 4198*a*.
on thyrotropic hormone potency, 3909*a*.
on trichophytin production and growth of *Trichophyton gypseum*, 5083*h*.
electrodeposition from iodides in $Ac_2O$, 2876*h*.
in enzyme activity, 1820*b*.
exchange of, between KI and $KIO_3$ in aq. soln., 4565*i*.
fluorescence of vapor of, 1265*i*.
in food products and water from endemic goiter regions, 8044*i*.
formation of, by ultrasonic waves in KI solns. contg. $CCl_4$, 1660*h*, 8779*i*.
gamma-ray-bombarded $I^{127}$, 936*g*.
neutrons from, 4116*b*.
threshold for reaction in, 4115*h*.
in gorgonins, 6253*i*, 7983*d*.
in hyperthyroidism remission, 6740*g*.
hypoiodous acid decompn. in solns. of, 8249*h*, 8250*a*.
in iodinated proteins and thyroid, 702*i*.
ion ($I_3^-$) of, 8285*c*.
isomerization of $C_2H_2Cl_2$ in light sensitized by, 5672*a*.
as isoprene-polymerization inhibitor and initiator, 5621*e*.
isotope of mass 124, positrons and γ-rays from, 8268*d*.
isotope of mass 125, $Te^{125}$ from, 486*d*.
isotope of mass 126, energy of γ-rays of, 6075*i*.
isotope of mass 129, quadrupole moment and spin of, 8879*d*.
isotope of mass 131, accumulation in thyroid gland in normal and thyrotoxic subjects, and effect of thiocyanate on its discharge, 7579*g*.
β-rays from, 5296*a*.
calibrating monitor films for checking exposure of personnel to ionizing radiations with β-rays from, 4118*f*.
complex disintegration of, 3285*c*.

*isotope of mass 131*, decay of, 2089*f*.
decay to $Xe^{131}$, 5296*d*.
in diagnosis and treatment of thyroid disorders, 1484*d*.
in estradiol metabolism studies, 3081*g*.
fixation by thyroid of fetus, 7060*b*.
γ-rays from, 4948*e*, 5296*d*.
as indicator of estrogen effect on thyroid function, 295*c*.
as indicator of immunologic reactivity of serum albumin, 9233*f*.
as indicator of its uptake by pineal gland, 8505*c*.
as indicator of monoiodotyrosine in thyroid gland, 6714*c*.
as indicator of thyrotropin action on thyroid gland, 8055*c*.
in localization of brain tumors, 1856*g*.
metabolism of, 6318*e*.
metabolism of, in anoxic anoxia, 8042*d*.
nuclear spectra of, 6913*b*.
protein-bound, in blood serum in hyperthyroidism, 5851*a*.
standardization of, 6694*f*, 7813*d*.
from Th by α-ray action, 4127*b*.
thyroid formation of iodotyrosine from, 709*b*.
tumorous growth in pituitary and trachea following radiotoxic doses of, 7120*d*.
uptake by thyroid after adrenaline administration, adrenals in, 7566*g*
urinary excretion of, in diagnosis of thyroid disorders, 9227*fg*.
isotope of mass 132, β-rays from, 8271*a*.
isotope of mass 136, 86 sec. I isotope from U fission as probable, 8872*f*.
isotopes of masses 127 and 129, magnetic moments of, 8879*e*.
isotopes of masses 128 and 131, β-rays from, 3707*g*.
isotopes of masses 136, 137, 138 and 139, disintegration of, 2861*e*.
isotopes (radioactive) of, 8261*c*.
in antiserum, 3923*g*.
casein treated with, action, fate and distribution of, 9255*b*.
in detn. of antithyroid effect of foods, 7602*h*.
effect on fungi, 273*f*.
in hormone and receptor studies, 9214*g*.
in hyperthyroidism treatment, 8533*d*.
as indicator of thyroglobulin formation in thyroid gland, 8487*f*.
in measurement of circulating red cells, blood-plasma vol. and distribution of blood in large and minute vessels in shock, 5855*a*.
in measurement of its urinary excretion, 8039*f*.
in plant nutrition studies, 1079*f*.
in study of antithyroid compds., 8544*f*, 9241*i*.
in therapeutics, 3524*c*.
in thyroid disease, 8533*d*.
in thyroid-function studies in vitamin A deficiency, 7560*h*.
in thyroid hormone studies, 3908*b*.
in thyroid (normal and neoplastic), 5490*f*.
in tissue after administration, 6716*i*.
in tissue of animals with and without Walker tumor after injection of radioactive NaI, 9229*h*.
in tissues of tumor-bearing mice after injection of radioactive iodinated trypan blue, 4308*b*.
tumor-necrotizing polysaccharide from *Serratia marcescens* tagged with, and its action, 6736*g*.
uptake and excretion curves of, 5839*c*.
Joshi effect in, light absorption and, 8882*i*.
Joshi effect in, production of, 8857*a*.
labilization of trans-group in complex by, 2854*g*.
in *Laminaria flexicaulis*, 4342*i*.
loss of, on bubbling, as through solns., 5234*e*.
lyoparachor of, 2834*d*.
in magnetic field, ratio of resonance frequency to proton frequency of, 8262*g*.
magnetic moment and gyromagnetic ratio of, 5303*f*.
magnetic susceptibility of at., 2831*f*.
manuf. of, P 8626*c*.
from oil-well brines, 8622*i*.
from seaweeds, P 4792*e*.
mercury-drop motion in presence of, 2942*e*.
metabolic circuit of, 3907*i*.
metabolism of, 4710*d*.
metabolism of, in thyroid gland, effect of I, thyroid hormone, thiocyanates, thiocarbonamide and aminobenzene on, 3932*a*.
neutron binding energy of, and energy of γ-rays emitted on neutron capture by I, 8861*c*.
neutron capture cross section of, 6506*b*.
neutron cross section of, 6909*d*, 8260*h*.
nutritional value of, 2295*c*, 8473*h*.
photocathodes sensitized by vapor of, 1641*i*.
potential of, 4586*f*.
prepn. from $HgI_2$, 2378*g*.
protein-bound, in animal organism in hypervitaminosis A, 8486*c*.
in blood in hyperthyroidism, 1477*c*.
in blood serum, age and, 8514*c*.
formation *in vitro*, 2647*i*.
in thyroid and pituitary glands, effect of Lugol soln. on, 7580*b*.
radii of, relation between covalent and packing, 9*i*.
radius of bonded atoms of, 3252*c*.
reactions—see also *Iodination*.
reaction with $(NH_4)_2C_2O_4$, kinetics of, 7309*i*.
with aromatic hydrocarbons, 7824*h*.
with azide ion and thiosulfate or tetra thionate ion, 7799*e*.
with glycogens and apoglycogens, 9109*b*.
with $H_2O_2$, 499*g*, 2122*a*, 8307*i*.
with methylmagnesium iodide, 991*g*.
with polysaccharides, 7870*d*.
with KCNS and $NaN_3$ or $NaHCO_3$, 6931*i*
with Ag salts and tertiary amines, 5683*h*.
with $Ag_2SO_4$, 5689*c*, 8249*i*.
with $Na_2S_2O_3$ in presence of $NaNO_2$, 6496*g*.
removal from iodobenzene, 8908*g*.
retention in normal and cancerous tissue, 8518*i*.
in saliva in hyperthyroidism after administration of KI and effect of 2-thiouracil and 4-methylthiouracil thereon, 317*e*.
in scleroproteins of horny stems of Gorgonidae, 1871*a*.
in sediments and sea water, 5350*e*.
in sodium chloride, prevention of loss of, P 1926*e*.
soly. in halogenated hydrocarbons, 2844*c*.
solns. of, 2490*g*
sorption by MgO, 17*a*.
spectra of solns. of, 6511*d*, 8884*f*.
spectra of solns. of, elec. moments of solvents and, 7817*g*.
spectrum of, 3712*i*, 4136*e*.
stabilization of cyanohydrins with, P 2223*i*.
stains, removal from paper, 3542*i*.
standard solns. of $Na_2CO_3$ and, 2893*e*.
sterilization of water with, in regions of endemic goiter, 5889*h*.
system: $CCl_4$–$H_2O$–, mass transfer in, 5647*b*.
system: $H_2O_2$–$HIO_3$–, 7799*b*.
system: S–, 2535*f*.
from tellurium by β-decay, valence of, 7332*f*.
terpene polymer stabilization with, P 3236*a*.
therapeutic activity of, thyroid and, 3907*f*.
thermochor of, 8226*e*.
in thyroid gland, fractionation of, 8417*i*.
in thyroid gland, thyroxine and, 8032*c*.
thyroid involution from, 8047*c*.
thyroxine formation by action of, on peptides contg. tyrosine, 1069*h*, 6253*h*.
thyroxine formation in proteins treated with, 3908*h*.
thyroxine-like action of elemental, 2705*b*, 8032*g*.
tincture of, and its substitutes, 6363*f*.
tincture of, iodide detn. in, 6111*h*.
permanence of stabilized and unstabilized, 356*i*.
properties and use of, 5533*c*.
in tissues, after administration, 3083*h*.
transition points, detn. in $C_6H_6$ soln. from surface tension, 7766*c*.
in *Trichomonas foetus* infection treatment, 4382*d*.
in urine after ingestion of I prepns., 8551*h*.
in urine, thyroid function and, 2308*e*.
in waters of Norio, Ga., oil deposit, 3995*b*.
yeast fermentation and respiration stimulation by, 5444*b*.

**Iodine, analysis.** (See also *Iodides*.)
chromatographic sepn. from Br, Cl and CNS on paper and detection, 8072*h*.
detection, 4542*f*.
detn., 3870*a*, 6934*d*, 8096*a*, 8300*f*, 8960*h*, 8961*a*.
coulometric titration with electrolytic Br and amperometric end point in, 8301*e*.
preventing iodate formation in, 7373*f*
detn. in animal or plant tissues and minerals, 1685*b*.
in antifermentatives and insecticides, 4179*e*.
in biol. solns., 8419*d*.
in blood, 8419*h*.
in drugs, 7640*b*.
in feeding stuffs, 9291*c*.
in I solns. in iodide, 8961*b*.
in iodotannic sirup, 8096*c*.
in org. compds., 67*a*, 522*b*, 1684*i*, 6539*h*.
in org. materials, 8960*i*.
in plant tissue, 4343*a*.
in presence of Br and Cl, 6943*b*, 7369*i*, 8972*f*.
in water, 9308*g*.
**Iodine amalgam.** See *Amalgams*
**Iodine benzoate**, compds. with 2- and 3 picoline, 5690*a*.
**Iodine bromides.**
**BrI**, bond moment of, 5240*i*.
**$BrI_3$**, electrolysis in $Ac_2O$, 2876*h*.
**Iodine *m*-bromobenzoate**, compd with pyridine, 5689*i*.
**Iodine *p*-bromobenzoate**, compds. with pyridine and 3-picoline, 5689*i*.
**Iodine chloride** (ICl), bond moment of, 5240*i*.
partition function of, 8838*h*.
reaction with double bonds, 5362*i*.
system: $C_5H_5N$–, 6901*a*.
systems. $AcNH_2$–, and $AcNH_2$–$PhNO_2$–, 6900*i*.
**Iodine *p*-chlorobenzoate**, compds. with pyridine and 2- and 3 picoline, 5689*i*.
**Iodine compounds.** (See also *Iodides*)
of β-amylose, relation to thyroid function, 3521*i*
formation in thyroid gland and appearance in plasma, 3908*b*.
iodine detn. in org., 67*b*
photolysis and photooxidation of org., 5313*e*.
polarography of org., 8916*g*
with pyridine or picoline and benzoates, etc., 5689*i*.
radioactive, distribution in tissue, 8060*i*
in thyroid gland of fetus, 8493*i*.
**Iodine 2,4-dichlorobenzoate**, compd. with pyridine, 5689*i*.
**Iodine 3,5-dinitrobenzoate**, compds. with pyridine and 2- and 3-picoline, 5689*i*.
**Iodine fluoride** ($IF_5$), formation of, 518*e*
reaction with $CCl_4$, $CBr_4$, $CI_4$ and $C_6I_6$, 3774*i*.
**Iodine *m*-fluorobenzoate**, compd. with pyridine, 5689*i*.
**Iodine *o*-fluorobenzoate**, compd. with pyridine, 5689*i*.
**Iodine *p*-fluorobenzoate**, compd. with pyridine, 5689*i*.
**Iodine *m*-iodobenzoate**, compd. with pyridine, 5689*i*.
**Iodine *p*-iodobenzoate**, compds with pyridine and 2- and 3-picoline, 5689*i*
**Iodine 1-naphthoate**, compd. with pyridine, 5689*i*.
**Iodine *m*-nitrobenzoate**, compds. with pyridine and 2- and 3-picoline, 5689*i*.
**Iodine *o*-nitrobenzoate**, compds. with pyridine and 2- and 3-picoline, 5689*i*
**Iodine *p*-nitrobenzoate**, compds. with 2- and 3-picoline, 5690*a*.
**Iodine number**, detn. of, 2547*g*, 3636*d*, 6784*g*, 8103*d*.
detn. of, of bone grease, 1581*d*.
of Buna-S, 5985*h*.
of drying oils, 1992*h*, 7718*a*.
of fats, 423*a*.
of fats and oils, 879*b*.
of liver fat acids, 9131*g*.
of milk fat, 8567*f*.
of oils, 1582*i*.
of poppy-seed oils, 423*a*.
of shale oils, 4452*h*.
of tallow, 1581*c*.
of unsatd. fat acids, 125*g*.
**Iodine phthalate**, compd. with pyridine, 5689*i*.
**Iodine preparations.** (See also *Lipiodol; Lugol solution*.)
iodine in urine after ingestion of, 8551*h*.

for radiography of subarachnoid space, 5534b.
tannin-contg., 5540e.
**Iodine stearate**, compd. with pyridine, 5689i.
**Iodine p-toluate**, compd. with pyridine, 5689i.
**Iodized salt.** See *Sodium chloride.*
**Iodoacetic acid.** See *Acetic acid, iodo-.*
**Iodoalphionic acid.** See *Propionic acid, β - (4 - hydroxy - 3,5 - diiodophenyl)-α-phenyl-.*
**Iodoaluminates**, structures of, 960c.
**Iodocadmates**, 5692b.
formation of, 8939h.
instability const. of $CdI_4^{--}$, 924a.
**Iodocobaltates(II)**, in ethyl alc. solns., 4970i.
spectra of, 520a, 7818b, 8273i.
**Iodocuprates(I)**, properties of, 3308a.
**Iodoeosin.** See *Erythrosin.*
**Iodoform** (*triiodomethane*), antibacterial action against aerobes and anaerobes, 6276a.
infrared Christiansen filter effect in, 1657f.
as polymerization inhibitor and initiator in isoprene, 5621e.
as polymerization modifier with butadiene with chloroprene, P 4051f.
in rosin (polymerized) color improvement, P 1996e.
soly. in Na xylenesulfonate solns , 1242e.
**Iodoform reaction**, 8974b.
**Iodogorgoic acid.** See *Tyrosine, 3,5-diiodo-.*
**Iodogorgonic acid.** See *Tyrosine, 3,5-diiodo-.*
**Iodomercurates(II)**, formation of, 8939h.
**Iodomethyl group**, parachor of, 2057f.
**Iodometry**, air displacement by Dry Ice in, 7368d.
fluorescent light for, 4054e.
teaching of, vitamin C detn. in, 2548e.
**Iodonium compounds**, bacteriostatic action of, 268eh.
bis(*p*-bromophenyl)— iodide, bacteriostatic action of, 268fi.
bis(*p*-chlorophenyl)— halides, bacteriostatic action of, 269a.
bis(*p* chlorophenyl)— iodide, bacteriostatic action of, 268f.
bis(*p*-chlorophenyl)— sulfate, bacteriostatic action of, 268fi.
bis(*p*-iodophenyl)— iodide, bacteriostatic action of, 268fi.
diphenyl— halides, bacteriostatic action of, 268fi.
**Iodopalladates(II)**, formation of, 8943e
**Iodophthalein.** See *Phenolphthalein, tetraiodo-.*
**Iodoso compounds**, diacylates, as catalysts for polymerization, P 5231c.
**Iodotannic acid.** See *Iodotannins.*
**Iodotannins**, iodine detn. in, 8096c.
sirup contg., 1528c.
**Iolite.** See *Cordierite.*

electron secondary emission from, 2859d.
gamma-rays from, 3287g.
**Ionization, electrolytic.** (See also *Conductivity, electric; Electric resistance; Heat of ionization.*)
of acetamide compd. with ICl, 6901a.
of acetic acid and MeOH, 6053c.
of acetophenone derivs., 1350e.
of acids as catalysts in bromination of Et cyclopentanone-2-carboxylate, catalytic consts. and, 3698e.
of acids during combination with wool, 3202s, 6829c.
of acids, effect on cleavage of 1,2-hydramines, 2315b.
of acids (org.) and esters in $H_2SO_4$, 568i.
of alkanephosphonic acids, 1315d.
of aluminum complex with salicylic acid, 2536e.
of amines (aromatic), 1247e.
of amines, catalytic activity in decompn. of nitramide and, 8828e.
of aminomethanephosphonic acid, 124d.
of ammonium hydroxide, 8220i.
of ammonium ion as acid and $NH_4OH$ as base, 7303b.
of ammonium (substituted) ions, 6904b.
of arsonic acids and their salts, 57b.
bactericidal power and mutual polarizability in relation to, 8243e.
of barium and Ca citrates, 7790g.
of bases, DDT decompn. and, 3697e.
of benzenephosphinic and benzenephosphonic acids and derivs., 6051a.
of benzeneseleninic acid and derivs , 6050i.
of benzoic acid, effect of substituents on, 8811d.
of beryllium ($Be^7$), effect on period of decay, 4117e, 4555b, 8866b.
of beryllium fluoride, 6049h.
of bromophenol blue, methyl orange and thymol blue, 58h.
of bromothymol blue and neutral red in alkali chloride solns., color changes and, 3307i.
of butyric acid in aq. iso-PrOH, 1244c.
of cacodylic acid, 7790d.
of cadmium complexes, 5692a.
of caffeine, theophylline and theobromine, 8615g.
of chloral hydrate as acid, 25i.
of chloroacetic acids, 4083a.
of chlorocadmate(II) ion and $CdI_4^{--}$, instability const. of, 923h.
of *N*-chloro dialkylamines and monochloramine, 8822a.
of citric acid, 6051d.
of colored complexes, 3306h.
of complexes, 4543a.
constitution and structure in relation to, 2074h.
of copper complexes with amines or glycine, 6934a.
of copper-ethylenediamine complex ion, complexity const. and formation const. of, 7858a.
of cyclic imines, 5400f.
Debye-Hückel equation for, and thermal properties of electrolytes, 7317h.
Debye Hückel theory and its application in teaching quant. analysis, 6014i.
Debye-Hückel theory of, hydration in, 7301h.
definition for instability const., 5344e.
of diacids and their monoesters, 7303a.
of diazo compds., 1736f, 2491i.
of dibasic and germanic acids, 7789i.
of 2-dibenzofuransulfonic acid, 6203h.
of diketene and related compds., 1320d.
of 1,3-dimethyl-1,2,3-cyclohexanetricarboxylic acid and its esters, in study of structure of abietic acid, 1042e.
in dipole mols , color formation in reagent and, 4174e.
of dithizone, 5344e.
of dyes (azo) from 5-amino-1-naphthol derivs., 4469a.
of dyes, spectra and, 3714c.
effect on analysis of mixts. of org. acids by extn. with immiscible solvents, 8976i.
on contraction and expansion of multivalent filamentous mols., 8812e.
on spectrum of benzene derivs., 7340d.
electrolyte properties and, 4544f.
of esters in $H_2SO_4$, 623a, 8808d.
extn of org. acids and, 8214c.
of α fagarine, 4280h.
of fatty acids and their derivs., pK value of, 3269h.
of fatty acids, effect of H and OH ions on, 8793h.
of fatty acids formed by hydrolysis of soap solns., soap concn. and, 8179g.
of ferriin and ferroin, 1630h.
of ferrous-α,α′-bipyridyl complex, 6056d.
of formaldehyde as acid, 25f.
of formaldehyde-pectic acid reaction products, 141c.
of germanic acids ($H_3GeO_3$ and $H_4Ge_3O_{11}$), 22g.
of heterocyclic bases, 3416d.
of hydrazides of acetic acid and glycine, 5741b.
of hydrochloric acid in acetone, dioxane, EtOH and $H_2O$, 4544g.
of hydrogen peroxide, 5651c.
of iodine chloride compd. with $C_5H_5N$, 6901c.
of iron-bipyridyl complex, 3695e.
of iron oxides in molten basalt, 526h.
of iron-slag systems, 2908h.
of iron tetracarbonyl hydride, 8809g.
of iron-thiosulfate complex ion, instability const. of, 6536c.
of lead chloride in aq. solns., 4544e.
of magnesium hydroxide, 4544f.
of malonates, 8809a.
of manganese sulfate in aq. EtOH, 8792g.
measurement of, of acids in solvents, 7793b.
of colorless acids with indicators, 6105h.
*measurement of*, light absorption in, 2868i.
of salts, 6054f.
of weak electrolytes in salt solns., 7302h.
of metals of Fe family in compds. contg. single magnetic constituent, 6018c.
of narceine and papaverine, 6887e.
of nickel hydroxide, 8809i.
of nicotinic acid, 5306d.
of nitric acid, 6053b.
in nonaq. solvents, 6055b.
of oxalosuccinic acid decarboxylase, 1014e.
of oxygen org. compds. in acid media, 4215d.
of phenols in EtOH solns. contg. NaOH, 8881c.
of phenols, partition between cyclohexane and phosphate buffer or $H_2O$ in relation to, 7788i.
of phenylalanine derivs , 8810b.
of platinum ammino and amino complexes, 1673e.
of polybasic acids, 2073a.
of polymeric acids, contraction and swelling by, 8803c.
of polymers (water-sol.), compatibility and, 6460f.
of polymethacrylic acid solns., 2487h, 6494a.
potential of, mol. structure and, 2479d.
of pyridine, 5306c.
of pyrimidine derivs., 9038c.
of pyrophosphoric acid, 6534g.
of resins, 7302e.
of salts, catalytic action in condensation of 2-furaldehyde with phenol and, 5224h.
in liquid $NH_3$, 6892b.
of oxyacids, 1630c.
in pyridine, 8811c.
of silica systems with $Al_2O_3$, CaO and MnO, 4937a.
of silver chloroacetate in aq. alc., 7793e.
of silyl derivs. of carboxylic acids, chem. constitution and, 5068f.
of sodium fluoberyllate, 6899g.
of solid solns , 5252i.
of strontium complexes contg. radioactive Sr tracer, 2113i.
of sulfosalicylic acid complexes, 5325b
of sulfuric acid solns., 7299h.
of tartaric acid, 8940e.
teaching of, 2826d.
of telluric acid, 2534f.
of tertiary alkylamines, 7303h.
of thallium complex bromide and chloride, instability consts. of, 8940a.
theories of, 8701e.
of thiocyanatobismuthates, complexity consts. of, 8939g.
of thiocyanic acid, 2074g.
of thiosulfuric acid, 2074f.
of thiouracil derivs , spectra and, 6081d.
of tris(2,2′-bipyridyl)ferrous ion, instability const. of, 8814h.
of uranium complex ions, 8941b.
**Ionization, gaseous.** (See also *Electrons;* and "sputtering" under *Cathodes.*)
of air, effect on denervated muscle, 5499e.
by alpha particles in liquids at low temp., 1257h.
by alpha-rays in air and A, 4558i.
app. for, P 6097a.
of argon by α-rays, 2861d.
balance of, in atm., 4128e.
of benzene, cyclohexane and hexane by electron impact, 6503c.
cosmic-ray—see *Cosmic rays.*
during detonation, app. for recording, 4453e.
by electrons, 34c, 4092g.
by electrons in cosmic rays, 4092f.
equil. in atm. air, 2505a.
in flame (transient), 481a.
of gases and hydrocarbons by β-rays from $C^{14}$, 4093d.
of hydrocarbons, 8259b.
of hydrogen, 4095a.
of ionosphere, 3701c.
of long-chain mols. by electron impact, 5280g.
measurement of, produced by $He^3(n,p)$ and $N^{14}(n,p)$ nuclear reactions, neutron-H mass difference and, 8865f.
measurement of, with gas-flow ion chamber, 5292h.
of mercury vapor by electrons, 7824f.
of metal vapors in flames, 5303g.
by meteors in atm., 4560a.
in molded ionization chambers with walls of various effective at. nos., 5064d.

at oxide-coated cathodes, 8847*i*.
by particles of high speed, 4099*f*.
potential, of *K*- and *L*-electrons, 4131*d*.
of first 23 at. nos., 8883*g*.
of gases in photoelec. cells, measurement of, 4089*h*.
of homologous series of normal hydrocarbons, Geiger-Müller-tube discharge and, 1646*c*.
of lanthanides, 1254*f*.
of metal ion chelates of sodium 2-formyl - 1 - phenol - 4 - sulfonate and, 1678*e*.
radiation producing, from neutral particles, 7320*b*.
of stellar material, 938*h*, 6916*c*.
thermal, 5659*d*.
of C, 5278*i*.
cell for, 5279*c*.
consts. of polycryst. metals, 4101*a*.
of Ni, 6907*b*.
of zirconium carbide, 8856*i*.
Townsend coeffs. in, of cyclohexane vapor, 6906*c*.
Townsend coeff. in, of mercury vapor, 6906*eh*.

**Ionization chambers**, P 44*i*.
boron fluoride in, properties of, 2505*g*.
at Chalk River, Canada, 4091*i*.
coated with B, prepn. of, 4560*g*.
coincidence bursts in small, 4110*b*.
counting vol. of cylindrical, 8851*f*.
current fluctuations in, 2087*g*.
current in, effect of γ-rays on, after passage through various materials, 5282*d*.
for detection of radiation in health protection, 7326*f*.
electrodes for, P 5357*f*.
for gamma-ray differential measurements, 4092*f*.
high-pressure γ-, -and gas ionization chamber for $C^{14}O_2$ or $H^3$, 5288*a*.
hydrogen filled high-pressure, 5292*i*.
measurement with, of impulses produced by cosmic rays in stratosphere, 5661*g*.
in measuring continuous and intermittent radiations, 2860*i*.
molded, with walls of various effective at. nos., ionization in, 5664*d*.
in x-ray measurements, 8844*c*.

for particle accelerators, 5660*i*.
of Penning type, 4945*j*.
speed gage for, radio-frequency, 8850*e*.
in sun's corona, 1651*b*.
transient from pos., in Townsend discharge tubes, 4091*g*.
of xenon, effect on chem. reactions, 6921*g*.

**Iontophoresis.** (See also *Electrophoresis.*)
of tubocurarine, 3522*e*.

**Iowa Award**, to Spedding, Frank H., 915*f*.

**IPC.** See "isopropyl ester" under *Carbanilic acid*.

**Ipecac**, alkaloid detn. in tincture of, 4810*f*.
alkaloid isolation from, 3975*d*.
effect on stomach lining, 3106*c*.
false—see *Heteropterys pragua* this year.
identification of exts. of, 361*c*.
origin of Johore, 3506*f*
sirup, folic acid prepn. contg., 355*i*.

**IPF 82**, as wood preservative, 5895*a*.

**Ipomoea, Ipomea** (See also *Morning glory; Sweet potatoes.*)
control in bamboo plantations, 5525*c*.
*hederacea*, resins in, 3565*g*.
oils of—see *Oils*.

**Ipomoeamarone***, and semicarbazone, 8453*d*.

**IPPC.** See "isopropyl ester" under *Carbanilic acid*.

**Ipral** (*5-ethyl-5-isopropylbarbituric acid*). (See also *Ipral calcium; Ipral sodium.*)
detection in urine, 1077*b*.
identification of, 8612*c*.

**Ipral calcium**, solubility in iso-PrOH, 3147*i*.

**Ipral sodium**, solubility in iso-PrOH, 3147*i*.

**Ips**, nitrogen fixation by, 3531*e*.

**Ips pini** and(or) **Pine engraver**, host selection by, 1145*d*.

**Iranolin 2241**, as paint material, 3209*g*.

**Irene** (*1,2,3,4-tetrahydro-1,1,2,6-tetramethylnaphthalene*), 5549*f*.

**Irgafen.** See *3,4-Xylamide, N-sulfanilyl-*.

**Irgamide** (*N-senecioylsulfanilamide, N-sulfanilylseneciamide*), calcium deriv., P 7043*b*.
detn. and species specific effects of, 2665*d*.
detn. of, 1908*f*.
effect on pea root growth, 7091*i*.
identification of, 1154*b*, 3974*a*.
manuf. of, P 1060*h*, P 7960*i*, P 7961*ch*.
penetration into eyes, effect of wetting agents on, 3563*g*.
sodium deriv., P 3457*e*.
therapeutic activity of, 3097*g*.

**Iridium.** (See also *Platinum metals.*)
bivalent and trivalent, 6535*g*.
bombardment with $\alpha$-rays and deuterons, Au and Pt isotopes from, 4125*a*.
as catalyst in cracking of $CH_4$, 3773*f*.
as catalyst in HCN synthesis, 9391*i*.
compression of, 4917*a*.
electrodes coated with black, polarization of, 2521*i*.
electroplating with, with reversing current, P 956*d*.
gamma-rays of, energy of, 6075*i*.
isotope of mass 192, from $\alpha$-ray-bombarded U, 4123*e*.
neutron binding energy of, and energy of $\gamma$-rays emitted on neutron capture by, 8861*d*.
neutron fission cross section for, 4127*d*.
nuclear isomerism of, 3280*b*.
solid solns. in Fe, 1300*h*.
sound velocity in, 3256*c*.
system: Sn–, 15*a*, 6137*i*.
thermocouples from, 8217*d*.
uses of, in industry, 532*i*.

**Iridium, analysis**, detection, 8300*g*, 8955*i*.
detn., 2542*e*.
detn. in precious alloys, 5334*b*.
sepn. and detection, 8304*e*.
sepn. from Au, Pd and Pt, 4595*g*.
sepn. from Rh at controlled cathode potential, 8956*c*.

**Iridium alloys**, platinum-, anodic potential, in electrolysis of alk. NaOCl, 6519*i*.
thermocouples from, 8217*d*.

**Iridium compounds**, complexes, induced dissymmetry and optical activity of, 2538*f*.
sulfitoammoniacal, 1676*a*.

**Iridium sulfide**, $Ir_2S_3$, soly. of, 7363*a*.

**Iridocyclitis**, anaphylactic, 5109*a*.

**Iridomyrmex humilis** and(or) **Argentine ant**, control of, 7185*d*.

**Iridophycus flaccidum**, as beverage suspension stabilizer, P 331*e*.

**Iris**, flowering of, delay by 3-indoleacetic acid, 2358*a*.
gaseous losses of N from leaves of, 282*h*.
*graminea, pseudacorus* and *sibirica*, conjugate-unsatd. acids in, 137*a*.
neo-$\alpha$-irone in, 3374*d*.

**Irish moss.** See *Carrageen*.

**Iris oil.** See *Oils*.

**Irmitol**, 4427*c*.

**Iroko**, chlorophorin of, 5388*b*.

**$\alpha$-Irol, dihydro-***, *cis-* and *trans-*, 5549*b*.

**$\gamma$-Irol, dihydro-***, *cis-*, 5549*b*.

**Iron** (See also *Cementite; Ferrite (stee constituent); Magnetic substances; Martensite; Mechanite; Pearlite.*)
absorption of, effect of diet and P on, 8478*i*.
effect of vitamin C on, 8468*b*.
effect of vitamin PP on, 9185*b*.
in pyridoxine deficiency, 6291*e*.
absorption of, and serum content after administration, 6737*i*, 6738*b*.
acicular cast, 2559*a*.
adhesion of particles of, to glass and films, 4077*i*.
adhesion to molten glass, 9400*b*.
adsorption by rubber-latex particles, 7249*d*.
agglomeration of materials bearing, P 1708*fg*.
in alfalfa and red clover, effect of $MnSO_4$ on, 1513*c*.
allotropy of, 3257*g*.
alloy cast, structural diagrams for, 5718*h*.
alpha, pptn. in solid solns. of N and C in, 3758*a*.
alumina wetting with, 4438*c*.
aluminum-alloy cast, 7395*a*.
in aluminum detn., thioglycolic acid as inhibitor for, 2889*b*.
in aluminum ingots, cracking and rolling in relation to, 7880*i*.
anodes, for corrosion prevention, 6560*h*.
Armco, as anode material for water electrolysis, 1704*i*.
corrodibility by electrolytes, 551*c*.
H annealing of, effect on pickle brittleness of, 1701*c*.
H diffusion in, 2560*a*.
thermoelec.-force studies with, 2912*c*.
atomic wt. of, 8764*k*.
austenitic cast, P 5728*g*.
austenitic cast, fatigue and static load strength of, 6554*a*.
bacteria—see *Bacteria; Leptothrix*.
balls for grinding mills from cast, P 3342*d*.
in barley, effect of K on, 9175*d*.
in beer, 1147*d*.
bending test, C equiv., correlation be-

tween mech. test and chem. compn. and practical results in gray cast, 9004*i*.
binding by aspergillic acid, conalbumin, hydroxylamine, siderophilin and other hydroxamic acids, 9211*d*.
binding by blood proteins, 9209*b*.
-binding substances, effect on N fixation by *Azotobacter*, 7173*a*.
blasting shot from, 90*d*.
in blood, effect of CO on readily dissociable, 318*f*, 5864*c*.
effect of drugs on easily split, 8051*e*.
effect of histamine on, 6730*g*.
effect of vitamin $B_1$ on, 4738*d*.
after gastric resection for ulcers, 748*d*.
in normal and pathological conditions, 2312*d*.
in pregnancy, 3086*c*.
in progressive paralysis, 2311*i*.
in typhoid fever, 9224*f*.
in blood plasma in blood diseases, 3076*e*.
in blood plasma of protein-deficient and Fe-deficient swine, 2292*c*.
in blood serum, in allergy process, 5483*h*.
in $C_6H_6$ poisoning, 6730*h*.
in *Brucella* immunity, 9228*e*.
of children, 5475*g*.
after hypophysectomy, 8032*g*.
in kala-azar, 3923*f*.
in pregnancy, parturition and puerperium, 3913*g*.
in trachea stenoses, 3506*f*.
bonderization of—see *Bonderization*.
books: 9886; Molybdenum, 554*a*; Sintereisen und Sinterstahl, 554*a*, 9871, Sintereisen, 2019*f*, 6964*e*; La sidere mia e il ricambio del ferro in condizioni normali e patologiche, 8041*h*; Ausgewählte chem. untersuchungsmethoden für die Stahl- und Eisenindustrie, 9018*a*.
boron effect on cast, 6957*b*.
brazing of, effect of temp. on, 7890*a*.
brittleness (acid) of single crystals of, 7395*f*.
in brookite, color and, 71*h*, 72*f*.
in butter, and effect of washing thereon, 8568*i*.
in calcium gluconate prepn., 8614*g*.
cannon ball, 9005*i*.
cans from lacquered black, 7603*a*.
carbon diffusion and solv. in, 9004*c*.
carbon effect on mech. properties of, 2912*a*.
in carboxypeptidase from pancreas, 3859*h*.
carburization of, P 9019*g*.
gases for, 1698*h*.
mixer and grader for powd. compds. for, P 9019*d*.
carburizing compacts of powd., 2141*e*.
casting of—see *Casting process*.
castings from—see *Castings*.
as catalyst, 8251*e*.
in alc. prepn. from CO and H, 994*e*.
in CO reaction with olefins and H, P 5032*a*.
in chlorination of aromatic hydrocarbons, P 1437*c*.
in chlorination of bis(perfluoroalkyl)-benzenes, 6174*i*.
in chlorination of $CH_2$:CHCl, P 7035*f*.
in chlorite manuf., P 3159*i*.
in decarboxylation of org. acids, 7801*b*.
in decompn. of $NH_3$, 7312*h*.
in decompn. of $H_2O_2$, 5553*h*.
in decompn. of oxalacetic acid, 6497*b*.
in HCl formation in chlorinated paraffin wax, triethanolamine in inhibition of, P 1179*d*.
in hydrogenation of CO, P 840*b*, 2081*a*, 2397*ehi*, 2398*bdghi*, 2400*acegh*, 2401*bdg*, P 3174*i*, P 3175*cdf*, P 4446*h*, 4828*i*, P 5574*b*, 6063*g*, 8117*a*, 9415*h*.
in hydrogenation of CO, regeneration of, P 3994*e*, P 4448*i*, P 8120*i*, P 9420*ah*.
in hydrogenation of CO, S removal and regeneration of, P 1551*h*.
in hydrogenation of CO to gasoline, P 3994*b*.
in hydrogenation of CO to hydrocarbons, P 4447*df*, P 5573*b*, P 6810*i*, P 9420*f*.
in H-atom recombination, 8251*d*.
in isomerization of β-hydromuconononitrile, P 6647*f*.
in oxidation of alc. by $H_2O_2$ and $Na_2S_2O_8$, 5269*h*.
in oxidation of gasoline, deactivation of, 5932*c*.
*as catalyst*, in oxidation of lubricating oil, phenylenediamines in inhibition of, P 1179*f*.
in oxidation of org. compds., deactivators for, P 3840*a*.
in oxidation of org. substances, deactivation by amino aldehyde-amine condensation products, P 4460*a*.
in oxidation of paraffin oil, 2411*b*.
in oxidation of soybean oil, inhibition of, 7723*f*.
in oxidation of styrene by $H_2O_2$, 7311*f*.
in oxidation of vitamin C, 1016*i*.
in polymerization of butadiene, 1598*c*.
in purification of fuel gas, 3172*i*.
in synthesis-gas manuf., P 4836*a*.
catalyst of Al, Cu and, in nitration of paraffins, P 4285*c*.
catalyst of boric acid, Cu, Mn and, in hydrogenation of CO, alkali and temp. effect on, 2397*h*.
catalysts, P 5135*a*.
adsorption of N by promoted, 6036*f*.
adsorption of vapors by, 7288*e*.
for hydrocarbon synthesis, acid treatment of siliceous diluent for, P 7214*e*.
for hydrocarbon synthesis, control of particle size of, P 3832*h*
for hydrogenation of CO, P 4836*h*, P 9420*a*.
for manuf. of liquid hydrocarbons and oxygenated compds., P 6702*g*. pelleted, P 8578*h*.
catalysts of, and its mixts. with kieselguhr in gasoline synthesis, H adsorption by, 2412*i*, 2413*ab*.
catalysts of, and its mixts. with kieselguhr or with kieselguhr, Cu and Mn in gasoline synthesis, CO adsorption by, 2413*e*.
as cathode in electrolytic reduction of 2-methyl-3-buten-2-ol and 2-methyl-3-butyn-2-ol, 994*g*.
as cathode in oxalic acid reduction, 49*f*.
cementation and hardening of, P 9019*h*.
cementation and nitridization of, rate near Curie point, 6018*e*.
cementation of, atms. for, P 5729*c*.
rate of, 472*d*.
with Si, P 4625*d*.
cemented with pure Fe and Cu powders, 2146*f*.
in ceramic industry, 2748*i*.
ceramic-molded-bodies contg., P 5566*a*.
in cerebrospinal fluid, 9201*c*.
in cheese, whey as source of, 3534*c*.
in chem. engineering, 8745*c*.
as chem.-engineering construction material, 1*c*.
chromatography on $Al_2O_3$, 8293*i*.
in citric acid production by fermentation, 814*f*, 9165*h*.
cladding of, with Cu or Cu alloys, P 2154*b*.
classification and strength of cast, 84*e*.
cleaning, 2917*b*.
electrolytic, P 5680*d*.
from heavy-metal compds., P 7405*c*.
cleaning, penetrating and corrosion-loosening compn. for, P 6147*h*.
cleavage and deformation of ingot, fractographic study of, 8320*d*.
cleavage of, 4991*h*.
in coal, 8639*e*.
coatings of, coatings for or coatings on—see *Coating(s)*.
coating pretreatment for, P 5730*i*.
coatings from, by spraying, 986*a*.
coating with, on Al, P 8917*h*.
coating with, on Al or Al alloys for soldering, P 5002*h*.
-cobalt-Ni ratio in meteorites and rocks, 5710*f*.
coke dry quenching in works for, 2555*i*.
colloidal, light polarization by, in rotating magnetic field, 7291*e*.
colloids in toluene, coagulation in contact with immiscible phases, 4926*g*.
coloring of, 5352*h*.
as coloring principle in amazonite, microcline and orthoclase, 6118*i*.
color in green fluorite from, 6116*h*.
color reaction of ions of, with azo dyes, 597*g*.
complex with siderophilin, $CO_2$ and O in formation of, 9211*c*.
compn. of edges and center of cast, 9004*g*.
compression of, 4917*a*.
in concn. cells, 8286*i*.
controlled cast, P 4625*g*.
copper-coated, cladding Be-Cu alloys with precious metals and, P 6966*b*.
copper effect on malleable, 1296*e*.
corrosion-inhibitor adsorption by, 6559*g*.
corrosion of—see *Corrosion*.
corrosion products of, effect on Ni corrosion by steam condensate, 4996*f*.
corrosion protection of, by thermoxyd method, 95*h*.
cosmic-ray-primary absorption by, 4103*a*.
couples with Zn, behavior underground, 6093*g*.
crystn. of castings of, 6135*c*.
crystallochem. electronegativity of ion of, 8231*b*.
crystals of, and oxide film thereon, 84*f*.
crystals of, slip of, 8329*f*.
crystals (single) of, homogeneous yielding of carburized and nitrided, 2558*h*
magnetic resonance absorption in, 4066*h*.
magnetostriction in, 5243*c*.
from recrystn., small isolated crystals in, 4072*c*.
strain-aging and yielding of carburized and nitrided, 7881*e*.
crystal structure of, 4535*g*, 6482*g*.
cutting cast, W carbide in, 3757*h*
for cyclotron electromagnet, 4199*c*.
deficiency in apples, 2722*g*.
in cherries, 2353*b*
in fruit tree, 6773*f*.
in ornamental plants, 2722*g*.
in plants, soil condition and, 7618*i*
in tuberculosis and its treatment, 3509*f*.
deformation and stress of, 82*e*.
deuteron-bombarded, Mn from, 8266*h*
diffusion of Cu and Ti in, and solid solv of Ti in, 8334*f*.
diseases and hazards in industry of, 7888*c*
displacement of, in austenite martensite transformation, 918*h*.
ductile cast, 3328*f*.
in dye bath, $Na_2H_2P_2O_7$ and phosphates in inactivation of, 4856*g*.
effect on adsorption of Cu and Ni by $Fe(OH)_3$, 2544*b*.
on Al and Mg, and its removal, 2143*c*
on Al-Mg-Zn alloys, 3333*h*
on Al soln. in NaOH, 8936*a*
on bactericidal properties of quaternary $NH_4$ compds., 8588*f*.
on brass α/β equil., 3258*g*.
on cathodes for electrolysis of NaCl, 505*a*.
on Cr-Ni alloys, 2918*d*.
on Cu absorption *in vivo*, 3038*g*
on Cu resistance to HCl, 5509*b*
on decompn. of oxalosuccinic acid, 10144*b*.
on dyeing of wool with chrome dyes, 5953*c*.
on grain growth in Al, 5715*f*
on grain size of Al-Cu alloys, 8537*f*
on lespedeza tolerance to Mn, 3067*f*
on magnetic properties of Ce and Mg, 9012*b*.
on metabolism of Ca and P by milking cows, 9313*a*.
on *Mycobacterium smegmatis*, 5441*c*
on oxidation of vitamin C in fruit juices, 9286*f*.
on oxidation-reduction reactions, 4713*e*.
on photometric analysis for cations, 8298*f*.
on polarography of As, 3297*g*.
on polymerization of $C_2H_4$ to lubricants, 384*d*.
on protein fraction of bone marrow, 6262*f*.
on *Proteus vulgaris* and *P. X19*, 1455*f*.
on spectrum of Al, 7338*d*
on stress-corrosion resistance of Al-Mg-Zn alloys, 92*c*.
on tuberculosis, 3509*f*.
on U phase in Mn-bearing Al alloys, 542*e*.
elastic aftereffect in, 6017*g*.
elastic and structural properties of, 9001*g*.
elasticity of, temp. and, 5715*c*.
elec. resistance of, effect of strain aging on, 7881*c*.
elec. resistivity and sp. heat of high-purity, 2559*b*.
elec. skin effect for, 5079*g*.
electrodeposited, cathodic polarization, hydroxide content, hardness and internal stress of, 7353*c*.
electrodeposition of, in vacuum, P 4151*b*.
electrodeposition with Mo, 6923*c*.
electrode potential of, effect of $K_2CrO_4$ on, 8340*e*.
electrodes, detn. of Townsend coeff. in

discharge tube with both Hg and, 6006*h*.
effect of pH, O, and $K_2CrO_4$ on reactions at, 4620*h*.
getters for, 2877*b*.
electron absorption in, 7811*e*.
electron diffraction by, ground in air and in vacuum, 4056*c*.
electroplating on—see *Electroplating;* and the specific materials electroplated.
electroplating with, pitting prevention in, P 4152*bd*.
electroplating with, with reversing current, P 956*d*.
emissivity of liquid, optical temp. scale and, 9004*e*.
emissivity-temp. curves for, 83*a*.
enameled ware—see *Enameled ware*
enameling—see *Enameling*.
for enameling, 7205*e*.
for enameling, detn. of Ni on, 9406*i*.
energy levels of, 6507*c*.
in enzyme activity, 1820*b*.
in epithelium of mammary gland, 738*b*.
equation of state for, 4916*c*.
equil. with $SiO_2$, 23*c*.
equil. with slag, effect of silicic acid on, 2908*h*.
explosive-incendiary mixt. contg. powd., P 8682*i*.
ferric ion effect on $H_2O_2$ reaction with $Fe^{++}$, 6895*b*.
ferrous ion-adrenaline antagonism, 3931*f*.
filamentous bacteria in relation to, 7080*d*.
films on galena, crystal structure of, 6483*e*.
in fluorescin production by *Pseudomonas aeruginosa*, 5078*h*.
fluorite coloration by, 7381*c*.
formation of ions of, from clay minerals by acids and salts, 372*b*.
foundry, manuf. from steel scrap, 8323*f*.
friction of cast, and its use as bearing material, 5716*d*.
in fruits (Italian), 5878*d*.
furnaces—see *Furnaces, blast; Furnaces, electric*.
galvanization of—see *Galvanization*.
galvanized—see *Galvanized iron*.
galvanizing properties of, effect of Ti and N on, 3336*c*.
gamma-alpha transformation in, 4615*i*.
gamma, nitrogen absorption by, 7314*i*.
gamma-ray action on ionization current after passage through, 5282*g*.
gamma-ray-bombarded, neutrons from, 4116*b*.
gamma-ray bombardment of, threshold for reaction in, 4115*g*.
gamma-rays from, after neutron capture, 5282*b*.
gases in cast, 3329*a*, 4199*f*.
grain boundaries of, electron microscopy of, 6553*g*.
in grapevine sap, 3889*f*.
in graphite, 8276*c*.
graphite in cast, conversion of eutectic, into flake, 7395*c*.
graphite in cast, effect of elements on form of, 7395*a*.
graphite nodulizing alloy for, 8336*c*.
graphite (somatoidal) in gray cast, 9004*h*
graphite (spherulitic) formation in cast, 2558*i*.
graphitization of cast, 7877*h*.
graphitization of white, 6134*f*.
in grasses and herbs of hay plots, 4347*i*.
in hair, 3084*d*.
hardening (age-) of ingot, 3757*e*.
hardening cast, P 4999*e*.
hardening (surface) of gray, Te in, 6957*i*.
heat of reaction of ferrous ions with $H_2O_2$ and ionization potential of ferrous ions, 5658*c*.
heat-treatment (isothermal) of cast, 1699*e*.
hot strength of $\alpha$- and $\gamma$-, 1298*d*.
hydraulic fluid for use with, P 5519*c*.
hydrogen penetration into, 7304*h*.
hydrogen peroxide decompn. by ferrous and ferric ions, 2653*i*.
hygiene and first aid in industry of, 8326*g*.
industry in 1946, 2127*cd*.
interaction of ferric ions with silicic acid, 8237*d*.
interfacial tension with fused FeS, 3257*c*.
ions of, as catalyst in the decompn. of DDT by bases, 3697*e*.
ions of, reactions with $H_2O_2$, 6895*c*.
in irrigation water, 3951*d*.
isothermal diagrams, accuracy of, 9001*e*.
isotope of mass 55, cytochrome c labeled with, 1818*g*.
isotope of mass 55, from decay of $Co^{55}$, 5294*h*.
isotope of mass 57, spin of, 8879*b*.
isotope of mass 59, in blood-vol. detn., 8037*h*.
isotope of mass 59, prepn. of, 1260*f*.
isotopes of, biochem. applications of, 7069*d*.
isotopes of masses 55 and 59, erythrocytes tagged with, for measuring post transfusion survival, 7540*a*.
isotopes of, natural abundance of, 1640*f*.
isotopic wt., packing fraction and binding energy of, 4129*h*.
lacquering pretreatment for, 9015*b*.
in leaves and roots of normal and Mn-deficient plants, 1836*h*.
in leaves of forest vegetation, 725*f*.
literature on, review of, 4615*h*.

in liver and spleen in infections, 5106*i*.
in liver, Co-deficiency ailment and, 8463*c*.
effect of age and sex on, 3894*d*.
of fetal and newborn lambs, 4361*c*.
in infectious hepatitis, 3922*f*.
luminescent substances activated by, 5670*i*.
macrographs of, 8288*h*.
-magnesia ratio in graphic representation of rock analyses, 8992*g*.
magnetic, magnetic properties of, 7394*b*.
magnetization of Armco and Hilger, adiabatic temp. changes accompanying, 3328*e*.
malleabilization of cast, P 988*i*, 8997*f*.
malleable, P 7892*g*.
malleable cast, P 1709*d*, P 7403*h*.
malleable cast, dark spots in, 4618*a*.
malleable, process, graphitization in, 6554*e*.
manganese extn. from, with Be, P 5727*f*.
-manganese ratio in pineapple nutrition, 8018*g*.
martensitic white cast, 93*a*.
mass of, binding energy and, 3702*f*.
mech. properties of cast, 5352*i*.
melted, H reaction with O in, 8822*e*.
H soln. in, 2490*a*.
S activity in, effect of C on, 4930*f*.
melting foundry, slagging-gas producer for, 4611*h*.
melting of, in elec. furnaces, P 5680*b*.
mesotron absorption by, 7325*d*.
mesotron-bombarded, electrons from, 6504*g*.
mesotron-pair production in, 5285*c*.
in metabolism and therapy, 3507*i*.
metabolism inhibition by, mechanism of, 8063*g*.
metabolism of, 287*g*, 202*f*, 5850*b*.
during childhood and its relation to schizophrenia, 9237*c*.
effect of vitamin $B_{12}$ on, 9184*i*.
in infancy, 8520*f*.
in infections and after resection of stomach, 3893*fg*.
radioactive isotopes in studies of, 4710*d*
vitamin C and, 8475*a*.
meteorites—see *Meteorites*.
microsections of, passivation of, 9004*g*.
in milk, and its distribution, 326*a*.
mixt. with $CaSO_4$, x-ray spectrum of, 8326*c*.
molded cryst., electron microscopy of, 5281*e*.
in muscles, in atrophy produced by fasting and by nerve section, 4357*a*.
of cockroach in relation to O consumption, 2333*c*.
in hypothyroidism, 8518*c*.
in ischemic necrosis, 8518*a*.
in myoglobin, 2264*h*.
neutron absorption by, 8854*i*.
neutron binding energy of, and energy of $\gamma$-rays emitted on neutron capture by, 8861*c*.
neutron scattering by, 4944*g*.
nitrogen in, hot galvanizing and, 6957*a*.
nitrogen in pig, 979*i*.
nitrogen in pig, effect on steel, 980*c*.
nodular cast, 535*b*, 4990*a*, 6957*deg*.
alloy for manuf. of, 7885*b*.
manuf. by Mg treatment, 7395*e*.
in orange (Valencia) leaves, effect of rootstock on, 3491*g*.
oxalacetate decarboxylation by, 5839*d*.
oxidation of, 4546*a*.
by air, rate of, 8916*c*.
in aq. soln. by x- and $\gamma$-rays, 2508*a*.
effect of cyanogen and S compds. on rate of, 1246*c*.
kinetic and structural factors in, 7309*d*.
pigments by, 8697*d*.
in spent pickling acids to oxide pigments, 8201*e*.
*oxidation of*, in weathering on Flagstaff Mt., Colo., 2905*f*.
oxide films on, breakdown and repair of, 9005*a*.
oxide films on, in HCl, 6931*c*.
oxygen in industry of, 3755*b*.
oxygen removal from white cast, 7877*d*.
paints for—see *Paint*.
passivation of, P 6143*i*.
passivation of, by adsorption of protein layers, 8246*c*.
passivity, polarization and periodic reactions in $HNO_3$, 7792*ade*.
peroxide reaction with ferrous, 8829*c*.
in perspiration, 4739*e*.
in petroleum, 2139*a*.
in petroleum, age and, 8654*h*.
pharmaceutical prepn. contg. beef, wine and, 6783*c*.
phosphate fixation by, 3957*d*.
pickling—see *Pickling*.
pipes—see *Gas pipes; Pipes; Water pipes*.
in placenta of rodents, 5466*h*.
in placenta of shrews, 7057*f*.
in plant nutrition in relation to P, 8015*i*.
plant requirements for, Mn and, 9313*d*.
poisoning by, effect of dimercaprol on, 763*b*.
polarization in sulfate solns. contg. oxidants, 47*e*.
polishing (electrolytic) of, 2101*c*, 5673*d*.
polishing of sheet, P 2153*b*.
polymorphism of, effect of elements on, 1636*c*.
potential in aerated AcOH, 6520*b*.
potential of electrodes of, in NaCl soln., effect of aeration on, 8906*d*.
powd., P 2879*ac*.
adhesion of nascent, 8322*i*.
adsorption of BuOH, PhOH and $BuCO_2H$ by, 28*c*.
articles from, P 4624*i*.
coating with Cu, P 9022*d*.
crystal hardness and manuf. of, 5714*e*.
crystallite dimensions in, 5252*d*.
decarburization of, P 8566*g*.
as dechlorination agent for org. chlorides, 2194*d*.
decolorization of rice oil with activated, 5611*b*.
electrolytic, P 3733*c*.
expansion and shrinkage in sintering of, 7391*c*.
magnetic properties of sintered, 536*a*, 7390*g*.
manuf. by electrolysis, 2522*c*, 5313*h*.
manuf. by electrolysis and properties of, 7833*a*.
manuf. of, 4611*f*, 4613*h*, 7879*c*, 8324*i*.
manuf. of friction materials contg., 80*c*.
O treatment of articles from, 9000*h*.
permanent magnets from, 2556*f*.
sintered compacts from Si and, elec. resistance of, 9001*b*.
and sintering course for, 2556*h*.
sintering of, 7390*c*.
powd. and sponge, lab. for, 8112*b*.
powder-metallurgy bodies from, recovering surface permeability of, P 8345*f*.
powder metallurgy of, 7879*c*.
with Ag powders, 7879*b*.
sintered steel by, 4990*f*.
precipitation in $ZnSO_4$ soln. with ZnO, 2493*c*.
in preputial gland, 2649*b*.
protactinium deposition on, 7791*g*.
radioactive, absorption and distribution of, 4354*c*.
in measurement of circulating red cells, blood-plasma vol. and distribution of blood in large and minute vessels in shock, 5855*a*.
re-utilization of hemoglobin derived, 7110*a*.
utilization in Fe-deficient and pyridoxine-deficient animals before and after inflammation, 2695*g*.
reaction products with maleic anhydride polymers with Me methacrylate,
reaction products with Me methacrylate polymers with $\alpha,\beta$-unsatd. carboxylic acids, 8202*g*.
reaction of ferric and ferrous, with 1,10-phenanthroline, 2078*g*.
reaction of ferric ion with acetic, hydrazoic and thiocyanic ions, 8935*b*.
reaction of ferric ion with $H_2O$, salt effects on, 5265*h*.
reaction with $NH_3$, 2744*d*.
with $B_2H$, 4238*i*.
with enamels, 2749*b*.

*reaction* with gases, 29*f*, 6053*f*.
with molten Al-Zn alloys, 2148*e*.
with pyrophosphates, 8935*f*.
with $Na_2CO_3$, $Na_2O$, $Na_2O_2$, $Na_2SO_4$ and $Na_2S$, 2109*b*.
with steam in fluidized bed, app. for, P 6873*g*.
with $TiO_2$-contg. slags, 5351*b*.
reduction in stomach, 5473*d*.
reduction potential for, half wave of, 5327*c*.
refractories for malleable-, furnaces, standards for, 4397*i*.
removal from Al, P 6964*g*.
from Al alloys, P 9020*c*.
from Al and Al alloys, P 4998*i*.
from $Al_2O_3$ with Cl, 1922*i*, 1923*b*.
from Al scrap, 6552*f*.
from Al-Si alloys, P 3771*e*, P 6966*h*.
from Al sulfate, P 9397*c*.
from Cr ores, P 103*f*, P 6143*d*.
from cider and wine, 5532*b*.
from clays, 8318*i*.
from clays for catalysts, P 4843*b*.
from cryolite in $Al_2O_3$ manuf., P 1273*f*.

complexes with isoxazolium compds., 7020*i*.
compd. with NOCl, 3305*h*.
corrosion of Cu-Au and Au-Ag alloys in solns. of, 7879*e*.
crystal structure of, 8782*i*.
decompn. potential in molten $AlCl_3$-NaCl, 8915*e*.
dehydration of tetra- and hexahydrates of, with $COCl_2$ or $SOCl_2$, 2533*c*.
in hydrogen halide removal from halogenated hydrocarbons, P 5424*b*.
in $H_2S$ reaction with olefins, P 5790*i*.
in isomerization of methoxychloropentenes, 131*a*.
in manuf. of chloro formals, P 4685*g*.
in reaction of alkyl halides with thiols, P 6646*d*.
diffusion of solns. of, in photogravure, 5684*a*.
effect on cornea, 771*c*, 3110*h*.
electrolysis of, colloidal soln. formation in, 5675*i*.
extn. with ether, app. for, 2042*g*.
extn. with $(iso\text{-}Pr)_2O$, 2489*g*.
in halogenation of unsatd. hydrocarbons, P 3436*h*.
in hardening of tung oil, 5605*e*.
interaction with silicic acid sols, 8237*d*.
iron(II)-ion diffusion through semipermeable membrane into, potentials of, 6893*f*.
magnetic ppts. from solns. of, 7763*b*.
mixt. (molten) of KCl, NaCl and, condensation of $C_2H_2$ with $NH_3$ in presence of, 3778*g*.
mixt. with $Fe(NH_4)_2(SO_4)_2$, liquefaction by trituration, 7767*c*.
as promoter in $HgCl_2$ catalyzed manuf. of Lewisite, P 5412*c*.
reaction product with $NaAsO_2$, 8296*c*.
reaction with $BrF_3$, 3739*e*.
reaction with Hg and potential with Hg and Pt, 2875*c*.
in stabilization of solns. of polythionates and polythionic acids, P 7651*h*.
temp. control of soln. of, in still etching in photoengraving, 5684*a*.
as termite repellent, 9341*e*.
volatility of, 4068*b*.
**Iron cholesteryl sulfate***, 6641*g*.
**Iron chromium tungsten carbide**, $(Cr,Fe,W)_3C_2$, crystal structure of, 2914*b*, 6958*b*.
**Iron citrate, formation of**, 1660*c*.
**Iron compounds.** (See also *Ferricyanides; Ferritin; Ferrocyanides; Iron carbonyls; Iron preparations; Pigments.*)
acetato, formation of, 8935*c*.
with antimony, As, N, O, P, Se, Si, S and Te, magnetic properties of, 6018*d*.
with azo pyrazolone dyes, P 857*g*.
bipyridyl complex, formation of, 3895*d*.
-yl hydride ($H_2Fe(CO)_4$), acid properties, ionization and K salts, 8809*g*.
carbonyl hydrides, reactions with organolead bases and $Me_3TlOH$, 4896*b*.
as catalysts in oxidation of cyclic ethers, P 2224*e*.
cement contg., P 6388*h*.
coloring of amethyst, halite and fluorite by colloidal, 8313*b*.
complexes, as catalysts for trimerization of $C_2H_2$ and its derivs 6202*d*.
crystal structure of $K_3FeCl_5.H_2O$, 8301*g*.
effect of pH on color and ionization of, 3306*h*.
$[Fe(OH)]^{+2}$ and $[Fe(O_2H)]^{+2}$, 5690*g*.
$[Fe(S_2O_3)]^+$, 6536*b*.
formation with $NH_3$+ citrate, 7863*c*.
$(NH_4)_3[FeF_5H_2O]$, mixed crystals with erythrosiderite, 3748*i*.
stability of, 4969*c*.
structure of $(NH_4)_2FeCl_5.H_2O$, 3301*f*.
structure of $K_3[FeCl_5OH_2]$ and $(NH_4)_2[FeF_5OH_2]$, 3747*i*, 3748*i*.
complex org., as polymerization activators, 8727*f*.
cyano, 1676*f*.
with α,γ-dihydroxy-β,β-dimethylbutyric acid, P 4816*h*.
with α,γ-dihydroxy-β,β-dimethylbutyric acid and Na salt, P 8619*f*.
with 3,5-diiodo-4-oxo-1(4 *H*)pyridineacetic acid, 5780*f*.
exchange reactions between Fe(II) and Fe(III) in, 8272*a*.
ferrides in Fe ores, Fe-bearing rocks and rocks assocd. with Fe ores in Sweden, and their geochemistry, 5710*be*.
ferrides in sediments from Tyrrhenian Sea, 4610*f*.
fluoride complexes, 7857*b*.
gels of $Fe(CNCH_3)_6Cl_2$, 922*g*.
with gluconic acid, 5743*h*.
histidine complexes, 7856*d*.
intermetallic, formation in Fe-alloy manuf., 4540*c*.
in isopropyl ether during extn. of $FeCl_3$, 2489*i*.
with lecithin and phytic acid, P 5156*d*.
with molybdenum (FeMo and $Fe_3Mo_2$), 7881*i*.
with molybdenum ($Fe_3Mo_2$) in steel, 7397*i*.
of nicotine salts, P 8605*b*.
nioxime complexes, 6932*d*.
of nitroso-2-naphthol, P 3650*f*.
*N*-nitroso-*N*-phenylhydroxylamine deriv., soly. of, 2488*g*.
nitrosyl complexes, 3303*i*.
organo lead carbonyls, 2111*e*.
phenanthroline ferrous, kinetics of formation and dissocn. of, 1630*h*, 2078*h*.
phosphate fertilizers and, 2724*f*.
photochem. after-effect in decompn. of $H_2O_2$ by $K_4Fe(CN)_6$ caused by $K_3Fe(CN)_5H_2O$ and $Na_3Fe(CN)_5H_2O$, 6088*a*.
with porphyrins—see *Hematins;* and the various porphyrins, such as *Mesoporphyrin*.
reaction of ferric, with thiocyanates, effects of $[NH_4]_2S_2O_8$, $BeSO_4$, light, $H_2SO_4$ and temp. on, 8310*f*.
reduction with Jones reductor, 5688*d*.
removal of, from steam in butene dehydrogenation, P 7950*g*.
removal of insol., from rubber dispersions, P 4326.
with salicylic acid, reaction with Al salts, 2536*e*.
in soil, 1133*e*.
in stabilization of vinyl halide resins to heat and light, P 8742*h*.
tanning by—see *Tanning; Tanning materials*.
with tartaric acid and its salts, 5745*f*.
as termite repellents, 9341*e*.
with tin ($FeSn_2$) in Sn plate, 8284*f*.
α,α′,α″-triaminotriethylamine complexes, stability of, 8812*e*.
tris(2,2′-bipyridyl)ferrous ion, instability const. of, 8814*h*.
**Iron cyanide**, $Fe(CN)_2$, heat of formation and lattice energy of, 2830*a*.
**Iron cyanoplatinate(II)**, $FePt(CN)_4$, prepn. and reduction to PtFe, 3260*f*.
**Irone**, isomers, 3376*c*.
isomers, nomenclature of, 5550*c*.
in perfumery, 1909*i*.
structure and synthesis of, 6365*g*.
——, **tetrahydro-**. See *2-Butanone, 4-(2,2,3,6-tetramethylcyclohexyl)-*.
**α-Irone**, *p*-bromophenylhydrazones of stereoisomers of, 5550*a*.
*cis*(2,6)-, and derivs., 5549*d*.
*cis*- and *trans*-, spectra of, 3375*h*.
*cis*(2,6), *trans*(2¹,2¹)-, in iris, 3374*d*.
4-phenylsemicarbazone, 3375*d*.
spectrum of, 3375*h*.
constitution of, and synthesis of derivs., 2371*i*.
derivs., 1909*i*.
derivs. of stereoisomers of, spectra of, 7644*g*.
2,4-dinitrophenylhydrazones of stereoisomers of, spectra of, 7644*f*.
isomerization of, in iris oil production, 5550*d*.
Raman spectra and structure of stereoisomers of, 5549*a*.
thiosemicarbazones of stereoisomers of, 5549*c*
**α-Irone, dihydro-***, *cis*- and *trans*-, Raman spectra of, 5549*b*.
**β-Irone**, derivs., 1909*i*.
2,4-dinitrophenylhydrazone, spectrum of, 7644*f*.
hydrogenation of, 4637*f*.
Raman spectrum and structure of, 5549*a*.
spectrum of, 3375*i*.
thiosemicarbazone of *d*- and *dl*-, 5549*c*.
——, **dihydro-***, and derivs., 3374*c*.
**γ-Irone**, *cis*(2,6)-, *p*-bromophenylhydrazone, 5550*a*.
*cis*(2,6)-*d*-, and derivs., 3375*c*.
*cis*-, spectrum of, 3375*h*.
derivs. of neo-, spectra of, 7644*h*.
detn. of neo-, and phenylsemicarbazone, 5550*f*.
isomerization of, in iris oil production, 5550*d*.
Raman spectra and structure of stereoisomers of, 5549*a*.
thiosemicarbazone of *cis*(2,6)-, 5549*d*.
**γ-Irone, dihydro-***, *cis*-, Raman spectrum of, 5549*b*.
and derivs., 3375*f*.
semicarbazone, detn. of, 5550*g*.
**Iron ferricyanide**, formation and compn. of, 1676*g*.
**Iron ferrites.** See *Iron oxides; Magnetite*.
**Iron fluorides**, as catalysts in fluorination of C, P 3834*g*.
**$FeF_2$**, antiferromagnetism of, 11*a*.
heat of formation and lattice energy of, 2829*i*.
magnetism of, 6877*d*.
**$FeF_3$**, as catalyst in $CF_4$ manuf. from C halides and HF, P 3437*a*.
**Iron formate**, $Fe(HCO_2)_2$, heat of formation and lattice energy of, 2830*a*.
**Iron gluconate**, effect on easily-split Fe of blood, 8051*f*.
vitamin $B_{12}$ hydrochloride and mononitrate stability in soln. of, 8610*i*.
**Iron glycerophosphate**, hydrolysis of, 4550*g*.
**Iron halides**, Curie point, pressure and, 8784*a*.
**Iron hydroxides.** (See also *Ferric(III) acid*.)
catalysts of kieselguhr and, in gasoline synthesis, H adsorption by, 2413*a*.
chem. properties and classification of natural ferric, 1291*c*.
colloidal—see also *Iron oxides*.
colloidal, 5654*c*.
manuf. from spent pickling acids and dehydration and oxidation to oxide pigments, 5200*i*, 8697*d*.
mixt. with kieselguhr, in S removal from water gas, 2401*f*.
precipitation of, pH for, 2493*c*.
**$Fe(OH)_2$**, formation on Fe aerated in NaCl soln., 8906*e*.
in iron (electrodeposited), 7353*c*.
lattice energy of, 2829*f*.
manuf. by electrolysis, 2522*f*.
reduction (electrolytic) of, passivation of Fe and, 1270*a*
**$Fe(OH)_3$**, adsorption of Cu and Ni by, 2544*b*.
electron microscopy of colloidal, 6040*g*.
flocculation by KOH, 2070*i*.
flow of suspension of colloidal, 7291*g*.
formation in Cu ores of Calabona, Italy, 6949*b*.
manuf. from pickle liquor, 4989*i*.
O absorption by, 81*b*.
recovery from pickling liquor and galvanizing wastes, 9309*g*.
silver and sulfate ion adsorption by, from $Ag_2SO_4$ solns., 6885*i*.
soly. product of, 7789*d*.
viscosity of colloidal, 5259*a*.
**Iron iodide** ($FeI_2$), folic acid prepn. contg., 355*i*.
lattice energy of, 2829*f*.
mixt. with molten NaI, decompn. potential of, 4582*g*.
**Iron lactate**, effect on flavor and keeping quality of butter, 6760*ac*.
**Iron lithium sulfate**, 4172*i*.

**Iron magnesium chlorides**, 6104*d*.
**Iron magnesium sulfate**, 4172*i*.
**Iron manganese phosphates**, in ferrous-part coating, 7892*b*.
**Iron manganese sulfate**, 4172*i*.
**Iron molybdates**, manuf. of, P 5160*b*.
**Iron molybdenum carbides**, crystal structure of, 2914*b*, 6958*b*.
in steel, 7397*g*.
**Iron nitrates**, as catalyst in condensation of 2-furaldehyde with phenol, 5226*b*.
**Fe(NO$_3$)$_3$**, heat of formation and lattice energy of, 2830*a*.
**Fe(NO$_3$)$_3$**, catalyst for hydrogenation of CO from, P 827*b*.
as catalyst in hydrolysis of cellulose by nitric acid, 1979*a*.
in coatings of polyvinyl alc., P 1670*e*.
electrolysis of, current thermal variations in, 5676*b*.
hydrogen peroxide decompn. in presence of, kinetics of, 25*b*.
polymerization of styrene in presence of, 5754*e*.
reaction with citric acid, 1660*c*.
**Iron nitrides**, decompn. of, S effect on, 2534*h*.
e-, rate of N evolution from, 4933*e*.
iron ionization in, 6018*d*.
magnetic properties of, 6018*d*.
prepn. and transformation of, 2744*d*.
pyrolysis of Fe$_2$N, and formation of Fe$_2$N and Fe$_4$N, 4169*c*.
review on, 7361*g*.
structure of, 3765*ac*.
**Fe$_2$N**, discontinuities in at. distances in crystals of, electronic interactions and, 6030*h*.
**Iron ores.** (See also *Hematite; Ilmenite; Limonite; Magnetite; Ochers; Oölites, Pyrite; Siderite.*)
agglomeration of, P 1708*f*.
of Alaska, as basis of industry, 2130*e*.
of Alaska (northwestern), 8314*i*
of Alaska (Prince of Wales Island), 1694*d*.
aluminum-, magnetic sepn. of reduced, 8995*h*.
analysis of—see also *Iron, analysis*.
analysis of, for Ca and Mg, 4176*c*.
analysis of, loss on ignition in, 520*g*.
apatite, formation and geochemistry of, 8317*abf*.
of Arizona (Apache, Navajo Co.), 7383*g*
arsenic and P in, formation conditions and, 2138*a*.
arsenic elimination from, 8323*f*.
arsenic-P-, of Blyav, Southern Ural, 2898*e*.
benefication or prepn. of, 8995*g*.
for blast-furnace treatment, 79*f*
of Mesabi, for blast furnace, 980*g*.
in Russia, 1293*d*.
of Brazil (Mato Grosso), 3750*i*, 3751*f*.
British lean, 5711*g*.
of California (Bessemer project) and their concentration, 7384*b*.
of Colombia, 8994*b*.
concg. titaniferous, 6133*b*.
concn. of, 1293*g*, 1294*d*, 2554*c*, 2566*e*, P 3339*a*, P 5726*i*.
preroast for magnetic, 1294*h*.
in spiral concentrator, 6131*h*.
concn. of auriferous, 6955*b*.
concn. of Pb-Zn-, 77*i*.
concn. of oxide, P 988*e*.
concn. of titano-magnetites, 3325*i*.
concn. of Zn-, 5711*g*.
copper-Ni-, of Stillwater Complex, Mont., 4982*a*.
copper-Ag-Au-, of Mt. Andrew, Prince of Wales Is., Alaska, and their concn., 7384*c*.
crushing, dressing and magnetic sepn. of, 4611*d*.
diagrams showing stages of crystn. and effect of strong fractionation on, 8092*g*.
drying of, 969*g*.
dust sampling in hematite mines, 910*f*.
electromagnetic separator for, P 6964*f*.
exploration for sedimentary, paleogeography in, 3320*i*.
ferromagnesiferric, of Capalbio, Italy, 5706*f*.
ferrous-Fe detn. in sinter cake and, 965*i*.
filled-sink, of Mo., 5708*a*.
flotation of, P 3768*ab*, P 4624*c*, P 4998*g*, P 5724*i*, P 7403*b*.
flotation of low-grade, and washery wastes, P 3339*b*.
flotation of siliceous magnetic, P 103*e*.
formation and transformation of, in Fensfelt, Norway, 4191*e*.
formation, geochemistry and analyses of Swedish, 5710*b*.
formation of, 2133*f*.
formation of quartzite, Na metasomatosis in, 6129*h*.
of France (Langres narrows), 6951*e*.
of France (Lorraine) and their oxidation state in detg. blast-furnace operation, 6951*g*.
fused, for open-hearth use, 4194*b*.
of Germany (Lahn), genesis of, 8990*i*.
of Germany (Thuringia), 3750*f*.
of Germany (Waser-Wiehen Mts.), 2550*i*.
gray, of Talladega Co., Ala., and their roasting and magnetic concn., 4608*g*.
hematite-milling plant at Marampa, Sierra Leone, 4611*a*.
hydraulic classification and refining of Fe$_2$O$_3$-contg. clay from João Pessoa, Brazil, 7716*i*.
industry in 1946, 2127*c*.
of Iowa (Waukon), 6125*a*.
iron detn. in, 8303*f*.
iron recovery from—see *Iron, metallurgy of*.
of Karelian Finnish S.S.R., 2550*e*.
of Labrador and New Quebec, 526*c*.
of Luxembourg minette formation, 2133*b*.
of Luxemburg, 2550*e*.
magnetizing roast of, 3326*e*.
manganese detn. in, 966*e*.
manganese-, of Boiling Springs, Pa., 5348*c*.
of Mesabi Range, 979*a*.
of Montana (Running Wolf deposits), 5348*a*.
of Montana (Sheep Creek deposits), 3322*f*.
of Nevada (Buena Vista), 7383*h*.
of Newfoundland (Southern White Bay), 1692*c*.
of New Mexico (Capitan) and their magnetic concentration, 8990*f*.
of New York (Redford-Clayburg magnetite district), 5348*b*.
nodulization in rotary kilns, 7878*h*.
of Norway (Rana Mines), 6546*b*.
of Ontario (Algoma dist.) assocd. with banded silica rocks and interbedded lavas, 8318*c*.
oölitic, of Anjou and Normandy, France, 7872*g*.
of Bell Isle, Newfoundland, 4189*i*.
Devonian Sedimentary, of Eastern Tataria and Western Bashkiria, 6951*h*.
of Sauvage, Longwy Basin, 8318*a*.
supraliassic, of upper Saône and upper Marne, 6124*i*.
of Wabana, Newfoundland, 8990*i*.
of Oregon (Grant Co.), 524*h*.
of Philippines (Surigao), 1291*i*.
of Portugal, 5708*c*, 7872*h*.
prospecting for, by compn. of plants and soils, 3549*f*.
reduction of, dilatation during, 527*i*.
review on, 6550*i*.
Rhine Valley oölitic Fe ores and, 8318*b*.
rubidium, Rb$^{87}$, Sr and radiogenic Sr in Grangesberg, of Sweden, 6132*d*.
of Rumania, 6125*c*.
salt-type lattice ore, decompn. and working, 528*i*.
sand and titanic, wet-processing of, 1924*d*.
sands of Italy, 2133*b*.
sands, Ti and V recovery from, P 7838*b*.
separator for, P 5726*b*.
sintering of, 4611*e*.
sintering of, with anthracite coal, 9411*h*.
sinters, effect on blast-furnace performance, 4196*a*.
sizing and sintering of, 7388*hi*, 7389*a*.
of Switzerland, 6124*f*.
taconite as, 4987*e*.
tailings from, SiO$_2$-gel manuf. from, 1925*h*.
of Tanganyika Territory, 75*i*, 5347*f*.
Texas (Llano) magnetic, 8990*g*.

thermal analysis curves of hydrous, 8987*h*.
**FeO.** (See also *Wüstite.*)

——— of, and its solid solns. with MgO, 11*a*.
calcn. in silicate inclusions in steel, 6111*a*.
catalyst from $MoO_3$ and, in H liberation from $NH_3$, P 3032*e*.
detn. in steels, 4600*f*.
diffusion in acid open-hearth process, 8327*e*.
effect on aluminosilicate refractories, 3582*d*, 3583*a*.
on m.p. of FeS, 3257*f*.
on quartz transformation into cristobalite, 371*e*.
free energy and heat of formation of, 9006*h*.
in iron-$SiO_2$ slags, 23*d*.
magnetism of, 6877*d*.
mixt. with CaO, effect on aluminosilicate refractories, 3582*i*.
refractory-material corrosion by, and system: $Al_2O_3$-$SiO_2$-, 5915*i*.
slags with $SiO_2$, viscosity of, and compds in, 6553*a*.
spectrum of, 3712*d*.
in steel desulfurization, 4936*b*.
system: $CaF_2$-CaO-MgO-, 8630*a*.
system: CaO-MgO-MnO-$SiO_2$-, 6067*h*.
system: $SiO_2$-, 2909*h*.
systems: Fe-, FeS-, and slags-, activities in liquid, 4931*a*.
$Fe_3O_4$, catalyst contg., for combustion, P 4835*f*.
in ceramics, 2388*c*.
formation on Fe cathode, in NaCl soln, 8906*f*.
on Hastelloy, 1299*f*.
magnetic properties and solns. of, 6017*a*.
magnetic resonance and permeability of, 4061*c*.
$Fe_2O_3$, adsorption of BuOH, PhOH and $BuCO_3H$ by, 28*c*.
α-, radioactivity of, effect of desorption of $H_2O$ and Tammann-exchange temp. on, 8822*c*.
anisotropic gels of, 922*d*.
as antioxidant in paraffin oil, 2411*b*
catalyst for hydrogenation of CO to hydrocarbons, P 6397*a*.
catalyst from alkali metal compd., $Cr_2O_3$ and, for dehydrogenation, P 5410*a*.
catalyst from $Al_2O_3$ and, in dehydrogenation of cyclohexane, 7912*b*.
in reaction of $H_2S$ with olefins, P 691*g*.
in reduction of esters, 5363*d*.
relaxation time for, 8832*a*.
catalyst from CuO, MgO, $K_2O$ and, in dehydrogenation of butene, P 663*a*.
catalyst from CuO, MgO, $K_2O$ and, in dehydrogenation of cumene, P 680*f*.
catalyst from gypsum and, in disproportionation of carene, 5012*g*.
as catalyst in aldehyde and ketone manuf. from mixts. of carboxylic acids, P 5791*h*.
in combustion of black rocket gunpowder, 9449*f*.
in decarboxylation, 7801*d*.
in dehydration of hydracrylonitrile, 4629*i*.
in hydrogenation of coal, 8640*f*.
in oxidation of mercaptans in natural gas, 7660*b*.
in oxidation of $SO_2$, 8325*e*.
in water gas reaction, 1945*e*.
catalysts, P 5135*b*.
catalysts for dehydrogenation, P 7610*b*.
catalysts from kaolin, KOH and, in dehydration of 1,3-butylene glycol, 2015*ghi*, 5360*dfg*, 5361*b*.
catalysts from kaolin, KOH and, stability of butadiene in, 4045*e*.
catalysts from $Mg(OH)_2$, $K_2CO_3$ and, in H manuf. from CO and steam, P 840*c*.
catalysts from $MnO_2$ and, in oxidation of H-$CH_4$ mixt., 2403*e*.
coagulates of, sediment vol. and rate of d. increase of, 7780*a*.
coating with, on clay minerals, 7620*h*.
colloidal, P 3161*c*.
detection in presence of other metal oxides, 8300*a*.
detn. in black sands, 8318*g*.
detn. in cosmetics, 9369*a*.
drying of, 3246*d*.
effect on $C_2H_2$ formation from $CaC_2$, 2082*a*.
on $Al_2O_3$ reaction with $BaSO_4$, 6894*i*.
on hydration of MgO and magnesite, 5919*h*.
on NaF yield from $CaF_2$, 1835*g*.
elec. cond. at high temps., 4533*i*.
gamma-, crystals from Fe corrosion, 101*h*.
gas-purification, disposal of, 837*h*.
manuf. of, 3596*b*.
revivification *in situ*, 6395*a*.
helium($He^4$) adsorption by, 8778*a*.
heptahydrate of, 7363*d*.
on iron, 84*g*.
in limestones of São Paulo, origin of, 3324*c*.
magnetic permittivity of mixts. of γ-, with paraffin wax, 3328*d*.
magnetic properties of rhombohedral, 5685*f*, 8221*d*.
manuf. from $FeCl_2$, P 6375*i*.
pharmaceutical use of, 9363*e*.
phosphor contg. $Al_2O_3$, $Li_2O$ and, 6084*d*.
rate of adsorption of Ba ions by hydrous, 6035*i*.
reaction with $Al_2O_3$ and CaO, 3587*h*.
with CoO and NiO, 3304*h*.
with NiO, 6018*e*, 8930*f*.
with oxides of Pb, Mg and Ni, 6059*i*.
with ZnO, temp. of prepn. and, 8933*h*.
reduction of, 4988*f*.
reduction of, kinetics of dissocn. of CO in, 4933*b*.
in rhubarb varieties, 9383*g*.
in sediments, 5523*c*.
solid solns. with $Al_2O_3$, 8934*d*.
solid solns. with Zn Fe spinel, 4171*e*.
sorption by, 1240*e*.
system: $Al_2O_3$-CaO-MgO $SiO_2$-, 3986*h*, 8832*f*.
system: $CaC_2$-CaO-, 2081*h*.
system: $CaCl_2$-NaCl-$H_2O$-, 7316*b*.
system: CoO-, and dissocn. of $Fe_2O_3$, 7314*i*.
system: $Fe_2(SO_4)_3$-$H_2O$-, pH in, 2493*b*.
system: NiO-, 4552*b*.
systems: $Al_2O_3$-CaO-$Na_2O$-, and CaO-$Na_2O$-$SiO_2$-, 930*i*.
systems: CoO-, NiO-, 5355*a*.
systems with MgO or NiO and ZnO, 8335*g*.
in viridine coloration, 6119*g*.
**Iron perchlorate**, $Fe(ClO_4)_3$, spectrum of, in EtOH and $H_2O$, 499*e*.
**Iron perrhenates**, 5688*e*.
**Iron phosphates**. (See also *Iron pyrophosphate*.)
catalysts of, for and in reactions of olefins, P 5419*b*.
detn. in phosphating baths, 7375*f*.
$FePO_4$, catalyst of kaolin, $H_3PO_4$ and, in dehydration of 1,3-butanediol, 5360*i*.
as fertilizer, 798*e*, 799*a*.
precipitation of, 6931*d*.
thermal stability of analytical ppts. of, 8971*h*.
**Iron phosphide**, $Fe_3P$, systems: $Cr_3P$-, $Cu_3P$-, $Mn_3P$-, and $Ni_3P$-, 5719*b*.
**Iron potassium sulfates**, 4172*i*.
mixt. with $MgK_2(SO_4)_2$, magnetic relaxation time of proton in $H_2O$ of crystn. of, 8878*g*.
**Iron preparations**, ammonium and Fe citrate, folic acid prepn. contg., 355*i*.
ammonium and Fe citrate, in beef, iron and wine, 6783*c*.
ammonium and Fe citrate, vitamin $B_1$ hydrochloride and mononitrate stability in soln. of, 8610*i*.
**Iron pyrites**. See *Pyrite*.
**Iron pyrophosphates**, as catalysts in polymerization of butadiene with styrene, 5987*f*.
polymerization activation by ferrous, in GR-S rubber prepn. in cumene hydroperoxide-sugar systems, 8727*f*.
polymerization activation by ferrous, of butadiene with styrene, 8725*c*.
**Iron rubidium sulfate**, 4172*i*.
**Iron salts**, as activators of cumene hydroperoxide in reduction-oxidation polymerization of butadiene with styrene, 8723*f*.
analysis of, 5331*c*.
as catalysts in hydrogenation of CO to hydrocarbons, P 5573*b*.
in oxidation of benzoin to benzil, 1368*b*.
in polymerization of butadiene hydrocarbons, P 2025*i*.
chlorinated-polythene treatment with, P 9534*a*.
of colloidal anion, diffusion through semipermeable membrane into $FeCl_3$ soln., potentials in, 6893*f*.
effect on flavor and keeping quality of butter, 6750*c*.
effect on foam formation in beer, 9359*g*.
ferrous, effect on vitamin C detn., 1076*d*.
of grapeseed-oil acid, effect on drying of linseed oil, 8699*f*.
hydrogen peroxide decompn. by, 4087*a*.
magnetic resonance absorption for, 4065*i*, 4568*cd*.
mixt. with Mg silicate, as decolorizing adsorbent for oils, P 884*i*.
in oxidation acceleration of acids in soap stocks, 5212*h*.
phosphate fixation by, 3957*e*.
platinum passivation by 2100*g*.
reaction with $H_2O_2$, 6895*b*.
removal from bituminous sandstones, 381*f*.
in tanning—see *Tanning*.
titer of solns. of ferrous, changes and maintenance of, 4601*h*.
vinyl-aromatic-compd. polymerization in emulsions in presence of, P 5641*f*.
**Iron sand**. See *Iron ores*.
**Iron selenide**, $FeSe_2$, bonds and interat. distances in, 2052*c*.
**Iron silicates**, crystal structure of, optical properties and, 8784*d*.
$Fe_2SiO_4$, effect on fluorescence of $Zn_2SiO_4$ activated by Mn, 8282*a*.
fluorescence of, and its decay, 2869*g*.
solid solns. with $Mg_2SiO_4$, heats of formation of, 3701*a*.
**Iron silicides**, ferromagnetic properties of FeSi and $Fe_3Si_2$, 7885*f*.
**FeSi**, bonds in, 918*i*.
in Fe-alloy manuf., 4546*d*.
$(FeSi)_4$, heat and entropy of fusion of, 477*c*.
**Iron sodium sulfates**, 4172*i*.
**Iron sodium sulfide**, $3Na_2S.2FeS$, 2109*b*.
**Iron stannides**. See *Iron compounds*.
**Iron stearate**, citric acid and sorbitol in counteracting proöxidant action of, 882*f*.
gels, softening point of, 8801*e*.
**Ironstone**, argillaceous nodulous, in Weser-Wiehen Mts., 2551*a*.
calcining of, fluorosis of farm animals from, 3508*h*.
of England (Northampton Sand), 5347*f*.
of Tanganyika Territory, 75*i*.
**Iron sulfates**, in asphaltic bitumens, 5178*f*.
in Indian and Turkey Reds, effect on rubber, 4870*g*.
recovery of waste solns. of, P 1927*b*.
$FeSO_4$, analysis for Cu, Pb and Zn, 2890*e*.
as catalyst in polymerization of unsatd. compds., 2811*a*.
catalysts of Te and, in Kjeldahl digestion, 8961*g*.
compds. with pyridinecarboxamides, P 253*a*.
effect on spinning viscose, 5588*b*.
effect on stomach lining and skin, 3106*c*.
ferric alum manuf. from, P 826*c*.
folic acid prepn. contg., 355*i*.
heat capacity and magnetic properties of heptahydrate, 6017*g*.
as initiator and modifier in butadiene-styrene polymerization catalyzed by Fe pyrophosphates, 5987*g*.
magnetic ppts. from solns. of, 7763*b*.
oxidation in soln. by free O, 1632*d*.
pharmaceutical use of, 9363*e*.
in phosphatic fertilizers, 2724*g*.
from pickling wastes, disposal of, 94*h*.
in pine-root-disease control, 7179*e*.
poisoning by, 2326*b*.
as polymerization activator in GR-S rubber manuf., P 6457*i*.
reaction product with $Na_2HAsO_4$, 8296*d*.
stable therapeutic prepn. of vitamin C and, P 5910*b*.
system: FeO-$H_2O$-, pH in, 2493*b*.
toxicity to bees, 344*e*.
in wood preservation against house borer, 8598*f*.
$Fe_2(SO_4)_3$, anionic ferric ion liberation from, by $Na_2SO_4$, 7245*c*.
as catalyst in condensation of 2-furaldehyde with phenol, 5224*h*.
corrosion of Cu-Au and Au-Ag alloys in solns. of, 7879*e*.
effect on protein synthesis by *Saccharomyces cerevisiae*, 9150*e*.
resinous reaction products with polyhydric alcs., P 4870*b*.
sepn. from $CoSO_4$ and $CuSO_4$ by chromatography, 2070*i*.
system: $Fe_2O_3$-$H_2O$-, pH in, 2493*b*.
**Iron sulfides**, as catalysts in aromatization of hydrocarbons, P 5039*i*.
as catalysts in hydrogenation of org. S compds. to thiols, P 2630*c*.

as catalysts in toluene manuf. from bibenzyl and H, P 3454*b*.
formation on wool, 924*d*.
oxidizability of pptd. FeS or $Fe_2S_3$, 5700*i*.
in steels, 4180*h*.
**FeS**, as catalyst in dehydration and dehydrogenation of EtOH and HCOOH, 6497*i*.
detn. in welded steel joint, 970*c*.
effect on decompn. of Fe nitrides, 2534*h*.
formation on steel in $SO_2$, 8325*e*.
fused, fluidity and interfacial tension of, 3257*b*.
in iron films on galena, 6483*g*.
oxidation by O, 7854*g*.
reaction with H, equil. in, 2558*g*.
reaction with CaO, 8326*b*.
roasting to FeO and $FeSO_4$, 3696*d*.
system: silicates–, effect of C on interfacial tension in, 7795*a*.
systems: Fe–, and FeO–, activities in liquid, 4931*a*.
system: ZnS–, 4936*e*.
**$FeS_2$**, bonds and interat. distances in, 2052*c*.
in coal cementing basin in Sardinia, 3323*d*.
detn. in gypsum and in presence of other sulfides, 6937*d*.
prepn. from $S^{35}$, 9418*e*.
reaction with water to form $H_2S$, 2847*b*.
**Iron tannates**, ink contg.—see *Ink*.
**Iron tartrate**, tanning with, 7245*c*.
**Iron telluride**, FeTe, bonds and interat. distances in, 2052*c*.
**Iron thiocyanates**, formation and color of complex ion $Fe(CNS)^{+2}$ and of higher complexes, 8310*g*.
**$Fe(CNS)_2$**, heat of formation and lattice energy of, 2829*i*.
**Iron titanates**, 8296*i*.
manuf. from Fe sand, P 7838*c*.
**$FeTiO_3$**, prepn. of, 2108*f*.
**Iron tungsten carbides**, crystal structure of, 2914*b*, 6958*b*.
**Iron vanadate (III)**, $FeV_3O_4$, 6519*d*.
**Iron vanadate(V)**, prepn. and soly. of, 8247*f*.
**Iron vanadates**, manuf. from Fe sand, P 7838*c*.
**Irradiation**. (See also *Hertzian waves; Light, infrared; Light, ultraviolet; Radiation; Radiotherapy; X-rays;* etc.)
ergosterol subjected to—see *Ergosterol*.
lamps for—see *Lamps, electric*.
milk subjected to—see *Milk*.
of proteins, proteolytic cleavage after, 9099*h*.
of 4,4′-stilbenedicarboxamidine diisethionate, 2982*g*.
**Irreversible processes**, in helium II, 8220*f*.
thermodynamics of, domain of validity of, 8246*e*.
**Irrigation**. (See also *Water, analysis; Waters, natural*.)
of citrus, 9317*e*.
effect on Hawaiian foliage crops, 9292*e*.
on rapeseed, 2286*g*.
on snap-bean compn., 1514*i*.
of flax, 2280*f*.
grass compn. and, 4408*g*.
manganese deficiency of leek from, 3129*b*.
moisture distribution in, 1889*e*.
of rice on saline soils, 1891*g*.
sediments, 7620*f*.
with sewage—see *Sewage*.
of South Carolina soils, 9328*f*.
**Irritants**, 8-quinolyl *N*-phenylbenzimidate as, to the nose, 1777*g*.
**Isabellin**, thermal anomaly in, 2149*a*.
**Isacen**, laxative activity of, 2319*f*.
**Isanic acid**, recovery from isano oil, properties, hydrogenation and ozonization and pptn. of Ba or Pb salts, 3630*bc*.
**Isano oil**. See *Oils*.
**Isatin** (*2,3-indoledione*), anthranilamide from, 1765*i*.
as antioxidant in alkyl benzenesulfonates, P 6846*a*.
azine and 3-hydrazone, 123*c*.
crystn. on sucrose, 8238*g*.
derivs., 215*c*, 1416*c*, 3428*d*.
and derivs., effect of carbonyl group reactivity on dehydrogenase activity of, 215*b*.
dyes from, P 7707*c*, P 9470*i*.
3-hydrazone, 6614*g*.
reaction with acetophenone derivs., 3825*d*, 7924*e*.
with cyclohexyl methyl ketone, 1411*d*.
with ketones, 227*g*.
3-semicarbazones of, and its derivs., and their use in analysis, 8979*g*.

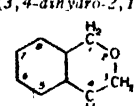
——, **γ-benzoyl-**, and semicarbazone, 2931*g*.
——, **α-butyl-**. See *Caproic acid, α-isobutyl-*.
——, **β-ethoxy-**, ethyl ester, 6169*a*.
——, **α-hydroxy-**. See *Leucic acid*.
——, **β-hydroxy-**, β-lactone, P 5415*a*.
——, **α-isobutyl-**, and ethyl ester, 1317*e*.
——, **α-methyl-**. See *Valeric acid, α,γ-dimethyl-*.
——, **β-methyl-**. See *Valeric acid, β,γ-dimethyl-*.
——, **γ-nitro-**, methyl ester, 1319*g*.
——, **α-oxo-**, asparaginase and glutaminase activation by, 6266*e*.
effect on enzymic deamination of glutamine, 3857*b*.
——, **β-oxo-**, ethyl ester di-Et acetal, 6169*b*.
ethyl ester, reaction with thiourea, P 674*i*.

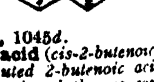
**2 - Isocapronaphthone, 6 - methoxy-**, 1382*i*.

**Isocapronitrile**, manuf. of, P 3440*b*.
phys. consts. of, 2592*b*.
——, **α-anilino-α-methyl-**, as insecticide, 4415*g*.
——, **γ-benzoyl-**, 2931*g*.
——, **β-oxo-**, and *p*-nitrophenylhydrazone, 2938*h*.



**Isocaprylic acid**. See *Enanthic acid, ε-methyl-*.
——, **γ-methyl-**. See *Enanthic acid, γ,ε-dimethyl-*.

**4a *H*-Isocarbazole**,



*4a-*
—, **1,2,3,4 - tetrahydro - 4a,8 - dimethyl-**, 4257*a*.
——, **1,2,3,4 - tetrahydro - 4a - methyl-**, 4257*a*.

**Isocarboline**. See *2 H-Pyrid[3,4-b]indole*.
**Isocarbostyril, 3,4-dihydro-6,7-dimethoxy-**. See *Corydaldine*.
**Isochavibetol** (*2-methoxy-5-propenylphenol, 5-propenylguaiacol*), and carbonate, P 4299*b*.
**Isochondrodendrine**, and derivs., 2626*b* and dimethyl ether, 2626*b*.
**Isochroman** (*3,4-dihydro-2,1 H-benzopyran*)

**Isochroman - 3 - carboxylic acid, 4 - hydroxy-1-oxo-**, 1045*c*.
**1,3 - Isochromandione, 4 - (2 - methyl-4(1 *H*) - quinolylidene)-**, 2290.
**Isocinchomeronic acid** (*2,5 pyridinedicarboxylic acid*), and dimethyl ester, 3825*c*.
**Isocitric acid** (*α hydroxytricarballylic acid*), conversion to α oxoglutaric acid, 1013*h*.
effect on acid metabolism in tobacco, 9177*d*.
oxidation of, 9122*h*.
in plant sap, soil pH tolerance and, 2288*e*.
**Isoclavacin**, cardiotoxic effects of, 1110*d*.
and derivs., 1407*a*.
effect on heart, 7138*h*.
——, **dimethyl-***, effect on heart, 1110*d*, 7138*h*.
**Isoconessine**, irritant action of, compared with conessine and neoconessine, 2327*d*.
pharmacology of, 1868*h*.
**17-Isocorticosterone, desoxy-***, acetate, P 7978*f*.
**Isocoumaran**. See *Phthalan*.
**Isocoumarin** (*2,1-benzopyrone*),

prepn. of, 1045*d*.
**Isocrotonic acid** (*cis-2-butenoic acid*). (*Unsubstituted 2-butenoic acids which have been assigned the cis configuration are entered here; undesignated and trans acids are entered at* Crotonic acid. *All derivatives of these acids are entered as inverted entries under* Crotonic acid *with "cis-" in the modification when they have been so designated.*)
**Isocyanates**, compns. with polyesters or polyester amides, increasing soly. in org. liquids, P 7753*a*.
di-, polyesters or polyester amides modified with, mixts. with polyvinyl acetal, P 3661*a*.
polymers from amino acids, amino alcs. or dihydroxy compds. and, P 6867*e*.

*di-*, polymers from, with acrylic acids, P 4516*e*.
in precuring superpolyester rubbers, P [illegible].
reaction products of org., with unsatd. polyesters or polyester amides, vulcanization with S, P 4046*g*.
as resin tanning agents, 1206*a*.
of hydrolyzed $C_5H_4$-vinyl ester interpolymers, P 1219*e*.
ions (neg.) of, 8848*a*.
org., chem. of, 1014*e*.
poly-, in dairy-equipment construction, 5877*e*.
polymers from, for coatings, 1604*i*.
reactions of inorg., with drying oils, factices, rubbers, varnishes, etc., P 908*a*.
protein derivs., P 3241*d*.
stabilizing solns. of aromatic, P 8732*c*.
in textile finishing, 7689*i*.

**Isocyanic acid.** (See also *Cyanic acid.*)
aralkyl esters and derivs., P 5800*e*.
aryl esters, in identification of heterocyclic compds., 8365*b*.
aryl esters, mechanism of reactions of, with amines and hydroxy compds., 7440*b*, 7441*ae*, 7442*ac*.
cyclohexyl ester, 4233*a*.
difluoromethyl, fluoromethyl and trifluoromethyl esters, 6793*e*.
α,α-dimethylbenzyl ester, 6993*i*.
esters, 169*a*, 3378*b*, P 6227*f*.
detn. of, 2125*f*.
with 3-hydroxy-4-(*p*-methoxyphenylazo) - 1 - methyl - 5 - pyrazolone, 4272*d*.
reaction with amides, 6162*e*.
reaction with wool, to improve wear resistance, P 9476*d*.
hexamethylene and tetramethylene esters, as resin tanning agents, 1206*b*.
hexamethylene ester, polymerization with acrylic acid and its derivs., P 4516*e*.
1-isoamylisohexyl ester, 2166*h*.
methyl ester, behavior in $Ac_2O$, 2110*f*.
1-naphthyl ester, Raman spectrum of, 8888*g*.
1- and 2-naphthyl esters, gelatin reaction products, 9512*e*.
*p*-nitrophenyl ester, condensation product with bis(4-biguanidinophenyl)urea, P 4880*b*.
octamethylene ester, 1563*d*.
phenyl ester, reaction with benzoin oxime, 1038*f*.
reaction with benzylpenicilloic acid and related compds., 6618*b*.
reaction with phenols, 1351*h*.
urease inactivation by, 5062*g*.
tetramethylene ester, 1564*i*.
triphenylmethyl ester, 4645*i*.
vinylaryl esters, and polymers, P 5422*f*.
vinyl ester, polymeric reaction products with N compds., gelatin compns. contg., P 5231*i*.
vinyl ester, polymers or copolymers with vinylidene compds. for textile treatment, P 6428*c*.

**Isocyanides.** (*The individual isocyanides (isonitriles) have their own index headings, e.g.*, Methyl isocyanide.)
calcn. of free energy function, heat content, heat and free energy of formation of, 5658*e*.
parachors of, 2057*h*.
polymers with carboxylic acid, P 4515*f*.

**Isocyano group,** bonds in, 8764*a*.

**Isocysteine** (*α-mercapto-β-alanine*), metabolism of, radio-S in study of, 5117*e*.

**Isocytosine** (*2-amino-4(3 H)-pyrimidone*), 2-amino-4-chloropyrimidine from, P 9082*f*.
spectrum of, 5307*c*.

**Isocytosine-4-acetic acid*,** spectrum of, 5307*c*.

**Isodecane.** See *Hendecane, 2-methyl-*.

**Isodextropimaric acid.** (See also *Dextropimaric acid.*)
sodium salt, chem. structure and emulsifying activity in GR-S rubber polymerization, 8724*i*.

**Isodienestrol*,** color and fluorescence tests for, 3870*h*.

**Isodistillene*,** 2983*e*.

**Isododecane*,** 5176*d*.

**Isodunniol*,** 2-(1,2-dimethylallyl)-3-hydroxy-1,4-naphthoquinone and, 3408*f*.

**β-Isodunniene,** 3408*e*.

**Isodurene** (*1,2,3,5-tetramethylbenzene*), formation of, 3377*d*.
prepn. and phys. consts. of, 7489*c*.

**Isoduренol** (*2,3,4,6 - tetramethylphenol*), 7465*e*.

**β - Isodurylaldehyde** (*2,4,6-trimethylbenzaldehyde*), derivs., spectra of, 3388*g*.

**β - Isodurylic acid** (*2,4,6 - trimethylbenzoic acid*), esters, reaction with PhMgBr, 9051*bd*.
hydrogenation of, 2964*b*.

**Isoelectric,** the term, 4082*h*.

**Isoelectric points,** of γ-alumina and Al(OH)₃ modifications, 6040*i*.
of blood-serum globulins, effect of nonelectrolytes on, 6888*f*.
of collagen, 8184*b*.
of collagen (deaminized and tanned), leather and nylon, 8184*e*.
detn. of, of gelatin, dyes in, 6884*d*.
of gelatin and gelatin derivs., increasing by methylation, P 9512*d*.
of phenylalanine and its derivs., 8810*c*.
of $[Pt(NH_3)_4(NH_3Cl)]Cl_2$, 1674*b*.
of proteins, effect of salts on, 3690*a*.
of proteins of blood plasma, variation with ionic strength, 3860*f*.
of sericin sols, 853*f*.
of tomato-juice globulin, 9167*i*.

**Isoenanthamide,** *N, N*-diethyl-α-isopropyl-, 1144*e*.
——, α-isoamyl-, in Hofmann reaction, 2166*h*.
——, α-isopropyl-, 1144*e*.
——, α-isopropyl-*N, N*-dimethyl-, 1144*e*.

**Isoenanthic acid** (*δ - methylcaproic acid*).
——, α-amino-α-isoamyl-, and hydrochloride, 2167*d*.
——, α,α - bis(2 - cyanoethyl) - β - oxo-, ethyl ester, 2582*g*.
——, δ-bromo-γ-oxo-, methyl ester, 3792*a*.
——, α - (α - chloroacetamido) - α - isoamyl-, 2167*d*.
——, β-ethyl-, 1374*b*.
——, β-ethyl-β-hydroxy-, methyl ester, 1374*a*.
——, δ-hydroxy-γ-oxo-, methyl ester, 3792*a*.
——, α-isoamyl-α-(3-phenylureido)-†, 2167*d*.
——, α-isopropyl-β-oxo-, ethyl ester, 6170*i*.
——, β-oxo-, ethyl ester, cyanoethylation of, 2582*g*.
——, γ-oxo-, methyl ester, 3792*a*.
——, γ,γ,δ - trihydroxy - α,β - dimethoxy-, γ-lactone, 1722*d*.

**Isoenanthyl chloride,** β-ethyl-, 1374*b*.

**Isoephedrine.** See *Pseudoephedrine*.

**Isoergoline,** 6-methyl-8-amino-*, P 6246*f*.

**Isoergosterone,** hydrogenation of, 7493*f*.

**Isoestriol A*,** and acetonide, 3435*a*.

**Isoetes echinospora,** lignins in, 2283*b*.

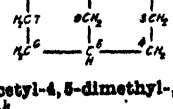
**14-Isoetiocholanic acid,** 3(β)-acetoxy-14-hydroxy-*, methyl ester, 2627*a*.
——, 3(β) - (thevetopyranosyloxy)-14-hydroxy-*, methyl ester diacetate, 1792*a*.

**Isoeugenitin,** 5-hydroxy-7 methoxy-2,8-dimethylchromone and, 6622*bc*.

**Isoeugenol** (*2-methoxy-4-propenylphenol*), condensation with *p*-quinone, 2181*g*.
dimer, as antioxidant, P 1586*d*.
reaction with $H_2S$ and NaHS, 9438*g*.
reaction with maleic anhydride, 1757*b*.
——, dihydrodehydrodi-*, 2427*i*.

**Isoeuphorol*,** 9512*f*.

**Isofebrifugine,** and derivs., 5406*a*.
identity with α-dichroine, 1530*a*.
——, dihydro-*, 5406*e*.
——, nitroso-*, 5406*d*.



**Isofenchocamphoric acid** (*1,4,4-trimethyl-1,3 - cyclopentanedicarboxylic acid*), *cis-* and *trans-*, 7462*a*.

**Isofenchone** (*1,5,5-trimethylnorcamphor*), and semicarbazone, 7462*h*.

**Isoflavone, 4',5,7-trihydroxy-,** 7-*d*-glucoside—see *Genistin*.

**Isoglucosamine,** *p*-tolyl-*, D-, and derivs., 5404*c*.

**1-Isogranatanine** (*1-azabicyclo[3.3.1]nonane*),

——, 3-acetyl-4,5-dimethyl-, and picrate, 3004*h*.

**Isoguanine** (*6 - amino - 2 - hydroxypurine*), labeled with $N^{15}$, 579*h*.
sulfate, spectrum of, 1425*a*.

**Isohemagglutination.** See *Hemagglutination*.

**Isohemagglutinins.** See *Hemagglutinins*.

**Isoheptyl alcohol.** See *1-Hexanol, 5-methyl-*.

**Isohexaphene.** See *Benso[a]pentacene*.

**Isohexestrol.** See "isomers" under *Phenol, p,p'-(1,2-diethylethylene)di-*.

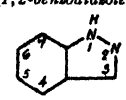
**Isohexylamine,** platinum complexes with, 1670*c*.
——, 1-methyl-†, vasoconstrictor prepn. contg. salts of, P 4429*d*.

**Isohydric point,** 22*f*, 6049*f*.
of aqueous borates and polyborates, 3693*g*.

**Isohydrobenzoin.** See *Hydrobenzoin*.

**Isohydrocinchene,** 4677*b*.

**Iso - *h* - hydrocinchonine, desoxy-*,** and hydriodide, 4677*f*.

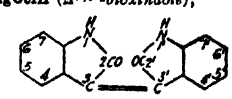


**Isohydrogen oxide.** See "heavy" under *Water*.

**4 *H*-Isoimidazole,**

——, 4,4 - dimethyl - 2,5 - bis(methylmercapto)-, 6171*f*.

**Isoindazole** (*1,2-benzodiazole, benzopyrazole*),



(See also *Indazole*.)
——, 6-nitro-, as antioxidant in alkyl benzenesulfonates, P 6846*b*.

**1 - Isoindazolecarboxamide, 3a,4,5,6,7,-7a-hexahydro-3-methyl-,** 1017*d*.

**β-Isoindigo*,** 7930*b*.

**Isoindigotin** (*$\Delta^{3,3'}$-bioxindole*),

derivs., 6614*e*.
1,1'-bis(phenylacetyl)-, 6614*f*.
1,1'-dibenzoyl-, 6614*f*.
1,1'-dimethyl-, 3428*g*.
1,1'-diphenyl-, 6614*i*.
1-phenyl-, 6614*f*.

**Isoindole** (*2-benzazole*),

(See also *Pseudoindole*.)
——, 1,3-dihydro-. See *Isoindoline*.

**1,3-Isoindoledione.** See *Phthalimide*.

**Isoindoline** (*1,3-dihydroisoindole*), compds. related to, derived from aniline, 237*g*.
and picrate, 121*h*.
——, hexahydro-. See *Isoindole, octahydro-*.
——, 1-oxo-. See *Phthalimidine*.

**2-Isoindolineacetamide, α-benzyl-*N*-[(carboxymethyl)carbamyl-methyl]-†,** DL-, 8357*b*.
——, *N*-(carboxymethyl)-1,3-dioxo-†, 8356*g*.
——, *N*-(α-carboxyphenethyl)-1,3-dioxo-†, DL-, 8356*i*.

**2-Isoindolineacetanilide, α-benzyl-1,3-dioxo-,** DL-, 8357*b*.

**2-Isoindolineacetic acid, α-benzyl-1,3-dioxo-,** DL-, 8357*a*.
——, α - 4 - hydroxybutyl - 2,3 - dioxo-, 4223*e*.
——, α-isopropyl-1,3-dioxo-, 5743*e*.

**2-Isoindolineacetyl chloride, α-benzyl-1,3-dioxo-,** DL-, 8357*a*.
——, 1,3-dioxo-, 8356*f*.

**2-Isoindolinemalonic acid, 1,3-dioxo-,** diethyl ester, reaction with acrolein, 143*c*.
——, α-2-formylethyl-1,3-dioxo-, diethyl ester, and derivs., 143*d*.
——, α-(3-indolylmethyl)-1,3-dioxo-, tryptophan from, P 2643*f*.

**2-Isoindolinepropionaldehyde, 2,3-dioxo-,** and hydrazones, 6169*h*.
——, α(and β)-methyl-1,3-dioxo-, and hydrazones, 6169*h*.

**2-Isoindolinepropionic acid, 1,3-dioxo-,** 6170*d*.
as pantothenic acid precursor for yeast, 9166*d*.

**1-Isoindolinone.** See *Phthalimidine*.

**Isoinositol,** of Müller, DL-inositol and, 2175*cd*.

**Isoionic points,** of proteins, effect of nonelectrolytes on, 6888*e*.
of proteins, effect of salts on, 3690*a*.

**Isoirone*,** isomers, 8375*i*.

——, dihydro-*, and derivs., 3376*d*.
——, tetrahydro-*, isomers, and derivs., 3376*e*.
**Iso-α-irone**. See *α-Irone*. For the term see 5550*c*.
**Isokaurene**, 2978*b*.
**14-Iso-20-ketopregnane-21-acid, 3(β)-acetoxy-14-hydroxy-***, lactone (21-14), 2627*a*.
**Isokhellin**, 7481*b*.
**Isolanostadiene**, oxidation of, 3830*c*.
**Isolauric acid**. See *Hendecanoic acid, 10-methyl-*.
**Isoleucine** (*α-amino-β-methylvaleric acid*), amino acid mixts. low in, N balance index and sp. dynamic action in rats receiving, 1468*b*.
antibacterial activity of, 3879*h*.
as antioxidant in alkyl benzenesulfonates, P 6845*d*.
from aspergillic acid, 3014*a*.
in barley, oats and wheat, 5450*g*.
in blood, carcass, heart, kidney, liver, muscle and skin of animals, 7061*e*.
in blood, effect of diet on, 5834*d*.
in blood plasma, 8429*d*.
in blood plasma, effect of fasting and N deprivation on, 4740*h*.
carboxypeptidase inhibition by, 701*g*.
chromatographic sepn. from other amino acids, 2266*g*.
chromatography on starch columns, 5818*e*.
in clupeine and salmine, 5431*i*.
cobalt complexes with, 5432*e*.
D- and L-, effect on tobacco seedlings, 7551*g*.
D-, detection of, and m.p. and optical crystallographic properties of its nitroindandionate, 69*i*.
D-, DL- and L-, polymerization of, 3787*c*.
detn. of, 3875*h*, 5341*g*.
in blood and urine, 265*b*.
in food and proteins, 9138*a*.
DL-, sepn. of isomers of, P 3029*h*.
effect on alanine (free) and pyruvate in blood, 4860*i*, 4354*e*.
on body wt. during growth, 6295*i*.
on growth of lactic acid bacteria, 4331*h*.
on sporulation of *Bacillus cereus*, 7082*i*.
on *Tetrahymena geleii*, 7593*c*.
in erythrocytes of chickens, 744*c*.
in hemolymph of dragon-fly nymph, 3114*d*.
inheritance of, in maize, 7088*e*.
in lactogenic hormone of pituitary, 5474*f*.
in *Lathyrus sativus* seeds, 1449*f*.
in liver, diet and, 7562*i*.
in lupine and soybean seeds and sprouts, 1080*e*.
in meats and foods, 3534*e*.
in nutrition of *Aedes aegypti* larva, 3940*i*.
optical antipodes of, as N sources for bacteria, 3063*i*.
in organs of swine, 7061*h*.
in pollen collected by bees, 732*e*.
in protein (basic) from sperm nuclei of different invertebrates, 4388*b*.
in royal jelly, 7149*f*.
sepn. from hydrolyzed egg albumin, 8807*c*.
in soybean meals, 3499*e*.
in thyroglobulin, 9121*i*.
in tobacco mosaic virus, 7092*b*.
urinary excretion of, 6714*b*.
in yeast nutrition, 1826*a*.
**Isoleucine, *N*-(2,4-dinitrophenyl)-*N*-methyl-, L-**, 3788*c*.
——, *N*-[3-hydroxy-5-(hydroxymethyl)-2-methyl-4-pyridylmethyl]-, DL-, 644*f*.
DL-, microbiol. activity of, 723*b*.
——, *N*-(α-hydroxyisovaleryl)-*N*-methyl-, and δ-lactone and Me ester, 3788*e*.
——, β-mercapto-, reaction with 2-benzyl-4-(methoxymethylene)-5(4*H*)-oxazolone, 1768*h*.
——, *N*-methyl-, L-, 3788*c*.
L-, detn. by chromatography, 3788*h*.
——, *N*-phenylacetyl-, and methyl ester, P 3574*b*, P 4698*b*.
——, *N*-phenylthioacetyl-, DL-, 3362*f*.
**Isoleucine anhydride, leucyl-***, 3014*a*.
**Isolinolenic acid**, chromatographic sepn. of, and its Me esters from linseed oil, 8707*e*.
methyl ester, spectrum of, 8275*b*.
**Isolinolenic acid**, in blood serum in infections, 5357*e*.
**Isolongifolic acid**, methyl ester, 2978*g*.
**Isolysergamide**, *N*-(2,2'-dihydroxyisopropyl)-, *d*-, P 2242*e*.
——, *N*-(2-hydroxyisopropyl)-, P 2741*b*.
——, *N*-[1-(hydroxymethyl)propyl]-, *d*-, P 2242*i*.
**Isolysergic acid**, derivs., and salts with tartaric acid esters, P 2740*g*.
isomerism of, and lysergic acid, 7031*g*.
structure of, 9384*i*.
——, dihydro-*, 7031*i*.
hydrazide, P 5427*h*.
**Isomalic acid**. See *Tartronic acid, methyl-*.

of phenols, 2598*d*.
of pyrazolones, 7478*e*.
ring-chain, of 2-alkyl-1,4-naphthoquinone oxidation products, 1383*h*.
spectra and, of β-amino-α,β-unsatd. ketones, 7820*b*.
spectra and, of org. N compds., 6984*d*.
in 3-C systems, 8373*b*.
of vinyl and related polymers, 9523*f*.
**Isomerization**. (See also *Elaidinization; Heat of isomerization; Mutarotation; Racemization; Rearrangements*.) 5359*f*.
of acetylenic aldehydes and ketones, 3355*a*.
of acetylmethoxybenzotriazole, 2618*f*
of acetyltetrahydrophenanthrenecarboxylic acids, 8376*g*.
acids, causing, in resinous rubber transformation products, neutralization of, P 7745*a*.
in alcoholate reaction with α-bromosenecioic acid, 6975*a*.
of alcs., 4215*a*.
of aldehydes into ketones, 4632*f*.
of aliphatic hydrocarbons and petroleum, HF and $HF-BF_3$ catalysts for, P 844*e*.
and alkylation of paraffins with olefins with $HF-BF_3$ catalyst, P 5583*h*.
in alkylation of 1,2,3,4-tetrahydronaphthalene with iso-AmOH, 1369*i*.
of alkyl chloropentenyl ethers, 6568*e*.
of ally benzyl sulfone, 6995*d*.
of 1-ally-2-ethoxy-3,4-dimethoxybenzene, 7451*i*.
of 2-allyl-6-ethoxyphenol, P 3037*e*.
of amidophosphoric acid hydrate to $NH_4H_2PO_4$, 2110*e*.
of amino cyclic alcs., 3372*g*.
of 5-amino-2-thiazolethiol derivs., 3409*f*
of ammonium compds., 6177*c*.
of *cis*-antheraxanthin, 4233*f*.
of benzene (cracked), high-octane fuel by, P 3604*f*.
of benzylpenicillenic acid, 1768*f*
of butadienes, methylstyrenes and pentadienes, 5275*f*.
of butane, P 660*e*, P 4283*d*.
with $AlCl_3$ catalyst in 2-step process, P 1561*b*.
with $AlCl_3$-HCl catalyst, dehydration of hydrocarbons from, P 4007*f*.
corrosion protection of app. for, P 103*a*.
regeneration of molten $SbCl_3$-$AlCl_3$ catalyst from, P 4843*d*.
temp. control in, P 4007*d*.
butane purification for, P 2423*c*.
of 1-butene, bentonite and gumbrin as catalysts in, 6153*a*.
of butenes, kinetics of, 24*f*.
of butene to 2-methylpropene, P 2216*d*
of butyl alc., 7899*b*.
in butyl alc. dehydration, P 3833*h*, P 7035*b*.
of *p*-butylphenol, P 5042*i*.
of camphene, 2975*d*.
of carbonyl compds., 1753*c*.
catalysts for, P 7102*f*, 8251*e*, P 8579*f*.
of 3-chloro-2-buten-1-ol and 1,3-dichloro-2-butene, 4214*g*.
of 1-chloropropane, mass spectroscopy in, 5734*c*.
of cod-liver oil, 9380*g*.
cracking, on $Al_2O_3$ catalysts, 1250*e*.
of cycloalkanone oximes, 5400*a*.
of cyclohexane, 7911*i*, 7912*b*.
of cyclohexane and methylcyclopentane, 587*b*.
of cyclohexanecarboxylic acid derivs. and in peroxide alkylation of 2-hydroxy-1,4-naphthoquinone, 1376*d*.
of cyclohexene and cyclopentene, 8255*a*
of cyclohexenes to cyclopentenes, 2173*b*.
of 4-cyclohexylcyclohexanol and 4-phenylcyclohexanol, 159*i*.
of cycloparaffins from naphthenic gasoline to hydroaromatic cycloparaffins, P 3605*f*.
dehydrogenation and, of $C_4H_{10}$ and paraffins, P 1955*i*.
of 2,5-diaminothiazole derivs., 3408*k*.
of diazo compds., kinetics of, 169*g*.
of 1,4-dibromo-2-butene, 2578*g*.
of 3,4-dichloro-1-butene, 6152*i*.
of dichlorobutenes, P 663*e*.
of *N*-(2,2'-dihydroxyisopropyl)lysergamide, P 2243*a*.
of 3(α),12(β)-dihydroxy-11-ketocholanic [illegible] y of, 4679*e*.
[illegible]-1,10-bis(2,6,6-trimethyl-[illegible]n-1-yl)-2,8-decadiene-5-yne-4,7-diol, 2588*f*.
2,2(and 2,4)-dimethylpentanes

methylcyclopentane in sepn. from $C_6H_6$ and cyclohexane mixts., P 1957*i*.
of 3,4-diphenyl-1,5-hexadiene, 612*e*.
of diphenylphosphinous acid esters, 3801*i*.
effect on ultraviolet absorption curves of unhydrogenated fish oils, 879*i*.

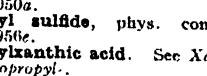
Isophthalic acid (*m-benzenedicarboxylic acid*), esters with quaternary ammonium iodides, curarelike action of, 1486i.
formation by anodic oxidation of vitrain, and di-Me ester, 376h.
ionization and resonance of, 7790c.
prepn. of, and 2-dialkylaminoethyl esters and their derivs., 2190e.
salt with piperazine, 235f.
spectrum of, 8890i.
——, 4-amino-, azo dye from, P 3204h, P 4478h, P 8144g.
——, 4-bromo-, 9332g.
——, 4 - (carboxy - *tert* - butyl)-, and 3,4-anhydride†, 2589c
——, 5-chloro-, and dimethyl ester, 609e.
——, hexahydro-. See *1,3-Cyclohexanedicarboxylic acid*.
——, 5 - (1 - hydroxy - 2 - naphthoylamino)-, dye from, light absorption by, 7232b.
——, 4-methoxy-2-methyl-, 2075c.
——, 5-methyl-. See *Uvitic acid*.
——, 1,2,3,6-tetrahydro-. See *4-Cyclohexene - 1,3 - dicarboxylic acid*.
Isophthaloyl chloride, chlorination of, 609e.
——, 5-chloro-, 609e.
——, 2-nitro-, 1780a.
Isopilocarpine, review on, 2616h.
Isopimaric acid, *d*-, from *d*-isopimarinal, 1390i.
*d*-, from pine oleoresin, 1390d.
*d*-, from proabietic acid of Kraft, 1390e.
Isopimarinal*, *d*-, and derivs., 1390e.
Isopinocampheol. See *Pinocampheol*.
Isopinocamphone. See *Pinocamphone*.
Isopods, control in concrete reservoirs, 2717d.
17 - Isopregnan - 3(α) - ol - 20 - one*, 5067g.
and acetate, spectra of, 3018i.
14 - Isopregnan - 20 - one, 3(β) - (thevetopyranosyloxy) - 14,21 - dihydroxy-*, and triacetate, 1791i, 1792a.
17 - Iso - Δ⁵ - pregnene - 3(β),17(β),20,21-tetrol*, configurational study of, 6210i.
17 - Iso - Δ⁵ - pregnene - 3(β),17(β),20-triol*, configurational study of, 6210h.
17 - Iso - Δ⁵ - pregnene - 3(β),17(β),20(β)-triol*, 3,20-diacetate, 8396c.
17 - Iso - Δ⁴ - pregnene - 17(β),20,21-triol-3-one*, configurational study of, 6210i.
17 - Iso - Δ⁵ - pregnen - 3 - ol - 20 - one*, acetate, P 7978f.
17 - Iso - Δ⁵ - pregnen - 3(β) - ol - 20-one*, 3-acetate, 8396d.
Isoprene (*2 - methyl - 1,3 - butadiene*). (See also *Rubber, substitute and synthetic.*)
chloro derivs., polymers of, coatings for rubber protection against sun from (*C. A.* has polychloroprene by mistake), P 5224e.
complex with $AlBr_3$, as catalyst dehydration of glycols, P 3834d.
condensation with *p*-quinone, 2181f.
condensation with rosin with $BF_3$ catalyst and esterification of condensate, P 9486a.
and derivs., 5362b.
detn. in petroleum-refinery $C_5$ fractions, 8123e.
Diels-Alder adduct with hexachlorocyclopentadiene, P 4693e.
dimer, reaction with $H_2S$, 999d.
by distn. of rubbers and polymeric olefins, P 1211f.
effect on gum formation in fuel gas, 5925a
from ethyl alc., 558d.
extn. with liquid $NH_3$ solns., P 3192b.
formation of, by dehydration of alcs., 111g.
in gasoline from Puertollano shale, 5578f
halogenation of, P 2218d.
manuf. of, P 3023c.
from 2-methyl-2-butene, 5733f
polymerization and dimerization of, 5621b.
polymerization (mixed) with styrene, P 2816f.
polymerization of, alone and with butadiene, effects of temps. on, 8725
with dodecanethiol modifier and peroxide catalysts to low-mol.-wt. liquid polymers, 8193e.
electronic structure and, 1631a.
with Et acrylate, 5988i
with isobutene at low temps. with fluorinated hydrocarbon dispersing agents, 2019g.
with 2-methylpropene and chlorostyrenes at very low temps., P 9519
with 2 methylpropene, temp. control to −120° in, P 7257f.
in the presence of Na and PhMe, 1714b.
Na catalyst for, P 1932c.
with styrene with $Bz_2O_2$ and $K_2S_2O_8$ as catalysts and thiols as modifiers, 2018h.
polymerization of, alone and with styrene in solns. with *tert*-Bu peroxide catalysts, and viscosities, etc., of polymers, 8190i.
polymerization of, by bleaching earths, and dimer, 109a.
polymers of, with acrylonitrile, balloon for compressed gas from, P 5224f
alone and with styrene, 2459g
alone and with styrene or chlorostyrenes prepd. in Buna S 3 and GR-S systems, 8189b.
alone or with butadiene, friction coeffs. on ice, 2012f.
with anilides of acrylic acid or methacrylic acid, rubberlike, P 2803g
breaking cationic emulsions of, P 5232c.
with 1,1-dichloro-2,2-difluoroethylene, 2465d.
intramol. statistics, elasticity, double refraction and partition function of chain mols. in stressed, 6855g
mechanism of chain propagation in oxidation of, 5271f.
with 2-methylpropene, polyalkylated phenol-stabilized, P 5992b.
oxidized, as tackifier in butadiene-styrene rubber, P 2804a.
with 2-pentene prepd. at very low temps., P 8195b.
pyrolysis products of, and formation in pyrolysis of other polymers, 2810h
reaction products with inorg. acids or anhydrides, P 2804c.
reaction with S, formation of cyclic and polysulfides in, 4886b.
by pyrolysis of rubber and polyisoprene, 2009g.
by pyrolysis of rubber, etc., P 3228c.
reaction with $BrCCl_3$, P 5789g.
with $H_2S$, P 691g.
with $CaF_4$, 3370d, P 4294c.
recovery from hydrocarbon mixts., with methylamine-CuOAc complex solvents, P 1955g.
from rubber, P 5281f.

sepn. from acetylenes, P 6218*a*.
from hydrocarbon mixts. by reaction with $SO_3$, P 2216*g*.
from $C_8$ hydrocarbons, P 2824*b*.
from hydrocarbons by extractive distn., P 3453*c*.
sulfone—see "1,1-dioxide" under *Thiophene, 2,5-dihydro-3-methyl-*.
terpene alcs. from, P 3039*g*.
thermodynamic functions of, 5275*e*.
ultraviolet absorption by, in vapor and in *n*-$C_7H_{16}$ soln., 3291*g*.
**Isoprenecarboxylic acid**. See *2,4-Pentadienoic acid, 4-methyl-*.
**1,4-Isoprenedicarboxylic acid**. See *Muconic acid, β-methyl-*.
**Isopropanolamine**. See *2-Propanol, 1-amino-*.
**Isopropenyl chloride**. See *Propene, 2-chloro-*.
**Isopropenyl group**, rearrangement of, 6578*f*.
**Isopropyl** (*free radical*), electronic structure of, 2512*a*.
heat of formation of, 6479*c*.
**Isopropylal**. See *Methane, diisopropoxy-*.
**Isopropyl alcohol**. (For derivs. see under *2-Propanol*.)
acrylate, P 6651*a*.
adsorption by bauxite contg. Fe, 6497*f*.
adsorption by $Ph_2NH$, 464*e*.
alkylation with, of $C_6H_6$, 7916*a*.
ammonia elec. conductivity in, 5655*h*
analysis of, for cations, solvents in chromatographic, 6537*c*.
assocn. of, and elec. conduction by, 8772*c*.
-butanol fermentation, 1145*e*.
butyric acid ionization in aq., 1244*c*.
in cellulose carboxyalkyl ether manuf., P 7685*h*.
*l* citronellate, 4633*g*.
cornea tolerance to, 3110*h*.
decompn. on NiS catalysts, 7802*i*.
dehydration and dehydrogenation on $Cr_2O_3$ catalysts, 4087*d*.
dehydrogenation of, 1249*e*, P 4287*f*.
on colloidal Rh, effect of S on, 27*i*.
by *Merulius lacrymans*, 9160*h*.
detection and detn. in denatured alc., 7377*g*.
detn. of, in presence of diacetone alc. and 2-methyl-2,4-pentanediol, 6112*h*.
drying of, P 7275*c*.
drying of, by azeotropic distn., P 3836*a*.
effect on coagulation of $As_2S_3$ by $BaCl_2$, 8794*a*.
on elec. conductivity of aq. dodecylammonium chloride, 3268*i*.
on interfacial friction, 2060*c*.
on long-chain electrolytes in aq. soln., 7303*f*.
on N fixation by *Azotobacter*, 9160*b*.
on oxidation of isopropyl ether, 6157*a*.
and esters, ionization in $H_2SO_4$, 8808*e*.
esters, spectra of, 1656*c*.
formation by hydrocondensation of CO with $C_2H_4$, 4829*i*.
formation in hydrogenation of diacetone alc., P 5794*b*.
manuf. and use as antifreeze, 3117*i*.
manuf. of, P 2218*i*, P 4682*g*, P 4693*a*, P 6645*g*, P 8397*i*.
from propene, P 5032*g*.
removal of water-insol. impurities in, P 5790*f*.
mixts. with acids and sugars, osmosis of, 7300*g*.
with *p*-*tert*-amylphenol or 2-ethylhexanol as foam suppressers, P 7610*c*.
with toluene, intrinsic vistex viscosities of butadiene-styrene polymers in, 9516*c*.
molasses extn. with, 6445*c*.
oxidation of, P 3025*i*.
to acetone on Ag catalyst, kinetics of, 5272*e*.
with chromic acid, kinetics of, 2847*g*.
rate of, 7798*e*.
in pharmaceuticals, 3147*h*.
phys. constants of, 2956*b*.
pyrolysis of, 7899*d*.
reactions with formaldehyde and with MeOH, 993*i*.
with olive oil, 1715*g*.
with PhNCO, kinetics of, 7441*bf*.
soly. in Na xylenesulfonate solns., 1242*f*.
soln. time of Na in, 5741*h*.
spectra of mixts. contg., 2095*c*.
systems: $NH_3$—, 5557*h*.
system: Na palmitate—, x-ray diffraction by, 2793*b*.
system: $CCl_3CHO$—, mol. wt. in $C_6H_6$, 1252*f*.
thermodynamic properties of, 476*g*.
viscosity (dilatational) of, 5249*g*, 8780*a*.
viscosity of, pressure and, 4067*d*.
**Isopropylamine**, derivs., 4263*a*, P 6231*e*.
formation in reaction of $Et_4CCO_2H$, $H_2SO_4$ and $HN_3$, 9027*h*.
identification of, 4630*d*.
prepn. of, 9027*c*.
thiocyanate, 578*g*.
——, **2 - (benshydryloxy) - *N*, *N* - dimethyl-**, hydrochloride, spasmolytic activity of, 8546*b*.
——, ***N* - [2 - (benshydryloxy)ethyl]-**, hydrochloride, P 3462*i*.
——, ***N*-benzylidene-**, 1776*c*.
——, **2 - (*o* - benzylphenoxy) - *N*, *N* - dimethyl-**, and hydrochloride, 3386*c*.
——, ***N* - [2 - (*o* - benzylphenoxy)ethyl]-**, hydrochloride, 3386*d*.
——, ***N* - [2 - (2 - biphenylyloxy)ethyl]-*N*-(2-chloroethyl)-**, hydrochloride, antagonism of adrenaline and histamine with, 6309*b*.
——, ***N*, *N*-bis(2-chloroethyl)-**, in cancer therapy, 5505*c*.
——, **2-chloro-*N*, *N*-dimethyl-**, 4243*f*, 9053*i*.
hydrochloride, 7466*c*.
——, ***N*-(2-chloroethyl)-**, hydrochloride, 3419*c*.
——, ***N* - (2 - chloroethyl) - *N* - methyl-**, 6587*d*.
——, ***N*, *N* - dimethyl - 2 - (α - phenyl-*o*-toloxy)-**, antihistamine activity of, 7134*h*.
——, **2,2'-diphenyl-**. See *Phenethylamine, α-benzyl-*.
——, ***N*-ethyl-**, P 253*h*.
——, **2-(*p*-hydroxyphenyl)-**. See *Pareduine*.
——, **2-hydroxy-2-phenyl-**. See *Norephedrine*.
——, **2-phenyl-**. See *Phenethylamine, α-methyl*.
**Isopropylation**, of benzene, 1732*e*.
**Isopropyl bromide**. See *Propane, 2-bromo-*.
**Isopropyl chloride**. See *Propane, 2-chloro-*.
**Isopropyl chlorophosphate** ((iso-PrO)$_2$POCl), 599*h*.
cholinesterase-inhibiting activity and toxicity of, 1109*h*.
**Isopropyl disulfide**, phys. constants of, 2956*f*.
**Isopropyl ether**, acetic acid extn. from water with, 2042*e*.
in ethylene chlorohydrin recovery from aq. solns., P 2633*c*.
iron chloride extn. by, 2489*g*.
oxidation of, effect of org. compds. on, 6157*a*.
oxidation of, in liquid phase, 4085*b*.
phys. consts. of, 2590*a*.
solubilization of, with Na secondary alkyl sulfates, 405*i*.
spectrum of, 3715*f*.
titration (electrometric) of, in nitrobenzene, 5346*b*.
**Isopropyl fluophosphate** ((*iso-PrO*)$_2$*POF*), 121*d*.
acetyl esterase inhibition by, 258*g*.
cholinesterase inhibition by, 9103*b*.
kinetics of, 7528*f*.
in relation to function in neuroeffector system, 5866*e*.
toxicity and, 1109*h*.
detn. of, 8613*b*.
effect on acid phosphatases of brain, 7060*e*.
on action potential and cholinesterase of nerve, 9259*e*.
on axonal conduction and synaptic transmission, 9261*h*.
on blood pressure, muscular function and respiration, 4775*c*.
on brain function and metabolism, 7147*g*.
on central nervous system and acetylcholine liberation, 8535*e*.
on chymotrypsin, 6680*a*.
on chymotrypsin and trypsin, 6679*i*.
on dehydrogenases of brain, 7066*f*.
on endplate potential of muscle, 9261*b*.
on glycolysis in muscle, 5478*b*.
on O quotient of rabbit cerebral cortex, 1446*b*.
on pseudocholinesterase and tributyrinase in blood serum, 5116*b*.
on synaptic transmission in crayfish, 5123*h*.
elec. major convulsive patterns from, 5122*e*.
electrical pattern in brain produced by, biochem. analysis of, 9262*f*.
in glaucoma treatment, 3974*e*.
injection site and variation in response to, 5122*g*.
labeled with $P^{32}$, prepn. of, 6508*e*.
pharmacol. comparison with other anticholinesterases, 3930*f*.
pharmacology of, 7129*b*.
poisoning by, cholinesterase in blood and brain in relation to signs of toxicity during recovery from, 6743*i*.
radioactive, prepn. from radioactive $KH_2PO_4$, 2507*e*.
volatility and vapor pressure of, 8841*a*.
**Isopropyl group**, removal of, in nitration of *p*-cymene, 9046*a*.
**Isopropyl iodide**. See *Propane, 2-iodo-*.
**Isopropyl ketone**. See *3-Pentanone, 2,4-dimethyl-*.
**Isopropyl mercaptan**. See *2-Propanethiol*.
**Isopropyl nitrite**, azeotropes of, 2834*i*.
**Isopropyl phosphate**, salt compns. stabilized by acid, and effect on oils, P 3216*b*, P 7240*d*.
**Isopropyl phosphite**, $(C_3H_7)_2HPO_3$, 599*h*.
**Isopropyl pyrophosphate** ((iso-Pr)$_4$P$_2$O$_7$), P 9357*a*.
prepn. and hydrolysis of, 1315*b*.
**Isopropyl sulfate**, (iso-Pr)$_2$SO$_4$, as catalyst in ether formation from acetals, P 1050*a*.
**Isopropyl sulfide**, phys. constants of, 2956*e*.
**Isopropylxanthic acid**. See *Xanthic acid, isopropyl-*.
**Isopseudocumenol** (*2,3,5-trimethylphenol*), 9044*a*.
**Isopurpurin**. See *Flavopurpurin*.
**3 *H*-Isopyrazole**,



——, **4,5-dihydro-**. See *Isopyrazoline*.
**4 *H*-Isopyrazole**,

, **3,5-dihydro-**. See *Isopyrazoline*.
**Isopyrazoline**,

**4 - Isopyrazolinecarboxylic acid, 3 - carbamyl-**, methyl ester, 579*d*.
**Isopyridindole**. See *Pyridindole*.
**Isoquercitrin**, adrenaline protection by, 5542*a*.
**Isoquinaldic acid** (*1-isoquinolinecarboxylic acid*), decarboxylation of, 7310*b*.
ester with benzoin, 9072*f*.
**Isoquinaldonitrile, 2-benzoyl-1,2-dihydro-**, 9072*f*.
**Isoquinamine**, and derivs., 7489*h*.
**anhydro-***, and salts, 7489*i*, 7490*a*.
**dihydro-**, 7489*i*.
**dihydroanhydro-***, sulfate, 7490*b*.

acetylation of cotton cellulose with, 3698*b*.

increased anaerobic splitting of the hexosephosphate. The overproduction of the coenzyme is suggested as the primary cause of the hypertrophy of the adrenal gland, especially of the cortex. The beneficial effect of adrenal cortex feeding in preventing B-avitaminosis is also attributed to the supplying of coenzyme. S. MORGULIS

**The role of the bile acids in carbohydrate metabolism. XXIII. Influence of bile acids and of adrenaline on experimental excretion of sugar in the bile.** TOSHIYUKI TANAKA. *J. Biochem.* (Japan) **16**, 407–16(1932); cf. *C. A.* **26**, 5638.—Expts. were made on dogs with bile fistulas. The glucose excretion in the bile increases after intravenous injection of sugar, but on administering cholic acid this excretion is decreased. Furthermore, the administration of adrenaline increases the sugar excretion in bile associated with sugar feeding. Sectioning of the left splanchnic nerve still further increases the depressing effect of cholic acid upon the sugar excretion in the bile, as it also diminishes the effect of adrenaline upon the excretion. S. MORGULIS

**Adsorption experiments with vitamins B($B_1$) and G($B_2$).** H. C. SHERMAN AND NELLIE HALLIDAY. *J. Am. Chem. Soc.* **55**, 332–5(1933).—Protein-free milk can be prepd. from skim milk powder without appreciable loss of vitamin B($B_1$) or vitamin G($B_2$) potency. Vitamin $B_1$ is relatively more efficiently adsorbed from protein-free milk on Lloyd's reagent than is vitamin $B_2$. Varying the amt. of Lloyd's reagent used from 5 to 40 g. per l. of protein-free milk (initially adjusted to $p_H$ 3 or 4) did not result in appreciable differences in the amts. of vitamin $B_1$ or $B_2$ adsorbed. Under the conditions of the expts. reported approx. 0.5 of the vitamin $B_1$ potency and 0.33 of the vitamin $B_2$ potency of the original protein-free milk were adsorbed on Lloyd's reagent; but no appreciable amt. of the original vitamin $B_1$ potency and only about 0.16 of the vitamin $B_2$ potency were shown by the filtrates after removal of the activated solids. When the adsorption processes were carried out in a N atm. rather than in air and under otherwise comparable conditions, the activated solids were somewhat more potent in both vitamins and the filtrates were more potent in vitamin $B_2$. The apparent losses are being studied in other ways and in the light of the newer evidence as to probable multiple nature of the 2 vitamins. C. J. WEST

**Comparative studies on the adsorption behavior of crude vitamin A, carotene and cholesterol** HARRY N. HOLMES, VINCENTE G. LAVA, ELEANOR DELFS AND HAROLD G. CASSIDY. *J. Biol. Chem.* **99**, 417–27(1933).—A new technic is described by which material is adsorbed from a solvent which permits good adsorption and recovered or liberated by use of a better solvent from which there is poor adsorption. (A combination of petr. ether and $CHCl_3$, in general, was the most effective in these expts.) The adsorbents used were various types of $Al_2O_3$, Patrick's com. $SiO_2$ gel, Holmes' vitreous and chalky $SiO_2$ gels and norite. Cholesterol was found to be much like vitamin A in its adsorption behavior so that the sepn. of these 2 substances by selective adsorption is a problem of great difficulty. Attention is directed to a new type of porous $Al_2O_3$ of low cost (prepd. commercially by slow crystn. from dil. NaOH soln. followed by heating to drive off most of the water of crystn.) which is of great value in adsorption studies. Adsorption *per se* does not necessarily destroy vitamin A, as a high percentage has been recovered from porous solids (particularly the new type of $Al_2O_3$) upon which it has been adsorbed. A. P. LOTHROP

## F—PHYSIOLOGY

HOMER W. SMITH

**Studies on blood catalase. I. The effect of electric current on blood catalase.** SUTETARO KONDO. *Acta Schol. Med. Univ. Imp. Kioto* **15**, 225-8(1932).—A. c. causes a decrease in blood catalase in rabbits, followed by gradual recovery when the current is turned off. *In vitro* at $p_H$ 8.0-8.5 the activity is gradually diminished; at $p_H$ 6.0-7.5 the activity is enhanced at the beginning followed by weakening. **II. The effect of infra-red rays on the catalase activity of the blood.** *Ibid* 229-32.—The activity is increased in the first period of radiation, and then is diminished. The action of the rays is not markedly influenced by $p_H$ variations from 6.0 to 8.5. **III. The effect of alkaloids on the catalase activity of the blood.** *Ibid* 233-38.—Concd. solns. of the alkaloids diminish, dil. solns. increase, catalase activity. The max. activation is at $p_H$ 7.5 to 8.0. At $p_H$ 7.5 and 0.000001 *M* the order of activation is strychnine nitrate > atropine sulfate > cocaine > pilocarpine > morphine > papaverine and emetine > quinine. (Cocaine to quinine inclusive as hydrochlorides.) **IV. The influence of metallic salts on the activity of blood catalase.** *Ibid* 239–44.—Concd. solns. of the sulfates of Zn, Cu, Pb, Cd, Ni and nitrates of Ag and Co diminish, dil. solns. promote, catalase activity. Activation rises to a max and then diminishes. PHILIP D. ADAMS

**Blood coagulation. III. Blood-coagulation curves of healthy and diseased persons.** SHIGERU TAKENAKA. *Acta Schol. Med. Univ. Imp Kioto* **15**, 245-60(1932); cf. *C. A.* **26**, 3813.—By use of the coaguloviscometer devised by Takenaka coagulation curves of healthy persons are classified into 3 types. The curves of several diseases are given. **IV. The prohibitory action of cold on the blood coagulation and recovery from this restraint.** *Ibid* 261–4.—When blood restrained from coagulating by cooling to zero or by freezing was warmed to 20° in about 1 hr the viscosity remained const. for

about 20 min. Stirring with a glass rod caused rapid coagulation. Spontaneous clotting in the normal time occurs in cooled blood warmed rapidly to 20°. **V. Mathematical analysis of the blood-coagulation curve.** *Ibid* 265–76.—The coagulation curves of normal and diseased persons are of 3 types: exponential, parabolic and an intermediate too irregular for math. analysis. No relation is shown between disease and type of curve. PHILIP D. ADAMS

**The relation between oxygen tension and protein synthesis in certain tissue extracts.** CARL VOEGTLIN, MARY E. MAVER AND J. M. JOHNSON. *Science* **77**, 92–3 (1933); cf. *C. A.* **26**, 2774.—A preliminary report. PHILIP D. ADAMS

**Critical temperature of serum. Ionic equilibrium of serum as a function of its temperature. V.** P. LECOMTE DU NOÜY. *Ann. inst. Pasteur* **48**, 187–207(1932); cf. *C. A.* **25**, 4033; **26**, 4857.—When horse serum is heated at 58° for 10 min. and then dild with distd. $H_2O$, the globulin which is pptd. seps. in a dispersed form which tends to remain in suspension, whereas if the serum is unheated or heated for 10 min. at <57°, the pptd. globulin tends to fall rapidly out of suspension. The crit. temp. is remarkably sharply defined within the limits of about 1° and is lower for longer periods of heating, being 58° for 5 min. and 53° for 2 hrs. A similar phenomenon is observed with the sera of other animals, the crit. temp. varying according to the animal from 55° to 59° for a period of heating of 10 min. The relation of this phenomenon to the state of the globulin and the modification induced in the latter by heat is discussed. B. C. A

**Respiratory changes in the rabbit uterus and their relation to endocrine activity. III.** J. M. ROBSON. *Quart. J. Exptl. Physiol.* **22**, 209–19(1932); cf. *C. A.* **26**, 4841. Daily injections of anterior pituitary-lobe substance in mature nonpregnant rabbits is followed by luteinization of the ovaries and proliferation of the endometrium of the uterus, but there is no inhibition of the reaction to pituitrin. Injection of standard corpus luteum exts. into the same animals generally fails to bring about this inhibition. Combined daily injections of anterior lobe and estrin usually bring about inhibition. Animals receiving $\alpha$-free gonadotropic prepns. from pregnancy urine do not show dissocn. of the uterine responses. $\alpha$-Hormone is evidently necessary for the development of the inhibitory reaction. RACHEL BROWN

**Physiology of pregnancy in the rat. I. The prolongation and interruption of pregnancy.** ANNIE M. HAIN. *Quart. J. Exptl. Physiol.* **22**, 249–67(1932).—The gestation period in the rat can be prolonged 4–10 days by the administration of anterior pituitary tissue, of ext. of human pregnancy urine, of alk. ext. of pituitary or of ext. contg. purified growth hormone. Pregnancy is apt to be interrupted when injection of the urine ext. is made in the early stages. The evidence suggests that the pregnant condition is not maintained solely by the corpus luteum and that parturition is not due merely to degeneration of that body. RACHEL BROWN

**Red cell density in certain common animals.** JOHN MACLEOD. *Quart. J. Exptl. Physiol.* **22**, 275–80(1932).—The mean d. of the plasma, the mean d. of red cells and the mean content of $H_2O$ are, resp., for man 1.0284, 1.0989, 66.09; rabbit 1.0246, 1.0980, 66.8; ox 1.0294, 1.0844, 71.2; and sheep 1.0275, 1.0837, 70.95. RACHEL BROWN

**The occurrence of acetylcholine in beef blood.** I. VOGELFANGER. *Z. physiol. Chem.* **214**, 109–10(1933).—The controversy between Kapfhammer (*C. A.* **26**, 3827) and Dale (*C. A.* **25**, 4592) and Wrede (*C. A.* **25**, 2175) regarding the occurrence of acetylcholine in beef blood is decided in favor of K. by the isolation, from 5 l. of blood, of 0.3862 g. of acetylcholine reineckate and the conversion of this into 0.1593 g. of chloroaurate m. 166°. Precautions observed were the withdrawal of blood from living animals, rapid evapn. of the EtOH ext. *in vacuo* and continual control with litmus and bromothymol blue to avoid alk. reaction. A. W. DOX

**The circulatory action of fresh defibrinated blood.** KARL ZIPF. *Arch. exptl. Path. Pharmakol.* **167**, 621–37(1932). HARRY EAGLE

**The specificity of the absorption of cholesterol and its biological significance.** RUDOLF SCHOENHEIMER. *Klin. Wochschr.* **11**, 1793–6(1932).—Despite their chem. similarity to sterols of animal origin, plant sterols are not absorbed from the intestinal tract, being treated as foreign matter. HARRY EAGLE

**The role of electrophoresis in the absorption of sugar.** R. KELLER. *Klin. Wochschr.* **11**, 2106–8(1932).—A preliminary review. HARRY EAGLE

**Gastric lipase.** H. LICHTENBERG. *Klin. Wochschr.* **11**, 2117(1932).—The optimum $p_H$ for the gastric lipase in infants is not 5, as reported by Davidsohn for adults, but varies from 5 to 7 according to the fluid used in the preliminary drink. In gastric fluids obtained during fasting or after drinking sugar solns., there is an optimum zone at 5–7; but "plasmon" or peptic products of casein digestion added to the fluid inhibit its action at $p_H$ 7. **The determination of basal metabolism before and after goiter operation and its clinical significance.** MASASHI KAWATA. *Tôhoku J. Exptl. Med.* **19**, 513–47(1932). HARRY EAGLE

**The effect of bilateral adrenalectomy on the basal metabolism in cats.** TOSIMITU KAIWA. *Tôhoku J. Exptl. Med.* **19**, 577–83(1932).—Unilateral adrenalectomy has no effect on the basal metabolism; but a 30–50% decrease was noted after removal of the other gland, beginning within 2 days. HARRY EAGLE

**Comparison of the hyperglucemic action of an adrenal extract with the adrenaline content as determined by colorimetric and physiologic methods.** HIROSHI SATO AND TATSUSABURO INABA. *Tôhoku J. Exptl. Med.* **19**, 603–8(1932).—Medullary exts (Folin's method) were tested for their adrenaline content by their hyperglucemic action, the Folin test, the Suto test, the paradoxical pupil reaction, and by the concn. of segments of rabbit intestine. The first gave somewhat lower results than the last, but 1.5 times as high as the other 3 methods. In each case solns. of known adrenaline content were used for the comparison. HARRY EAGLE

**The maternal and fetal distribution of parathyroid and thyroid hormones.** SHUNKAI UJIIE. *Tôhoku J. Exptl. Med.* **20**, 34–64(1932).—U. concludes that the placenta is permeable for the thyroid and parathyroid hormone of the fetus, on the basis of maternal extirpation expts. There is a large bibliography. HARRY EAGLE

**Physiology of normal and frizzle fowl, with special reference to basal metabolism.** FRANCIS G. BENEDICT, WALTER LANDAUER AND EDWARD L. FOX. Conn. Agr. Expt. Sta., *Bull.* **177**, 13–100(1932).—The frizzle fowl because of its scanty covering of feathers has a much higher heat production than normal fowls. The output of water vapor per kg. of body wt. per 24 hrs. was between 50 and 60 g. with normal fowl and between 30 and 35 g with homozygous frizzles. Adult frizzles show a series of abnormalities as lack of fat deposits, enlarged thyroid, increased heart rate, hypertrophy of the heart, decrease of hemoglobin content of the blood, frequent sterility and low hatchability of the eggs. C. R. FELLERS

**Metabolism in pregnancy. IX. Fetal influence on the basal rate.** ALLAN W. ROWE AND WM C. BOYD. *J. Nutrition* **5**, 551–79(1932); cf. *C. A.* **25**, 2761.—The heat production of a series of 77 women showed that during the 3rd to 4th month of gestation there is a rapid decline in the energy requirement from a normal to a subnormal level, the latter reached in about 4 weeks From this time on there is a steady increase in the metabolic rate amounting to 13% or more in excess of that conditioned by the gross increase in body wt. It is not believed that this excess is contributed primarily by the fetus but rather to a complicated and unknown mechanism engendered by the state of pregnancy. C. R. FELLERS

**Heat production of unusually large rats during prolonged fasting.** FRANCIS G. BENEDICT, KATHRYN HORST AND LAFAYETTE B. MENDEL. *J. Nutrition* **5**, 581–97 (1932).—In studying the basal metabolism of rats, the larger the rat the lower was the metabolic rate per unit of wt. and per unit of surface area. Two very large male rats before fasting produced 603 and 621 cal. per unit area of surface; during fasting the heat production fell off markedly for the first few days but after 30–40 days it increased definitely. The rectal temps. did not appreciably change. In 1 of the rats after fasting for 29 days, the low heat-production value of 377 cal. per sq. m. of body surface per 24 hrs. was reached. C. R. FELLERS

**Chemical differences in male and female hair [Kosjakoff].** J. PIEPENBORN. *Z. ges. exptl. Med.* **76**, 587(1931); *Physiol. Abstracts* **17**, 94.—One-tenth g. of male or female hair is dissolved in 1 cc. of boiling 10% KOH. One cc. of distd. water is added and it is again boiled. The soln. is dild. with 15 cc. distd. water. Two cc. of final soln. and 1 drop of 1% alc. methylene blue are taken, and 4% HCl is added drop by drop until the blue color disappears. This decolorization occurs much more quickly with male than with female hair. During pregnancy, however, this difference disappears. This reaction depends on the sulfur content of the soln. In general gray and white hair contain more S than colored hair. In diseases involving considerable tissue catabolism the S content of organs is also raised. P. considers that the increased S content is an expression of higher degrees of protein catabolism. G. G.

**Hormone of the anterior hypophysis in the serum of women during normal and**

**pathological pregnancy.** A. BRINDEAU, H. HINGLAIS AND M. HINGLAIS. *Compt. rend soc. biol.* **111,** 988–92(1932); cf. *C. A.* **27,** 529.—Assayed by the method previously described the serum during normal pregnancy contained 1000–4000 rabbit units per l. In cases of hydatiform mole the value was increased to 50,000–100,000 rabbit units (333,000–1,000,000 mouse units by Zondek's method). In cases of dead fetus the values were less than 500 rabbit units. L. E. GILSON

**Presence of a melanophore-dilating principle in the tuber cinereum of the guinea pig.** R. COLLIN AND P. L. DROUET. *Compt. rend. soc. biol.* **112,** 63–5(1933). L. E. GILSON

**Demonstration of the true hormone character and properties of vagotonin.** D SANTENOISE, Y. PORCHER AND M. VIDACOVITCH. *Compt. rend. soc. biol.* **112,** 67–70 (1933); cf. *C. A.* **27,** 338.— Summary and discussion of several previous papers. L. E. GILSON

**Differences in the prolan A produced by pregnant and castrated women.** CHRISTIAN HAMBURGER. *Compt. rend. soc. biol.* **112,** 99–102(1933).—Slight differences in the effect upon rats of the 2 kinds of prolan prepns. are described. L. E. GILSON

**Metabolism of the glucides in the central nervous system.** MICHELE MILOLO *Arch. ital. biol.* **87,** 185–93(1932).—A summary is given of the literature and M.'s published work. HELEN LEE GRIFFITH

**Comparative studies on the physiology of the iris. I. Selachians.** JOHN Z YOUNG. *Proc. Roy. Soc.* (London) **B112,** 228–41(1933).—In the genera *Scyllium*, *Mustelus* and *Trygon*, dilatation of the pupil was caused by adrenaline, acetylcholine, pilocarpine and eserine Atropine inhibited this action of pilocarpine and acetyl choline, ergotoxine that of adrenaline. Neither inhibitor influenced the response of the sphincter to illumination. **II. Uranoscopus and Lophius.** *Ibid* 242–9.—The exptl animals were *Uranoscopus* and *Lophius piscatorius*. The pupil was constricted by pilocarpine-$HNO_3$, eserine-$H_2SO_4$ in concns >1:10,000, adrenaline-HCl, and acetyl choline bromide in concd soln., and, usually, by arecoline-HBr, and was dilated by acetylcholine bromide in dil. soln. Addn. of ergotoxine-$H_3PO_4$ reversed the action of adrenaline. The constrictive action of pilocarpine, acetylcholine and the stimulated sympathetic nerves was inhibited by atropine-$H_2SO_4$, but not by ergotoxine $H_3PO_4$ Atropine did not influence the action of adrenaline. JOSEPH S. HEPBURN

**Group-specific substance of horse saliva.** K. LANDSTEINER. *Science* **76,** 351–2 (1932).—An active substance was obtained from horse saliva by treatment with acid and acetone and fractionation with alc., which gave only a weak biuret reaction and on hydrolysis yielded 48.5% reducing sugar (calcd. as glucose). Another prepn. made in a different way from saliva adsorbed with kaolin and charcoal, reacting strongly with anti A immune sera, had the compn C 44.65%; H 6.76%; N 7.43% (calcd. for ash free substance; ash 3.37%). J. A. KENNEDY

**The effect of temperature on the carbon dioxide absorption curve of human blood.** ANNA J. EISENMAN. *J Biol. Chem.* **99,** 359–81(1933); cf. *C. A* **18,** 2195.—An increase in $H_2CO_3$ and $BHCO_3$ occurs when the temp. is decreased at const. $CO_2$ tension but this increase is not uniform for each degree and is greater around 23° than around 38°. The increase in $BHCO_3$ for the temp fall from 38° to 23° is directly proportional to the hemoglobin content of the blood and the relationship is expressed by the equation, $\Delta[BHCO_3]_{23-38°}$ = (0.32 $O_2$ capacity + 6.7) vols. per cent. The effect of temp. on the $CO_2$ capacity of true serum is 1.1 times that on whole blood. The effect of temp. on *p*H of whole blood depends also on the hemoglobin content, very anemic bloods showing a decrease and normal bloods an increase. Tension and temp. effects are dissimilar. A 30 mm. tension increase has about the same effect on $H_2CO_3$ as a temp. decrease from 38° to 23°. This increment of $H_2CO_3$ from temp change has about twice as great an effect on $BHCO_3$ as does the same increment of $H_2CO_3$ resulting from an increase of $CO_2$ tension at const. temp. A bibliography of 29 references is included. A. P. LOTHROP

**The effects of yeast ingestion on the composition of the urine and feces.** H B PIERCE. *J. Biol Chem.* **98,** 509–35(1932).— Live yeast has a laxative effect which is more marked on a carbohydrate-rich than on a protein-rich diet. It causes a diminution in putrefaction which is indicated by the phenol content of the urine and feces The indole and indican excretion rose during the periods of yeast ingestion but not to the extent expected if the yeast tryptophan were subjected to the same degree of putrefaction as that in the protein of the control diet. Total sulfate-S excretion usually decreased after addn. of yeast to the diet. The elimination of inorg. sulfates decreased and of ethereal sulfates increased during yeast periods. Yeast has a favorable effect on the acid-base balance which was indicated by a fall in the titratable acidity of the urine. Extra $NH_3$ was formed for the purpose of neutralizing extra acid and conserving the

fixed base in the body. On the yeast diet there was greater formation of org. acids which may very likely have been responsible for the laxative effect. The production of volatile acids was much higher on the carbohydrate than on the protein diet. The yeast N was readily retained and was not lost during the control periods following yeast ingestion. In fact the amt. of N retained was often greater than that contained in the ingested yeast protein. The excretion of uric acid fell or showed no change on adding yeast in 7 of the 16 averaged 6-day trials and, while it was evident that individual subjects possessed varying capacities in metabolizing nucleoproteins, the results indicate that up to 6 cakes of yeast daily cannot cause an increase in uric acid production sufficiently great to exert a harmful effect on the organism. A bibliography of approx. 75 references is included. A. P. LOTHROP

**The metabolism of sulfur. XIX. The distribution of urinary sulfur in the dog after oral administration of monobromobenzene as influenced by the character of the dietary protein and by the feeding of *l*-cystine and *dl*-methionine.** ABRAHAM WHITE AND HOWARD B. LEWIS. *J. Biol. Chem.* **98,** 607–24(1932); cf. *C. A.* **26,** 1325.—If abundant cystine is available, the major portion of any $C_6H_5Br$ ingested is conjugated with the amino acid and excreted as the bromophenylmercapturic acid but if the supply of cystine is limited, oxidation, conjugation and elimination of the $C_6H_5Br$ as ethereal sulfates occur. After $C_6H_5Br$ feeding greater increases in the org. S fraction of the urine occur if the protein of the diet is lactalbumin, a protein rich in cystine, than when the protein element is furnished by casein or peas, both low in cystine. With the latter substances there is a greater excretion of extra ethereal sulfate S than when lactalbumin is fed. If the peas are supplemented by either *l*-cystine or *dl*-methionine, results similar to those with lactalbumin are obtained and they also prevent the increased N excretion which occurs when the basal diet was fed without supplement. These effects are specific for the S-contg. amino acids as similar results are not obtained when glycine is fed with $C_6H_5Br$. The suggestion is made that methionine may function as does cystine in the detoxication of $C_6H_5Br$ but as yet no direct exptl. evidence has been obtained. A. P. LOTHROP

**The tryptophan content of blood serum and other organic fluids in normal and pathological conditions.** VITTORIO G. BARONE. *Boll soc. ital. biol. sper.* **7,** 1077–9; *Sperimentale* **86,** 343–55(1932).—Fürth's colorimetric method was used. The results obtained with blood serums, exudates, transudates and spinal fluid indicate that the tryptophan content varies with the protein content and increases with an increase in globulins. There is, however, no certain parallelism between them. The hypothesis that a detn. of tryptophan may constitute an exact and reliable index of the protein quotient and may have a particular diagnostic value in hepatic diseases cannot be confirmed PETER MASUCCI

**The lipides in the blood serum of cattle.** NIKOLA PLATIKANOFF. *Z. Züchl. Riehe B. Tierzucht. u. Zuchtungsbiol.* **26,** 1–36(1932).—Total lipides, total cholesterol and combined cholesterol were detd for 8 cows at 9 different times during a period of 4 months Single detns were made on 39 cows. All values were higher and more variable when the animals were on pasture than under conditions of winter feeding. There was a high correlation between total and combined cholesterol and between total cholesterol and total lipides. There was no correlation between the percentage of fat in milk and the amt. of any blood lipide. L. A. MAYNARD

**The influence of the time of year on the adrenaline content of the adrenal gland and the glycogen content of the liver and muscle of the toad.** YUTAKA IINO. *Mitt. Med. Akad. Kioto* **3,** 249–78(1930) **The influence of the splanchnic nerves on the adrenaline content of the adrenal gland and the glycogen content of the liver and muscle of the toad.** *Ibid* **4,** 11–30. **The influence of the thyroid gland on the adrenaline content of the adrenal gland and the glycogen content of the liver and muscle of the toad.** *Ibid* **4,** 73–92. J. D. S

**The effect of liver injury on the conjugation of benzoic acid in the dog.** ARMAND J. QUICK AND MARY A. COOPER. *J. Biol. Chem.* **99,** 119–24(1932); cf. *C. A.* **26,** 2772, 3568, 5638.—Neither ligation of the common duct nor introduction of the Eck fistula in dogs changed significantly the rate at which BzOH was conjugated, either with glycine or with glucuronic acid. After light $CHCl_3$ anesthesia the rate of synthesis of glucuronic acid monobenzoate was diminished for the first 12 hrs. and then returned to normal; the synthesis of hippuric acid, however, was apparently unaffected. K. V. THIMANN

**The relationship between muscle creatine and creatinine coefficient.** ALFRED CHANUTIN AND F. W. KINARD. *J. Biol. Chem.* **99,** 125–34(1932).—The muscle was dried, freed from visible fat and the ash, fat and total creatine were detd. In the muscle of dogs the creatine was 2.06%, of rabbits 2.28%, of rats 2.18% and of guinea pigs

2.77%. The proportion in guinea pigs is thus significantly higher than in the other animals. Statistical comparison of the muscle creatine concns. with the creatinine excretion in the urine showed no correlation whatever. K. V. THIMANN

**Chemical studies on the parathyroid hormone.** WILBUR R. TWEEDY AND MASAMICHI TORIGOE. *J. Biol. Chem.* **99**, 155–64(1932).—By treating parathyroid hormone with 40% HCHO at $p_H$ 4.6, and then pptg. it with alc. and $Et_2O$, the potency was entirely lost. Subsequent boiling with 0.001 *N* HCl for 15 min. restored about half the original potency. The hormone was completely inactivated by standing 24 hrs. at room temp. with 0.75 *N* HCl in 75% EtOH, and could not be reactivated. However, similar inactivation by 0.1 *N* HCl in MeOH could be partly reactivated by contact with 0.08 *N* NaOH at 0° for 3 hrs. Deamination of the hormone by $HNO_2$ produced complete inactivation. An $NH_2$ or NH group is probably responsible for the activity of the hormone. K. V. THIMANN

**Ketosis during fasting in Eskimos.** PETER HEINBECKER. *J. Biol. Chem.* 99, 279–82(1932).—The acetone bodies in the urine of 3 Eskimos during a 7-day fast were much lower than the corresponding figures for white people. This small degree of fasting ketosis, together with the previous results (*C. A.* **23**, 1160; **26**, 1028), indicates the power of the Eskimo to burn large amts. of fat to completion. K. V. THIMANN

H. GIDEON WELLS

**Hyoscine amnesia in labor.** C. H. G. MACAFEE. *J. Obstet Gynaecol. Brit. Empire* **39**, 804–10(1932).—Review of 80 cases. RACHEL BROWN

**Effect of trypan blue, thionine and pyronine on the agglutination titer of cows infected with Bang's disease.** E. E. SLATTER AND ROBERT GRAHAM. *J. Am. Vet. Med Assoc.* **35**, 76–8(1933).—No evidence was obtained to suggest that trypan blue, thionine or pyronine altered the agglutination titer of the blood or milk sera of the treated animals. RACHEL BROWN

**Experimental production of hepatoma through feeding *o*-aminoazotoluene.** TOMIZO YOSHIDA. *Proc. Imp. Acad.* (Tokyo) **8**, 464–7(1932).—Dosages of 5–10 mg. daily over a period of 9 or more months resulted without exception in typical hepatoma. Aminoazobenzene caused degenerative changes without sign of proliferation. A. W. D.

**Disturbances in the osmotic regulation of the tissues during water intoxication.** PAUL GÖMÖRI AND STEPHEN MOLNÁR. *Arch. exptl. Path. Pharmakol.* **167**, 459–68 (1932).—The min. osmotic concn. in the brain, liver and muscle of rabbits which is compatible with life is that corresponding to a f.-p. lowering of 0.6°. The toxic action of excessive $H_2O$ intake is due, not to the increased intracranial pressure, but to the excessive lowering of the tissue osmotic pressure. Muscle binds most of the water, the liver binds moderate quantities, and the nervous system least, presumably a protective mechanism to guard the latter from the toxic effect of the water. HARRY EAGLE

**The "pituitrin-reaction" in spinal-cord disease.** MAXIMILIAN SILBERMANN. *Arch. exptl. Path. Pharmakol.* **167**, 573–89(1932).—In 9 cases with complete pathol. section of the spinal cord at or above the fourth cervical the subcutaneous injection of 1 cc. pituitrin ("pituisan") failed to inhibit diuresis. In one case with a transverse lesion at the fifth cervical, the normal inhibition was obtained. These results suggest that the antidiuretic action of pituitrin is of central rather than renal origin, and that the fibers leave the spinal cord somewhere near the fourth cervical. HARRY EAGLE

**The problem of gastritis in the light of modern gastric function tests. III. The determination of enzymes and its relationship to gastric acidity, particularly in complete achylia.** W. SCHEMENSKY AND J. GELING. *Arch. Verdauungskrankh.* **52**, 427–34 (1932).—In complete achylia, with neg. reaction to histamine and neutral red, rennin and pepsin are usually decreased or absent. HARRY EAGLE

**Artificial and spontaneous hyperinsulinism.** MAX ROSENBERG. *Klin. Wochschr.* 11, 2097–103(1932).—A review. There is an extensive bibliography. H. E.

**The problem of achylia gastrica and achlorhydria.** R. SCHMIDT. *Klin. Wochschr.* 11, 2117–21(1932).—A review. HARRY EAGLE

**Experimental production of a status lymphaticus by artificial hyperthyroidism produced with thyroxine [Roche].** A. v. ALBERTINI. *Klin. Wochschr.* **11**, 2154–5(1932).—After daily subcutaneous injections of thyroxine (up to 4 mg.) over a period of 5 months, a dog developed massive hyperplasia and hypertrophy of the lymphoid tissue. Similar changes in Basedow's disease may therefore be due to the hyperthyroidism as such. HARRY EAGLE

**The urea, uric acid and cholesterol contents of the blood in meningeal and cerebral disease.** L. RICCITELLI. *Klin. Wochschr.* **11**, 2155–6(1932).—The blood content of all 3 substances is frequently changed in meningeal and cerebral disease. HARRY EAGLE

**The colloid-osmotic pressure of the blood in normal and pathological conditions.**

**VI. Comparative studies of the colloid-osmotic pressure of the blood and lymph and the effect of lymphagogs of the first and second order.** HIROSHI SAITO AND FUSAKICHI NAKAZAWA. *Tôhoku J. Exptl. Med.* **19**, 233–51(1932); cf. *C. A.* **26**, 2235.—The colloid-osmotic pressure of the thoracic lymph of normal dogs average 172 mm. $H_2O$, and 35.2 mm. for 1% lymph protein; per unit protein it is approx. the same as that of blood. Peptone increases the colloid pressure of lymph per unit protein, while NaCl and glucose cause a decrease; all 3 lower the colloid pressure of blood per unit protein. **VII. Comparative study of the colloid-osmotic pressure of the blood and lymph in experimental kidney damage.** *Ibid* 252–61.—Exptl. kidney damage (ureteral ligation, cantharidin and U) generally causes a decrease in the colloid-osmotic pressure of lymph and blood per unit protein. HARRY EAGLE

**Studies in anemia. IV. Colloid-osmotic pressure of the blood in anemia.** HIROSHI SAITO. *Tôhoku J. Exptl. Med.* **19**, 445–61(1932); cf. *C. A.* **26**, 770.—The total blood protein content is slightly decreased in anemia, as is also the colloid-osmotic pressure per unit protein. After a large venesection (20 cc./kg.) the hemoglobin, serum protein and colloid-osmotic pressure of the blood all decrease, the degree of decrease being in the order named. During the recuperative period the total protein concn. recovers faster than its osmotic pressure, while the regeneration of hemoglobin is even slower. As could be predicted from the foregoing, after repeated small venesections the hemoglobin falls, the total serum protein remains more or less const. but the osmotic pressure per unit protein falls considerably. In anemia induced by the repeated injections of phenyl hydrazine, the hemoglobin falls promptly, the serum protein increases somewhat and the colloid osmotic pressure per unit protein falls sharply. **V. The colloid osmotic pressure of the thoracic lymph in experimental anemia.** *Ibid* 462–78.—After a single large venesection in dogs, the colloid-osmotic pressure of the thoracic lymph decreases, despite an increase in total protein. Repeated small venesections and repeated injections of phenylhydrazine cause a decrease in both the lymph protein content and its colloid-osmotic pressure per unit protein. HARRY EAGLE

**Functional tests with urea or creatinine in surgical kidney disease.** KOJI YAGO. *Tôhoku J. Exptl. Med* **20**, 14–33(1932). HARRY EAGLE

**Experimental studies in the intermediary metabolism of muscle in fever. I. Gas and carbohydrate metabolism in muscle during experimental fever.** KESAK ADACHI. *Tôhoku J. Exptl. Med.* **20**, 93–106(1932).—Fever induced by the injection of tetrahydro β-naphthylamine into dogs causes a temporarily increased $O_2$ consumption by muscle which quickly falls to normal. The blood flow generally parallels the $O_2$ consumption. The blood sugar falls temporarily, and the sugar utilization by muscle (arterial glucose concn.—venous) usually increases. In very high fever the blood lactic acid first rises, and then falls precipitously to normal values despite continuing fever. The blood CO is considerably decreased, and $CO_2$ formation in muscle accelerated. **II. Phosphoric acid and uric acid metabolism in muscle during experimental fever.** *Ibid* 107–22.—Dogs' arterial blood normally contains 3.81 mg. % inorg. P; venous blood (M. gastrocnemius), 3.92 mg. % (the difference representing that liberated in the muscle). In fever the blood inorg. P usually increases; the amt. formed in the muscle decreases. The arterial uric acid content in dogs normally averages 0.76 mg. %; the venous, 0.79 mg. %. In fever the blood uric acid increases considerably, and the formation in the muscle is also increased. The leucocytosis observed during fever is partially responsible for this increased blood uric acid, as shown by inducing leucocytosis with morphine or physical restraint. HARRY EAGLE

**Experimental studies on the nitrogen metabolism after blood transfusion.** WATARU KI. *Tôhoku J. Exptl. Med.* **20**, 123–47(1932). HARRY EAGLE

**The intermediary carbohydrate metabolism during experimental fever.** KESAI ADACHI AND SHINTARO KASAI. *Tôhoku J. Exptl. Med.* **20**, 191–210(1932).—Prolonged tying down of rabbits causes a fall in body temp., a prolonged (7 hrs.) hypoglucemia and a temporary increase in blood lactic acid. During naphthylamine fever, the blood sugar shows inconst. variation, and the blood lactic acid begins to rise after the max. temp. has been attained. During fever induced by medullary puncture, the blood glucose and lactic acid both rise after the max. temp. has been attained. HARRY EAGLE

**Resorcinol reaction in tuberculosis.** L. NÈGRE. *Rev. hyg. méd. prév.* **54**, 646 (1932).—Resorcinol flocculates all sera, but in the sera from tuberculous cases the optical density is greater. Results are read by means of a photometer. With a photometric index of 15 for normal sera, tuberculous sera were usually above 30. C. R. FELLERS

**Chemical and physicochemical modifications of serum during the development of cancer.** J. LOISELEUR. *Paris Médical* **21**, 343(1931); *Rev. hyg. méd prév.* **54**, 640–1.—Definite and significant changes in the blood serum in cancer were not found. The

investigation included detn. of $p_H$, alk. reserve, isoelec. point, adsorption power, reducing power, anti-diastatic power, protein decompn. products, lactic acid and minerals.
C. R. FELLERS

**Purification and concentration of diphtheria anatoxin by ultrafiltration.** R. ZAJDEL. *Compt. rend. soc. biol.* **111,** 1029-30(1932).—Two specially prepd. collodion filters were used. The first retained protein mols. but allowed the anatoxin to pass through and the second retained the anatoxin but allowed salts and amino acids to pass through.
L. E. GILSON

**Production of diphtheria toxin having an intrinsically higher antigenic value.** G. RAMON. *Compt. rend. soc. biol.* **112,** 8-10(1933); cf. *C. A.* **26,** 5116.—Toxin titrating 30-40 antigenic units or even higher is readily prepd. by means of the special culture medium described.
L. E. GILSON

**Importance of the $p_H$ in the formation of diphtheria anatoxin.** S. SCHMIDT AND I. FJORD NIELSON. *Compt. rend. soc. biol.* **112,** 106-7(1933).—The formation of anatoxin from diphtheria toxin and HCHO occurs most readily at $p_H$ 8-8.5 At $p_H$ 6 no union takes place. At $p_H$ 9-9.5 the prepn. is partly destroyed
L. E. GILSON

**Presence of specific receptors M and N in tumor tissue.** ALFRED ZACHO. *Compt. rend soc. biol* **112,** 108-12(1933).
L. E. GILSON

**Antigenic activity in vivo of B. anthracis and its fractions. I. Fixation antibodies.** A. SORDELLI, V. DEULOFEU AND J. FERRARI. *Folia biol* **1,** 45-6(1932).—Discussion. **II. Coagulation antibodies.** *Ibid* 93-4.—*In vivo* the formation of coagulation antibodies, *i. e.*, agglutinins for *B. anthracis* or precipitins for its exts., are caused by suspensions of the bacilli, washed or not, or the filtered aq. ext., or a derived fraction of nucleoprotein nature, but not by the carbohydrate fraction.
L. E. GILSON

**Formolized antigens. I. Pneumococcus antigen in vitro.** C. E. PICO AND J. NEGRETE. *Folia biol.* **1,** 57-8(1932).—After treatment of *D. pneumoniae* antigen with HCHO (5% for types I and II and 10% for type III) the precipitinogen is no longer sepd. by simple water extn. but requires heating to 100° at $p_H$ 4.7 for its liberation. The complement-fixation fraction of non-formolized antigen is inactivated by $p_H$ 4.7 but the formolized prepn. is unaffected. The insol. fraction (agglutinogen) of the antigen is unaffected by the HCHO.
L. E. GILSON

**Complexity of the precipitinogen antigen of B. anthracis.** A. SORDELLI, V. DEULOFEU AND J. FERRARI. *Folia biol.* **1,** 94-6(1932).—*B. anthracis* contains 2 precipitinogen antigens, one having the character of a nucleoprotein and the other carbohydrate in nature. The first is antigenic *in vivo*, but the second is not unless the bacilli bodies are present. The 2 can be sepd. by selective absorption by the proper antigens. Both are partly pptd. by dilg. the serum with $CO_2$-satd. water.
L. E. GILSON

**Precipitins for agar. IV.** A. SORDELLI, V. DEULOFEU AND J. FERRARI. *Folia biol* **1,** 97-9(1932), cf. *C. A.* **27,** 131.—For the formation of the precipitin previously described the presence of both agar and the bacterial bodies is necessary. *B. anthracis* grown on agar but washed before injecting does not cause the formation of precipitin, nor does the agar medium after dilu. and removal of the bacteria by centrifuging.
L. E. GILSON

**Free amino nitrogen of the blood in various liver diseases and its diagnostic importance compared with other tests of hepatic function.** G. USSEGLIO AND T. OLIARO. *Minerva med.* **1932,** II, 825-33.—The free amino N of the blood was studied in 31 cases by the Van Slyke micromethod after fasting for at least 12 hrs. and the results were compared with the bilirubinemia, bilirubinuria, urobilinuria, stercobilin and alimentary levulosuria tests for hepatic function. The amts. of free amino N varied from 16 to 56 mg. % (normal controls 7-12 mg. %) and paralleled the other tests, increasing in proportion to the severity of the disease. This is an easy and reliable test for hepatic function.
HELEN LEE GRUEHL

**Free and protein sugar in pulmonary tuberculosis.** G. NANNINI AND B. DAVOLIO-MARANI. *Minerva med.* **1932,** II, 833-7.—Free and total sugar of the plasma were studied by the Bierry-Voskressensky method, protein sugar being the difference of these values. From 28 cases in various stages of tuberculosis it was shown that the free sugar values were inconstant and irregular; protein sugar was about normal in the inactive stages of the disease but increased as the disease became more advanced and active.
HELEN LEE GRUEHL

**Relation between the time curves of uremic and uricemic retention.** PIETRO STEFFANUTTI. *Minerva med.* **1932,** II, 838-40.—Tests for urea N (Melli and Tasso method, cf. *C. A.* **26,** 5318) and uric acid (Benedict, cf. *C. A.* **25,** 4296) of the blood were made at various times of day and night on normal individuals, those with hypertension,

or with kidney lesions. The uric acid of plasma was always higher than that of whole blood, but there was no parallelism between the curves of uric acid and urea N.
HELEN LEE GRUEHL

**Calcium metabolism and some bone diseases and their relation to parathyroid hyperfunction.** MARIO MASSA. *Minerva med.* **1932**, II, 873–7.—A review is given of the clinical and exptl. literature preparatory for a clinical article to appear soon.
HELEN LEE GRUEHL

**Metabolism in tetany.** ISIDOR GREENWALD. *Biochem. J.* **26**, 954–6(1932).—A criticism of the paper by Morris, Watson and Morris (*C. A.* **26**, 199). B. H.

**Differences in the growth of transplantable tumors in plasma and serum culture media.** R. J. LUDFORD. *Proc. Roy. Soc.* (London) **B112**, 250–63(1933).—Malignant cells behave differently in plasma (migrating from the explant) and in serum (carcinomata becoming rounded, sarcomata tending to disintegrate). "The results render invalid conclusions drawn concerning the specific destructive action of immune sera on cancer cells in serum cultures." JOSEPH S. HEPBURN

**Role of lipoids in Forssman antigens.** M. ARMANGUE, P. GONZALEZ AND SARA ROMERO. *Am. J. Hyg.* **17**, 277–86(1933).—In sheep cells, horse and guinea-pig kidneys the common antigenic factor appears to be the alc.-sol. lipoid. The proteins in the Forssman antigen appear to act as carriers. The fixation of lipoids to kaolin according to the method described gives better results than those secured by the use of protein lipoid complexes. The role of the protein is not dependent upon its own antigenic properties. The lipoids manifest better antigenic qualities when united with adsorbents. The sheep erythrocytes contain various antigens capable of the stimulation of hemolysins as shown by Landsteiner and van der Scheer. Proteins present in Forssman antigens produce strictly specific antibodies. Specific antisera acting upon the proteins of the kidney of the guinea pig prove toxic for this animal. The same is true for sera produced against the heterophile lipoids. J. A. KENNEDY

**Bile salts in the urine in obstructive jaundice.** SHUNZOO OKAMURA. *Arb Med Univ. Okayama* **3**, 219–21(1932).—Glycodesoxycholic acid is found in the urine in obstructive jaundice. B. S. LEVINE

**Studies in the combining and inhibition zones in immunoreactions and colloidal reactions.** KAZUYOSHI OHTAHARA. *Arb. Med. Univ. Okayama* **3**, 255–78(1932).—The immunoreactions, particularly the pptn. reaction, behave with regard to optimal flocculation and inhibition of flocculation much as do oppositely charged dyes. The optimal flocculation of oppositely charged dyes occurs only when definite quant. relationships are maintained. Deviation from this relationship in one direction or the other leads to a soln. of the dye flocculation. Electrolytes markedly change this quant. balance. Highly colloidal dyes have a narrow zone of optimal flocculation, while in the less colloidal dyes the flocculation zone is broader and not so well defined. Complement is adsorbed by the ppt. resulting from the interreaction between the oppositely charged dyes. (To prove this O. had to allow the complement to stand mixed with the test dyes for 24 hrs. at room temp., a procedure which tends to impair the effectiveness of the complement.) B. S. LEVINE

**Fractional specificity of serum albumin.** T. ASABA. *Arb. Med. Univ. Okayama* 3, 314–46(1932).—The different fractions of bovine serum manifest a definite fractional specificity. Anti-albumin 3-serum reacts the strongest with its corresponding antigen, moderately with albumin 2 and 1, only slightly with euglobulin and weakly with the other globulins. Anti-albumin 2-serum reacts the strongest with its corresponding antigen, moderately with albumin 3 and 1, with pseudoglobulin, globulin and globulin E, and only weakly with euglobulin. Albumin-antiserum reacts the strongest with its corresponding antigen, moderately with albumin 3 and 2, with pseudoglobulin, globulin and globulin E, and only very weakly with euglobulin. Pseudoglobulin antiserum reacts the strongest with the homologous antigen, as well as with globulin and globulin E, moderately with euglobulin, weakly with albumin 1, very weakly with albumin 2, and not at all with albumin E. Globulin E antiserum reacts the strongest with the homologous antigen, very strongly with globulin, moderately with euglobulin and pseudoglobulin, and very weakly with the 3 albumins. Euglobulin antiserum reacts the strongest with its corresponding antigen, but not with the fractions it contains, such as globulin and globulin E; it reacts moderately with pseudoglobulin, weakly with albumin 2 and 1, and not at all with albumin 3. Globulin antiserum reacts the strongest with the homologous antigen, very strongly with globulin E, moderately with euglobulin and pseudoglobulin, weakly with albumin 1, very weakly with albumin 2, and not at all with albumin 3. It appears that globulin E obtained by electrodialysis contains mostly eu- and pseudoglobulins and but little albumin. After ordinary immunization with

bovine serum the antibodies react stronger with globulin than with albumin. After intensive immunization the antiserum reacts equally strongly with globulin and albumin; however, the combination zone of the albumins is higher than that of the globulins. In the process of immunization with bovine serum the globulin antibody appears prior to the albumin antibody. B. S. LEVINE

**Antilipoid antibodies and tumors. I. The preventive value of the various fractions.** BRUNO BOTTA. *Boll. soc. ital. biol. sper.* **7**, 1341–5(1932).—Neoplastic masses were removed from mice with adenocarcinoma and extd. with various solvents (acetone, EtOH, MeOH, $Et_2O$). The various fractions were injected into normal mice. Later, adenocarcinoma was implanted in the treated mice. The anti-lipoid antibodies produced by the EtOH or MeOH fractions of the tumor showed a marked inhibiting action on the development of the tumor. PETER MASUCCI

**Calcemia in dermatoses.** JOSE LUIS CARRERA. *Rev. sudamericana endocrinol. inmunol. quimioterap.* **15**, 893–928(1932).—The method of Clark and Collip (cf. *C. A.* **19**, 2217) is sufficiently reliable for the detn. of calcemia. Figures of calcemia in dermatoses, which differ much from normal, must be explained by defective methods, as C. found in 167 cases only slight deviations. A. E. MEYER

**Obesity and constitution.** DONATO BOCCIA AND VICENTE A. FRANCO. *Rev. sudamericana endocrinol. inmunol. quimioterap.* **15**, 929–45(1932).—Obesity, its relation to metabolism, constitution and endocrine system is discussed. A. E. MEYER

**Residual albuminurias.** MANUEL YANOVSKY. *Semana méd.* (Buenos Aires) **1933**, 1, 167–72.—The methods of testing and differentiation of the types of protein in albuminuria of less than 1% are described and the clinical significance is discussed. A. E. MEYER

**The lactic acid content and alkali reserve of the blood in experimental trypanosome infections.** TH. V. BRAND, P. REGENDANZ AND W. WEISE. *Zentr. Bakt. Parasitenk.* I Abt. **125**, 461–8(1932).—In the blood of rats and rabbits, the lactic acid is increased in trypanosome infections. The rise in lactic acid is only agonal or preagonal. This agonal rise of lactic acid also occurs in *Bartonella* infections in splenectomized rats. In spite of this increase in acid there is no agonal decrease in alk. reserve. J. T. M.

RUBINSTEIN, M.: **Traité pratique de sérologie et de sérodiagnostic.** 2nd ed. Paris: N. Maloine. 428 pp.

## H—PHARMACOLOGY

A. N. RICHARDS

**The time course of the action of adrenaline on the blood vessels.** KENJI FUJIMORI *Acta Schol. Med. Univ. Imp. Kioto* **15**, 277–80(1932); cf. *C. A.* **27**, 343.—The action of adrenaline on the mesenteric arteries and veins of cattle was investigated. P. D. A.

**Neutralization of toxic properties of strychnine sulfate.** A. C. MARIE. *Ann. inst Pasteur* **48**, 449–56(1932); cf. *C. A.* **26**, 3038.—$KMnO_4$ will neutralize the toxicity of about an equal wt. of strychnine sulfate. Neither adrenaline nor blood alone shows any effect but together they detoxicate strychnine sulfate; the blood may be replaced by bile. The alkaloid is nontoxic even when extd. from the mixt. by $Et_2O$, but regains its toxicity on reduction by $Na_2S_2O_4$. The effect is due to a preferential oxidation of strychnine in presence of adrenaline. B. C. A.

**Joint action of quinine and ethyl urethan in relation to their use in treating malaria.**

**I. Cause of death in subacute poisoning by ethyl urethan.** A. SPANIO. *Arch. farmacol. sper.* **53**, 53–65(1931).—The min. fatal intravenous dose of Et urethan is 2 g. per kg. of body wt. Death ensues mainly by paralysis of the respiratory center. B. C. A.

**Experimental catatonia by means of synthetic derivatives of mescaline and adrenaline.** L. NOTEBOOM. *Nederland. Tijdschr. Geneeskunde* **76**, I, 517–18, II, 2860–2 (1932).—Mescaline, trimethoxyethylamine, and some other similar synthetic substances were tested on cats for their effect on the central nervous system. R. BEUTNER

**Is it advisable in carbon monoxide poisoning and similar conditions to use oxygen alone or oxygen and carbonic acid combined?** C. J. MIJNLIEFF. *Nederland. Tijdschr. Geneeskunde* **76**, IV, 5745–59(1932).—The inhalation of a $CO_2$ mixt. is considered preferable. R. BEUTNER

**Toxic action of lysocithin and of snake venom.** E. CUBONI. *Boll. ist. sieroterap. milan.* **11**, 264–70(1932); cf. *C. A.* **26**, 4861. G. A. BRAVO

**Intravenous injection of sclerosing substances. Experimental comparative studies of changes in the vessels.** ALTON OCHSNER AND EARL GARSIDE. *Ann. Surgery* **96**, 691–716(1932). RACHEL BROWN

**Treatment for mastitis with ultra-violet light, formalin, colloidal carbon and autogenous bacterins.** E. M. GILDOW, H. C. HANSEN AND V. A. CHERRINGTON. *J. Am. Vet. Med. Assoc.* **35**, 55–64(1933).—No consistent reduction in the no. of bacteria or of the leucocytes in the middle milk of cows affected with subacute or chronic mastitis was obtained after treatment with formalin, colloidal carbon, autogenous bacterins or ultraviolet light. RACHEL BROWN

**Infectious enteritis of swine. VII. The use of colloidal iodine in swine coccidiosis.** H. E. BIESTER AND CHAS. MURRAY. *J. Am. Vet. Med. Assoc.* **35**, 79–83(1933).—Colloidal I in large repeated doses did not influence the course of controlled coccidial infections in swine. RACHEL BROWN

**The intensive antimonial treatment of kala-azar: urea stibamine.** UPENDRANATH BRAHMACHARI, AKHIL RANJAN MAJUMDER AND RASH BEHARI DE. *J. Trop. Med. Hyg.* **36**, 1–5(1933); cf. *C. A.* **26**, 4313.—By intensive treatment 29 out of 31 cases of kala-azar were cured with 1.5 g. or less of urea stibamine. RACHEL BROWN

**Mode of action of respiratory stimulants. I. Mode of action of oxygen lack.** S. SELLADURAI AND SAMAON WRIGHT. *Quart. J. Exptl. Physiol.* **22**, 233–48(1932).—In decerebrate or chloralosed cats O lack acts as a depressant to the isolated respiratory center. **II. Mode of action of carbon dioxide.** *Ibid* 285–93.—The response of the intact animal to $CO_2$ is greater than that of the same animal with sinuses denervated and vagi divided. The chem. compn. of the blood stimulates the sinus nerve-endings in the resting animal to discharge tonic excitor impulses to the respiratory center. Increased $CO_2$ concn. stimulates respiration in part reflexly from the carotid sinuses. $CO_2$ may act differently on the various sensory components of the vagus nerve. R. BROWN

**The hyperglucemic action of kallikrein.** HERBERT HERBIG. *Arch. exptl. Path. Pharmakol.* **167**, 555–72(1932).—Kallikrein injected into pancreatectomized diabetic dogs causes a pronounced fall in blood sugar toward normal values, lasting for hrs. It does not affect the blood-sugar level in normal dogs or the normal alimentary hyperglucemia. HARRY EAGLE

**The effect of narcotics upon the decomposition of histamine during autolysis.** Å. BERGWALL AND FRITZ TECHNER. *Arch. exptl. Path. Pharmakol.* **167**, 609–20(1932).—The addn. of $CHCl_3$, EtOH or ether to autolyzing beef lung inhibits the disappearance of the lung vasodepressor substance, or of added histamine. Avertin and somnifen proved ineffective in this regard. As little as 0.0025 *M* KCN also prevented the decompn. of histamine. These results suggest the presence of a specific enzyme for histamine which catalyzes oxidative processes. HARRY EAGLE

**The pharmacology of salamander alkaloids.** OTTO GESSNER AND PAUL MÖLLENHOFF. *Arch. exptl. Path. Pharmakol.* **167**, 638–53(1932).—The toxic concn. of salamandarin-HCl for salamander larvae is approx. $10^{-5}$, and decreases with increasing temp. and $p_H$. The lethal dose for frogs is 0.019 mg./g., as compared with 0.026 mg. for the sulfate. The hydrochloride causes reptiles to die in convulsions, but does not affect the heart; injected into white mice or rabbits it causes tonic and clonic convulsions, and death from respiratory failure, cardiac action continuing in the mice for 12 min. after death. The lethal dose for mice is 0.0034 mg./g. subcutaneously, and 0.0019 mg./g. intravenously. The drug is not hemolytic, causes no contraction of isolated skeletal muscle, and causes a reversible vasodilatation. In concns. of 1:500–1:2500 it produces local anesthesia of rabbits' cornea. Salamander-alkaloid II behaves like salamandarin-HCl, but is less active. HARRY EAGLE

**The diuretic action of the digitalis glucosides of the first order, and some of the**

second order, in isolated frog kidneys. BASILIOS C. COSTOPANAGIOTIS. *Arch. exptl Path. Pharmakol.* **167**, 660–80(1932). HARRY EAGLE

Histological findings in rabbits poisoned with furfural. GEORGES GANDER. *Arch exptl. Path. Pharmakol.* **167**, 681–6(1932).—Doses >0.3 cc. may cause convulsive seizures and paralysis. In animals dying immediately thereafter no changes in the ganglion cells could be demonstrated; but in one animal dying 3 hrs. after the injection of 0.6 cc., there were extensive ganglion cell degenerations. Similar less extensive changes were observed in an animal treated with 0.2 cc. furfural repeatedly over a period of 11 days HARRY EAGLE

The behavior of pectins in metabolism. KURT IMHÄUSER. *Arch. exptl. Path Pharmakol.* **167**, 702–7(1932).—The blood sugar shows slight and inconst. variations after the ingestion of pectin prepns. of low galactose content; nor does pectin prevent fatty changes in the liver of fasting dogs treated with phlorhizin. On the other hand, pectin does have a definite antiketogenic action in these animals, decreasing the excretion of acetone bodies in the urine. HARRY EAGLE

The effect of chloralose on the electrocardiogram. GEORG V. LUDÁNY. *Arch exptl. Path. Pharmakol.* **167**, 717–24(1932).—The observed changes could all be explained on the basis of the sympathicotonic action of chloralose. HARRY EAGLE

Experimental studies of nephritis. Mechanism of the urinary changes during nephritis. LUCIEN BRULL AND GEORGES FANIELLE. *Arch. intern. pharmacodynamie* **42**, 1–35(1932).—From 4 to 6 mg. of U nitrate injected into dogs causes acute nephritis. An initial stage of polyuria, albuminuria, cylindruria, glucosuria and moderate N retention is followed by a stage of oliguria, with less albuminuria, cessation of glucosuria, and increasing N retention terminating with death. As shown by double circulation expts. through the kidneys of a normal animal, both the albuminuria and glucosuria are renal in origin, neither protein nor sugar appearing in the urine secreted by normal kidneys from nephritic blood. The polyuria, on the other hand, is detd. by the properties of the blood, is observed even with normal kidneys, and is due both to the absence of normal vasoconstrictors and to the presence of diuretic by-products in the nephritic blood. The blood of the uremic dogs never develops toxic properties for normal kidneys, even in the terminal uremia; in fact, it even stimulates secretion. The terminal uremia and oliguria are therefore also renal in origin. HARRY EAGLE

Comparative actions of sympathomimetic compounds: the circulatory responses to isomeric propanolamines, *m*-synephrine, hordenine, etc. M. L. TAINTER. *Arch. intern. pharmacodynamie* **42**, 128–39(1932).—Of the isomeric hydroxyphenylpropanolamines, $m > p > o$ in pressor activity in cats. Similarly, *m*-synephrine is more active than the *p*-isomer, being the most active sympathomimetic yet studied. It is only $\frac{1}{4}$ as toxic as adrenaline, and $\frac{1}{16}$ as active. Previous administration of cocaine has no effect on these compds., but ergotamine inhibits their action. Hordenine has a variable effect while "*m*-hydroxyphenylpropanolamine ketone," *p*-hydroxyphenylethane and *p*-hydroxyphenylacetic acid do not have consistent pressor effects. HARRY EAGLE

Pharmacological study of embelin, with reference to its use as an anthelmintic. A. S. PARANJPÉ AND G. K. GOKHALÉ. *Arch. intern. pharmacodynamie* **42**, 212–32 (1932).—The galenic prepn. from the dried fruit of *Embelia ribes* Burm. and *Embelia robusta* Roxb. contains along with other constituents about 2.5–2.7% of embelin (embelic acid, 2,5-dihydroxy-3-lauryl-*p*-benzoquinone), which is probably the active anthelmintic principle. The drug is effective against tapeworms, but not round worms or hookworms. Doses of 0.66–0.8 g. are non-toxic for dogs or men. It is excreted in the urine, giving it a red-brown color. Pharmacological effects are discussed in detail HARRY EAGLE

The effect of small quantities of adrenaline upon the oxygen consumption of artificially perfused dog bone. U. S. v. EULER. *Arch. intern. pharmacodynamie* **42**, 259–77(1932).—Adrenaline added to the arterial perfusion fluid (defibrinated dog blood) in concns. of $10^{-9}$–$10^{-10}$ causes a 23% increase in $O_2$ consumption of dog bone, with concns. of $10^{-8}$–$10^{-9}$ an initial increase is followed by a decrease. Ergotamine (0.5 g./kg.) prevents this metabolic effect of adrenaline, as does sectioning the ischial nerve from 3 days to 3 weeks previously. Tetrahydro-β-naphthylamine in blood concns. of $10^{-6.2}$–$10^{-6.1}$ slightly increases the $O_2$ consumption; higher concns. ($10^{-4.6}$) inhibit it. HARRY EAGLE

Insulin and phosphagen. A. MOSCHINI. *Arch. intern. pharmacodynamie* **42**, 328–33(1932).—In frogs dying as a result of massive doses of insulin (50 units into animals of 30–40 g.) with profound hypoglucemia and convulsions, there is no regular increase in the muscle phosphagen. The inorg. P which disappears from the circulating

blood after the administration of insulin is therefore not fixed in the muscles as phosphagen. HARRY EAGLE

**Mechanism of chemotherapeutic action. VI. The binding of arsenicals by trypanosomes in vitro.** L. REINER, C. S. LEONARD AND S. S. CHAO. *Arch. intern. pharmacodynamie* **43**, 186–98(1932).—Dead organisms (*T. equiperdum*) absorb more As from solns. than the living organisms. The amt. of As taken up from solns. of various trivalent As compds. is proportional to their *in vitro* toxicity, the order of increasing absorption being Na arsanilate ($As^{+++++}$), sulfarsphenamine, stabilarsen, neoarsphenamine, 3 amino-4-hydroxyphenylarsenious oxide. The amt. of As so combined corresponds to a monomol. surface layer, loosely packed, and suggests that certain definite chem groups are responsible for the binding. Na thioglycollate inhibits the binding of all the trivalent arsenic compds. studied; but previous treatment with Bayer 205 does not interfere with the binding of neoarsphenamine. **VII. The binding of arsenicals by arsenic-resistant trypanosomes in vitro.** *Ibid* 199–208.—An arsenic-resistant strain of *Trypanosoma equiperdum* was found to bind approx. as much As from solns. of neoarsphenamine and 3-amino-4-hydroxyphenylarsenious acid as normal organisms (10γ per $10^{10}$ trypanosomes). Sulfarsphenamine was bound loosely, but in larger quantity. A five fold variation in neoarsphenamine concn did not affect the degree of adsorption. These results indicate a real increase in tolerance for the drug rather than a decreased affinity for As in the As-resistant strain. Its reduction capacity (rate of reduction of methylene blue) was found to be normal. **VIII. Variations in the size of the spleen of albino rats, following treatment with arsenicals, blockade with India ink, and infection with Trypanosome equiperdum.** L. REINER AND S. S. CHAO. *Ibid* 209–15. HARRY EAGLE

**The role of the liver in the passage of polypeptides.** NOËL FIESSINGER, MAURICE HERBAIN, AND RENÉ LANÇON. *Arch. intern. pharmacodynamie* **43**, 216–36(1932).—After the ingestion of peptone by dogs there is a brief but definite increase in polypeptides in the portal vein, also observed to a less degree in the peripheral circulation, where it is roughly paralleled by an increase in the non-protein N. As shown by hepatectomy, the liver keeps the circulating polypeptides at a low level, presumably by weeding out part of the polypeptides brought to it by the portal vein. Polypeptides may be formed in the tissues, as after traumatic autolysis of the spleen, but this peripheral formation does not become evident so long as the liver is intact. HARRY EAGLE

**Experimental thyrotoxicosis.** J. H. DRAIZE AND A. L. TATUM. *Arch. intern. pharmacodynamie* **43**, 237–45(1932).—Correcting the acidosis is the most efficient therapeutic measure in animals poisoned with otherwise fatal doses of desiccated thyroid (50 mg./kg.). Stimulants, viosterol and Ca gluconate, also proved beneficial. HARRY EAGLE

**The reflex hypertensive action of amyl nitrite.** LUCIEN DAUTREBANDE. *Arch. intern. pharmacodynamie* **43**, 246–67(1932). HARRY EAGLE

**Is the action of barium chloride on dog intestine in situ similar to that of the digitalis group?** RAYMOND-HAMET. *Arch. intern. pharmacodynamie* **43**, 386–412(1932). HARRY EAGLE

**Chemical studies of pathological liver biles and the effect of Karlsbad mineral water.** W. NONNENBRUCH AND P. MAHLER. *Arch. Verdauungskrankh.* **52**, 337–61(1932).—The mineral water caused an increased biliary secretion, contg. more Ca, K, S and Na. The biliary $HCO_3$, Fe, lecithin, fatty acids, cholesterol and non-protein N were not affected; and the concns. of mucus and total N were decreased. There is a complete bibliography. HARRY EAGLE

**The effect of Anticoman upon the carbohydrate metabolism.** KURT FRÖHLICH. *Arch. Verdauungskrankh.* **52**, 434–40(1932).—In non-toxic doses "Anticoman" has no effect on the fasting blood-sugar level, increases the glucose tolerance of normal dogs and rabbits for hrs., and partially reduces the insulin requirement of pancreatectomized dogs. HARRY EAGLE

**Therapeutic attempt with thyreotropic hormone.** A. SCHITTENHELM AND B. EISLER. *Klin. Wochschr.* **11**, 1783–5(1932).—The administration of thyreotropic hormone (cf. *C. A.* **26**, 3571, 5136) to a case of myxedema caused an increase in the blood I level (from 6.5γ% up to 16.5γ%) without affecting the basal metabolism or the clinical picture. In cases of adiposity, although less effective than thyroxine, it does have some effect. HARRY EAGLE

**Peroral or intravenous administration of glucose for the testing of the glucemic response?** ERICH URBACH. *Klin. Wochschr.* **11**, 1789–91(1932).—Results with the peroral and intravenous administration of glucose agreed in 75% of the cases; in the remainder, the peroral method gave better results. Fewer blood samples are necessary

with the peroral method; and it is to be preferred because it is a physiol. test of pancreatic function. HARRY EAGLE

**Detoxication of the thyroid hormone.** ERICH HESSE AND K. R. JACOBI. *Klin. Wochschr.* **11**, 2117(1932).—A preliminary report. Small amts. of Cu (0.4 mg./kg daily) given as the acetate, glycocoll or chlorophyll compd. protect dogs from otherwise fatal doses of dried powd. thyroid gland (3 g./kg. daily). HARRY EAGLE

**The effect of thyroxine upon tissue oxidation.** GUSTAF MYHRMAN. *Klin. Wochschr.* **11**, 2139–40(1932).—A preliminary report. Thyroxine has no effect upon the $O_2$ consumption of tissue *in vitro*. No definite results were obtained upon attempting to det. whether the tissues of thyroxine-treated animals had an abnormally high $O_2$ consumption *in vitro*. Also in *Acta Med. Scand.*, **79**, 323–30(1932). HARRY EAGLE

**The behavior of the alkali reserve during salyrgan diuresis.** A. BÖGER AND M. NOTHMANN. *Klin. Wochschr.* **11**, 2146–8(1932).—There is a significant increase in the $CO_2$-binding power of blood 8–12 hrs. after an injection of salyrgan. The simultaneous administration of $NH_4Cl$ inhibits the alkalotic action, and promotes diuresis. H. E.

**The effect of diiodotyrosine upon the thyroid activity.** I. ABELIN AND C. WEGELIN. *Klin. Wochschr.* **11**, 2103–6(1932).—The injection of anterior pituitary exts. into guinea pigs causes histological changes of hyperactivity in the thyroid gland, inhibited or prevented by the simultaneous ingestion of diiodotyrosine. HARRY EAGLE

**Histological studies on the effect of intravenous injection of thorium dioxide sol.** PAOLO RAVENNA. *Klin. Wochschr.* **11**, 2151–2(1932).—$ThO_2$ is stored in all organs contg. reticulo-endothelial cells, as well as in the endothelial cells of the renal glomeruli. The function of the Th-loaded cells is probably not impaired. No immediate histological changes in the organs could be demonstrated, but the possibility of later changes is not excluded. HARRY EAGLE

**The effect of convulsive toxins upon the respiration of rabbits.** TAMON HOSHI. *Tôhoku J. Exptl. Med.* **19**, 548–65(1932).—$NH_4$ salts and lobeline in sub-convulsive doses cause acceleration and deepening of respiration by direct action on the medullary respiratory center. Picrotoxin, caffeine and atropine accelerate respiration without increasing its amplitude. Strychnine affects respiration only in convulsive doses. H. E.

**The effect of morphine upon the respiration of rabbits.** TAMON HOSHI. *Tôhoku J. Exptl. Med.* **19**, 566–76(1932); cf. *C. A.* **26**, 5657.—Morphine first retards and then accelerates respiration by direct action on a pontine and medullary center, resp. HARRY EAGLE

**The effect of guanidine hydrochloride and synthalin upon the blood-sugar content of bilaterally suprarenalectomized or splanchnicotomized rabbits.** HYOZO TADA. *Tôhoku J. Exptl. Med.* **19**, 584–602(1932).—Subcutaneous injections of 0.25–0.4 g. guanidine-HCl into rabbits usually cause hyperglucemia, inhibited by bilateral splanchnicotomy and completely prevented by bilateral adrenalectomy. The latter procedure also prevents synthalin hyperglucemia. HARRY EAGLE

**The relationship of the increased adrenaline secretion in dogs treated with guanidine to the simultaneous change in the blood-sugar concentration.** HYOZO TADA. *Tôhoku J. Exptl. Med.* **20**, 1–13(1932). After splanchnicotomy in dogs, the injection of guanidine causes hypoglucemia instead of hyperglucemia; the effects of adrenaline and guanidine in such animals are algebraically additive. The guanidine hyperglucemia in normal dogs is due to the increased secretion of adrenaline. HARRY EAGLE

**The significance of highly unsaturated fatty acids in organs.** SEINOSUKE HOTTA. *Tôhoku J. Exptl. Med.* **20**, 65–78(1932).—During the increased metabolism caused by the injection of thyroxine, adrenaline and phlorhizin into rabbits, the total unsatd. fatty acids in the tissues increase, but there is no appearance of very highly unsatd. acids. Those which occur normally, or which appear upon the administration of oils with a high I no. to dogs, are not simply unsatd. normal acids, but represent stored fat which resists decompn. Unlike slightly unsatd. fatty acids, the highly unsatd. acids are not to be classed as readily metabolized reserve fat. There is an extensive bibliography. HARRY EAGLE

**The state of the fat in the pancreatic-diabetic dog and its change upon insulin and sugar administration.** SEINOSUKE HOTTA. *Tôhoku J. Exptl. Med.* **20**, 79–92(1932).—The tissues of pancreatectomized dogs contain a large quantity of fat, particularly rich in satd. fatty acids. This change does not appear after partial resection of the pancreas, quickly disappears after the administration of insulin or intravenous glucose, and is responsible for the delayed fat catabolism in the untreated diabetic organism. HARRY EAGLE

**Hyperglucemic action of β-dimethyltelluronium dichloride.** TOSIMITU KAIWA. *Tôkohu J. Exptl. Med.* **20**, 163–77(1932). HARRY EAGLE

**Changes in the carbohydrate and gas metabolism of muscle during acidosis.** KONGO KODERA AND KESAR ADACHI. *Tôhoku J. Exptl. Med.* **20**, 178–90(1932).—Acids (0.4 *N* HCl) injected into dogs caused decreased $CO_2$-binding power in blood and muscle, hyperglucemia, decreased consumption of sugar and $O_2$ by muscle, decreased lactic acid in blood and muscle, decreased blood flow and increased blood pressure. All these changes persist at least an hr. after the injection. HARRY EAGLE

**Autopsy findings in hydrocyanic acid poisoning.** M. STAEMMLER. *Klin Wochschr.* **11**, 2113–16(1932).—In spite of the fact that death had occurred 4 days previously there was no evidence of post-mortem autolysis in the gastric mucosa; and the oxidase reaction of the leucocytes in the gastric wall was almost completely neg. In one spot where the HCN had only penetrated half of the mucosa, the leucocytes in the unaffected area gave a normal oxidase reaction. HARRY EAGLE

**Immediate effects of toxic gases on the [human] organism.** J. IZARD, J. DES CILLEULS AND R. KERMARREC. *Rev. hyg. méd. prév.* **54**, 569–94(1932).—Chem. warfare agents are classified on the basis of their physiol. and pathol. actions on the body. Each agent is discussed separately. Seventy-five references are appended. C. R. F.

**Action of procaine. Relations between hydrogen-ion concentration, potassium content and headaches in spinal anesthesia.** B. BRANDI *Z. ges. exptl. Med* **76**, 760–79(1931); *Physiol. Abstracts* **17**, 145.—For avoidance of headaches and unpleasant after-effects of spinal anesthesia with procaine it is essential that (1) the soln. should be neutral or very slightly alk.; (2) the K content should not exceed 10 mg. %; (3) the soln should be freshly prepd every time. Vasomotor collapse and fall in blood pressure can partly be prevented by intramuscular injection of adrenaline or ephedrine. Trial of a large no. of mixts. led B. to prefer a procaine-adrenaline-phosphate buffer combination of the appropriate $p_H$, with which no evil effects were obtained. G. G.

**[Toxicity of] cadmium vapor.** L. SCHWARZ AND W. DECKERT. *Zentr. Gewerbehyg. Unfallverhüt* **18**, 66(1931). G. G.

**Fate of chloral hydrate in the animal and its fixation in different organs.** B. OLSZEWSKI AND N. P. RENESCU. *Bull. soc. chim. biol.* **14**, 1510–30(1932).—See *C. A.* **27**, 340. L. E. GILSON

**Histamine and asthmatic dyspnea.** J. STAHL AND J. MASSON. *Compt. rend. soc. biol.* **111**, 1003–4(1932).—Histamine given intramuscularly aggravates asthmatic dyspnea, but 0.1–0.3 mg. given intradermally or applied to the scarified skin gives relief and permits free breathing in 10–15 min. At the same time a marked skin reaction is produced. L. E. GILSON

**Action of acetylcholine on the acidity of the gastric juice.** P. MERKLEN, J. WARTER AND J. KABAKER. *Compt. rend. soc. biol.* **111**, 1013–15(1932).—The effect of subcutaneous injections of 0.2 g. acetylcholine on normal and on dyspeptic persons was studied. Where the free acidity was less than 2 g. per l. (Toeppfer method) the treatment caused an increase in acidity and in cases of acidity above 2 g. a decrease was produced. L. E. GILSON

**Therapeutic treatment of experimental hypertension.** LUCIEN DAUTREBANDE. *Compt. rend. soc. biol.* **111**, 1038–41(1932).—None of the common hypotensive drugs had any appreciable effect on dogs in which a chronic hypertension had been induced by section of the nerves of Hering and Cyon 6–10 months previously. L. E. GILSON

**The insulin-adrenaline equilibrium.** P. P. DE NAYER. *Compt. rend. soc. biol.* **111**, 1049–51(1932).—Because of their antagonistic action fatal doses of insulin and adrenaline can be administered together with little effect on the animal; *e. g.*, 80 units insulin and 17.12 mg. adrenaline given together caused practically no change in the blood sugar of a rabbit. L. E. GILSON

**Influence of excitation of the reticuloendothelial system on alimentary hypercholesterolemia.** P. LAMBIN AND J. STEENHOUDT. *Compt. rend. soc. biol.* **111**, 1088–9(1932).—In rabbits hyperactivity of the reticuloendothelial system caused by injections of small doses of India ink or caseosan Heyden prevented the usual increase in blood cholesterol after ingestion of cholesterol emulsion. Possibly the absence of hypercholesterolemia in jaundice is the result of a persistent reticuloendothelial hyperactivity. L. E. GILSON

**Action of intravenous injections of sodium bicarbonate on the fats of the kidneys of the dog.** C. ACHARD, J. VERNE, M. BARIÉTY AND E. HADJIGEORGES. *Compt. rend. soc. biol.* **112**, 30–1(1933); cf. *C. A.* **26**, 5135.—Marked alkalosis produced by large doses of $NaHCO_3$ had no noticeable effect on the fatty constituents of the kidneys. L. E. GILSON

**The antagonism of chelidonine and adrenaline.** RAYMOND-HAMET. *Compt. rend. soc. biol.* **112**, 31–4(1933); cf. *C. A.* **26**, 3299.—In dogs anesthetized with chloralose the

hypertensive effect of 0.05 mg. adrenaline was counteracted by 45 mg. chelidonine sulfate. L. E. GILSON

**Action of heliotropin on the isolated intestine. Its atropine-like effect.** H. BUSQUET. *Compt. rend. soc. biol.* 112, 51–2(1933); cf. *C. A.* 25, 3079.—Heliotropin (piperonal) is an intestinal paralysant of the atropine type acting on the parasympathetic system. Pilocarpine has an antagonistic action. L. E. GILSON

**Histamine and histamine-like substances in the therapy of rheumatic diseases.** PAOLO JACCHIA. *Minerva med.* 1932, II, 865–73.—Beneficial effects previously reported are corroborated and the literature is discussed. HELEN LEE GRUEHL

**Adonis poisoning.** A. v. DEGEN. *Fortschr. Landw.* 7, 556–8(1932).—The death of 4 horses was traced to ingestion of lucerne hay contg. 8.5% of *Adonis phoenicea*, which, in turn, contained an av. of 0.216% glucoside and also an undetd. amt. of a saponin. K. D. JACOB

**The effect of bile acids on carbohydrate metabolism. XX. Glycogen synthesis by bile salts upon the administration of different amino acids.** SEI FUZITA. *Arb. Med. Univ. Okayama* 3, 192–200(1932); cf. *C. A.* 26, 4873.—Glycogen synthesis in starving dogs is augmented by the administration of bile salts. F. regards this as an indication of the effect bile salts have upon the liver glycogen synthesis from *d*-alanine, *l*-leucine and glycocoll. *d*-Alanine and *l*-leucine augment, while glycocoll reduces, the above synthesis after the administration of bile salts. B. S. LEVINE

**The influence of bile salts on salt excretion in liver bile. II. Elimination of phosphoric acid through bile acids after the administration of glucose.** YUTAKA KAWADA. *Arb. Med. Univ. Okayama* 3, 163–71(1932); cf. *C. A.* 25, 4601.—The ash and total solid content of fistula bile from dogs is lowered after the administration of glucose. It remains unaltered or only slightly lowered after the administration of bile salts. The elimination of phosphoric acid is lowered after oral administration of glucose, but remains unchanged or only slightly lowered when the glucose is administered in conjunction with bile salts. K. believes that the lowered phosphoric acid elimination is in some way connected with the glycogen synthesis by the liver. B. S. LEVINE

**The action of *p*-hydroxybenzylguanidine.** AKIO KURODA. *Arb. Med. Univ. Okayama* 3, 279–304(1932).—The pharmacol. action of *p*-hydroxybenzylguanidine is qualitatively similar, but quantitatively different from that of benzylguanidine B. S. LEVINE

**Pharmacological investigation on in vitro cultures from the pigmented epithelial cells of the iris. IV. The influence of emetine, cephaline, sinomenine and parasinomenine on the growth of in vitro cultures from iris epithelium and the histological changes in the culture through these poisons.** KANO SANJO. *Folia Pharmacol. Japon* 15, No. 2, 147–58, Breviaria 10(1932); cf. *C. A.* 26, 4101.—The above poisons decrease the growth of cultures of iris epithelium in low concn.; with higher concns. degeneration sets in and death follows. In weak concn. sinomenine and parasinomenine produce some stimulation, but the others never do. Histological changes are discussed. The intensity of the poisonous action decreases in the order: emetine, cephaline, parasinomenine and sinomenine. G. H. W. LUCAS

**Studies on the in vivo action of lysocythin on the blood.** V. GRONCHI. *Boll. soc. ital. biol. sper.* 7, 1297–1301(1932).—Lysocythin exerts a hemolytic action *in vivo*. Injected intravenously into rabbits in doses of 5–10 cg. per kg. it causes destruction of the red blood corpuscles followed by the liberation of hemoglobin in the plasma and its elimination in the urine. The hemoglobinemia generally disappears in 24 hrs. although ocasionally it may reappear a few days later. PETER MASUCCI

**The influence of intraperitoneal injections of hydrogen peroxide on the catalase of the blood.** LUIGI CASTALDI. *Boll. soc. ital. biol. sper.* 7, 1303–5(1932).—Repeated intraperitoneal injections of $H_2O_2$ into rabbits in doses of 0.08–0.10 g. per kg. produce a marked diminution of the catalase activity of the blood. This diminution is accompanied by a simultaneous diminution in the red blood corpuscles. These facts do not favor the hypothesis that catalase is an enzyme of defense against the toxic action of $H_2O_2$ formed as an intermediate product furing the oxidation of tissues. P. M.

**The lesions caused in the nervous system by the intravenous injections of hypertonic salt solutions.** CAMILLO COLOMBI AND ULRICO SACCHI. *Boll. soc. ital. sper.* 7, 1315–18(1932). PETER MASUCCI

**Changes in the development of experimental tuberculosis after treatment with substances lowering the surface tension.** BRUNO BOTTA. *Boll. soc. ital. biol. sper.* 7, 1345–9(1932).—In the initial stages, exptl. tuberculosis is favorably influenced by treating the animal with Na sulforicinate or Na sulfooleate. PETER MASUCCI

**The action of chemical substances on mycetes causing dermatomycosis.** G

FALCHI. *Boll. soc. ital. biol. sper.* **7**, 1352–7(1932).—The actions of methyl violet, crystal violet, gentian violet, malachite green, methylene violet and saffranine on the cultural development of *Trichophyton*, *Achorion* and *Microsporon* were studied. Gentian violet and malachite green were the most effective in inhibiting the cultural development followed closely by methylene violet and crystal violet. The organisms most sensitive to these substances were *Achorion schonleini* and *T. violaceum*. PETER MASUCCI

**The relation between arterial blood and diuresis as manifested in normal and hypertensive individuals. I. The water test.** PAOLO LEVI AND ERCOLE BUCCIANTI. *Boll. ital. biol. sper.* **7**, 1305–8(1932). **II. The adrenaline test.** *Ibid* 1309–12. P. M.

**The action of some expectorants on mucin.** M. DEGANELLO. *Biochim. terap. sper.* **19**, 321–9(1932).—The changes of viscosity of mucin solns. under the influence of expectorants have been investigated. The decrease of viscosity was most remarkable with $NaHCO_3$, less with NaCl and $CaCl_2$, small with $PhCO_2Na$. The effect of expectorants of the saponin group, emetics and balsamic is insignificant. A. E. MEYER

**Hypericism.** W. HAUSMANN. *Biochim. terap. sper.* **19**, 330–2(1932).—An historical study about the effect of *Hypericum crispum* on white animals, which renders them sensitive to light. A. E. MEYER

**The influence of some chemical substances on the defensive power of the peritoneum.** MARIO TABANELLI. *Biochim. terap. sper.* **19**, 362–417(1932).—The introduction of colloidal Ag, of arsenobenzene or $MgCl_2$ into the peritoneal cavity produces vasodilation, congestion and exudation and attracts white blood elements, all factors apt to increase the natural defense of the serosa. A. E. MEYER

**Pepsinotherapy in gastric ulcer.** RAÚL NOVARO AND DOMINGO R. PESCUMA. *Semana méd.* (Buenos Aires) **1932**, II, 1947–51.—Parenteral pepsin treatment is successful in hyperchlorohydria and gastroduodenal ulcers. It must be applied for a long time and must be supplemented by a suitable diet. A. E. MEYER

**The diuretic action of ammonium bromide.** FRANCISCO C. ARRILLAGA AND ALBERTO C. TAQUINI. *Semana méd.* (Buenos Aires) **1932**, II, 1951–6.—The diuretic action of $NH_4Br$ was established in patients with edema. Doses of 5 to 10 g. are well tolerated. The combination with mercurials is extremely effective. A. E. MEYER

The chemical behavior of Millon base (BERNARDI, SCHWARZ) **10.** Catalytic synthesis of phenylpyridines (MUSAJO, COLONNA) **10.** Ethylene oxide (ZERNIK) **17.** Local anesthetics derived from dialkylaminopropanediols (SCOTT, RIDER) **10.** Piperidine derivatives. XII. Local anesthetics derived from reduction products of β-acetylpyridine (STRONG, MCELVAIN) **10.**

WITTE, RICHARD: [illegible] Chore[illegible]

## ZOOLOGY

### I—ZOOLOGICAL Behavior

[illegible]visch-che[illegible]

R. A. GORTNER [illegible]

**The role of the vitelline sac in the metabolism of the embryo of Syngnathus acus** M. KONOPACKI AND K. BRECIŃSKI. *Bull. intern. acad. pol[illegible]* [illegible]*andere[illegible]lonaise. Classe sci. math* [illegible] 'telline sac are only parti[illegible] 1932, No. 5–6B, II, 141–51.—The reserve materials of the v[illegible] lamps tributed among the va used by the young organism. These reserve materials are dis[illegible] olism until quite late in rious organs and are not utilized in the various processes of metab[illegible]ch zu PHILIP D. ADAMS the development of the embryo. [illegible]0. MAYER. *Jena* [illegible]

**Röntgenographic investigation of gastropod shells.** FRITZ K. [illegible]en. [illegible]s of regenerating *Naturw.* 65, 487–512(1931); cf. *C. A.* 26, 5151, 5583.—X-ray studi[illegible]der[illegible] first formed shells of *Helix nemoralis* show, at the outset, formation of mixts. of vat[illegible]es, finally into nite. M. postulates that in the formation of gastropod shells, vaterite [illegible]. DUNLAP which goes over more or less completely into aragonite and, in certain cas[illegible] of train oil calcite.

**Lipochromes in the fat of marine animals. I. The coloring matters** F. [illegible] TRUMPY from Regaleous glesne. S. SCHMIDT-NIELSEN, NILS A. SØRENSEN AND B[illegible] ar-colored *Kgl. Norske Videnskab. Selskab Forh.* 5, 114–17(1932).—The strongly cinnab[illegible] es of the liver of *R. glesne* yields a deep-red oil. This contains 2 benzine-sol. substan[illegible] carotenes same max. light absorption at 505 mμ ± 5 mμ in $CS_2$. These belong neither to the [illegible] r times nor the xanthophylls, but rather are similar to a coloring matter which in ol[illegible] *Ibu* was described under the name of zoonerythrin. II. **A red-colored whale o[illegible]** [illegible] whale 118–21.—Two coloring matters have been isolated from a light reddish colore[illegible] so been oil. These have a broad absorption band with a max. at 505 mμ. These have al[illegible] *glesne.* found in salmon oil and in the train oil of *Cyclopterus lumpus* and *Regalecus* [illegible] LAP urchin

**Stimulating action of minute doses of thyroxine on the development of sea eggs.** G. UNGAR AND M. R. ZERLING. *Compt. rend. soc. biol.* 112, 25–7(1933). F. L. DUN[illegible]

**Mechanism of adaptation to varying salinity in the common eel and the ge[illegible] problem of osmotic regulation in fishes.** ANGEL B. KEYS. *Proc. Roy. Soc.* (Lon[illegible] B112, 184–99(1933).—The changes in $H_2O$ content of the eel during adaptatio[illegible] changed salinity are not paralleled by changes in $H_2O$- or osmotic-concn. of the bl[illegible] Two primary mechanisms are involved in the active regulation of osmotic con[illegible] L. E. GILG[illegible]

(*a*) the kidney concn. of salt and elimination of large amts. of $H_2O$, and (*b*) the gill conservation of $H_2O$ and elimination of excess salt. JOSEPH S. HEPBURN

**Chemistry of coccids produced in Japan. I. Waxy substances of Ceroplastes rubens Mask.** MICHIO KONO. *J. Agr. Chem. Soc. Japan* **8**, 1150–60(1932)—The insects were collected and extd. with $C_6H_6$. The wax is sol. in $C_6H_6$, $CHCl_3$ and $CCl_4$, difficultly sol. in ether, petr. ether, glacial AcOH and EtOAc. The properties were: $d_{15}$ 1.03, m. p. 55–8°, acid value 63.4, sapon. value 139.0, ester value 75.5, I value 90.3, Ac value 23.8, neutral fat 36.5% and unsapon. matter 19.98%. The wax was sepd. into cold alc.-sol. and -insol. parts. The cold alc.-insol. part was recrystd. from hot alc., and melissic acid, ceryl alc., an unknown cyclic alc., $C_{11}H_{18}O$, b. about 120°, $((\alpha)^{?}_{D}$ +47.3°, mol. wt. 165.45), ceryl melissiate, m. 86°, and melissic ester of $C_{11}H_{18}O$, m. 68°, were isolated. From the alc.-sol. part a red colloidal mass was obtained, and abietic acid, m. 163° $((\alpha)^{20}_{D}$ +69.2°), and an unknown unsapon. matter, $C_{16}H_{26}O$, $b_2$ 190° $((\alpha)^{?}_{D}$ −27.75°), were isolated. $C_{16}H_{26}O$ may be a resinol. Y. KIHARA

**Biochemical investigations on fish muscle. III. Changes in the amount of "press-juice" from the muscle of the haddock.** S. SCHMIDT-NIELSEN AND JÖRGINE STENE. *Kgl. Norske Videnskab. Selskabs Forh.* **4**, 198–201(1932); cf. *C. A.* **26**, 2248.—The amt. of press juice to be obtained from the minced muscle of the haddock varies with the period of keeping of the fish after killing. From a very low value immediately after death the amt. rises to 20 g. per 100 g. muscle in 3–4 hrs. at 5–10°, and falls again after 1–2 days. Finally it rises again to about 20 g. per 100 g. muscle. The amt. is not affected by freezing, but on subsequent keeping, the vol. of juice increases and the content of coagulable protein decreases. The highest value reached, after 3 weeks of freezing, was 44 g. per 100 g. muscle. K. V. THIMANN

**Effects of inorganic salts on photic orientation in Allolobophora foetida (Sav.). VII. Effects of sodium chloride and magnesium chloride of different concentrations.** JUKITARO NOMURA AND SHINRYO OHFUCHI. *Science Repts. Tohoku Imp. Univ.* [4], 7, 457–97(1932); cf. *C. A* **25**, 2489.—The angle of orientation of *A. foetida* to light and their forward and backward movements were measured with the worms in different salt solns. The 4 types of effects are ascribed to a combination of strengthening or weakening of the positively phototropic center in the ventral nerve cord with similar effects on the negatively phototropic center in the brain. K. V. THIMANN

**Glomerular function.** H. L. WHITE. *Am. J. Physiol.* **102**, 222–6(1932).—Mol. concn. of the glomerular fluid of Necturus was the same as that of the serum. Conclusion Glomerular function is very probably a passive filtration process J. F. L.

CULEMANN, H. W.: **Das Verhalten der Pyrenoide bei vegetativer und geschlechtliche Fortpflanzung, eine Untersuchung an Eudorina elegans.** Thesis, Berlin, 1931. 28 pp.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

**Chemical composition of Spanish foods. I. Foods of vegetable origin.** J. PUYAL AND ISABEL TORRES. *Anales soc. españ. fís. quím.* **31**, 74–80(1933)—Twenty-one Spanish foods of vegetable origin were analyzed for carbohydrates, protein, fat, water and ash, and the ash for Ca and K. Spanish peas (*garbanzo*) are as high in protein as meat (21.8%), and have a higher food value than lentils. Results of analyses are tabulated in comparison with similar results obtained by others. A table shows the standing of foods in the order of carbohydrate content. **II. Cantabrian fish.** *Ibid* 81–6.—Twenty-five kinds of fish from the Cantabrian sea, used widely in Spain, were analyzed for protein, fat, water and ash, and the ash for Ca and K. Protein varied from 26.7% in *Germa alalonga* to 15.6% in *Conger conger;* fat from 6.2% in *Cuplea pilchardus* to only 0.14% in *Gadus luscus.* Food value varied from 147 cal. in *Germa alalonga* to 70 cal. in *Merlucius merlucius.* In general, the fish contained less protein (av. 18.7%) and less fat (av. 1.8%) than many meats tested (av. 20.9 and 3.5% resp.), with the exception of pork. However, some kinds of fish, *e. g., Germa alalonga* and *Cuplea pilchardus,* show the same or even higher protein and fat contents as meat, which makes them valuable meat substitutes. **III. Meat from the mountains.** *Ibid* 87–90.—Twelve meats used most widely in Spain were analyzed for albumin, fat, water and ash, and Ca and K in the ash. With the exception of pork, the albumin content is inversely proportional to fat, *e. g.,* veal (leg) contains more albumin (23%) and less fat (1%), while beef (loin) has less albumin (17.2%) and more fat (6.8%). The food value of beef varies from 92 cal. in leg to 141 cal. in kidney. Wide differences

from the results of other analysts were found. **IV. Milk and cheese.** *Ibid* 91–6.—For a period of a year milk was analyzed daily. The albumin content (0.75%) was higher, and fat and lactose (3.15 and 4.29%) were lower, than those of foreign analysts. Ten kinds of cheese were analyzed and gave albumin 17.3–35.6%, and 36.1–14.9%. Cheese from sheep milk contained much less albumin (14.3%) and fat (25.4%) than that from cow milk. Foods analyzed here have been arranged in the Lawrence dietetic system for Spain. E. M. SYMMES

**A new method for the preservation of foodstuffs.** JOHAN SEVÓN. *Teknillinen Aikakauslehti* **23**, 1–7(1933).—HCl has a preservative effect on foodstuffs, but it attacks colloidal org. matter even in low concn. This effect can be eliminated by the use of HCl-NaCl mixts. in proportions detd. by expt. for each foodstuff. An almost unlimited durability is obtained both for animal and vegetable foods. Temp., air, light and desired preserving time are necessary considerations. In general the $p_H$ is about 4–5. The acid quantities are small, and the salt is removed by washing before consumption of the food. Meat and fish can be kept fresh for 2 weeks by painting the surface with the preservative. Replacement of air by an indifferent gas increases the time of preservation. Fermentation processes, such as pickled cucumbers and fermented cabbage, can be stopped or shifted in any desired direction by the addn. of proper proportions of HCl and NaCl. S. A. KARJALA

**Chemical research in the canning industry.** GULBRAND LUNDE. *Teknisk Ukeblad* **79**, 311–13, 322–3(1932).—A review. C. A. ROBAK

**Influence of variety and environment on various properties of rye.** FR. SCHNEIDER AND FR. HEISER. *Mühlenlab.* **3**, 3–14(1933).—Thirteen varieties of rye were grown under different environmental conditions in various parts of Saxony. The properties investigated were: test wt., wt. per 1000 kernels, protein (N. × 6.25), maltose (by Bach and Oparin's method), and test no. (by Pelshenke's doughball method, cf. *C. A.* **26**, 3306). Environment had the greatest influence on all properties. For each property, the differences between the max. and min. values for variety and for environment, resp., were expressed as percentages of the corresponding mean values, and the ratios between these percentages calcd. These ratios, showing the relative influences of variety and environment, were: test wt. 1:1.8; wt. per 1000 kernels 1:1.5, protein 1:5; maltose 1:3.6, test no. 1:2.8. Practical applications are suggested. CLINTON L. BROOKE

**A new apparatus for determining the milling value of wheat.** CARL SCHMORL. *Mühlenlab.* **1932**, 63–4.—From 5 to 6 g. of wheat kernels are halved and placed in a lactic acid soln. for 48 hrs. at 40–50°. The swollen kernels are then washed for 10 min. in a mech. gluten washer, returned to the lactic acid soln. for 6–8 hrs. at 40–50°, washed for 20 min., and dried at 105° for 15 hrs. or at 130° for 1 hr. The residue represents the branny coatings and the aleurone layer, and the material is removed by washing the flour. The ratio between actual milling yields and yields obtained by this method may be established by a few parallel tests. CLINTON L. BROOKE

**A short method for the determination of gluten quality of wheat.** P. PELSHENKE. *Cereal Chemistry* **10**, 90–6(1933).—See *C. A.* **26**, 3306. L. H. BAILEY

**Determination of particle size and distribution in wheat and rye flours.** W. GRÜNDER. *Mühlenlab.* **1932**, 85–90.—A sedimentation method with the pipet method of Andreasen (cf. *C. A.* **26**, 5357) is used to det. the degree of fineness of flour. "Palatinol A" is used as dispersion medium. CLINTON L. BROOKE

**The effect of diastatic malt upon the loaf volumes of commercial flours.** R. H. HARRIS. *Can. J. Research* **7**, 571–7(1932); cf. *C. A.* **26**, 2249, 5349.—A series of 10 com. flours of different protein contents and baking strengths was baked by a variety of methods to det. the effect of adding to the dough progressively increasing quantities of diastatic malt. The 2 lower malt concns., 2 and 4% resp., increased the resulting loaf vols. in every case, but the highest percentage of malt, 6%, only increased the loaf vol. over the values obtained with 2 and 4% of malt when the highest protein flours were used. Flours which yielded unsatisfactory loaves when baked with the simple formula gave much better results when malt was added. The inclusion of 0.002% of $KBrO_3$ increased the loaf vols. except in the cases of 2 flours evidently of low diastatic power, where little improvement was shown on the results with the simple formula. The further addn. of 2% of malt reacted very favorably with the higher protein members of the series, but had no effect upon these 2 flours. The addn. of 2 and 4% of sucrose to the simple formula did not prove as beneficial as the addn. of like quantities of diastatic malt. No significant relation was found between protein content and loaf vol. in the absence of malt and bromate. J. W. SHIPLEY

**The formation of volatile fatty acids during storage of rye and wheat fat under**

**access of air.** S. C. L. GERRITZEN AND M. KAUFFMAN. *Chem. Weekblad* **29**, 742–5 (1932).—Rye and wheat fats stored in thin layers under access of air are oxidized and relatively large quantities of volatile fatty acids are formed, which are partly sol. in water and have water-sol. Ag salts. After storage for 8 weeks, the R. M W. no. increased from 0.6 to 16, the Kirschner no. from 0.2 to 12. This change does not take place in absence of air. Sterilization and storage in the dark do not prevent the oxidation; light may, however, have an accelerating influence. The Kottstorfer no. increases more than corresponds with the increase in free acid; this indicates other intramol. changes besides the acid formation. F. DE LEEUW

**Determination of benzoyl peroxide in flour.** JOHN R. NICHOLLS. *Analyst* **58**, 4–7(1933).—Benzoyl peroxide is sometimes used to bleach flour and the usual methods for its detection depend upon the oxidizing power of the unchanged peroxide. As a result of its bleaching effect, however, the peroxide is changed to benzoic acid and the method here described (cf. *C. A.* **22**, 930) provides for the colorimetric detn. of the benzoic acid formed. A mixt. of 40 g. $CaCl_2$, 50 g. flour and 10 ml of concd. HCl is distd. with steam until 300 ml. of distillate has been obtained. This is satd. with NaCl and extd. with two 50-ml portions of ether. To the residue obtained after the removal of the ether, 5 ml of acetone and an equal vol of 2 *N* NaOH are added and after dilg. to twice the vol., the acetone is removed by boiling. After cooling to 50–60°, $KMnO_4$ is added in excess, 10 ml. of 2 *N* $H_2SO_4$ is added and the excess $MnO_4^-$ reduced by oxalic acid. After filtering off any insol. fatty acids, the benzoic acid is extd. with two 20-ml. portions of a mixt. of ether and gasoline. The ext. is evapd. to dryness, dissolved in 15 ml. of water, treated with 1 ml of $FeCl_3$ soln. (2.7 g. $FeCl_3$ and 13 ml. of *N* $H_2SO_4$ dild to 100 ml.) and with 1 ml of 0.1% $H_2O_2$. After heating to 100°, 0.5 ml. of *N* NaOH is added and the soln. filtered. To the cold filtrate 1 drop of Fe soln. is added and the resulting color is matched by adding 0.01% salicylic acid to a soln. obtained by adding the reagents to 15 ml. of water and completing the test as above. The salicylic acid soln. is standardized against the color produced when the test is carried out with a known quantity of benzoic acid. W. T. H.

**Testing dog-biscuit flours.** A. S. CARLOS *Food Tech* **2**, 95–6(1932).—An app. is described suitable for detg the breaking point of dog biscuits It consists essentially of a rectangular iron bar pivoted at one end, and provided on its under side, at a point near the pivoted end, with a short projecting stud which applies pressure to the biscuit, the latter being placed on 2 iron supports at a definite distance apart. Pressure is exerted by means of a series of wts. which can be displaced along the iron bar. Within limits, the higher the N content of the flour, the stronger the biscuit. A. P.-C.

**Fermentation of dough.** A. DANGOUMAU. *Bull. soc. chim. biol* **14**, 1552–4 (1932) —Discussion L. E. GILSON

**Testing the quality of flour by the recording dough mixer.** C. O. SWANSON AND EARL B WORKING. *Cereal Chemistry* **10**, 1–29(1933). L. H. BAILEY

**Some aspects of the bromate baking test.** W. F. GEDDES AND R. K. LARMOUR. *Cereal Chemistry* **10**, 30–72(1933).—Results of baking tests conducted on flours experimentally milled from Western Canadian hard spring wheats lead to the conclusion that the bromate formula gives a much better measure of the relative strength of such flours than the basic formula. L. H. BAILEY

**Measuring and recording some characteristics of test-sponge cakes.** WASHINGTON PLATT AND PHILIP D. KRATZ. *Cereal Chemistry* **10**, 73–90(1933).—The authors describe and illustrate methods of measuring and recording many of the characteristics of test-sponge cakes. L. H BAILEY

**Investigations on milk.** GIUSEPPE BRAGAGNOLO. *Chim. ind. agr. biol.* **8**, 412–14 (1932).—Milk from several cows fed fodder and beets was examd. The $p_H$ was 6.39–6.51, and after 20 days, 4.15–4.79. The reductase test (Barthel and Orla-Jensen method) decreased from 7 hrs. to 20 min. in this time period. G. A. BRAVO

**The distribution of nitrogen in milk with reference to the solids-not-fat content.** WM. L. DAVIES. *J Dairy Research* **4**, 142–6(1932).—The N distribution in 62 samples of whole morning milk covering a range of solids-not-fat from 6.5 to 9.0% was discussed. Samples high in solids-not-fat showed greater constancy in N distribution over a consecutive range of samples than those low in solids-not-fat and were characterized by high total N, low non-protein N and high casein N. Samples low in solids-not-fat were characterized by low total N, high and variable non-protein N, low casein and high and variable albumin and globulin N. The casein to albumin to globulin ratio was roughly 14:2.5:1 for samples high in solids-not-fat but the casein dropped in its proportion to albumin and globulin as the solids-not-fat decreased. It was suggested that

samples low in solids-not-fat were abnormal secretions as such samples showed increased albumin, globulin and chloride contents. A. H. JOHNSON

**Freezing point of pasteurized and sterilized milks.** G D ELSDON AND J. R. STUBBS. *Analyst* **58**, 7–10(1933).—Numerous expts. show that there is a slight tendency for the f.-p. depression to be decreased when milk is heated but the change is so small that it does not in any way interfere with the value of the f.-p. test. W. T. H.

**York's experience with tuberculous milk.** F. FISHBURN. *J. Royal Sanit. Inst* **52**, 539–50(1932); *U. S. Pub. Health Eng. Abstracts* **12**, Mi, 32(Nov. 12, 1932).—Results of examns. of 535 milk samples taken between 1912 and 1931 show 65–82% contained less than 200,000 bacteria per cc. Pos. tests for the tubercle bacillus were obtained in 5.5–21.4% of the samples examd. The British Royal Commission is quoted as stating "A considerable proportion of the tuberculosis affecting children is of bovine origin." C. R. FELLERS

**The Hortvet cryoscope.** G. D. ELSDON AND J. R STUBBS. *Analyst* **58**, 27 8 (1933).—Comments on the use of the instrument in the *analysis of milk*. W. T. H

**Short cuts in actual technic of the Babcock test.** A. C. DAHLBERG AND A. J. POWERS. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect.* **25**, 171–6(1932). PHILIP D. ADAMS

**Accuracy of sampling for fat tests at the weigh can.** A J. POWERS, *Proc. Intern Assoc. Milk Dealers, Lab. Sect.* **25**, 150–7(1932).—A comm. rept. Extensive data are given and the variations under various conditions of sampling milk. P. D A

**Weigh-vat test variations.** D. H. BAILEY, F. M. TWINING, J. W. MITTEN AND W. D. SWOPE. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect.* **25**, 157–70(1932).—The variations within the milk-weighing vat may be as much as 2.0%. A device and the method of mixing are described. PHILIP D. ADAMS

**Determination of fat in dried milk.** ANTONIO CERIOTTI. *Rev. centro estud farm. bioquím.* **22**, 148–51(1932).—A review of methods. L. E. GILSON

**Factors affecting the solubility of milk powders. I. The effect of heat on the solubility of milk proteins.** NORMAN C. WRIGHT. *J. Dairy Research* **4**, 122 1 (1932).—Soly. of roller-dried skim-milk powder varied with the temp. at which it was reconstituted, the powder showing higher soly. at high temp. of reconstitution. The heating of milks of high solids concn. tended to make the protein of such milks insol Also as the solids content of the milk increased (to 86.66%) the more rapidly did the protein become insol. at any temp. Thus it was interpolated that on heating at 100°, 50% of the protein was made insol. in 33 min. when the milk solids concn. was 28%, in 2 sec. when the milk solids concn. was 48%, and in 0.4 sec. when the milk solids concn was 88%. The heating of dry skim-milk powders also made the protein insol Thus on heating the dry skim-milk powder at 100° the casein was made 50% insol in 10 hrs., at 117°, 123°, 129° and at 139°, 35 min., 10 min., 3 min. and 40 sec., resp., were required to make 50% of the protein insol. Heating the dry powders also made small proportions of the non-nitrogenous constituents of skim-milk powder insol A. H. JOHNSON

**Increase in non-lactic acidity in raw cream and its control.** P. F SHARP AND J. A. DE TOMASI. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect.* **25**, 3–20(1932).—Lipase activity is evident as low as —10°. Non-lactic acidity develops only in the presence of fat and is greater in cream than in whole milk. Practically no increase occurred in skim milk in 3 weeks although it contains lipase. A high concn. of sucrose partially protects lipase against heat destruction. Heated homogenized cream is a better substrate for the detection of lipase than unhomogenized cream. Raw whole milk shows greater increase in acidity the higher the homogenization pressure. Lipase acted fastest at 48°. High chloride content and lipase activity are assocd. to some extent. To prevent the increase in non-lactic acidity and the development of the rancid bitter flavor in held raw cream it is recommended to warm the milk to 100–115°F. before sepn. and to eliminate cream of milk high in chlorides. PHILIP D. ADAMS

**Determination of butter fat in fat mixtures.** BIRGER PLATON AND N. BENGTSSON *Medd. Centralanstalt. försöksväsendet jordbruks. Mejeriförsök No.* **42**, *Bakt. avdel. No* **54**, 38 pp.; *Kgl. Landtbruks-Akad. Handl. Tid.* **70**, 222–57(1931); cf. *C. A.* **24**, 2500.—The method for analyzing butter and its mixts., proposed by Bertram, Bos and Verhagen (*C. A.* **18**, 556), has been applied to many butter and margarine samples; and the *A* and *B* nos. which they introduced have been critically examd. for reliability, with particular reference to "mixed butter," a product which under Swedish law must contain at least 18% butter fat. The Klostermann-Quast procedure (*C. A.* **22**, 1697) for determining the *A* and *B* nos. has been further improved and brought to a degree of accuracy such that 2 out of 22 analyses were in error by 6 to 7%, the error being less

than 5% in the other 20. The new method is much more rapid than the original Bertram-Bos-Verhagen method and requires less material and app. The procedure is: Saponify 5.0 g. of filtered fat with 2.3 cc. KOH (1:1) and 8 g. glycerol in a 200-cc. Erlenmeyer flask, dissolve the soap in hot water and transfer quantitatively to a 100-cc. volumetric flask having a bulb of about 100-cc. capacity in its neck above the vol. mark. Fill this flask to the mark at room temp. and introduce a glass rod ending in a ball just small enough to pass through the neck of the flask. The rod passes loosely through the cork closing the upper neck of the flask. Heat 15 min. in a water bath at 80–85° and add from a pipet 25 cc. of cold $MgSO_4$ soln. (150 g. per l.), stir by moving the rod up and down. After 10 more min. in the water bath, with repeated stirring, cool rapidly to 20° and after 5 min. remove the Mg soap by suction filtration (in blank tests, filter without suction). Measure 100 cc. of filtrate into a like volumetric flask, add just enough $H_2SO_4$ (20 cc. of concd. acid per 100 cc.) to decolorize phenolphthalein, then 25 cc. of 0.1 *N* $AgNO_3$, and shake violently for 1 min. After 5 min. filter through a dry filter, add 5 cc. of *N* $HNO_3$ and 3 cc. of ferric $NH_4$ alum soln. satd. in the cold, and titrate with 0.1 *N* $NH_4SCN$; the result, after subtracting the result for a blank titration without fat, gives half the *A* no. of the sample. Then transfer the flask contents quantitatively to a 400-cc. flask by rinsing with water to a total vol. of 200–225 cc., add a little pumice and distil in a Polenske app. down to 30–40 cc. Titrate the distillate against phenolphthalein with 0.1 *N* NaOH; the result, minus the NaOH used in a blank test, gives half the *B* no. JULIAN F. SMITH

**Correlation between the organisms found microscopically and the bacteriological deterioration of butter.** J. A. NELSON Mont. Agr Expt. Sta. *Bull.* **267**, 2–27(1932).—The keeping qualities of 449 samples of com. salted and unsalted butter were detd. and correlated with the microörganisms present The types and nos. of rod-shaped bacilli seemed to be an index of keeping quality. The presence of clumps of well-stained thin rods was a strong presumption of deterioration. Protein decompn., cheesiness and putridness were the most common defects encountered in connection with the rod-shaped bacteria. These produced deterioration at a temp. of 21°. NaCl had a decided inhibiting effect on the bacteria in butter. There was little correlation between nos. of bacteria and keeping quality. In general, direct microscopic counts were higher than plate counts. C. R. FELLERS

**Triacetin in the adulteration of butter.** ALDO NEMBROT AND MARCELL CEOLA. *Giorn. chim. ind. applicata* **14**, 497–8(1932).—Triacetin is often added to butter to bring the values of the Reichert value, and *n* to permissible limits. Finke's method of detg. these values, both before and after extg. with 50% EtOH, will detect addn. of more than 1% triacetin in butter. For smaller amts., N and C recommend detg. AcOH in the EtOH ext., after sapon. with KOH In this way 0.4% or less of triacetin can be detected. A. W. CONTIERI

**Design of equipment and method for preparing starter for Oregon creameries and cheese factories.** F. E. PRICE, G. H. WILSTER AND C. J. HURD. Ore. Agr. Expt. Sta., *Bull.* **301**, 5–28(1932).—Starter is defined as a product obtained by inoculating pasteurized skim milk or whole milk at about 21° with a mixed culture of bacteria producing lactic acid and bacteria fermenting citric acid and holding it at this temp. until a certain acidity and desirable flavor and aroma are developed. *Acetoin* and *diacetyl* have odors similar to butter made from starter-ripened cream of good quality, and are responsible in part for fresh butter flavor. Acetoin is formed in the starter through the activity of the organisms fermenting citric acid and is subsequently oxidized to $CH_3COCOCH_3$. Starter manuf. is described. C. R. FELLERS

**Storage studies of Louisiana eggs.** CHARLES W. UPP. La. Agr. Expt. Sta. *Bull.* **229**, 5–46(1932).—Approx. 60% of the total loss in grade of stored eggs occurred between the beginning of the storage season and mid-season. The av. loss in gross wt per case in storage was 2.49%. There was no significant relationship between av. grade per case of in-going eggs and percentage of eggs which graded as loss at the end of the storage season. The av. percentage of olive yolks was directly proportional to the amt. of cottonseed meal in the ration. Olive yolks did not constitute a serious source of loss except when cottonseed meal was fed. Olive yolks were not caused by bacterial or mold infection, though a large percentage of the abnormal eggs discarded at the end of the storage season was infected with bacteria or molds or both. Upon cooking the color of olive-yolked eggs became bright yellow. Olive-yolked eggs are discarded by the trade. Sixty references are appended. C. R. FELLERS

**The determination of nitrate in meat products.** F. TH. VAN VOORST. *Chem. Weekblad* **30**, 101–3(1932).—The method of Grandval and Lajoux is recommended. The chlorides must be removed; $Ag_2SO_4$ is used for this purpose. E. SCHOTTE

**Influence of sex on the quality and palatability of beef.** M. D. Helser, P. Mabel Nelson, Belle Howe, B. H. Thomas and J. W. Woodrow. Iowa Agr. Expt. Sta *Leaflet* **29**, 6 pp.(1932).—There was little difference between steer and heifer carcasses in percentage of lean, fat and bone at the start and at the end of 90 days of feeding As the feeding period progressed the animals became fatter and the difference wider The percentage of lean to fat was less in both sexes as the feeding progressed, but the difference increased faster in the heifers. There was little or no difference in palatability, and amt. or distribution of elastic tissue in heifers or steers during feeding or after finishing. C. R. Fellers

**Composition of the canned meat of crab [Chionectes phalangium Fabr.].** Mrs Yasu Hatakoshi. *J. Chem. Soc. Japan* **53**, 1026–30(1932).—The meat contained water 77.65, protein 19.35, fat 0.85, glycogen 0.23 and ash 1.95%. The dry matter contained 13.57% N, of which 0.11% was insol. in hot 20% HCl. The N distribution of the hydrolytic products was ammonia N 8.57, humin N 1.38, arginine N 11.89, histidine N 5.13, lysine N 10.92 and cystine N 0.97%. K. Kitsuta

**Investigations on the fermentation of mincemeat.** Lloyd A. Hall. *Fruit Products J.* **12**, 107, 124(1932).—Fermentation troubles with mincemeat were prevented by eliminating most of the vinegar previously used, by decreasing the amt. of sugar and by boiling the liquid ingredients with the sugar for 10 min. before mixing with the other solids. J. R. Neller

**Effect of temperature on speed of drying of Corinthian grapes.** N. Ch. Roussopoulos. *Praktika (Akad. Athenon)* **6**, 465–8(1931); cf. *C. A.* **23**, 3992.—The value of $A$ in the formula $\log (K_2/K_1 = A[(T_2 - T_1)/(T_1 T_2)]$, giving the increase in reaction velocity with the temp., is equal, in the case of the velocity of drying of Corinthian grapes in a confined atm. in the presence of dehydrating agents ($CaCl_2$, $H_2SO_4$), to 2182 for the interval 37.5–47.5°. This comes within the accepted limits of 2000–4000. The result is, that for an increase of 10° the drying speed of Corinthian varieties increases 1.66 for the temp. interval 37.5–47.5°, and slightly more (1.8) for lower temps. (above 10°). Results are plotted graphically. Lucien Y. Dyrenforth

**Blueberries.** James M. Bartlett. Maine Agr. Expt Sta *Official Inspection Bull.* **143**, 3(1932).—Because many blueberry growers dusted their fields with Ca arsenate to control the blueberry maggot, chem. examn. of 52 samples of fresh berries was made for As. Thirteen samples contained in excess of 0.01 grain per lb. of As. All the samples contg. much above the tolerance of As had been picked soon after dusting and before any rain had fallen. C. R. Fellers

**Determining the color of tomato concentrates.** F. Emanuelle and C. Mauri *Ind. ital. conserve alimenti.* **7**, 178–80(1932); *Chemie & Industrie* **28**, 1447.—A circle is built up of 4 colored disks, yellow, gray, black and red, variable sectors of which are uncovered and rapid rotation of which gives a color impression which is used for comparison. Numerical values are obtained from the angles of the 4 sectors. E. and M. have modified the method by rotating on the same support the above disk and a sample of the concentrate which spreads out, by centrifugal force, in a thin film on the inside wall of a glass cylinder. As in the preceding case the resp. lengths of the arcs of the colored sectors permit of a numerical evaluation of the color. A. Papineau-Couture

**Composition of Golden Delicious and Boston Marrow squashes.** E. M. Bailey Conn. Agr. Expt. Sta *Bull.* **341** (*36th Annual Rept. on Food Products*) 718 (1932).—The seed-free flesh contained 7.68–15.42% of solids. The samples represented various crosses between these varieties. C. R. Fellers

**Peppers.** A. T. Erwin. Iowa Agr. Expt Sta *Bull.* **293**, 121–52(1932).—Botanical discussion, nomenclature, diseases, yields, uses and compn. of peppers of various sorts are given. There are 42 references. C. R. Fellers

**Maple sirup.** James M. Bartlett. Maine Agr Expt. Sta. *Official Inspection Bull.* **143**, 4–5(1932); cf. *C. A.* **26**, 1149.—Of the 18 samples examd., 6 contained slightly more than 35% of water, the legal max. Only 1 sample had a low Pb no., and none was low in ash content. The standards require not less than 0.45% ash and a Pb no. of not less than 1.19. C. R. Fellers

**Coffee-bean fat and wax.** F. Munk. *Allgem. Oel- u. Fett-Ztg.* **29**, 13–15(1932).—In decaffeinating coffee by solvent extn., crude coffee-berry wax (about 1.25–1.5 times the wt. of caffeine removed) contg. 50% of coffee-bean fat, caffeine, etc., is obtained as a by-product. Coffee oil ("HAG") prepd. from extn. residues is identical with ordinary coffee-bean oil and contains ergosterol of high vitamin-D activity. The vitamin-D content of the bean is stated to be increased by roasting. B. C. A.

**Losses in the effluent of pilchard reduction plants in British Columbia.** Desmond Beall. Biol. Board of Can., *Bull.* No. **35**, 11 pp.(1933).—The effluent of a pilchard

reduction plant contained 0.57% oil, 1.91% suspended solids and 2.96% dissolved protein. Since the quantity of effluent is large, these losses are considerable. Some types of equipment materially reduce these losses. The effluent is now run into the sea.
C. R. FELLERS

**Nitrogenous constituents of a variety of Rhaphanus sativus, "Sakurajima-daikon."** KIYONAO YOSHIMURA, TADAMI EFUJI AND TAKESHI IWATA. *J. Agr. Chem. Soc. Japan.* **8**, 1060-3(1932).— Fresh radish, "Sakurajima-daikon" (66.09 kg.), was crushed and pressed, and the residue was boiled with $H_2O$. From the juice and $H_2O$ ext. adenine (HCl salt) 0.6 g., arginine ($HNO_3$ salt) 1.2 g., choline (Au salt) 0.6 g., and trigonelline (HCl salt) 0.1 g. were isolated. The results were compared with those for other varieties of radish.
Y. KIHARA

**Botulism poisoning.** WALTER G. SACKETT. Colo. Agr. Expt. Sta. *Circ* **73-A**, 4 pp.(1932).— *Cl. botulinum* occurs naturally in Colo. soils and thus is present on many vegetables and other foods which come in contact with soil or dust. The organism is destroyed at a 10 min. exposure at temps. of 58–60° in a pressure cooker. The toxin is inactivated by boiling for 8-10 min. In canned foods, *Cl. botulinum* usually produces gas accompanied by a peculiar rancid spoiled odor.
C. R. FELLERS

**Van Slyke method for protein analysis is affected by the presence of fats.** SIGRED M. HAGUE. Purdue (Indiana) Agr. Expt. Sta., *Rept. of the Director* for Year Ending June 30, 1931, 50.— Fats materially affect the distribution of N as detd. by this method. The reactive constituent of the fat mol. is glycerol, the fatty acids being without effect. The significant effects produced by the presence of fats or glycerol are: increase in the acid-sol. humin, in the phosphotungstic acid humin, and in the nonamino N and arginine value. Carnauba wax, which is not a glyceride, had little if any effect on results obtained by the Van Slyke method.
C. R. FELLERS

**Ensilage of raw potatoes by embedding in potato mash.** G. RUSCHMANN AND G. GRAF. *Landw. Jahrb.* **74**, 447–56(1931). - Potatoes are steamed, mashed and used as an embedding medium for raw potatoes for ensilage. The extent of the subsequent fermentation is largely controlled by the sugar content of the potatoes. Lactic fermentation predominates, and smaller proportions of acetic and other acids occur.
B. C. A.

**Drying of legume hay plants. A study to determine the role of the leaves in drying the stems and the relation of method of drying to loss of leaves and chemical composition.** FLOYD L. HIGGINS. Minn. Agr. Expt. Sta. *Tech. Bull.* **83**, 3-42(1932).—Red clover or alfalfa leaves did not function to any appreciable extent in withdrawing moisture from the stems during the drying period. Sweet clover and soy-bean leaves aid in the drying of the stems. In ordinary sun- or shade-drying of hay fermentation does not occur. Alfalfa dried in the shade was slightly lower in N-free ext. and fat than oven-dried. Sun-dried alfalfa was lower in fat than either the oven- or shade-dried. The red clover dried in the sun was slightly lower in N-free ext. and in crude protein than that dried in the oven. Shade-dried red clover was slightly lower in fat than either sun- or oven-dried. In general, oven-dried and sun-dried samples of legumes were of similar chem. compn.
C. R. FELLERS

Report of the entomology department [*Leucopholis* as food] (LOPEZ) **15.** Two new reactions for caffeic acid and chlorogenic acid (HOEPFNER) **7.** Physical and chemical changes in the ripening of deciduous fruits (ALLEN) **11D.** Relationship between viscosity, elasticity and plastic strength of soft materials as illustrated by some mechanical properties of flour doughs (SCHOFIELD, BLAIR) **2.** Straw utilization [as a feeding material] (LEMAY) **15.** Drying apparatus, especially for drying fish, whale flesh, etc. (Brit. pat. 362,680) **1.** Oils and fats (Fr. pat. 736,984) **27.** Sucrose extraction from materials such as sugar-beet slices [and caffeine extraction from coffee] (U. **Vitamin-containing foods.** SOC. ANON. DES USINES RÉMY. Belg. 386,419, Mar 31, 1932. Food products, stirred mechanically or by means of an inert gas, are exposed in a non-oxidizing atm. to the action of ultra-violet rays of wave length greater than 250 A. U.

**Preventing fermentation.** LABORATORIES DE CHIMIE APPLIQUÉE. Fr. 737,267, May 18, 1932. An aq. soln. of $ZnCl_2$ or $ZnSO_4$ is used to prevent fermentation in fermentable materials. In larger proportion the soln. is used to coagulate albuminoids and other substances in food.

**Apparatus for sterilizing viscous food products such as malt extracts by the action of actinic rays.** HUGO W. ROHDE (to Jos. Schlitz Beverage Co.). U. S. 1,888,172, Nov. 22.

**Preserving milk.** WALTER PFUNDT. Ger. 567,188, April 30, 1929. Skim milk for use as fodder is evapd. *in vacuo* to about $^1/_6$ of its vol. and then treated with about 0.8% of powd. CaO, which may be mashed with water shortly before use. About 1% of com. lactic acid may be added to the milk at the same time as or after the CaO.

**Artificial cream or milk.** AXEL BENZON and KJELD KRUSEBEK JENSEN. Brit 362,744, Jan. 22, 1931. Liquefied butter, without addnl. oil or fat, is injected into heated skimmed or sweet milk by means of a high-pressure atomizer.

**Apparatus for homogenizing milk, etc.** HENRI CORBLIN. Ger. 567,112, Dec 17, 1930.

**Apparatus for margarine manufacture.** V. FAURSKOV. Norw. 50,857, May 18, 1932. A rotary drum roller with device for the application of a cooling or heating fluid is described.

**Preserving cheese.** ROLF H. J. GAARDER. Norw. 50,578, Dec. 5, 1932. The pieces are coated with an alcoholic soln. of Na benzoate by dipping or by application.

**Composition containing dextrose and calcium lactate for use in making bakery products.** EINAR WOXVOLD (to American Maize Products Co.). U. S. 1,887,175, Nov. 8. Thin shell-like particles are prepd. contg. dextrose and Ca lactate in pro-

portions such that a 5% soln. has a $p_H$ of between 6.1 and 3.1. When used in making dough the compn. serves to accelerate yeast propagation.

**Preserving fruit, etc.** ALFONCE W. BOHTE. Australia 26,890, May 24, 1930. Fruit and vegetables are preserved by a "sweating" or drying of the moisture from the skin and immediately beneath the skin, by a gradual heating to 120–150°F. The fruit, etc., is stored in hermetically sealed dry containers.

**Dehydrating fruit juices, etc.** OCTAVE BURÉ. Fr. 736,342, April 18, 1932. Fruit juices and worts, after fermentation or not, are dehydrated by forming a hydrogel in the liquid, the colloid used being a metal oxide, preferably $SiO_2$. The coagulum obtained dries at ordinary temp. when exposed to dry air, or the org. constituents may be extd. by suitable solvents.

**Apparatus for testing the hardness and toughness of fruits and vegetables.** VICTOR B. BONNEY and PAUL A. CLIFFORD (dedicated to the Government and people of the U. S.). U. S. 1,887,850, Nov. 15.

**Food product from cocoa, sugar and water.** HANS-ADALBERT SCHWEIGART. U. S. 1,887,905, Nov. 15. A partially de-oiled cocoa powder is mixed with a sugar-contg. liquid and with an acidified aq. liquid contg. milk constituents and the mixt. is heated under pressure at boiling temp. to effect solubilization of starch and proteins and swelling of non-sol. constituents of the cocoa powder.

**Removing skins from nut meats.** CAREY K. BIZZELL and JAMES E. BIZZELL. U. S. 1,887,256, Nov. 8. Nut kernels such as those of Brazil nuts are immersed in a hot dil. alkali carbonate or hydroxide soln. for about 1–7 min. to permit reaction with the fatty materials of the skin but without permitting reaction upon the meat of the kernel, the skins and reaction products are removed, and the treated kernels are then neutralized with acetic, citric, malic, tartaric, phosphoric or hydrochloric acid.

**Tea.** THEODOR GRETHE. Fr. 737,303, May 19, 1932. Tea is obtained free from theine by moistening it with water, extg. with an org. solvent such as $CH_2Cl_2$, $CHCl_3$, or benzene, removing the solvent and drying with a warm current of air at reduced pressure, the temp. of the tea not rising above 65°.

**Apparatus for drying tea, etc.** M. J. BALDWIN. Brit. 356,385, July 16, 1930. Structural and mech. details.

**Drying or cooling fresh tea by air currents before withering.** J. A. MAIN. Brit. 354,791, May 14, 1930. App. and various details of operation are described.

**Tea-withering apparatus.** L. N. LLOYD and BROOKE BOND & CO., LTD. Brit. 352,641, May 19, 1930. Structural details of an app. with wire mesh racks.

**Roasting coffee.** DANIEL J. KENNEDY. U. S. 1,887,686, Nov. 15. Coffee is roasted substantially to the point of max. expansion and subjected to a burning flame for a few min. This treatment is for the purpose of checking development of rancidity and is followed by cooling and spraying of the coffee with alc.

**Oil cakes.** ANDRÉ PHILIPPOU. Brit. 367,751, Aug. 19, 1930. Void. See Fr. 702,132 (*C. A.* **25**, 4070).

**Preserving grain.** YA. M. VAINSHTEIN. Russ. 25,005, June 1, 1931. Enzymic processes and heating of grain are prevented by treatment with gaseous $CO_2$.

**Nutritive salt for cattle and poultry, containing iodine.** ARNBJÖRN LAERDAL. Norw. 48,753, Dec. 8, 1930. Small amts. of I in the form of incinerated sea-weed are added to a mixt. of NaCl, bone meal, powdered limestone, sulfur, $Fe_2O_3$, phosphates, and like substances.

---

## 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**The role of scientific research institutes in different Soviet chemical industries.** D. A. EGIZ. *J. Chem. Ind.* (Moscow) **1932**, No. 10, 42–5. H. M. LEICESTER

**Depreciation of chemical plant: Financial accounting.** S. HOWARD WITHEY. *Chem. Age* **28**, 72–4(1933). E. H.

**The functions and training of a chemical engineer.** W. E. GIBBS. *Chem. Age* **28**, 67–9(1933). E. H.

**United States imports of chemicals and allied products.** ANON. *Ind. Eng. Chem., News Ed.* **11**, 36–8(1933). E. J. C.

**Solvent recovery.** W. L. BROGAN. *Chem. Eng. Mining Rev.* **25**, 88–91(1932).—Solvent-recovery processes are classfied as: direct condensation, condensation after compression, processes of absorption in liquid media, and processes of adsorption in solid media. Each is briefly outlined. Recovery at Deer Park factory of Leathercloth

Ptg., Ltd., is described. The solvent is a mixt. of $Me_2CO$, $C_6H_6$ and EtOH. The solvent/air mixt. is drawn by a fan from the coating dept. and recovery effected by the adsorption of the solvent vapors in activated C, with the adsorbed solvent discharged by means of low-pressure steam. W. H. BOYNTON

**Recovery of volatile solvents.** THORMANN. *Zentr. Gewerbehyg. Unfallverhut* **18,** 67–75(1931).—Dangers and precautions are discussed. B. C. A.

**Extractions from solutions by means of solvents.** A. F. HOLLEMAN. *Chem Weekblad* **29,** 762(1932).—H. gives an algebraic demonstration of the proposition that when a given amt of solvent is used, the max. efficacy of ext. corresponds to an infinite no. of successive extns. with an infinitely small amt. of solvent. G. CALINGAERT

**A demonstration experiment on the problem of gas liquefaction.** H. KEEFER *Physik. Z.* **33,** 967–8(1932). C. E P. JEFFREYS

**American Society for Testing Materials, 1932 Supplement to Book of Standards,** 102 pp.; cf. *C. A.* **26,** 4391.—*Standard specifications* are given for Cu and bronze trolley wires. *Standard methods* are given for: sampling and testing portland cement; test for distn. of natural gasoline; and chem analysis and phys. testing of rubber products. *Standard definitions* are given of terms relating to materials for roads and pavements. G. G.

**American Society for Testing Materials, Tentative Standards, 1932,** 1236 pp. The subjects treated are similar to those listed in *C. A.* **26,** 4391. A few subjects not included in the 1932 Tentative Standards are covered in the preceding abstr. The following addnl. topics are covered: Tentative specifications are given for: structural medium and rivet steels; elec.-fusion-welded steel pipe (sizes 8 in. to but not including 30 in., and 30 in. and over); cast-Fe culvert pipe; ferro-W; low-C ferro-Mo, Mo salts and compds.; hard-drawn Cu transmission cable; Cu water tube; Al-Cu-Mg-Mn alloy bars, rods and shapes; Mg-base alloy sheet and wrought shapes, specifications and tests for masonry cement; pure linseed oil putty for glazing, ethylene glycol monobutyl (and monoethyl) ethers, acetate ester of ethylene glycol monoethyl ether (90–1 and 95–6% grades); insulated wire and cable (performance rubber compd.) friction tape for elec. purposes; and tolerances and test methods for tubular sleeving and braids. *Tentative methods* are given for: tests for magnetic properties of Fe and steel, for gypsum and its products, for particle size of ground refractory materials, and for comparative hiding power of paints; viscosity-temp. chart for liquid petroleum products; chem. analysis of $CaCl_2$; sampling coke; sampling coal by ball mill method, vol. and sp. gr. correction tables for creosote, creosote coal-tar soln. (to 50% tar) and coal tar (coke-oven tars); sampling and tension-testing natural building stone and sample for testing; testing laminated tubes and round rods, flexible varnished tubing, and pasted mica used in elec. insulation; test for grading natural mica according to size, com. quality and thickness; and Rockwell hardness testing of metallic materials. *Tentative recommended practice* is given for safeguarding against embrittlement of hot galvanized structural steel products and procedure for detecting embrittlement. *Tentative revisions of standard specifications* are given for: low-C-steel splice bars and track bolts; steel screw spikes; quenched C-steel and alloy-steel track bolts; structural steel for buildings; cold-drawn steel wire for concrete reënforcement; com. quality hot-rolled bar steels; com. cold-finished bar steels and shafting; welding and seamless steel pipe; lap-welded and seamless steel and lap-welded Fe boiler tubes; gray Fe, high-test gray-Fe and malleable castings; Zn coated (galvanized) Fe or steel telephone and telegraph line wire, tie wires, farm-field and railroad right-of-way wire fencing, barb wire, wire strand and chain-link fence fabric galvanized after weaving, Cu plates for locomotive fireboxes; Cu bars for locomotive staybolts; seamless Cu boiler tubes; Cu and brass pipes of standard sizes; sheet high brass; clay sewer pipe; gypsum partition tile or block; basic carbonate white lead; tolerances and test methods for cotton sewing threads and asbestos yarns. *Tentative revisions of standard methods* are given for: chem. analysis of ferro alloys; making and storing compression test specimens of concrete in the field; making compression tests of concrete; test for org. impurities in sands for concrete; test for sieve analysis of aggregates for concrete; routine analysis of white pigments, of white linseed oil paints, of dry red lead, of yellow, orange, red and brown pigments contg. Fe and Mn, of yellow and orange pigments contg. Cr compds., blue pigments and chrome green, of Ti pigments, of dry $Cu_2O$ and of dry HgO; tests for hygroscopic moisture (and other matter volatile under the test conditions) in pigments, for flash and fire points by means of open cup and for cloud and pour points; lab. sampling and analysis of coal and coke; and testing molded materials and oils used for elec. insulation. *Tentative revisions of standard definitions*

are given for terms relating to heat-treatment operations (esp. as related to ferrous alloys). G. G.

**Studies in agitation. Suspension of sand in water.** A. McLaren White, S. D. Sumerford, E. O. Bryant and B. E. Lukens. *Ind. Eng. Chem* **24**, 1160-2(1932).—The performance of a stirrer in suspending sand in water has been studied in semi-plant scale expts. L. W. T. Cummings

**Accident prevention in the chemical industry.** Rheinfels *Chem. Fabrik* **6**, 51 5(1933); cf. *C. A.* **24**, 1910. J. H Moore

**Destruction of toxics in industrial establishments.** Heinr. Dräger. *Dräger-Hefte* **1932**, 2210 13.—The toxics concerned are *chemical warfare agents* of which *mustard gas* is the only one that presents a serious problem. The destruction of mustard gas under various conditions and on various materials is described. The principal agents of destruction recommended are water and chloride of lime. Carefully trained personnel is necessary. A. L. Kibler

**The regeneration of respiratory air in gas-protection apparatus with alkali superoxides.** A. Hloch. *Angew. Chem.* **46**, 45–7(1933) $Na_2O_2$ is not suited for complete regeneration. $KNO_3(Na_2O_2 + K_2O_4)$ and $K_2O_4$ will serve the purpose theoretically but practical difficulties exist. 10 references. Karl Kammermeyer

**Experiments in chambers protected from air raids [breathing experiments in closed spaces].** Karl Quasebart. *Gasschutz u. Luftschutz* **3**, 13 20(1933). —Expts were carried out with 10 men in a gas tight cylindrical tank of 10 cu. m. capacity, with 53 adults in a cellar of 53 cu. m. made as gas tight as possible by means of oil paint and with 2 men in a lab. gas chamber. Some expts. were made without ventilation and some with ventilation with known vols of fresh air. Observations were made for pressure, relative humidity, temp and percentage of $O_2$ and $CO_2$ and the results are shown by curves. Conclusion: The $O_2$ content of the air could sink to 12–10% without injuring a healthy, resting person. At 5% $CO_2$ causes distinct effects and at 6% may cause considerable annoyance. A. L. Kibler

**Recognition of poison gases and chemical warfare agents by the sense of smell.** Münsch. *Gasschutz u Luftschutz* **2**, 273-5(1932).—A system of classification of odors is given, the odors of the most important chem warfare agents are described and the difficulties of recognition by means of odor are emphasized. A L Kibler

**Systematic classification of heat-insulating material.** Kh. A. Kaplanov *Izvestiya Teplotech. Inst.* **1932**, 951-68.- A bibliography of a great no. of org. and mineral heat-insulating material in tabular form giving the vol./wt. (kg./m.), av. temp. during the expt. and the heat cond. factor. 27 literature references are given. A. A. B.

**Aluminum oxide as a highly refractory material.** H. Gerdien. *Z. Elektrochem* 39, 13 20(1933).—A highly refractory insulating material which was developed for spark plugs (D. R. P. 274,039 and 326,841) is now on a production basis and has been applied to other uses. It consists of nearly pure alumina, highly sintered and has been named "Sinterkorund." The structure consists of closely packed corundum grains embedded in a glass. The sp. gr. is 3.78, slightly lower than natural corundum; sp. heat 0.2; m. 2050°; water absorption nil; porosity in fuchsin soln. under 600 atm. nil; Moh's hardness 9. The mech. properties are crushing strength 6190 kg./sq. cm.; tensile strength 350 kg./sq. cm.; modulus of elasticity 2,350,000 kg./sq. cm.; softening temp. under load 1730°; and deformation temp. under load undeterminable. Thermal cond. is 18 times that of tech. porcelain. Coeff. of thermal expansion is $46 \times 10^{-7}$ at 20–100° and $80 \times 10^{-7}$ at 20–800°. The corresponding figures for Berlin porcelain are 30.3 and 38.8. "Sinterkorund" has a good resistance against melted $Na_2O_2$, NaOH, $Na_2CO_3$, Al and many alloys. It is attacked by F at high temp., by the halogens in the presence of C, by melted Li, Zr and by Cr, Mn and Fe in an oxidizing atm. The resistance to a large no. of molten salts and minerals is also given. A large variety of lab. crucibles, tubes, boats and dishes have been made from this material. R. F. F.

**Process and apparatus for effecting exothermic reactions [sulfuric esters].** RICHARD M. DEANESLY (to N. V. de Bataafsche Petroleum Maatschappij). Brit. 363,028, Oct. 9, 1930. See Can. 310,439 (*C. A.* **25**, 3014).

**Temperature control of exothermic catalytic reactions such as oxidations of organic compounds.** HARLAN A. BOND (to Roessler & Hasslacher Chemical Co.). U. S. 1,888,066, Nov. 15. In connection with a reaction such as the production of formaldehyde from MeOH and air with a Ag catalyst, heat is removed uniformly through and from planes perpendicular to the gas flow in the reaction zone by uniformly cooling the exit end of the catalyst body throughout its whole extent while preventing removal of heat from the reaction zone in a direction reverse to the gas flow. In a described app., a water-cooled base plate in contact with the exit side of the catalyst body is used for cooling.

**Carrying out chemical syntheses.** INSTITUT FÜR PHYSIKALISCHE GRUNDLAGEN DER MEDEZIN. Brit. 362,869, June 2, 1930. Addn. to 340,862 (*C. A.* **25**, 4092). Syntheses involving surface reactions are carried out with the aid of dark a. c. discharges at above the crit. temp. of the gas produced, the speed of flow of the reactants being sufficiently high to prevent decompn. of substances decomposing under the action of the discharge. In an example the production of $C_2H_2$ from $CH_4$ or a mixt. of $CH_4$ and H is cited. Void.

**Rapid drying.** USINES CHIMIQUES DES LABORATOIRES FRANÇAIS (UCLAF) (Pierre Huchet, inventor). Fr. 736,235, Aug. 11, 1931. A rapid drying at a const. temp. is obtained by submitting the substance to be dried to a vacuum while it receives heat liberated by a liquid or soln. maintained in the solidification or crystn. phase.

**Purification and decolorization.** M. ERNOTTE. Belg. 387,742, May 31, 1932. The material to be purified or decolorized is intimately mixed with carbonation sludge or with dried and powd. sugar-house scums, and the decolorizing agent is sepd. by filtration. The process is applicable to the refining of sugar; decolorizing juices, sirups, molasses; purification of crude petroleum solns. and other petroleum products; treatment of waste waters; wine, cider, etc.

**Digesting or extracting.** JENS W. A. ELLING. Fr. 41,008, Nov. 23, 1931. Addn. to 697,406 (*C. A.* **25**, 2883). Modification of app. are given.

**Compressing gases.** N. V. PAVLOV. Russ. 26,767, Dec. 1, 1928. In compressing the gas by means of a statically or a dynamically acting liquid flow which carries the gas off in an undissolved state, the flow of liquid which moves under the influence of gravity only is periodically retarded to compress the gas above the static pressure. The compressor is equipped with valves and receiver for the gas.

**Separating gases by liquefaction and rectification.** SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE). Fr. 737,295, May 19, 1932.

**Apparatus for liquefying and separating gases containing carbon dioxide.** SOCIÉTÉ L'AIR LIQUIDS (SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE). Fr. 40,755, Mar. 19, 1931. Addn. to 709,448 (*C. A.* **26**, 1160).

**Separating dust from gases.** WM. ALEXANDER. Fr. 736,458, April 30, 1932.

**Removing dust from gases by water.** SOC. D'ÉLECTRICITÉ DE LA RÉGION DE VALENCIENNES-ANZIN. Fr. 40,789, Sept. 14, 1931. Addn. to 711,127 (*C. A.* **26**, 1682).

**Evaporating liquids.** SOC. ANON. "LE CARBONE." Fr. 40,579, Jan. 17, 1931. Addn. to 707,749 (*C. A.* **26**, 788). Woven carbonized fibers, preferably activated, are used instead of the activated charcoal.

**Atomizing liquid and semi-liquid masses.** ERIK ROTHEIM. Norw. 50,567, April 11, 1932. The gas serving as a pressure medium, *e. g.*, $Me_2O$, hydrocarbons or halohydrocarbons, which in condensed state is dissolved in the substance to be atomized, is brought to partial or total expansion during the flowing of the mass before it leaves the spraying device. App. is described.

**Separating solid materials; feeding granular materials.** SIMON-CARVES, LTD. Brit. 380,196, July 11, 1931. Removal of dust from coal is specified.

**Drying solids.** HENRIK NIELSEN. Norw. 51,641, Oct. 17, 1932. The wet material, *e. g.*, *clay*, is carried on a belt conveyor through the app. countercurrent-wise to hot gases. The belt permits the passage of the gases through as well as along the material. App. described.

**Emulsions.** WILLIAM SELTZER. Ger. 559,222, May 13, 1931. See Brit. 361,262 (*C. A.* **27**, 1065).

**Drying animal and vegetable products.** ADAM MEIRO. Fr. 736,570, May 3, 1932. Solid animal and vegetable products are sepd. from liquids and juices by evapn.

to dehydration in a petroliferous oil at a temp. not destructive to the solids treated The products are preserved by remaining impregnated with the oil.

**Operating rapid filters.** K. V. ROZENTAL. Russ. 24,388, June 27, 1929 and addn. to Russ. 26,977, Dec. 11, 1930.

**Gas-filter absorbent, especially for respiratory apparatus.** GERHARD K E. H STAMPE. Brit. 362,552, Sept. 22, 1930. An absorbent for use against $H_2S$, $NH_3$, etc., consists of $Cu_2Cl_2$ on a solid carrier which may itself be absorptive, *e. g.*, active charcoal The efficiency may be increased by satg. the carrier with a soln., preferably other than $Cu_2Cl_2$, *e. g.*, $Pb(NO_3)_2$, reacting with the gas.

**Control devices for oxygen respirators.** EDMUND KOCH. Brit. 362,573, Sept 30, 1930.

**Canister for respirators containing chemical purifying agents.** ROBERT H. DAVIS U. S. 1,889,015, Nov. 29, Structural features.

**Composition for producing smoke and irritating and disabling gases.** BYRON C. Goss (to Lake Erie Chemical Co.). U. S. 1,886,394, Nov. 8. A compn comprising chloroacetophenone 12.5-30, hexachloroethane 27.3-52.5% and also contg $NH_4ClO_4$, Zn dust and ZnO is suitable for disabling bandits.

**Cleaning wall surfaces in storage tanks.** AKTIESELSKAPET FREDRIKSSTAD SAAPEFABRIK. Norw. 49,390. Dec. 5, 1932 Addn. to Norw. 46,791 (see Brit 349,536, *C. A.* **26,** 2047). The coating of water glass is applied on the unclean surfaces and after a partial hardening is washed off with water with or without the use of steam

**Treating wall surfaces in storage tanks for oils and similar fluids.** AKTIESELSKAPET FREDRIKSSTAD SAAPEFABRIK Norw. 51,792, Nov. 14, 1932. The interior surfaces of the tanks are provided with a coating of water glass produced from solns of alkali silicate contg. 2.5-4.9 parts of $SiO_2$ for each part of $Na_2O$ (or $K_2O$). The coating is afterward converted into water-sol. form by heating.

**Removing coatings of paint, etc.** ALEXANDER ARNESEN Norw 50,744, April 25 1932. Coatings of paint, fat or similar substances are removed by spraying the surface with a hot soln. of caustic alkali under pressure and of such a high concn that on cooling the alkali soln. solidifies to a compact film, after which the surface is treated with steam or water under pressure.

**Refrigerating agents.** SIEMENS-SCHUCKERTWERKE A.-G. Brit 351,713, June 5 1929. In an absorption system, a refrigerant is used b. near 100° and freezing below 0 Ethyl isoamyl ether and toluene may be used as refrigerants with paraffin and quinoline as corresponding absorbents

**Refrigerating agents.** LIGHTFOOT REFRIGERATION CO., LTD. and W G NORCKS Brit. 352,528, April 7, 1930. In a system with a flooded evaporator and employing a refrigerant such as MeCl or EtCl in which the lubricant is sol., the refrigerant is evapd in successive stages at progressively increasing temps in order to sep. the lubricant App. is described in which a "cold accumulator" contg. a low-freezing soln. such as Na chromate may be placed over the evaporator.

**Refrigerating agents.** T MIDGLEY, A. L. HENNE and R. R. MCNARY (to Frigidaire Corp.). Brit. 357,263, Feb. 8, 1930. In a condensation and evapn system, F derivs. of aliphatic hydrocarbons are used such as difluorodichloromethane, tetrafluorochloroethane, tetrafluorodichloroethane or 1,2-chlorofluoroethylene. Cf. *C. A.* **26,** 1047.

**Refrigerating agents.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 40,710, Sept. 2, 1931. Addn. to 695,866 (*C. A.* **25,** 2787). HCOOMe stabilized by the addn. of less than 10% of an anhyd. alc., such as MeOH or EtOH, is used.

**Refrigerating materials.** H. FREDHOLM (to Electrolux, Ltd.). Brit 358,844, Feb. 18, 1930. $NH_3$ used as a refrigerant is absorbed in and regenerated from the liquid formed by absorption of $NH_3$ in $LiNO_3$ (the absorption medium being always in the liquid state). Some mention is also made of the possible use of $NH_4NO_3$, $NH_4$ thiocyanate, $CaCl_2$ and NaI.

**Use of toluene as a refrigerant.** SIEMENS-SCHUCKERTWERKE A.-G. Brit 353,806, Dec. 6, 1929. Toluene is used as a refrigerant with paraffin oil as an absorption medium, and a neutral gas (preferably argon) may be used to counterbalance in part the difference between condenser and evaporator pressures.

**Absorption refrigerating systems.** SIEMENS-SCHUCKERTWERKE A.-G Brit 356,597, Dec. 7, 1929. A system is described suitable for use in air-cooled app. employing refrigerants of low-vapor pressure such as water, with $H_2SO_4$ or alkali soln. as absorbent, and toluene, with quinoline or paraffin oil as absorbent.

**Warning odorant for use with refrigerating systems.** ALEXANDER D. MACALLUM (to Roessler & Hasslacher Chemical Co.). U. S. 1,886,034, Nov. 1. A lachrymatory alkyl bromoacetate such as ethyl, isopropyl or butyl bromoacetate is added to a relatively inodorous refrigerant such as MeCl to serve as a warning agent in case of leakage.

**Use of dichloromethane or the like as an indirect cooling medium in continuous cycle absorption refrigerating apparatus, etc.** D. B. KNIGHT (to Electrolux, Ltd.). Brit. 356,928, Aug 28, 1929. Various details of app. and operation are described.

**Cooling medium for refrigerating apparatus.** EINAR KOLLE Norw. 50,834, May 18, 1932. Hydrocarbons of high b. p. such as paraffins or high fractions of tar oil are used as absorbents for the organic cooling substance.

**Apparatus for compacting carbon dioxide snow.** JAMES W. MARTIN, JR. (to Dryice Corp. of America). U. S. 1,887,692, Nov. 15. Mech. features.

**Apparatus and procedure for transferring liquid carbon dioxide from one container to another under its own vapor pressure.** WALTER H. FREYGANG (to Walter Kidde & Co.). U. S. 1,886,175, Nov. 1.

**Treating fibrous materials with sulfur.** FREDERICK V. D. CRUSER (to Diamond Match Co.). U. S. 1,886,170, Nov. 1. Material such as paperboard is satd. with molten S and subsequently tumbled (in a described app.) and heated to a temp. sufficient to effect the absorption of the S by and into the body of the material, leaving the exposed surfaces of the material free from S film or scale.

**Use of biphenyl and other liquids for heat transfer.** I. G. FARBENIND. A.-G. Brit. 354,886, May 26, 1930. For heat transfer at high temps., 2 or more polynuclear aromatic compds. are used which are stable at the temps. involved and which in mixt. have a m. p. below 60°. Biphenyl, diphenylmethane or diphenyl ether may be used together with naphthalene, phenanthrene, fluorene, diphenylene oxide or *o*- or *m*-diphenyl benzene.

**Utilizing solar heat.** M. M. K. JUSCHENKO. Brit. 354,338, Dec. 20, 1929. A liquid of relatively high b. p. such as amyl alc. is vaporized by solar heat and the vapor is employed to heat water or generate steam.

**Heating brine.** GEORGE B. BURNHAM (to Burnham Chemical Co.). U. S. 1,886,868, Nov. 8. Brine such as Searles Lake brine is exposed to the action of the sun's rays beneath a sheet of material such as glass arranged to exclude the atm., for a time sufficient to cause crystn. of a salt from the brine.

**Cooling air by direct contact with a spray of brine.** AKT.-GES. BROWN, BOVERI, ET CIE. Brit. 353,620, June 24, 1929. The dild. brine is cooled and concd. by the direct action of a water vapor refrigerating app. Various details of operation are described.

**Insulating composition.** B. S. AVTZEN. Russ. 25,207, April 23, 1930. An insulating compn. consists of a mixt. of casein about 100, disintegrated mica 20, powd. anhyd. lime 5–6, and coloring material 1–2 parts.

**Heat insulation.** SAMUEL T. SHERRICK (49% to Charles Diehl). U. S. 1,888,437, Nov. 22. Material suitable for insulating refrigerators is formed of rubber 40, water-absorbent clay 60 and resinous material such as shellac or rosin gum 1 lb., sufficient non-drying solvent such as triethanolamine to dissolve the resinous material, and water 1 gal.

**Heat-insulating compositions.** BALTHASAR PESCHMANN. Ger. 567,007, Sept. 6, 1929. Blast-furnace dust having hydraulic properties is used as a binding agent for other powd. or granular heat-insulating materials, *e. g.*, kieselguhr, artificial pumice or nonhydraulic blast-furnace dust.

**Heat-insulating paper.** LOUIS WEBER. U. S. 1,887,726, Nov. 15. Slag wool and asbestos fibers are used together with a binder such as a colloidal clay.

**Electric conductors covered with fibrous insulation.** ANTHONY P. HINSKY (to E. T. Trotter & Co.). U. S. 1,887,851, Nov. 15. Fibrous insulation such as cotton insulation on wire is first treated with a black, flame-retarding saturant and is then treated with another flame-retarding substance such as $NaHCO_3$ or Na tungstate and with a coloring compn. contg. a wax base. App. is described.

**Incorporating fibrous materials in aqueous dispersions such as those of asphalt or rubber.** EDWIN O. GROSKOPF (to Flintkote Corp.). U. S. 1,889,473, Nov. 29. Fibrous material such as wool, cotton, etc., is disintegrated to render it "substantially individualized" and the fibers are introduced into a dispersion in a stream while in their individualized condition. App. is described.

# 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Enlarging the Detroit water works.** ANON. *Gas- u. Wasserfach* **75**, 930-2(1932).—An illustrated description of improvements at the Detroit water works. R. W. R.

**Biology of the Colombo water supply.** L. FABIAN HIRST. *Ceylon J. Sci.* **2**, 203–43(1932); *U. S. Pub. Health Eng. Abstracts* **12**, W, 129(Oct. 29, 1932).—The raw water is very soft but contains an objectionable amt. of air-reducible Fe. The fauna and flora of the supply are carefully described. In the tropics, H. believes the presence of *B. aerogenes* has little significance C. R. FELLERS

**The water problem at Fort-de-France [Martinique].** JEAN TOULOUSE. *Eau* **25**, 133–4, 155–6(1932).—The source is the Dumauzé Branch of the Case-Navire River After storage, filtration and chlorination it supplies nearly 50,000 people. Filtration is necessary because of the high amt. of org. sediments. C. R. FELLERS

**Water supply and German geology.** W. v. SEIDLITZ. *Gas- u. Wasserfach* **75**, 1013-16(1932).—A general discussion. R. W. RYAN

**Study of the water of the port of Montreal for the production of steam.** GUY LANCTOT. *Rev. trimestr. can.* **19**, No. 71, 317-38(1932).—For the purification of Montreal water for steaming purposes 3 systems were compared by phys. and chem. means Evapn. produced the best water but cost 33.13 cents per 1000 gallons per day; coagulation and filtration gave satisfactory water for 13.58 cents; while softening with permutite was generally most satisfactory although at the higher cost of 20.00 cents, and this method was recommended. R. M. BOARTS, JR

**Water for industrial purposes.** A. S. BEHRMAN. *J. Penna. Water Works Operators Assoc.* **4**, 102-8(1932). G. L. KELSO

**Directory of important water-works systems of Canada.** ANON. *Contract Record Eng. Rev.* **46**, 276–84(1932); *U. S. Pub. Health Eng. Abstracts* **12**, W, 123(Oct. 1, 1932) —Authoritative and full statistics are given relative to the important Canadian water supply systems. C. R. FELLERS

**Medicinal springs of South Africa. Supplement IV.** M. RINDL. *S. African J. Sci.* **29**, 278-80(1932).—Analyses of the waters of 3 mineral springs in S. Africa are given. K. V. THIMANN

**Unsuspected, unusual and little known factors in water-supply quality.** PAUL HANSEN. *J. Am. Water Works Assoc.* **24**, 1780-91(1932).—Cross connections, leaky conduits, corroded casings, siphonage and back flow, unsterilized newly laid mains and many other factors are suggested as hidden and overlooked dangers to perfect sanitation. D. K. FRENCH

**Evaluation of the constituents of potable and other waters.** HARTWIG KLUT *Arch. Pharm.* **270**, 554-70(1932).—The more common constituents of potable and other waters are enumerated in connection with the usual methods of estn A bibliography is appended. W. O. K.

**The sterilizing effect of acid waters.** LEWIS V. CARPENTER AND EDMOND F. ROETMAN. *J. Penna. Water Works Operators Assoc.* **4**, 83-90(1932).—Drainage from bituminous-coal operations produces acidity in streams which is very costly to water works in chemicals required for treatment. Both the technic and indicator for the detn of this acidity in water should be standardized. A 10% mixt. of acid mine water and sewage will remove 95% of the bacteria from the sewage, in a 2-hr. contact period Bacterial count decreases with the $p_H$ value. A new strain of bacteria was found to grow at an optimum $p_H$ of 3.0. G. L. KELSO

**The use of bleaching clays in water purification.** EDWARD M. SLOCUM. *J. Penna. Water Works Operators Assoc.* **4**, 53-64(1932).—Bleaching clay shows advantage in water treatment by reason of its low price and its great capacity to remove tastes, odors and color. Bleaching clay will remove phenol, Cl and $H_2SO_4$ from water. It will form a heavy floc with $Al_2(SO_4)_3$ which settles rapidly. Its use with prechlorination will reduce putrefaction in basins and filters. Economies are possible by decrease in amts. of lime, alum and other chemicals required when bleaching clay is used. Also in *Public Works* **63**, No. 9, 11(1932). G. L. KELSO

**Action of iodine in sea waters.** GEORGES DENIGÈS. *Compt. rend.* **195**, 669-71 (1932).—Analytical work was done on superiodine marine waters and waters from oyster beds of the same character. Two main forms of I are represented, that ionized as iodide (*IM*) and that ionized as iodic iodine ($IO_3$). Marine waters in contact with I dissolve a part and ionize the rest as $IO_3$ and I, as in the action of alkalies. Alk. earth bicarbonates in sea water are agents of this ionization. Where I remains simply dis-

solved in sea water contg. algae or mollusks, I is ionized in part in the form *IM* and in part is fixed on the vegetable or animal, whether living or dead. Since amts. of iodic and iodide ions are functions of various factors, such as time and temp., variations of detns. of these ions, especially in the higher porportions, may be explained. NaCl is not always the most active element in these marine waters, as alk. earths influence ionization. An aq. soln. of salt is not to be considered the equiv. of sea water in comparative expts., even if the titer is the same as in ocean waters. A. W. E.

**Estimation of the turbidity of waters by means of the filter paper disk process.** F. Sierp. *Wasser* **6,** 3–11(1932).—The quantity of suspended matter in waters may be roughly compared by filtering samples through filter papers of the same size and quality on Büchner funnels and then comparing the appearance of the deposits on the dried papers. M. G. Moore

**How St. Cloud combined use of activated carbon with the ammonia-chlorine process.** C. L. Ehrhart. *Water Works Eng* **86,** 16–18(1933) W. A. Moore

**Is germ chlorination fatal?** David W. Horn. *Am. J. Pharm.* **104,** 651–5(1932).—See *C. A.* **26,** 6040. W. G. Gaessler

**Laboratory control of filter-plant operation.** Geo F Gilkison. Mo. Water and Sewerage Conference, *6th Annual Rept* 60–3; *U. S. Pub. Health Eng. Abstracts* **12,** W, 122(Oct 1, 1932). —General. C. R. Fellers

**Filter sand and gravel.** R F Abel. *J. Penna. Water Works Operators Assoc.* **4,** 68–73(1932). G L. Kelso

**Hydraulics of rapid filter sand.** Roberts Hulbert and Douglas Feben. *J. Am Water Works Assoc.* **25,** 19–65, *Water Works Eng* **86,** 62–4, 102–4(1933). E. H.

**The cause, prevention and elimination of mud-ball formation in rapid sand filters.** Edward S. Hopkins. *J. Penna. Water Works Operators Assoc.* **4,** 74–82(1932).—Mud-deposit formation is caused by compacting of dirty sand grains due to improper washing of filters. Fine sand promotes this condition. Sand of at least 0.5 mm. diam. with high velocity wash to give 40–50% expansion will maintain clean beds free from mud deposits. G. L. Kelso

**Sterilization of sand filters [in waterworks].** F. Meyer. *Gas- u. Wasserfach* 75, 29–30(1932).—Complete removal of *B. coli* from sand filters requires prolonged treatment with a high concn of $Cl_2$. In an example quoted, the sand became sterile after treatment with 1500 g. $Cl_2$ per hr. (35 g. per cu. m. of wash water or 100 g. $Cl_2$ per cu. m. of sand). Such severe treatment destroys the layer of algae on the walls of the container, which layer, according to some authorities, serves to protect these walls from attack by the water B. C. A.

**Use of floc detector to determine filter runs.** E. E. Wolfe *Water Works Eng.* 85, 40–3(1932); *U. S. Pub. Health Eng. Abstracts* **12,** W, 136–7(Nov. 5, 1932).—The floc detector consists of a 2 l. round-bottomed flask, connected by tubes to the filtered water, mounted in front of a flood light, and all contained in a galvanized Fe box. The detector will detect as little as 0.01 p. p. m. of floc, in terms of turbidity and is particularly valuable in cold weather when floc tends to penetrate the filter beds very rapidly. Its weakness is that it will not detect uncoagulated turbidity in amts. less than 1 p. p. m. The detector should be used in conjunction with bacteriol. methods and loss of head data to det when the filter beds should be washed C. R. Fellers

**The filchlorator.** H. A. Ickes. *Can. Engr.* **62,** 13(1932); *U. S. Pub. Health Eng. Abstracts* **12,** W, 123(Oct. 1, 1932) – This app. removes phys. and chem. impurities from Cl gas for treating water supplies The equipment is simple, efficient and requires practically no attention after installing C. R. Fellers

**Report of committee on control of tastes and odors.** Martin E. Flentje. *J. Am. Water Works Assoc.* **24,** 1738–49(1932).—After an outline of the various methods of treatment practiced to reduce or eliminate taste and odor, 3 analytical methods are outlined for the recording of odor. The detn. of phenol is also referred to, special attention being called to the modified Gibbs method for accuracy, and Scott's procedure for coke-oven plant effluents. D. K. French

**Taste and odor control with activated carbon.** B. F. Johnson. *J. Penna. Water Works Operators Assoc.* **4,** 43–52(1932).—New Castle, Penna., takes its water supply from the Shenango River. The stream rises in swampy ground and flows through an industrial section before reaching the city. The raw water carries a color of 10 to 260 p. p. m., an alky. of 100 to neg. 115, and a turbidity of 25. The first taste complaints came from the far ends of the distribution system. Tests for taste and odor were made by distg. a 500 ml. portion of the water and collecting the first 100 ml. of distillate which will contain most of the odor. This test indicates formation of after-tastes and odors. Powd. activated C in *doses of 0.5–1.0 grains per gal.* gave potable water. When C treat-

ment was stopped a 30% increase in $Cl_2$ demand was noted. Max. cost of the C treatment was $1.90 per million gallons with a min. of $0.20 and an av. cost of $0.70. Also in *Am. City* **47**, No. 4, 53–5(1932). G. L. KELSO

**Eliminating tastes and odors from the New Jersey water supplies.** LEROY FORMAN. *N. J. Pub. Health News* **17**, Nos. 3–4, 35–43(1932); *U. S. Pub. Health Eng Abstracts* **12**, W, 132(Oct. 29, 1932).—Tastes and odors from the following sources are discussed: $H_2S$, algae, phenols, chem. and dye wastes, excessive org. matter, excess Cl, Fe, Fe algae, $CO_2$ and low $p_H$. The best remedies are aeration, chlorination, lime treatment, $NH_3$-Cl and sedimentation. C. R. FELLERS

BUCK. **Clarification by coagulation without filtration.** C. E. BURLINGAME. **Chlorine-ammonia treatment.** J. C. DEGROOT. **Chlorine-ammonia treatment.** J. G. DELL. **Continuous use of activated carbon in taste prevention.** EMERSON FOSTER. **Coagulation troubles.** THOMAS JONES. **Correction of acidity.** E. O. HORNER **The cause and cure of red water at Eagles Mere.** R. D. KEHRER. **Copper sulfate and fish.** WALTER STOCKBINE. **Displacement of filter gravel.** E. B. WAGNER. **Ammonia-chlorine process of water sterilization.** R. W. WOODRING. G. L. KELSO

**Biological problems in relation to water storage.** W. RUSHTON. *Water and Water Eng.* **34**, 665–74(1932); cf. *C. A.* **26**, 1368.—A discussion of the seasonal appearance of different groups of algae and their treatment. W. A. MOORE

**Biological control as affecting plant operation.** CARL WILSON. *J. Am. Water Works Assoc.* **24**, 1792–9(1932).—$H_2S$ is the result of active sulfate-reducing bacteria which cannot grow unless sufficient org. food is present. Bacterial growth can increase or decrease O and $CO_2$. In the latter case exhaustion of $CO_2$ may bring about natural softening, while decay can increase $CO_2$ to such an extent as greatly to increase the cost of softening. "Biological Control" as recommended is defined to include both immediate and consequential effects of org. growth. D. K. FRENCH

**The elements of water bacteriology and the reasons for their application.** JOHN J. SHANK. *J. Penna. Water Works Operators Assoc.* **4**, 32–42(1932). G. L. KELSO

**Tuberculation of mains as affected by bacteria.** H. G. REDDICK AND S. E. LINDERMAN. *J. New England Water Works Assoc.* **46**, 146–59(1932); *U. S. Pub. Health Eng Abstracts* **12**, W, 135(Nov. 5, 1932).—A tubercle is defined as a limpet-like structure arising from the surface of Fe. Data are presented which indicate that tubercles formed within a water pipe are of bacterial origin. These bacteria do not need the Fe to live. Fe-gathering bacteria may get their Fe from the water. They require a min. bare spot of Fe to secure a footing on the pipe. C. R. FELLERS

**Preliminary report on Escherichia coli in the Calcutta filtered water supply.** J. DAS-GUPTA. *Indian Med. Gaz.* **67**, 380–6(1932); *U. S. Pub. Health Eng. Abstracts* **12**, W, 129(Oct. 29, 1932).—Though many members of the colon group were isolated, *E. coli* could not be identified by use of the Voges-Proskauer or Koser-Smith tests. In the tropics it is necessary to distinguish between *E. coli* and closely related bacilli because the latter are of no significance in water supplies. C. R. FELLERS

**Aeration. III. Present practice of aeration.** JOHN R. BAYLIS. *Water Works and Sewerage* **79**, 275–81(1932); *U. S. Pub. Health Eng. Abstracts* **12**, W, 132(Oct. 29, 1932); cf. *C. A.* **27**, 152.—Aerating systems for the removal of objectionable odors, $CO_2$, Fe, Mn and $H_2S$ are discussed. For effectiveness there is probably little difference whether the aerating surface is formed by spraying the water into the air, or by forcing fine bubbles of air into the water. C. R. FELLERS

**Iron and lime in removal of manganese.** E. C. CRAIG, E. L. BEAN AND R. W. SAWYER. *J. Am. Water Works Assoc.* **24**, 1762–79(1932).—Copperas is added first and aeration follows; the lime is added later to bring the $p_H$ to approx. 10. After mixing there is a retention period of about 2 days. No difficulty is experienced with the filter. Better coagulation follows the use of ferric than ferrous coagulants. D. K. FRENCH

**Preparation of a soap solution for the determination of water hardness.** K. SCHERINGA. *Chem. Weekblad* **29**, 606–7(1932).—Ordinary stearin (candle material) is satisfactory to prep. the soap soln. needed in water-hardness detn. Dissolve about 10 g. of stearin in 200 cc. of strong wood alc.; titrate with 0.5 *N* alc. potash in the presence of phenolphthalein; add 400 g. $H_2O$, and fill to 1000 cc. with wood alc. ALBERT L. HENNE

**Behavior of calcium salts at boiler temperatures.** FREDERICK G. STRAUB *Ind Eng. Chem.* **24**, 1174–8(1932); cf. *C. A.* **26**, 5245.—The reaction $CaSO_4 + Na_2CO_3 \rightleftharpoons CaCO_3 + Na_2SO_4$ has been investigated at temps. between 182° and 282° in a study to det. the mechanism of boiler-scale formation. The presence of a low concn. of carbonate

forces the reaction to the right. The addn. of NaOH and NaCl reduces the amt. of carbonate necessary to produce the same effect. The carbonate-sulfate ratio does not remain const., probably because of bicarbonate formation at elevated temps.
L. W. T. CUMMINGS

**Water softening and boiler practice.** DAVID GARDNER. *Gas J.* **201,** 52(1933); *Gas World* **98,** 13-14(1933).—Water with a hardness of 16 degrees is softened to 2 for boiler use by means of a permutite plant. P. J. WILSON, JR.

**Continuous lime slakers feature small water-softening plant.** H. F. WIEDEMAN *Am. City* **46,** No. 6, 63-4(1932); *U. S. Pub. Health Eng. Abstracts* **12,** W, 131(Oct. 29, 1932).—Because of lower cost, CaO was used in preference to $Ca(OH)_2$ in the lime-soda process of water softening at Thomasville, Ga. A continuous slaker was successfully installed and operated. The plant includes, besides the slakers, mechanically agitated mixing tanks where CaO and soda ash are added, a clarifier providing mech. removal of sludge, a carbonating chamber, plain sedimentation basin and filters. C. R. FELLERS

**Control tests for the treatment of feed and boiler water.** J. K. RUMMEL. *J. Am. Water Works Assoc.* **24,** 2004-24(1932).—Proper collection of samples at the outset is of prime importance. A universal indicator, in place of methyl orange and phenolphthalein, is recommended for alky. Volumetric and colorimetric methods are suggested for phosphates, special attention being given the aminonaphthosulfonic acid method which is described. A colorimetric method is also recommended and described for the detn. of silica. D. K. FRENCH

**The after-softening of feed water with phosphate during water purification.** W. WESLY. *Beiheft Z. Ver. deut. Chem.*, No. 1; *Angew. Chem.* **46,** No. 1, 19-20(1933); cf. *C. A.* **27,** 545.—Lab. test with stagnant and running water and large-scale tests indicated that phosphate should not be added on completion of the softening process after purification, but right after the pptn. of most of the hardening compds. by means of the usual softening agents. KARL KAMMERMEYER

**Boiler feed-water treatment with special reference to corrosion.** J. H. PYBUS *Gas World* **98,** No. 2527, Coking Sect. 9-12(1933).—A review of the com. water-treatment methods. P. J. WILSON, JR.

**Incrustations and corrosion in the Schwenningen water-distribution system.** K. HERRMANN. *Gas u. Wasserfach* **75,** 890-3(1932).—Photographs and photomicrographs are given of incrustations in the water pipes. These deposits are attributed to iron algae and are greatest in pipes having low velocities. To prevent such deposits and corrosion, internal coatings must be very homogeneous. R. W. RYAN

**Prevention of health injuries by powdered hydrated lime.** HANS LEHMANN AND ARNOLD HELLER. *Gas u. Wasserfach* **75,** 967-70(1932).—The possibility of injuring the health of employees handling hydrated lime at water-deacidifying plants is reviewed. Sacks of lime may be emptied by the use of suitable appliances without causing appreciable dust. Lime dust was detd. chemically and also microscopically. The latter method differentiated the particles likely to cause lung injury by filtering the air first through a glass filter having an av. pore diam. of 20-30 μ. The air then impinged on a glass plate, depositing the remaining lime particles. It was found that the majority of the lime particles passed this filter. An upper limit of 4000 lime particles per l. of air was tentatively set as the upper limit of safety. R. W. RYAN

**Use of copper and lead water pipes.** G. NACHTIGALL. *Gas u. Wasserfach* **75,** 941-9(1932).—Soft water, high in $CO_2$, may dissolve enough Pb on standing (overnight, etc.) in Pb pipes to cause Pb poisoning. Remedies are aeration to remove $CO_2$ and deacidification with marble, magnesite or lime water, so that a protective coating will be formed in the pipe. This treatment also decreases the amt. of Cu dissolved from Cu pipes, although toxic amts. of Cu are not dissolved under any conditions.
R. W. RYAN

**Sewage disposal at Todmorden.** J. H. LUMB. *Surveyor* **81,** 515-16(1932); *U. S. Pub. Health Eng. Abstracts* **12,** S, 100(Sept. 17, 1932).—Equipment and operation are detailed. C. E. FELLERS

**Sewage-disposal trends in the New York City region.** GEO. W. FULLER. *Sewage Works J.* **4,** 637-46(1932). E. HURWITZ

**A quarter century of progress in sewage treatment.** LANGDON PEARSE. *Sewage Works J.* **4,** 647-54(1932). E. HURWITZ

**The Rockford, Illinois, sewage-treatment works.** FRED E. CARPENTER. *Sewage Works J.* **4,** 1041-5(1932).—Dedicatory address. E. HURWITZ

**Allentown sewage-treatment works.** HARRY KRUM. *Sewage Works J.* **3,** 647-55(1931).—The plant includes a rack chamber, detritus tanks, screens, incinerator, Imhoff tanks, sludge ejector, chlorinator and sludge-drying beds. Coarse and fine screen-

ings are pressed and buried with all skimmings. Foaming which occurred at the start of plant operation was eliminated by removing the tanks from service and hosing. Sludge drys in 14–20 days. Final effluent before chlorination has a biochem. O demand reduction of 54.1% and after the addn. of 4.86 p. p. m. of Cl the reduction is 59.9%. Heavy chlorination of the final effluent is made necessary by the fact that the water-works of the adjacent city are located 3 miles down stream. E. HURWITZ

**Operation of New Castle sewage plant.** F. J. NUGENT. *Sewage Works J.* 3, 404–10(1931).—An av. daily flow of 4,800,000 gals. is treated in Imhoff tanks fitted with gas collectors. About 0.5 cu. ft. of gas (17% $CO_2$) is obtained per capita per day, but the thermal value of most of it is wasted by burning the gas as a means of odor prevention only. B. C. A.

**Folsom State Prison sewage-treatment works.** L. E. RUSITON. *Sewage Works J.* **4**, 674–9(1932).—This plant which is designed for a 12-hr. day flow of 730,000 gallons includes screens, grit chambers, primary clarifiers, mech. aeration with provision for reaeration, heated digestor, final settling tank and chlorinating equipment. Operation for the first 4 months showed an 87% removal of solids by the primary clarifier and the production of a final effluent with a biochem. O demand of 10.5 p. p. m. and a turbidity varying from 7 to 15 p. p. m. E. HURWITZ

**Requirements for satisfactory results from sewage-treatment plants.** H. D. PETERS AND H. M. BOSCH. Mo. Water and Sewage Conference, *6th Ann. Rept.* 90 pp.; *U. S. Pub. Health Eng. Abstracts* **12**, S, 110(Oct. 8, 1932). C. R. FELLERS

**Significance of laboratory tests at sewage-treatment plants.** CHARLES C. AGAR. *Sewage Works J.* **4**, 1060–8(1932). E. HURWITZ

**Operation of sewage-treatment works.** W. DONALDSON. *Sewage Works J.* 4, 48–59(1932); cf. *C. A.* **26**, 2261.—At a spiral-flow activated-sludge tank in operation at Tenafly, N. J., dealing with approx. 450,000 gals. per day, "bulking" of the sludge is always accompanied by a profuse growth of *Sphaerotilus*. It has been controlled by raising the $p_H$ of the effluent to 8.6–8.8 by means of $Ca(OH)_2$ fed at the inlet to the aeration tank and by reducing short-circuiting by means of transverse baffles. The excess sludge is conditioned by the addn. of 5–7 lb. of alum per 1000 gals. and is dried on covered beds in 18–30 hrs. when applied at a rate of 2.1–2.7 gals. per sq. ft. Putrefactive changes in the semi-dried sludge have been avoided by adding 1–2 lb. of $CuSO_4$ per 1000 gal. of wet sludge. B. C. A.

**Routine tests for operation of sewage-treatment works.** C. F. WERTZ. *Sewage Works J.* **3**, 669–75(1931).—A discussion of routine tests which can be made by the non-tech. operator of a small treatment plant E. HURWITZ

**The practical operation of sewage-disposal plant units.** F. E. DANIELS. *Sewage Works J.* **3**, 662–8(1931). E. HURWITZ

**Practices of industrial waste-disposal at Milwaukee, Wis.** H. M. HEISER AND JAMES BROWNLEE. *Sewage Works J.* **4**, 680–5(1932).—Wastes with high sp. gr. must receive settling treatment. Pickle liquor and similar materials must be neutralized or kept out of the sewers. Oil, grease and tarry wastes must not be allowed to enter the treatment plant. All service-station drain-pit sewer connections were closed and the city collects waste crank-case oil to use in garbage incineration. Wet grains and spent hops must be hauled to dumps. E. HURWITZ

**Industrial wastes in relation to sewage treatment.** STUART E. COBURN. *Sewage Works J.* **4**, 686–94(1932).—Industrial wastes may be grouped as org. wastes, inorg. wastes and a combination of the 2. The effects of industrial wastes upon the character of sewage may be classified as phys., chem., biol. and relative quantities of sewage and waste. C. cites numerous examples of plant difficulties arising from industrial wastes and the laws and regulations adopted to eliminate these nuisances. E. HURWITZ

**Effect of hydrogen-ion concentration on the distillation of free ammonia nitrogen from sewage and trade wastes.** M. E. FOOTE AND M. S. NICHOLS. *Sewage Works J.* **4**, 37–43(1932).—A const. $p_H$ of 7.4 is recommended for avoidance of incomplete recovery of ammonia N at $p_H$ values < 6.0 and hydrolysis of org. N compds. at $p_H$ > 10.6. $Na_2CO_3$ and other usual buffering agents are unsuitable. Addn. of 25 cc. of a 0.5 *M* phosphate soln. contg. $KH_2PO_4$ 14 and $K_2HPO_4.3H_2O$ 90 g. per l. is suggested. B. C. A.

**Excreta-disposal plant of Kyoto, Japan.** S. NISHIHARA. *Sewage Works J.* 3, 656–61(1931).—Excreta are dumped into a biolysis tank where they are diluted 1 to 10 with sewage. The effluent is diluted with 28 parts of sewage and mixed with the return sludge from the final settling tank before entering the spiral flow aeration tank. Sludge from the biolysis tank is mixed with the excess activated sludge and pumped

to the digestion tank. Scum formation in the biolysis tank is prevented by the use of water jets and an auto siphon. Final effluent is treated with 2.0 p. p. m. Cl. E. H.

**Institutional sewage and sewage-flow characteristics.** G. M. RIDENOUR AND I. O. LACY. *Sewage Works J.* **4**, 1046–53(1932).—Data from 7 state institutions indicate the distinctive characteristics of this type of sewage. The ratio of the max. to the av. rate of flow was found to be influenced by sewer-line grades and the arrangement of the collecting system with respect to the treatment plant. Analysis of raw sewages indicated their strength to be 2–3 times stronger than strictly domestic sewage. The av. 5-day biochem. O demand on the basis of 100 gal. per capita flow was 472 p. p. m. Per capita O demand (20 day) varied from 208 to 286 g. per day E. HURWITZ

**Operation of the pre-aeration plant at Decatur, Ill.** WM. D. HATFIELD. *Sewage Works J.* **3**, 621–35(1931).—The system is a short-period activated-sludge plant interposed between the Imhoff tank and the dosing tank. The unit includes 6 tanks of the spiral-flow type having a detention period of 2.5 hrs. with a sewage flow of 10 million gal. daily. Sludge is returned to the influent conduit without provision for re-aeration and thence to the Imhoff tanks where it is digested with the primary sludge. Three methods of operation were tried: normal aeration, re-aeration, and no sludge return. Results indicated a reduction of biochem. O demand of 30–40% by all 3 methods. Odor hazard is greatest with no sludge return and least with re-aeration. Absence of protozoa had no appreciable effect. The presence of large nos. of ciliates was coincident with complete removal of turbidity. E. HURWITZ

**The anaerobic stabilization of sewage screenings.** C. S. BORUFF AND A. M. BUSWELL. *Sewage Works J.* **4**, 973–81(1932).—With a special drum-type digestor which is described, it was found possible to feed sewage screenings at the rate of 1530–2100 wet weight per day per 1000 cu. ft. of digestion capacity. The resulting gas production amounted to 5.45 cu. ft. per lb. of dry screenings added or an av. production of 1.00 vols. of gas per tank vol per day. The residue which contains approx. the same amt. of moisture as the screenings added is inoffensive and non-putrescible. It may be disposed of in the usual manner. E. HURWITZ

**Digestion of bar screenings.** A. M. RAWN. *Sewage Works J.* **4**, 982–5(1932).—Bar screenings and skimmings were successfully digested in the following manner: An unlined open pit with a capacity of about 1500 cu. ft. was dug in tight clay soil. Sixty % of the pit capacity was filled with well-digested sludge. A daily addn. of 25 cu. ft. of bar screenings and 80 cu. ft. of skimmings was made until the pit was filled after which digestion was allowed to proceed for 45 days. The material was then pumped to the sand beds where it dryed without nuisance. The temp. of digestion averaged 65° F. E. HURWITZ

**Sedimentation of sewage.** CHESTER A. SMITH. *Sewage Works J.* **4**, 601–8; *Western Construction News* **7**, 453–6(1932) – At one plant the efficiency of sedimentation was increased 33% by changing from a longitudinal flow to a cross-over flow and thus providing an outlet weir 38 ft long. Another test of a similar nature indicated the necessity of low overflow rates The use of chlorinated clay as a settling agent has given improved clarification. E. HURWITZ

**Sedimentation and chlorination of excess flow.** A. L. THOLIN. *Sewage Works J.* **4**, 655–64(1932).—A small Imhoff tank and trickling filter with a capacity about half that of the tributary population was supplemented as follows: Coarse bar screens, an Imhoff tank, drying beds and chlorinating app. were installed to treat all sewage above the capacity of the old plant. Provision is made to by pass to the creek any flow in excess of 16 million gal. daily. Final effluent is chlorinated to control odors and to retard the O demand until natural purification processes become effective. E. H.

**Pathogenic bacteria in sewage. Bacterolysis.** H. GOLDIE. *Rev. hyg. méd. prév.* **55**, 5–23(1933).—Lysis, together with the destructive action of saprophytic organisms, greatly reduces the no. of pathogens in sewage. Domestic sewage possesses a powerful bacteriophage which is active against nearly all types of intestinal bacteria. Lack of proper nutritive substances and low temp. are also limiting factors for the bacterial population of sewage. The activated sludge method of sewage purification is a particularly effective method of destroying pathogens by bacteriolysis. Forty-eight references. C. R. FELLERS

**Effect of some constituents of coke-oven effluents on the rate of decomposition of sewage.** B. A. SOUTHGATE. *J. Soc. Chem. Ind.* **52**, 1–4T(1933).—PhOH, *p*-cresol and the tar acid constituents of spent $NH_3$-still liquors are decompd. when dild. with water contg. sewage. The rate of decompn. of cyanides is not increased by the presence of sewage; cyanides in concns. of the order of 0.01–0.1 g. per 100 l. partly inhibit the

biol. oxidation of dild. sewage, but the no. of bacteria capable of growing in agar at 20° is greater in the solns. contg. cyanide than in solns. of sewage alone. A. P.-C.

**Sewage works cross connections.** LEWIS S. FINCH. *Sewage Works J.* **4**, 669–71 (1932).—Cross connections may occur between the water supply and the Imhoff tank flushing ring, on hose lines used for flushing sludge pipes, and by using the water supply as a priming source for sewage pumps. E. HURWITZ

**Heat and energy relations in the digestion of sewage solids. II. Mathematical formulation of the course of digestion.** GORDON M. FAIR AND EDWARD W. MOORE. *Sewage Works J.* **4**, 428–43(1932); *U. S. Pub. Health Eng. Abstracts* **12**, S, 116(Oct 15, 1932).—Gas production is a satisfactory yardstick of mass activity in sludge digestion. The course of cumulative gas production is an S-shaped curve which may be formulated mathematically. Two formulations are presented: (1) an autocatalytic equation, or equation of a unimol. reaction accelerated by the catalytic action of the products of reaction and (2) a 2-stage formulation or equation of a discontinuous unimol. reaction preceded by a discontinuous equation of const. rate of increase. C. R. FELLERS

**Heat and energy relations in the digestion of sewage solids. III. Effect of temperature of incubation upon the course of digestion.** GORDON M. FAIR AND EDWARD W. MOORE. *Sewage Works J.* **4**, 589–600(1932).—A math. development of the course of sludge digestion indicates that the process may be formulated by use of the Arrhenius equation. Seven series of expts. were performed with plain sedimentation sludge and activated sludge in conjunction with different seeding materials. The temp. of digestion ranged from 77° to 140°F. It was found that the observed magnitude of the temp. characteristic ($m\mu$) between temps. of 77° and 104° F. was 10,000 for activated sludge and 5000 for plain sludge. These values dropped at 122° F. for plain sludge and at 140°F. for activated sludge. The ultimate gas yield is increased with the rise of the temp. of incubation. In seeding, the best results were obtained by using material from the same sewage solids and also from the same temp. of incubation. **IV. Measurement of heat and energy interchange.** *Ibid* 755–70.—Seven mixts. of plain sedimentation solids and activated sludge were digested; various seeding materials were used. Temp. of digestion ranged from 25° to 60°. The change in heat of combustion when expressed as a percentage of the fuel value of the original charge varied from a 21.7% loss of that fuel value to a 28.3% gain. The higher values of the heat of combustion generally prevailed at the higher temps. of incubation. An increased heat of combustion occurred more frequently when the seeding conditions of the mixt. were ideal. Theoretical consideration of sludge digestion from a thermodynamic standpoint admits the possibility of an increase of the heat of combustion. E. HURWITZ

**Starting and operation of the Collingswood, N. J., activated-sludge plant.** I. O. LACY. *Sewage Works J.* **3**, 636–46(1931).—The plant is designed to treat a domestic flow of 1.33 million gal. daily. The raw sewage is treated with 5.5 p. p. m. Cl to control odors, settled for 1.5 hrs. in a mechanically cleaned tank and aerated with mech. agitators. The final effluent is chlorinated and sludge is separately digested. By returning 20% activated sludge it was found difficult to maintain a good floc so the return was reduced to approx. 10%. Considerable operating difficulties were eliminated by increasing the speed of the agitators from 44 to 54 r. p. m. Supernatant liquid in the digestion tanks is filtered through sand and returned to the influent. Daily addns. of fresh solids varied from 570 to 1400 cu. ft. The first sludge withdrawal of 1900 cu. ft. had a solids content of 5%. Samples from the clarifier showed an av. removal of 72%. Results for operation for 1 month showed an overall biochem. O demand reduction of 95%. E. HURWITZ

**Sludge operations at the Baltimore sewage works.** EDWARD C. CROMWELL. *Sewage Works J.* **4**, 1054–9(1932).—The plant serves a population of 750,000 and includes plain sedimentation, trickling filters, sep. sludge digestion and sand drying beds. The raw sewage averages 225 p. p. m. suspended matter of which 75–80% is removed by sedimentation. From 10 to 25% ripe sludge is added to each digestion tank to keep them in a gassing state. The digested sludge which averages 4.4 cu. yd. (90% moisture) per million gallons of sewage has a volatile matter content of 60% and a $p_H$ of 6.9. Sludge is applied to the drying beds 12 in. deep and the moisture content has been reduced to 70% in as short a period as 10 days. Demand for the sludge as a *fertilizer* is greater than the yearly production. E. HURWITZ

**Certain environmental conditions affecting the value of thermophilic seed sludge.** H. HEUKELEKIAN. *Sewage Works J.* **4**, 986–92(1932).—Large quantities of fresh solids and thermophilic sludge were mixed 2:1 on the basis of volatile matter. The original and subsequent mixts. were incubated at 50°. The degree of digestion of seed sludge had a marked effect on the digestion time of mixts. made from it. The best seed sludge

is produced when gas production has reached 90-95% of the total. Thermophilic seed sludge is little affected by storage up to 3 months, either at a temp. of 20° or 50°. Storage of low-temp. sludge at 50° increased its seeding value for thermophilic digestion. When low-temp. sludge was stored for 40 days at 50°, the time of digestion of fresh solids at the same temp. was decreased from 37 to 20 days. E. HURWITZ

**Digestion of activated and primary sludge at Salinas, California.** T. R. HASELTINE. *Sewage Works J.* **3**, 599–614(1931); cf. *C. A.* **26**, 231.—Descriptions of the plant used and of the 1st year's experience in the collection, digestion and disposal of fresh and activated sludge solids are given in detail. A digestion tank of 34,100-cu. ft. capacity is provided for a population of 10,000 with an average daily flow of 620,000 gal. of sewage. Without temp. control an av. of 0.5–0.8 cu. ft. of gas per head per day was obtained when activated sludge was not being digested and 0.8–1.3 cu. ft. when this was the case. The high gas production may be due to the high grease content of the sewage (340 p. p. m ). The final sludge is run on to open drying beds and is ready for removal in 10–20 days. The addn. of surplus activated sludge to the incoming sewage is recommended as an effective means of reducing the total vol. of sludge to be passed to the digestion tank. B. C. A.

**Sludge digestion and sludge disposal.** R. F. GOUDEY. *Sewage Works J.* **4**, 604-13(1932).—Acceleration of digestion is not as important as the production of sludge with good dewatering characteristics. Expts. indicate the importance of enzymes, catalysts and filamentous bacteria. Reduction of alky. points to the need of a distinction between normal inorg. alky. and the org. alky. changed by bacterial action. Properly conditioned, digested sludge can be filtered to 65% moisture at a chem. cost of $3.50 per million gallons of sewage treated. Preliminary studies are being made with spray-drying equipment and indications are that digested sludge can be dried to 10% moisture without the addn. of chemicals. E. HURWITZ

**Effect of coagulants on sludge digestion.** WILLEM RUDOLFS, W H. BAUMGARTNER AND L. R. SETTER. *Sewage Works J.* **4**, 628-36(1932).—Dry Na aluminate, Na aluminate soln. contg. free NaOH, Feralum, Feralum sulfate, alum and $FeCl_3$ were tested with properly and improperly seeded digestion mixts. A mixt. of Na aluminate and $FeCl_3$ applied to raw sewage produced a better flocculation with less chemicals than by the use of $FeCl_3$ alone. Alum compds. retarded digestion and increased the production of $H_2S$. Dry Na aluminate stimulates digestion, produces more gas and is better than lime as a means of reaction control. E. HURWITZ

**The thermophilic digestion of municipal garbage and sewage sludge, with analogies.** CHARLES G. HYDE. *Sewage Works J.* **4**, 993-1001(1932).—A description of the digestion of garbage by the Beccari method which utilizes thermophilic microörganisms. It compares this process with the thermophilic digestion of sewage sludge in an effort to arrive at a general method for the digestion of org. matter. E. HURWITZ

**Destruction of organic solids in sewage by separate sludge digestion.** WM. R. COPELAND. *Sewage Works J* **4**, 672-3(1932).—The daily addn. of small vols. of fresh sludge to a large vol of ripe sludge is necessary to prevent foaming and to maintain an optimum $p_H$. When $NH_3$ and other alk. substances are lacking the use of lime is indicated Sludge storage space may be kept to a min. by the careful regulation of temp. and $p_H$. E. HURWITZ

**The dewatering of sludge by vacuum filtration.** C. E KEEFER AND E. C. CROMWELL. *Sewage Works J* **4**, 929-59(1932).—Two vacuum filters, an Oliver and a Genter, were set up at the Baltimore Sewage Works and expts. conducted to det. the characteristics of each type. It was found that by increasing the amt. of coagulant the capacities of both filters could be increased. With the Genter filter a max. output of 20 lb. dry solids per sq. ft. of filter area per hr. was obtained when the separately digested sludge was conditioned with 10.5 lb. of $FeCl_3$ per 100 lb. of dry solids. The Oliver filter produced a max. of 18 lb. dry solids with 12 lb. of $FeCl_3$ per 100 lb. of dry solids. Expts. conducted on the dewatering of raw sludge and semi-digested sludge produced effluents contg. 1359 p. p. m. and 1002 p. p. m. suspended solids, resp. Cost ests. based on conditions at Baltimore indicate that digested sludge can be dewatered at a cost of $4.22 per ton of dry solids with $FeCl_3$ as a conditioner. The use of chlorinated copperas increases this cost to $4.66. The av. cost of air-drying sludge at Baltimore is estd. at $6.23 per ton of dry solids. E. HURWITZ

**A study of conditions favoring "bulking" of activated sludge.** JAN SMIT. *Sewage Works J* **4**, 960–72(1932).—In an effort to det. the effect of carbohydrates on bulking, glucose, sucrose, lactose and starch were added to sewage in a small exptl. plant. Results indicated that although sugars do impair the settling qualities of sludge, this effect occurs only after the addn. of much larger amts. than would be found in domestic

sewage. In all cases, decompn. of the carbohydrates occurred rapidly after their addn. was stopped. Conclusion: Carbohydrates are not the cause of bulking. E. H.

**Gas yield from sewage sludge.** WILLEM RUDOLFS. *Sewage Works J.* **4**, 444–53 (1932); *U. S. Pub. Health Eng. Abstracts* **12**, S, 100–1(Sept. 17, 1932).—The gas yields from the digestion processes are 0.21–1.32 cu. ft. per capita, with an av. of about 0.7 Larger yields may be due to excessive digestion capacity and the presence of org. trade wastes. It is unlikely that gas production from settled sewage sludge will be greater than 0.9–1.1 cu. ft. per capita even under conditions of prolonged digestion. On the basis of lb. of volatile matter retained, max. gas yields to be expected are 8–11.5 cu. ft In lab. expts. about $^3/_4$ of the gas yield can be accounted for by the fat ($Et_2O$ ext.) Nearly all cellulose substances capable of decompn. were destroyed. The portion of the sludge which is lost on ignition was very resistant to anaerobic decompn. C. R. FELLERS

**Gas collection and [sewage] sludge heating.** J. R. DOWNES. *Sewage Works J* **4**, 72–82(1932); cf. *C. A.* **26**, 3318.—Expts. made with a simply constructed earth tank with a floating wooden cover having shown that sludge heating is a practicable method of accelerating digestion, concrete tanks were constructed 40 ft. in diam. and 20 ft. deep. The bottom of the tank was made of dense material and was placed above the ground-water level, and the heating arrangement consisted of one coil of 2-in. pipe placed 18 in. from the wall, which provided 64 sq. ft. of heating surface for a tank of 20,000 cu. ft. effective capacity. Incrustation of the coils at a temp. > 43° was not serious after 3.5 yrs. The floor was given a slope of only 1 in 12, as the entrained gas made the sludge "lively" and capable of bearing a reasonable proportion of grit. The vol. of gas collected proved more than sufficient for the requirements of the plant B. C. A

**Development of power from sewage-sludge gas.** W. B. WALRAVEN. *Sewage Works J.* **4**, 614–27(1932). E. HURWITZ

**Nitrogen fixation in activated sludge.** PAUL J BEARD AND LAURA MUNSON *Sewage Works J.* **4**, 1002–5(1932).—A 2% milk waste made from skim milk powder was digested for 21 days in a small tank so constructed as to eliminate absorption of atm. $NH_3$. Results showed no evidence of N gain. The expt. was repeated with domestic sewage seeded with crenothrix and these results were also neg. E. HURWITZ

**Sewage sludge as fertilizer.** HORACE J. HARPER. *Sewage Works J* **3**, 683–7 (1931).—The availability of the N in sewage-plant sludge is low, but the effect on the soil is prolonged. The rate of application is very high when used in general farming Mixts. of sludge and com. fertilizer give very good results. Liquid sludge is more valuable than dried sludge. E. HURWITZ

**The effects of sewage discharge on streams.** H. W. STREETER. *Sewage Works J.* **3**, 713–23(1931).—Accumulating data serve to emphasize the limitation and extreme variability of the forces involved in natural stream purification. Oxidation of sewage proceeds in 2 stages, the primary or carbonaceous and the secondary or nitrogenous oxidation. It has been found that the time to complete either phase varies from 6 days at 30° to 20 days at 9°. By the discharge of large amts. of sewage the rate of deoxygenation is increased over that of reaeration and a slow recovery of the stream results. Recent unexplained outbreaks of gastro-intestinal disorders may have come from toxic substances derived from industrial wastes or from septic sludge deposits on the river bottom. E. HURWITZ

**Effect of pulp manufacture on mountain streams.** A. W. SILFVERSBARRE *Papers Trävarutid. Finland* **2**, 104–12(1932); *Chimie & industrie* **28**, 1426.—Waste liquor from mills making sulfite alc. was found not to deplete the O content of streams into which it is discharged and to have no deleterious effect on fish life. Tests carried out with the sulfite waste liquor itself showed that the liquor and the fibers which it contains absorb the O present in the water and are fatal to fish life. The investigation was of particular interest owing to the fact that phys., chem., biol., botanical, microscopical and elec. methods were used and their results coördinated. A. P.-C

**Pollution and recovery of the Mississippi River at and below Minneapolis and St. Paul.** G. J. SCHROEPFER AND J. A. CHILDS. *Sewage Works J.* **3**, 693–712(1931). Such factors as oxidation, diln., sedimentation and reaeration are interpreted with allowance for differences between calcd. and observed results. Oxidation of sludge in dam-created pools during the winter has little effect on O balance, but during the summer this process requires an av. of 1.35 lb. of O per 1000 sq. ft. of pool area per day. Sedimentation was responsible for a reduction of the O demand varying from 10 to 40% during the summer months. It was found that in a section of the river having an O

satn. of 40% that 0.50 lb. of O per 1000 sq. ft. surface area per day was supplied by reaeration. On a section having a satn. of 60% the figure was reduced to 0.35 lb.
E. HURWITZ

**Study of bacteriological methods of testing and means of disinfecting water with chlorine with particular reference to swimming-pool water.** W. L. MALLMANN AND WM. CAREY, JR. *Am. J. Pub. Health* **23**, 35–44(1933).—Samples of swimming-pool $H_2O$ collected during periods of use and tested immediately showed more pollution than duplicate samples handled in the usual manner by storing and testing later. During periods of use, swimming-pool $H_2O$ showed marked pollution as measured by colon bacilli and streptococci indices in the presence of residual $Cl_2$ contents of 0.2–0.5 p. p.m. During periods of rest, the pollution evidenced during use disappeared. The rate of disappearance depended upon the type of treatment used. With chloramine treatment, a delayed germicidal action occurred. This was also true of $Cl_2$ treatment in alk. $H_2O$ but to a lesser extent. The colon bacilli and streptococci indices roughly parallel each other. The preponderance of the colon bacilli and streptococci incidences varies. A $Na_2S_2O_3$-treated sample bottle is recommended for collecting pool samples.
J. A. KENNEDY

**Fumigation for plague prevention with special reference to Colombo Port.** L. FABIAN HIRST. *Ceylon J. Sci.* **2**, 277–327(1932); *U. S. Pub Health Eng. Abstracts* **12**, P, 8(Oct. 15, 1932).—Of the various agents used in fumigation, the cyanide products, zyklon B and discoids, are considered best for tropical conditions. Liquid HCN in cylinders is unsafe in the tropics because it decomposes into explosive products. The direct generation of HCN by means of KCN and $H_2SO_4$ by either the dumping method or the use of the Liston cyanide fumigator is also considered feasible. The penetration of HCN gas in foodstuffs is discussed. Provided the gas surrounds grain which is either loosely boxed or sacked, it will penetrate if given sufficient time. C. R. F.

**Atmospheric dust- and air-cleaning devices. Modern practice in the control of dust.** HOWARD C. MURPHY. *Aerologist* **8**, No 6, 5–8(1932); *U. S. Pub Health Eng. Abstracts* **12**, AC, 17(Sept. 24, 1932).—Results of dust detn. in 24 cities are given. Persons suffering from various allergic disorders often obtain definite relief when occupying quarters equipped with air-cleaning devices. Various types of equipment are described.
C. R. FELLERS

**Determination of fine soot inhaled by man.** A. I. BURSTEIN. *J. Ind. Hyg.* **14**, 339–44(1932). A known amt. of air contg. soot is drawn through filter paper and the color of the deposit compared against standards. According to the detns. it is calcd. that firemen and smiths inhale 0.05–0.35 mg. of fine soot per hr.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

**To the memory of K. K. Gedroiz.** *Uspekhi Khimii* **1**, 665–8(1932).
F. H. RATHMANN

**A quarter century progress in soil science.** JACOB G LIPMAN *J. Am. Soc Agron.* **25**, 9–25(1933).—A review of work on the origin, formation and classification of soils, soil chemistry and microbiology, plant nutrition, soil erosion, lysimeter investigations and field plats. J. R. ADAMS

**The mystery of the soil.** P. E. BROWN. *J. Am. Soc. Agron* **24**, 935–50(1932) An address. J. R ADAMS

**Chemistry and modern questions of agriculture.** G. TOMMASI *Chim. ind agr. biol.* **8**, 438–44(1932).—Some questions relating to the Italian agriculture and soils are discussed: fertilization, oxidation-reduction potentials of the soils, N balance and $H_2O$ consumption, overproduction, etc. G. A. BRAVO

**Soils of Texas.** W. T. CARTER. Tex. Agr. Expt. Sta., *Bull.* **431**, 50 pp.(1932).—About 21% of the land area of Texas has been covered by soil surveys. About 100 of the most important soil types are described as to compn., phys. properties and suitability for crop production. C. R. FELLERS

**Natural and artificial classification of soil components.** V. G. GLUSHKOV. *Proc 2nd Intern. Congr. Soil Sci., Leningrad 1930*, **I**, 44–5(1932)(in German).—A system of nomenclature and designation by nos. for describing particle size distribution in soil is outlined. C. J. SCHOLLENBERGER

**An experiment in the classification of the colorings of soils based on the doctrine of Wilhelm Ostwald.** N. A. ARKHANGELSKAYA. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930*, **I**, 76–81(1932)(in English).—Definition of soil color by O.'s system is proposed as a practical method. The connection between soil color and factors operative in soil development is discussed. C. J. SCHOLLENBERGER

**The problem of soil structure.** A. N. SOKOLOVSKII. *Proc. 2nd Intern. Congr Soil Sci., Leningrad 1930*, **I**, 94–8(1932)(in English). C. J. SCHOLLENBERGER

**Water-holding capacity as related to soil structure and drying.** A. I. AKHROMEIKO. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930*, **I**, 71–5(1932)(in German) C. J. SCHOLLENBERGER

**The microscopic estimation of size of soil particles.** D. J. HISSINK AND S. B.

HOOGHOUDT. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 46–7(1932)(in German).—Errors and means for avoiding them are discussed. C. J. S.

**Size distribution of soil particles in several Ohio soil profiles.** G. W. CONREY & E. E. BARNES. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 19*

[illegible] particles 0.05–.002 mm. diam.; hence it is of special value with silt and silty clay loams. C. J. SCHOLLENBERGER

**Profile characteristics of New England forest soils.** HERBERT A. LUNT. Conn. Agr. Expt. Sta., *Bull.* **342,** 743–836(1932).—Soil types and profiles are described. C. R. FELLERS

**New methods for studying some physical properties of soil.** N. A. KACHINSKII. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 129–60(1932)(in German).—Means is described for taking samples with undisturbed structure and for detg. porosity, permeability to $H_2O$, compactness, viscosity or resistance to tearing, swelling, etc. Most of the methods are applicable either to soil in the field or to monoliths in the lab. These characteristics of a loamy podzol profile are discussed. There are 48 references. C. J. SCHOLLENBERGER

**The significance of the composition of the clay fraction in profile studies.** C. W. ROBINSON. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 194–5(1932)(in English).—R. suggests that the $SiO_2:R_2O_3$ ratio of the clay fraction, assumed to be identical with the weathering complex, may be the best index to eluviation processes active in soil development. In prepn. of the clay fraction, acid pretreatment should be avoided. C. J. SCHOLLENBERGER

**Preliminary report on "single value" coöperative work.** B. A. KEEN. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 1–7(1932)(in English).—Detns. of "sticky point," *i. e.*, $H_2O$ content at which kneaded soil just ceases to adhere to external objects, on soils in a no. of cooperating labs. indicated that the detn. presents difficulties, the more so because Keen and Coutt's (cf. *C. A.* **23,** 5261) original description of the procedure is inadequate. It is believed that this or some other "single value" detn. may serve to indicate probable behavior of the soil under cultivation, and further study is recommended. C. J. SCHOLLENBERGER

**Aggregate analysis and aggregate composition of soils.** G. I. PAVLOV. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 179–93(1932)(in German).—By special technic the nature of soil particles resulting from degradation of dry soil structure on moistening, characteristic of gray soils, was investigated. Study of a no. of soils of this type indicated that fertilization with org. fertilizers andgro wing legumes was effective in preserving a granular soil structure even under irrigation. C. J. S.

**Mechanical analysis in the British Empire.** A. F. JOSEPH. *Proc. 2nd Intern Congr. Soil Sci., Leningrad 1930,* I, 52(1932). C. J. SCHOLLENBERGER

**Preparatory treatment of soil samples for mechanical analysis.** V. NOVÁK. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 14–39(1932)(in German).—Data obtained in a coöperative study of various methods are reported. No conclusions are drawn, but in view of the surprising lack of uniformity in results obtained by different workers, further study is recommended. **Reports on the paper of V. Novák "Preparation of soil samples for mechanical soil analysis."** *Ibid* 196–261.—The comments of individual coöperators in the above study are published. C. J. SCHOLLENBERGER

**Oxidation of organic matter in the pretreatment of soils for mechanical analysis.** E. M. CROWTHER AND K. E. TROELL. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 48–51(1932)(in English).—Various treatments preliminary to mech. analysis and the necessity for oxidation with many soils are discussed. If the ratio of total to inorg. colloids, as indicated by ignition loss:$H_2O$ in air-dry soil, exceeds 2.5, oxidation is probably necessary. A method of cold oxidation by NaBrO is described and its advantages over hot $H_2O_2$ treatment pointed out. Ten g. soil is treated overnight in a 400-ml. beaker with 200 ml. *N* NaOH and 5 ml. Br. Excess Br is destroyed by addn. of a little $NH_4OH$ and the soil washed on a filter with *N* and 0.1 *N* NaCl, and finally $H_2O$, until the filtrate becomes slightly turbid. C. J. SCHOLLENBERGER

**The use of the electrodialysis for the pretreatment of soil samples for the mechanical analysis.** L. F. SMOLIK. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 70(1932)(in English).—Electrodialysis to absence of Ca from dialyzate is satisfactory, but the percentage of clay found in samples so treated is always lower than in duplicates prepd. by the usual method. C. J. SCHOLLENBERGER

**Method for measuring albedo of soils.** N. N. KALITIN. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930,* I, 40–3(1932)(in French).—Albedo designates the percentage

of radiant energy reflected. Besides being important with respect to soil temp., reflection of ultra-violet is of interest for possible biol. effects. A photoelec. app. for the detn. is described. Quartz sand reflects about $^1/_3$ of the incident energy, humus $^1/_4$, blue clay soil dry $^1/_4$, same wet $^1/_8$. Reflection of short waves is much less than the above. C. J. SCHOLLENBERGER

**The existence of two equilibrium series in soil-capillarity phenomena.** WM. B. HAINES. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930*, I, 8–13(1932)(in English).—Soil $H_2O$-capillarity studies have been conducted in 2 ways by: (I) starting with soil dry, and (II) starting with soil wet. It has not been recognized that the equilibria are distinct and that there is no single reversible series. A theory of capillarity is developed and app. for detn. by II described. C. J. SCHOLLENBERGER

**Method of investigation of soil moisture.** N. A. KACHINSKII. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930*, I, 167(1932)(in English). C. J. SCHOLLENBERGER

**Heat of wetting of soil.** H JANERT. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930*, I, 99–123(1932)(in German); cf. *C. A.* **25**, 4957. App. and method for the detn. are described, and a no. of relations between heat of wetting and other soil properties are discussed. C. J. SCHOLLENBERGER

**A new calorimeter for measuring heat of wetting of soils.** P. I. ANDRIANOV *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930*, I, 53–8(1932)(in German).—Construction and operation are described. C. J. SCHOLLENBERGER

**Preservation of soil monoliths.** F. F. MORWICK *Sci. Agr.* **13**, 1–6(1932).—A method for mounting soil monoliths by use of water glass and asphalt tar is described. C. R. FELLERS

**Leaching of mineral matter in some Alberta soils.** ALFRED LEAHEY *Sci. Agr.* **13**, 7–15(1932).—The various horizons representing soils of the brown, black and gray wooded soil belts were examd. for Si, Al, Fe, Ca, Mg and P. Little leaching of the elements occurred in the brown soils. The black soils had been leached of Ca but showed little movement of Al or Fe. The gray wooded soils showed leaching of Ca to a considerable depth, while Fe and Al were also translocated to some extent. Alberta soil can be fairly closely correlated with the Russian system of soil classification. C. R. FELLERS

**Comparison of the soil-plaque method with the Neubauer and Hoffer corn-stalk methods for determining mineral soil deficiencies.** LAURA C. STEWART, WALTER G. SACKETT, D. W. ROBERTSON AND ALVIN KEZER. Colo. Agr. Expt. Sta., *Bull.* 300, 59 pp.(1932); cf. *C. A.* **26**, 390.—The soil-plaque and Neubauer methods are equally applicable and reliable for the detn. of mineral soil deficiencies. The Hoffer corn-stalk method is satisfactory in most cases for the detn. of the K and N needs of corn where marked deficiencies or abundant supplies exist, but is not so dependable for border line cases. Close correlations were obtained between the different methods where comparisons were possible. The soil-plaque method is well adapted to the detn. of P deficiencies and may prove equally valuable in relation to K. All points considered the soil-plaque method is most satisfactory. C. R. FELLERS

**Root systems of plants in soils of the podzol type.** N. A. KACHINSKII *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930*, I, 165–6(1932)(in English). Studies indicate that plant roots have been the principal source of humus. Soln. and pptn. of org. matter are minor factors. Roots do not penetrate heavy podzol readily, and those which enter deeper horizons generally follow cracks. C. J. SCHOLLENBERGER

**[Report of the] soil chemistry department. Fertility value of soil at different depths to a total depth of four feet.** M. M ALICANTE. Philippine Sugar Assoc., *Ann. Repts.* **1930**, 128–34(1931).—A study was made of cane soils from 10 Philippine districts. The $p_H$ values ranged from 5.40 to 8.06, and, with 1 exception, the values decreased with increase in depth of sampling. With all soils, the N content progressively decreased with increase in depth, but the results for $P_2O_5$ and $K_2O$ showed no definite trends. The soils varied considerably in nitrifying power, but in all cases the best nitrification of $(NH_4)_2SO_4$ was obtained in the 1st and 2nd 8-in. layer. **A survey of the chemistry of soils in the Sara-Ajuy district.** *Ibid* 134–7.—Chem. analyses and $p_H$ values are tabulated. **Chemical analysis and $p_H$ value of soils from fertilizer-constituent experiments at Concepcion experimental field, Central Luzon Milling Company.** *Ibid* 137–40.—$(NH_4)_2SO_4$ increased and $K_2SO_4$ decreased soil acidity, superphosphate having no effect. **Phosphoric acid and potash requirements of soils.** *Ibid* 140–3.—Data are given on the total $P_2O_5$ and $K_2O$ contents of cane soils from 11 districts. No definite relation existed between these figures and those obtained for $P_2O_5$ and $K_2O$ sol. in 22.9% HCl and in 2% citric acid, resp. There was no correlation between the $p_H$ values of the soils and their contents of citric acid-sol. $P_2O_5$. K. D. JACOB

**An attempt to control the reaction of a soil.** HENRY C. HARRIS. *J. Am. Soc. Agron.* **24**, 981–3(1932).—After a wide range in the reaction of Sassafras silt loam was established by the application of CaO and S at different rates an attempt was made to maintain the soil reaction as nearly as possible under crop conditions. This was found very difficult to do, with any great degree of exactness, by the methods and treatments used and under the field conditions. It seems that there are seasonal factors which cause the reaction of this soil to change in one direction one summer while the next summer it may change in the opposite direction. J. R. ADAMS

**The applicability of the quinhydrone method to determinations of the degree of acidity in soil suspensions.** JOHS. LINDEMAN, VIGGO NÆSVOLD AND F. LØSCHBRANDT. *Meldinger Norges Landbruks.* **12**, 727–910(1932)(in English).—A detailed description is given of an app. especially designed for rapid mass detns. of $p_H$ in soils by means of the quinhydrone electrode. The factors affecting the accuracy of the method are discussed in great detail. Detns. in soil pastes so highly concd. that no sedimentation can take place may lead to considerable error with soils of high exchange acidity, because of the comparatively high diffusion potential set up at the point of contact between the KCl bridge and the soil suspension. This source of error may be avoided by interposing the particle-free soil soln between the suspension and the KCl soln., this permitting measurements to be made while the suspension is stirred continuously. With most soils, however, the $p_H$ values obtained when the electrodes are placed directly in the sedimented paste do not differ greatly from those obtained when the electrodes are placed in the particle-free liquid. The causes of temporary variations in $p_H$ and of systematic errors in the method are pointed out. With proper precautions, the quinhydrone electrode gives accurate results on all soils, except those where for obvious theoretical reasons the presence of certain substances interferes with the functioning of the hydroquinone–quinone system. Bibliography. INGEBERG

**The base economy of arable soil with special reference to leaching.** A. JACOB. *J. Landw.* **80**, 241–69(1932).—The washing out of the soil of Ca, Mg and K has been known to be influenced by the method of cultivation, but for K the loss previously has been underestd. The loss of K by exchange except in sandy and moorland soils is not increased by the addn. of K salts A review is made of previous literature. J. R. H.

**"Kuhlerde" and its action on marsh soil.** E BLANCK AND F. KLANDER. *J. Landw.* **80**, 293–316(1932); cf *C. A.* **24**, 5409.—The favorable effect of certain lower soil strata ("Kuhlerde") on marsh soils is due to the presence of compds. capable of base exchange as well as sand and lime. Analyses are given. JOHN R. HILL

**New apparatus for colorimetric investigation.** M. WALLOOH. *Phosphorsäure* **2**, 765–7(1932).—A turntable carrying 12 glass tubes for standard solns., all enclosed in a metal case provided with side door, metal support stand and optical system permitting observation through a horizontal tube, enables any one of the standard solns. to be brought into position for comparison with the unknown. The app. was developed for the *detn. of easily sol.* $P_2O_5$ *in soils* according to Gericke (*C. A.* **25**, 5947). W. L. H.

**Soil-corrosion survey gives valuable data as aid in selecting proper type of coating.** WAYNE DENMAN. *Oil and Gas J.* **31**, No. 31, 12(1932).—The ideal noncorrosive soil has a high elec. resistance, no acidity, is coarse in texture, and well-drained. To test resistance a potential is impressed across 2 electrodes in contact with the soil, and the current is measured in ohm-cm. Acidity or alky. is usually expressed in terms of the $p_H$ value. Beyond a $p_H$ value of 9 corrosion practically ceases. J. R. STRONG

**Solubility of phosphorites and leucites in soils.** C. ANTONIANI AND M. NICCOLINI *Giorn. chim. ind. applicata* **14**, 490–1(1932).—Phosphorite and leucite were added to soils kept impregnated with water to the extent of 30% of satn., and the amt. of $P_2O_5$ and $K_2O$ taken up was measured according to Neubauer (cf. *C. A.* **26**, 3520.) Soil with $p_H$ 7.5–7.0 after 5–6 months had taken up 0.002 g. $P_2O_5$ per 100 g. soil At $p_H$ 6.5, almost twice as much $P_2O_5$ is absorbed. Leucite is taken up more readily, as 0.005 g. $K_2O$/100 g. soil is taken up in 2 months. The reaction of the soil, however, has no effect on the rate of absorption of $K_2O$. A. W. CONTIERI

**Microbiology of the soil. V.** S. VINOGRADSKII. *Ann. inst. Pasteur* **48**, 89–134 (1932).—The technic of a method of studying the bacterial content of soil is described. The method consists essentially in the examn. of the cultures of single species of bacteria obtained by the use of media infected with all the species in the soil, but contg. only one substrate of a type on which that species exercises its natural function. The cultures are made on disks of $SiO_2$ gel impregnated with mineral salts and the chosen substrate. If a source of N is required, $NH_4Cl$ or $NH_4NO_3$ is included. To study the fixation of N, no combined N is introduced, and in the case of the nitrifying bacteria, $NH_4Cl$ or $NH_4NO_3$ is used as substrate. The media thus prepd. are treated with definite

quantities of soil, varying according to the bacterial content, and incubated for definite periods, after which a morphological and, if necessary, a chem examn. is carried out

**VI. Synthesis of ammonia by Azotobacter.** *Ibid* 269–300.—The primary product of N fixation by *Azotobacter* is $NH_3$, which is subsequently assimilated by the organism. In certain circumstances assimilation may be arrested, but $NH_3$ production continues and $NH_3$ appears in the media. Liberation of $NH_3$ from *Azotobacter* cells continues after their death, and may be entirely a post-mortem process. *Azotobacter* utilizes the decompn. products of vegetable tissues as a source of energy. B. C. A

**Decomposition of pentosans by soil bacteria.** J. Ziemiecka. *Polish Agr. Forestal Ann.* **25**, 313–32(1931).—*B. xylanophagus*, which decomps. xylan in nonacid medium, but not cellulose, was isolated from soil, straw and stable manure. B. C. A.

**The effect of Colpidium on ammonia production by soil bacteria.** Jane Meiklejohn. *Ann. Appl. Biol.* **15**, 584–608(1932).—Expts. were performed with a mixed culture of 2 species of soil bacteria with and without a *Colpidium* resembling *C. colpoda*, one series on a soln. of peptone in soil ext., the other on a synthetic medium contg. alanine. Cultures contg. *Colpidium* showed a reduction in no. of bacteria. On the peptone medium, *Colpidium* produced slightly more $NH_3$ than the controls; on the alanine medium this organism produced the same amt. of $NH_3$ and $CO_2$ as the controls An inverse linear relation exists between the no. of bacteria and the efficiency of $NH_3$ production in both series of cultures. The same relation was found for $CO_2$ in the 2nd series. The stimulating effect of the presence of *Colpidium* is not due solely to the reduction of bacteria to an optimum value. In the cultures contg. *Colpidium* the bacteria are probably kept in a state of youth for a longer period. C. H. Richardson

**Agricultural lime; its effects on the soil.** W. R. Jewell. *J. Dept. Agr. Victoria* **31**, 22–4(1933). K. D Jacob

**The changes of cyanamide in the soil. II. The decomposition of dicyanodiamide and guanylurea in paddy soil.** H Murata. *Bull Kagoshima Imp. Coll Agr* 10, 115–32(1932), (abstract in English); *Bull. Agr. Chem. Soc. Japan* **8**, 83–7(1932) It was shown previously (*C. A.* **25**, 762) that the formation of $NH_3$ from cyanamide, mainly through urea, is almost the same in normal and water-logged soil. However there is a marked difference in the water-logged soil when cyanamide is transformed into dicyanodiamide. In water-logged soil dicyanodiamide is comparatively easily ammonified, especially at the usual summer temp., and this is the main reason for the special fertilizing value of dicyanodiamide on paddy rice, in contrast to its harmful effect on ordinary farm crops. Further studies showed that: (1) In the majority of water-logged soils, dicyanodiamide is ammonified at the incubation temp. of 30–36° (2) The optimum temp. for the ammonification of dicyanodiamide in water-logged soil is 35–45°. (3) Air-drying of the soil markedly increases the ammonifying power of the soil in the water-logged state, both for the soil org. N and the added dicyanodiamide a putrid smell is always emitted when the air-dried soils are incubated in the water logged condition. (4) In the water-logged soil, the formation of guanylurea from dicyanodiamide is noticed when the soil is partially sterilized. (5) The environmental conditions to which the soil is subjected before incubation in the water-logged state greatly affect the ammonification of dicyanodiamide and guanylurea; the prolongation of a liberal aerobic condition in the normal soil state is detrimental to the agencies which ammonify dicyanodiamide and guanylurea in the water-logged condition; the weakened ammonifying power of dicyanodiamide and guanylurea is gradually restored by the addn. of $CaCO_3$ when the soil is water-soaked, the decreased $p_H$ value of the soil being thereby increased; the same effect is also obtained by simply inoculating the soil with the paddy soil, without increasing the decreased $p_H$ value.
H. Murata

**Changes of cyanamide in the soil.** H. Murata. *J. Sci. Soil Manure* **6**, No 1, 121–5(1932); cf. preceding abstr.—The effects were investigated of (1) time of soil sampling and (2) kinds of treatment of soil, on the decompn. of dicyanodiamide and guanylurea in the soil under flooded conditions. Y. Kamoshita

**Easily soluble phosphorus in Oklahoma soils.** Horace J. Harper. Okla Agr Expt. Sta., *Bull.* **205**, 3–24(1932); cf. *C. A.* **27**, 795.—About 6200 soils were collected and analyzed for sol. P by extn. with 0.2 *N* $H_2SO_4$. More than 50% of the soils of eastern Okla. contained less than 50 lb. per acre of sol. P. In the central and western soils, the P was less deficient but was still a limiting factor in crop production. The bottom lands along rivers were normally rich in sol. P. The early growth of plants is particularly susceptible to lack of P. This is because P is necessary for cell division. Grain sorghums can grow in soils contg. very little sol. P. With the exception of alfalfa,

the legumes commonly grown in Okla. are more vigorous feeders on the insol. P compds. of the soil than crops like corn, wheat, oats or barley. C. R. FELLERS

**The mobility of phosphoric acid in the soil.** K. C. W. VENEMA. *Landbouwk. Tijdschr.* **43**, 364(1931); *Phosphorsäure* **3**, 127.—Characteristic graphs are obtained by plotting the amts. of $P_2O_5$ fixed by soils against the $p_H$ values of the soils. The graph for the fixation of $P_2O_5$ below $p_H$ 6 takes the form of a curve, whereas that for the soln. of the $P_2O_5$ above $p_H$ 6 is a straight line, which shows that the soln. of the $P_2O_5$ is caused by chem. reaction. When the amt. of $P_2O_5$ added to a clay soil is plotted against the amt. fixed by the soil, the graph takes the form of a hyperbola K. D. JACOB

**Mobilization of the phosphoric acid of phosphorites and of soils by the roots of the lupine and certain other plants.** M. DOMONTOVICH AND V. POLOSSIN. *Result. Vegetationsvers. u. Labor. Arb.* **15**, 103(1931); *Phosphorsäure* **3**, 124.—When $P_2O_5$ was supplied in the form of phosphorite, the development of oats, in pot expts., was increased by growing the plants together with lupine, lentil or sainfoin. This effect is attributed to the increased solubilization of the $P_2O_5$ of the phosphorite resulting from the comparatively high acidity developed in the neighborhood of the roots of these plants. K. D. JACOB

**Determination of easily assimilable potash and phosphoric acid in the soil.** K. BAMBERG *Lauks. Fakultates Serija* II, **4**, 119(1931); *Phosphorsaure* **3**, 126.—Expts on the action of acids on soils showed that the soil has a higher buffer capacity toward $H_2SO_4$ than toward the monobasic mineral acids. Consequently, a greater portion of the soil $P_2O_5$ is dissolved by treating the soil with $H_2SO_4$ to a predetd $p_H$ value than by treating it with HCl or $HNO_3$ to the same $p_H$ value. B. outlines a titration method for quickly obtaining predetd $p_H$ values in acid exts. of soils, and compares the results for easily assimilable $K_2O$ and $P_2O_5$ obtained by this method with those obtained by other methods of detg. the fertilizer requirements of soils. The method is particularly suitable for investigations requiring detns. on numerous samples. K. D. J.

**The phosphoric acid nutrition of pines in permanent enclosures.** ANTONIN NĚMEC. *Forstwiss. Centr.* **54**, 57, 88(1932); *Phosphorsaure* **3**, 121.—Applications of superphosphate increased 7 26% the height of pines grown on soils not excessively acid and showing a decided deficiency in available $P_2O_5$ in comparison with a sufficient supply of exchangeable Ca. No response to phosphate fertilizers was obtained on P-deficient soils in which the exchangeable acidity was less than $p_H$ 4 0 and the CaO content less than 100–150 mg. per 100 g. soil. In soils contg more than 250 mg. citrate-sol. $P_2O_5$ and more than 5 mg. $H_2O$-sol. $P_2O_5$ per kg no visible response to applications of superphosphate was obtained in 1 year. The amt. of reabsorbed $P_2O_5$ in the needles of unfertilized pine trees paralleled the content of citrate- and $H_2O$-sol. $P_2O_5$ in the soil but bore no relation to the effect of phosphate fertilizers on the growth of the trees. K. D. JACOB

**Influence of phosphoric acid fertilization on the yield and quality of malting barleys.** C. KRÜGEL, C. DREYSPRING AND H. KURTH *Superphosphate* **5**, 229–43(1932).—In pot expts. with malting barley on a sandy soil of approx. neutral reaction, increasing the rate of application of $P_2O_5$ in the form of superphosphate from 30 to 134 lb. per acre caused a progressive increase in the yields of grain and straw (particularly the former), in the size and wt. of the individual grains, in the starch content of the grain and in the yield of malt ext. obtained therefrom. The albumin content of the grain decreased with increase in the $P_2O_5$ application Also in *Z. Pflanzenernähr. Düngung u Bodenk.* **12B**, 12–32(1933). K. D. JACOB

**Phosphate rock statistics, 1931.** A. N GRAY. *Superphosphate* **6**, 6–13(1933).—Data on the world production and trade are tabulated K. D. JACOB

**The fertilizer value of ammoniated superphosphate.** H. KAPPEN, TH. AYMANS AND W. HILLKOWITZ. *Arch. Pflanzenbau* **7A**, 272(1931); *Phosphorsaure* **3**, 120.—As detd. by the Neubauer method, the root-soly. of the $P_2O_5$ in (I) superphosphate, (II) ammoniated superphosphate and (III) basic slag was in the order I > II > III, when the expts. were made in pure sand cultures. In acid soils the root-soly. of I was considerably depressed and that of II and III was increased, the 3 materials giving approx. the same results. In alk. soils the soly. of the $P_2O_5$ in II and III was greater than in acid soils and that of I was approx. the same as in pure sand, the relative order being I > III > II. In vegetation expts. on different types of soil, the $P_2O_5$ in II was, in general, as effective as that in I and III in promoting plant growth, and approx. the same amts. of $P_2O_5$ were taken up by the plants from the 3 materials. I tended to increase the acidity of the soil, but to a much smaller extent than an equiv. mixt. of $(NH_4)_2SO_4$ and ordinary superphosphate. K. D. JACOB

**Rate and degree of fixation of superphosphate by Black Belt soils.** G. D. SCAR-

SETH. Ala. Agr. Expt. Sta., *42nd Ann. Rept.*, 20(1931); cf. *C. A.* **26**, 6043.—Greenhouse expts. showed that on Black soils an application of 250 lb. of superphosphate per acre without liming 1 yr. before planting was practically lost to the crop. $CaCO_3$ greatly aided fixation of P. C. R. FELLERS

**Basic slag versus superphosphate for cotton.** J. T. WILLIAMSON. Ala. Agr. Expt. Sta., *42nd Ann. Rept.*, 16–17(1931).—The av. results from 109 expts. covering several soil types and a 5-yr. period show that 400 lb. of 16% superphosphate produced an av. increase in seed cotton of 167 lb. as compared with an increase of 99 lb. for 10.5% basic slag (600 lb. per acre). Only on unlimed soils was the basic slag as effective as the superphosphate. C. R. FELLERS

**Plant-buffer systems in relation to the absorption of bases by plants.** T. C DUNNE. *Hilgardia* **7**, 207–34(1932).—The principal types of substances responsible for the buffering of plant saps are org. acids, amides, amino acids, phosphates and sugars. In studies on plant metabolism, titration curves are a useful means of detg. large changes in some of the org. sap constituents. A low phosphate supply resulted in an increase of H-ion concn. and buffer in the sap. This probably indicates an increase in org. acids, amides, amino acids and possibly sugars. Similar changes may occur as a result of low K supply. Ca is not an indispensable part of the buffer system of the plants studied, *e. g.*, wheat and buckwheat. When grown with a small Ca supply these plants do not necessarily show an increase of H-ion concn. in the sap, nor are they always injured. Under these conditions, the base necessary for the buffer system is supplied by an increased absorption of K. $CaCO_3$ treatment may produce an alky. which is distinctly injurious to some plants. $CaCO_3$ had no tendency to decrease the oxalate content of the plant sap in buckwheat. The theory that $CaCO_3$ or $Ca(HCO_3)_2$ is necessary for the neutralization of org. acids in such plants is not substantiated. The high Ca content indispensable for good growth of certain plants requires some other explanation. Twenty-one references are appended. C. R. FELLERS

**Special and methodological investigations in the laboratory of analytical and colloid chemistry.** I. N. ANTIPOV-KARATAEV. Lenin Agr. Sci Acad., Inst. Fertilizers Agro-Soil Sci., Leningrad Branch (U. S. S. R.), *Bull.* **15**, 148–59(1932).—A check-up on the Schollenberger method for detg. org. matter showed that a lower concn. of $H_2SO_4$ (1:1 of $H_2O$ and $H_2SO_4$, or even less $H_2SO_4$) was more efficient in a 0.4 *N* chromic acid soln. A modification was also made of the Szebellidy (*Z. anorg. Chem.* **81**, 1–4(1913)) method for detg. $Fe^{++}$. For the formation of the complex salt, which takes out the Fe, $NH_4F$ and $K_2C_2O_4$ in the ratio of 5:1 by wt. were used. To avoid the difficulty in recognizing the I color methylene blue was used, which is colorless in a reduced condition. The titration with a standard I soln. was carried out as follows: to the test soln. add 12 cc. of 1:3 HCl and a few drops of methylene blue. Then add 5 g. of $KHCO_3$, when the soln. is satd. with $CO_2$ add the oxalate and fluoride. As the oxalate and fluoride dissolve, the blue color disappears and a yellowish color appears. Add the I soln. until an intense blue color appears, which, if it remains for 0.5 min., shows that the titration has been completed. J. S JOFFE

**Special and methodological investigations in the agrochemical laboratory.** K V FLEROV, N. I. ALIAMOVSKII AND I. E. KINZERSKII. Lenin Agr. Sci. Acad., Inst. Fertilizers Agro-Soil Sci., Leningrad Branch (U. S. S. R.), *Bull.* **15**, 137–43(1932). A check-up on the volumetric method of Scheffer for the detn. of $P_2O_5$ showed it to be just as accurate as the Lorenz or Woy methods. J. S. JOFFE

**Artificial fertilizers registered for 1933; analyses and unit values.** WILL C ROBERTSON. *J. Dept. Agr. Victoria* **31**, 27–36(1933).—Data on the compns. of com fertilizers in Victoria are tabulated. K. D. JACOB

**Effect of commercial fertilizers on the quality of wheat.** GYULA SURÁNYI *Mezo gazdasági Kozlöny* **4**, 440(1931); *Phosphorsäure* **3**, 122.—In general, the quality of wheat was improved by the use of com. fertilizers. $NaNO_3$ gave better results than $CaCN_2$. $P_2O_5$ fertilizers were harmful only when used in too large excesses as compared with the applications of N and potash, poor results being obtained under these conditions more often with superphosphate than with Rhenania phosphate. The effect of $K_2O$ fertilizers, used alone, on the quality of wheat was indeterminate. K. D. JACOB

**A review of researches on nitrogen fertilization in relation to economic crop production with special reference to future investigations.** W. P. KELLEY. *J. Am. Soc. Agron.* **25**, 51–64(1933).—A review covering the effect of N on the yield and quality of crops, effect of different N fertilizers, relation of N to other elements, chem. and phys. effects of N fertilizers, and N gains and losses from soils. Suggestions are given for future work on N fertilization. J. R. ADAMS

**Hygroscopicity of fertilizer salts.** ALBERT R. MERZ, WILLIAM H. FRY, JOHN O.

HARDESTY AND J. RICHARD ADAMS. *Ind. Eng. Chem.* **25**, 136–8(1933); cf. *C. A.* **23**, 2236.—The vapor pressures of satd. solns. of mixts. of fertilizer salts not having common ions were detd. at 30°, and calcns. were made of the relative humidities prevailing over the solns. Comparisons of the values obtained show that the hygroscopicity of such mixts. is, in general, greater than that of the most hygroscopic salt present in the solid phase. A system is suggested for expressing hygroscopicities by nos. directly proportional to this property. J. R. ADAMS

**The importance of sulfates as fertilizer.** GABRIEL BERTRAND AND L. SILBERSTEIN. *Compt. rend.* **195**, 1349–52(1932).—Carefully controlled expts. show that plants require S and that all fertilizer mixts. should contain a certain proportion of sulfate. Treating the soil in which rape was cultivated with $Na_2SO_4$ increased the seed yield 83.3% and gave a yield that was 207% above that obtained when the small amt. of sulfate native to the soil was rendered inactive with $Ba(NO_3)_2$. The relatively small amt. of assimilable S in the soil very markedly limited the action of other growth factors, notably, N, $P_2O_5$ and $K_2O$ added as fertilizer. Also in *Compt. rend. acad. agr. France* **19**, 50–4(1933). J. R. ADAMS

**Comparison of nitrate of soda and ammonium sulfate for cotton.** R. Y. BAILEY. Ala. Agr. Expt. Sta., *42nd Ann. Rept.* 15(1931).—Both fertilizers gave equally good results on limed soils, but the $NaNO_3$ was superior on unlimed soils. C. R. FELLERS

**Decomposition of organic fertilizers. IV. Decomposition of straws.** SHIGERU OSUGI AND TARO GOTO. *J. Agr. Chem Soc. Japan.* **8**, 640–51(1932); cf. *C. A.* **25**, 3114.—The straws of corn, rice, pampas grass, rye and wheat and rice hulls were decompd. in soil. The amts. of the decompn. products were estd. from the amt. of $CO_2$ produced. The decompn. of the straws depends on the C:N ratio of the materials. When the ratio C:N is small, the decompn. is more rapid. Making the ratio 20:1 or 10:1 by the addn. of $(NH_4)_2SO_4$ generally accelerated the decompn. except with rice hulls. Y. KIHARA

**Hot- and cold-fermented manure.** W ZIELSTORFF AND A. KELLER. *Landw Jahrb.* **75**, 449–65(1932).—Differences in the compn. and efficiency of the 2 forms of manure were small. B. C. A.

**Compositions of soy-bean plants at various stages of growth as related to their rate of decomposition and use as green manure.** LLOYD M. TURK Mo. Agr. Expt. Sta., *Research Bull.* **173**, 3–40(1932).—Decreased wheat yields following soy beans were probably due to microbiological assimilation of nitrate. A study was made of the variations in the amt. of decomposable material in soy-bean plants at different stages of maturity. Soy-bean tissue was successively treated with $Et_2O$, cold $H_2O$, hot $H_2O$, dil. NaOH and dil. HCl, and detns. were made of the org. constituents in the various exts. and residues, as well as in the original material. The rate of decompn. was studied by various methods including the evolution of $CO_2$, $NH_3$ production, nitrate accumulation and humus production. The percentage of total N decreased with the age of the plants. The roots were below 1.7% N except in the early part of the season The $H_2O$-sol. constituents decreased in both roots and tops as the plants became older. The alkali-sol. material, considered slowly decomposable, increased markedly toward plant maturity, and the N content of this portion increased, especially in the alkali-sol. lignin. The carbonaceous materials, including reducing sugars, cellulose and pentosans, are all decomposable by soil microörganisms in the presence of sol. N, and all increased with plant maturity. With advancing maturity there was a widening in the C:N ratio. The percentage of total lignin increased enormously during the season's growth. The pentosan-lignin ratio was narrow, which might indicate slow decompn., especially in the roots. In general, the rate of decompn. of the different plant parts decreased with advancing maturity, as indicated by evolution of $CO_2$. The rate of decompn of plant parts was in the order: tops, complete plants and roots. The cold $H_2O$-sol. fraction is largely responsible for the immediate and rapid evolution of $CO_2$. There was a distinct narrowing of the C:N ratio in the soil during the 30-day decompn. period. Soy-bean tops were transformed more rapidly into humus than were the roots. $NH_3$ and nitrate accumulation following the incorporation of the plant materials in soil were less with the successive or more mature growth stages. A pos. accumulation of nitrate occurred following the incorporation of the total soy-bean plants and the tops in soil A neg. accumulation occurred with the soy-bean roots. The later the stage of growth, the more pronounced was the depressive effect. The addn. of a sol. N fertilizer to a wheat crop following soy beans effectively eliminates the depressive effect. Sixty-six references are appended. C. R. FELLERS

**The relation between decomposition of green manures at different temperatures and their chemical constituents.** H. MISU. *J. Sci. Soil Manure* **6**, No. 1, 1–21(1932).—

In the case of decompn. of grasses at different temps., the relations between their chem. constituents and the development of $NH_3$, $HNO_3$ and acidity were investigated. Y. KAMOSHITA

**The physiological reaction of fertilizers.** S. OOSUGI AND T. ENDO. *J. Sci. Soil Manure* **6**, No. 1, 22–34(1932).—The physiol. reaction of several chem. nitrogenous fertilizers was ascertained by Neubauer's seedling method. Y. KAMOSHITA

**Microbiology of organic manures. 1. (b) Decomposition of rape cake by various stock cultures.** A. ITANO AND S. ARAKAWA *J. Sci. Soil Manure* **6**, No 1, 35 52 (1932); cf. *C. A.* **27**, 1079.—Effects of (1) kind of microörganism, (2) length of culture of organism, (3) $p_H$ and (4) addn. of glucose on the decompn. of rape cake were investigated. Y. KAMOSHITA

**Fertilizing value of Peruvian nitrogenous guanos.** Y. HAYASHI AND H. YAGI *J. Sci. Soil Manure* **6**, No. 1, 76–82(1932).—Pot expts. were conducted with paddy rice and barley to det. the availability of N in Peruvian nitrogenous guanos. Y. KAMOSHITA

**[Report of the] agronomy department. Fertilizer requirements of Philippine sugar districts.** MARIANO MEDALLA AND ANTONIO DE LUZURIAGA Philippine Sugar Assoc., *Ann. Repts.* **1931**, 48 73(1932). **Most efficient sources of nitrogen for fertilizer use.** *Ibid* 73–9.—As measured by the total yield of sugar, $(NH_4)_2SO_4$ was a more efficient source of N for cane than urea, $NaNO_3$, Leuna saltpeter, $NH_4Cl$, or Kalkammon, the next best results being obtained with $NH_4Cl$. In water cultures, $(NH_4)_2SO_4$ gave better growth of cane than $NaNO_3$. **Optimum fertilizer sources for phosphoric acid.** *Ibid* 85–9.—As sources of $P_2O_5$ for the growth of cane and production of sugar, the efficiencies of phosphate fertilizers were in the order: Leunaphos > superphosphate > Rhenania phosphate. Phosphate fertilizers increased the total yield of sugar but decreased the yield per ton of cane. K. D. JACOB

**Sugar-beet trials in 1931.** T. REMY, E. OHLY AND A. DHEIN *Landw. Jahrb.* **75**, 241–309(1932).—The effects of various fertilizer treatments on the yield and compn. of roots and tops are recorded. B. C. A

**Experiments in 1929 at the pond-cultivation experiment station, Wielenbach.** E. WALTER. *Fischerei-Ztg.* **33**, 11, 129(1930); *Allgem. Fischerei Ztg.* **55**, 7, 98(1930); *Phosphorsaure* **3**, 122.—Treatment of ponds with various fertilizers resulted, in some instances, in increased yields of fish, the increases being due to the effect of N and $K_2O$ on the growth of vegetation in the ponds. When used alone, $P_2O_5$ fertilizers had little, if any, effect. The best results were obtained with guano. K. D. JACOB

**The close-grazing scheme of pasture management.** FRANK T. SHUTT AND S. N. HAMILTON. *Can. Chem. Met.* **17**, 5–6(1933) The influence of successive applications of N on the compn. and yield of the herbage is indicated. With fertile soil, suitable fertilization, and favorable seasonal conditions, a highly digestible, high-protein herbage is obtainable throughout the whole season. W. H. BOYNTON

**Straw utilization and a study of its constituents.** LIONEL LEMAY *Sci. Agr.* **12**, 749–54; **13**, 58–67(1932)(in French) A review of investigations on the use of straw as a fertilizer, as a feeding material and as a source of furaldehyde, gas, tar, and pulp, and on the constituents of straw. Seventy-five references are appended C. R. FELLERS

**The woody diagnosis of the vine and future production.** E. VINET *Compt. rend. acad. agr. France* **18**, 1061–9(1932); cf. *C. A.* **26**, 2214, 3278, 5604.—The ratio of the $P_2O_5$/N ratio in the base of the branches of fertilized grapevines to the corresponding ratio of unfertilized vines is the same as the ratio of the sum of the saccharifiable materials in the base of the branches of the treated to the sum of those in the untreated vines. This $P_2O_5$/N ratio can be used to predict future grape production, as it varies directly with the no. of bunches formed. Continuous fertilizing increases the $P_2O_5$:N ratio in the base of the branches, this indicating that it aids in increasing future grape production. J. R. ADAMS

**Report of the entomology department.** A. W. LOPEZ. Philippine Sugar Assoc., *Ann. Repts.* **1930**, 145–72(1931).—*P*-dichlorobenzene was repellent but not toxic to the grubs of *Leucopholis irrorata*. Analyses of the adult beetles of this species and of an unnamed species of *Leucopholis* gave N 8.67 and 11.72, $P_2O_5$ 1.835 and 2.017 and $K_2O$ 1.55 and 1.375%, resp. The use of the insects as *fertilizer* is suggested. In certain sections of the Philippines they are used as *food* by the natives. K. D. JACOB

**Wetting, spreading and emulsifying agents for use with spray fluids. III. Emulsifiers, and soaps containing spraying oils.** R. M. WOODMAN *J. Soc. Chem. Ind.* **51**, 358–60T(1932); cf. *C. A.* **24**, 3311.—*Linseed products* are unsuitable spray emulsifiers. *Formulas* are given for moderately stable *soaps contg. insecticidal and ovicidal*

*oils.*—Although these soaps yield oil-in-water emulsions when soaked in water and shaken, their content of toxic oil is probably too low for general use. W. L. HILL

**Spray residues on fruit; methods of removal.** A. G. STRICKLAND. *J. Dept. Agr. Victoria* **31**, 18–21(1933).—Removal of arsenical spray residues from apples by means of HCl is discussed. K. D. JACOB

**Pyrethrum insecticides.** W. E. EDMONTON. *Am. J. Pharm.* **104**, 793–8(1932). W. G GAESSLER

**The rotenone content of Malayan tuba root.** C. D. V. GEORGI AND G. L. TEIK *Malayan Agr. J.* **20**, 498–507(1932).—The rotenone contents of com. tuba root consignments varied widely. A similar variation exists between different varieties of *Derris* from which the roots are obtained. *D. elliptica* is the best source of rotenone, while *D. malaccensis* is the poorest. J. R. NELLER

**A gummosis of citrus caused by Dothiorella.** GIULIO SAVASTANO. *Boll. staz. patol. vegetale* **12**, 245–74(1932). **Experimental investigations on citrus fruit diseases.** *Ibid* 306–42.—Several diseases caused by *Dothiorella* sp., *Phytomonas citriputeale*, *Phytophthora* sp., *Sclerotinia* sp., *Penicillium* sp., etc., are described, and the methods of controlling and combating them are discussed. G. A. BRAVO

**Treating cotton seed by the dusting method.** NAOMI C. WOODROOF. Ga. Agr Expt. Sta., *Bull.* **170**, 16 pp.(1931).—Tests were made on 94 dusts. The av. percentage increase in germination of the highest-yielding dust treatment for each year was 8.28% over the untreated check. The increase over the delinted seed was 10.13%. Yield increase of the best dust treatment over untreated check was 47 lb. of seed cotton. A Hg compd., called Ceresan, is recommended above all others and gave excellent results when applied to cotton seed at the rate of 4 oz. per bu. C. R. FELLERS

**Control of the cabbage root maggot.** L. G. SCHERMERHORN AND C. H. NISSLEY N. J. Agr. Expt. Sta., *Extension Bull.* **74**, 4 pp (1930).—$HgCl_2$, 1:1300, applied at the rate of ½ cupful per plant gave full protection from the cabbage maggot. C. R. F.

**Biology and control of the blueberry maggot in Washington County, Maine.** F. H. LATHROP AND C. B. NICKELS. U. S. Dept. Agr., *Tech. Bull.* **275**, 1–76(1932). $Ca_3(AsO_4)_2$ when sprayed on the blueberry bushes twice a year at the rate of 6–8 lb. per acre served as a fairly good control for the blueberry maggot, *Rhogoletis pomonella* The maggot causes great economic loss to the blueberry industry. C. R. FELLERS

**Mushroom insects, their biology and control.** C. A. THOMAS. Pa. Agr. Expt Sta., *Bull.* **270**, 42 pp.(1931); cf. *C. A.* **26**, 5691.—For fumigating mushroom houses the use of $Ca(CN)_2$ at the rate of 1 lb. per 1000 cu. ft. of space, or flowers of S at the rate of 1½–2 lb. is advocated to destroy insects. $CS_2$ for fumigation purposes is not recommended until further work has been done on this chemical. Growing mushrooms are easily injured by HCN and not more than 1½–2 oz. of $Ca(CN)_2$ per 1000 cu. ft. of air space should be used at any one time. C. R. FELLERS

**The use of a modified McIndoo olfactometer for the European earwig, Forficula auricularia [Dermap.].** GEOFFREY BEALL. *Entomol. News* **44**, 6–10(1933).—The chemotropic responses of this insect to common foods and chem. compds. were tested in a special app. which is described. An aq. soln. of Na arsenite was neutral; naphthalene, EtOH, fresh apple and fresh liver tissue were repellent. The reactions to the last two foods are inexplicable, since they are readily eaten by this insect. C. H. R.

**Experiments in the treatment of stomach worms in sheep.** F. H. S. ROBERTS. *Queensland Agr. J.* **38**, 493–507(1932).—Expts. on the control of stomach worms (*Haemonchus contortus*) in sheep were carried out with (I) $CCl_4$, (II) tetrachloroethylene, (III) Cu sulfate, (IV) Cu sulfate and mustard, (V) $As_2O_3$ and $MgSO_4$, (VI) Na arsenite and Cu sulfate, and (VII) $Na_2SiF_6$. I was the best anthelmintic for both lambs and adult sheep, good results also being obtained with III, IV, V and VI. Erratic results were obtained with II, and those with VII, were inconclusive. K. D. JACOB

**Control of weeds in lawns with calcium cyanamide.** D. G. STURKIE. *J. Am. Soc. Agron.* **25**, 82–5(1933).—Applications of 800 lb. or more of $CaCN_2$ per acre on dormant Bermuda grass infested with weeds killed the weeds, and the added N stimulated the later growth of the grass. Applications of 1000 lb. or more per acre on lawns of various perennial grasses killed the weeds, and while the grass leaves were seriously burnt, new ones were soon put out and grew vigorously. J. R. ADAMS

**The use of kainite for the control of poison ivy.** O. BUTLER. *J. Am. Soc. Agron.* 24, 979–81(1932).—Kainite, broadcast when the foliage is wet, is effective in killing poison ivy. The amt. required varies with the size and density of the plants, 0.1 lb./sq. ft. usually being sufficient. Two or more applications may be necessary. J. R. A.

**Fertilizer.** HERMAN L. HARTENSTEIN. U. S. 1,888,921, Nov. 22. Finely divided Fe is added to material such as natural muck or peat, and the mixt. is digested with $SO_2$ and finely divided iron. Lime may be added. U. S. 1,888,922 relates to a process in which material such as muck or peat is admixed with $NaNO_3$, phosphate rock, Al nitrate, digested with $SO_2$ and then aged for at least 10 days.

**Fertilizers.** KALI-FORSCHUNGS-ANSTALT G. M. B. H. Brit. 362,069, Sept. 30, 1930. A fertilizer is produced by mixing 3.5 parts $KNO_3$ with 1.5 parts $MgNH_4PO_4 \cdot H_2O$. Other suitable compds. contg. N, P and K, *e. g.*, the double Ca-, Na- or K- Mg phosphates, may be added to the mixt.

**Fertilizers.** HENRI VANDERPUTTEN. Brit. 371,556, Mar. 18, 1931. Siliceous nitrogenous fertilizers are prepd. by mixing $NH_4NO_3$ and non-phosphatic blast furnace slags after treating the slag with $H_2SO_4$ to render inactive the compds. which would give rise to liberation of $NH_3$. The $H_2S$ liberated by the $H_2SO_4$ action may be recovered. Cf. Fr. 709,529 (*C. A.* **26,** 1380).

**Fertilizer.** GEWERKSCHAFT VICTOR (Hans Schmalfeldt, inventor). Ger. 507,857, May 7, 1929. A soln. contg. $(NH_4)_2SO_4$ $Na_2SO_4$, and $(NH_4)_2CO_3$ or $NH_4HCO_3$, obtained by conducting the Solvay process with $Na_2SO_4$ instead of NaCl, is neutralized with $HNO_3$ and treated so as approximately to equalize the concns. of $(NH_4)_2SO_4$ and $NH_4NO_3$. The soln. is then evapd. until about 80% of the $(NH_4)_2SO_4$ has crystd., and the sepd. mother liquor is treated with $NH_3$ at 30–35° to ppt. $Na_2SO_4$ and residual $(NH_4)_2SO_4$. The sepd. mother liquor is evapd., and the dry residue is mixed with the first $(NH_4)_2SO_4$ ppt. to produce a fertilizer of the approx. compn. $(NH_4)_2SO_4$ 55, $NH_4NO_3$ 35, and $NaNO_3$ 7%. Cf. *C. A.* **26,** 3065.

**Fertilizers.** SOC. D'ÉTUDES POUR LA FABRICATION ET L'EMPLOI DES ENGRAIS CHIMIQUES (Louis Hackspill and Louis Andrès, inventors). Fr. 40,948, Oct. 23, 1931.

Addn. to 720,356 (*C. A.* **26**, 3866). The mother liquors of Fr. 720,356 are concd. and cooled to ppt. only $NH_4Cl$, and the rest is returned to the cycle. Before pptn. $NH_3$ may be added to convert the monophosphates to more sol. biphosphates.

**Fertilizers.** NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB. Fr. 736,127, Apr. 29, 1932. Finely ground dolomite or magnesite is mixed with molten $NH_4NO_3$ and the mass is granulated, *e. g.*, by pptn. in a tower in which the drops coagulate.

**Fertilizers.** SOC. INDUSTRIELLE ET FINANCIÈRE DE LENS. Fr. 736,283, Aug. 20, 1931. A fertilizer is composed of a mixt. of $NH_4NO_3$, KCl and superphosphate, the acidity of which has been neutralized by a base.

**Fertilizer.** KOTA NAGATA and ZYOHU HUKUSIMA (to Nippon Kali Kogyo K. K.). Japan 93,209, Oct. 9, 1931. A mixt. of soy bean or soy-bean cake, KCl, $H_2SO_4$, Ca phosphate, alkali carbonates, etc., is specified.

**Fertilizer.** KOTA NAGATA AND ZYOHU HUKUSIMA (to Nippon Kali Kogyo K. K.). Japan. 93,405, Oct. 26, 1931. Addn. to 89,664. Ores contg. Fe phosphates and $Al_2O_3$ are mixed with $Ca(CN)_2$ and $H_2SO_4$; then KCl, org. compds. contg. N and $Ca(CN)_2$ are added, and the mixt. is left until the reaction is completed. Cf. *C. A.* **26**, 1702.

**Fertilizer.** AKIYOSI GODA. Japan 93,458, Nov. 4, 1931. The fertilizer is prepd. by heating a mixt. of cement dust, waste from salt-mfg. industry from sea water (mainly $MgSO_4$), and artificial carnalite (mainly KCl and $MgCl_2$) at 300–600°.

**Fertilizer.** TIYOKITI SUZUKI (to Dai Nippon Tokyo Hiryô K. K.). Japan 93,605, Nov. 16, 1931. A mixt. of the residue obtained by extg. $H_3PO_4$ from insol. phosphate with $H_2SO_4$ and $CaCN_2$ is treated with steam under pressure of 15–35 lbs.

**Fertilizer.** MASAZI HURUKAWA and KEN'ITI ODA. Japan 93,672, Nov. 21, 1931. A mixt. of P ore, $K_2SO_4$ and $HNO_3$ (or a mixt. of $HNO_3$ and $H_2SO_4$ or $HNO_3$ and $H_3PO_4$) is heated under pressure. The product is then treated with $NH_3$.

**Fertilizer.** YAITI WATANABE (to Dai Nippon Tokyo Hiryô K. K.). Japan 94,023, Dec. 21, 1931. By introducing steam into a closed vessel contg. $CaCN_2$ and $K_2SO_4$, $NH_3$, $CO_2$, KOH and $CaSO_4$ are produced. $NH_3$ and $CO_2$ thus produced are introduced into a mixt. of $H_2SO_4$, $H_3PO_4$ and KOH, producing the fertilizer contg. N 15, $H_3PO_4$ 25 and K 15%.

**Fertilizer.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,189, Feb. 8, 1932. The mother liquor obtained by decompn. of raw phosphate with $HNO_3$ and crystn. of $Ca(NO_3)_2$ is treated with raw phosphate in such proportions that after elimination of the $H_2O$ a product is obtained contg. all the $P_2O_5$ in sol., preferably water-sol., form.

**Fertilizers.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,600, Dec. 5, 1932. The $H_3PO_4$-contg. mother liquor obtained by decompn. of raw phosphate with $HNO_3$ and crystn. and sepn. of part of the formed $Ca(NO_3)_2$ is neutralized and brought to dryness. The dried product is crushed or granulated and then sieved. The too fine or too coarse material is sorted out and mixed with such an amt. of mother liquor as to obtain by the subsequent neutralization of the mixt. a relatively stiff, plastic mass which is again granulated, dried, sifted, etc.

**Fertilizers.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 51,651, Oct. 24, 1932. Raw phosphate is decompd. with excess $HNO_3$, and a large part of the $Ca(NO_3)_2$ formed is crystd. out and sepd. To the mother liquor is added a K salt, preferably chloride or sulfate, in an amt. at least equiv. to the quantity of $NH_4NO_3$ which is formed by the subsequent neutralization with $NH_3$. The soln. is then neutralized with $NH_3$ and brought to dryness.

**Fertilizer.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 51,652, Oct. 24, 1932. Raw phosphate is decompd. with an excess of $HNO_3$, and part of the formed $Ca(NO_3)_2$ is sepd. by crystn. as described in the preceding abstract. To the mother liquor is added $(NH_4)_2SO_4$ or $H_2SO_4$ in such amt. that by subsequent neutralization with $NH_3$ and evapn. to dryness a product is obtained contg. between 1 and 2 mol. $(NH_4)_2SO_4$ for every 2 mol. $NH_4NO_3$.

**Fertilizer ingredient.** CHARLES H. MACDOWELL (to Armour Fertilizer Works). U. S. 1,889,125, Nov. 29. The vapor pressure of an ammoniacal liquid having a vapor pressure substantially above atm. pressure is reduced by dissolving in it a N-contg. fertilizer material such as $NH_4NO_3$, and the soln. is stored under its own normal vapor pressure in a sealed container of sufficient strength to withstand such reduced pressure.

**Damp-proof phosphoric acid fertilizer.** YOSIZO TOMAYONEZI (to Dai Nippon Zinzôhiryô K. K.). Japan. 93,317, Oct. 22, 1931. The cryst. solid produced from $(NH_4)_2SO_4$ or a mixt. of $(NH_4)_2SO_4$ and $K_2SO_4$ with $H_3PO_4$ (50° Bé.) is treated with a limited amt. of $NH_3$ in a closed vessel to produce a damp-proof fertilizer, the main component of which is $(NH_4)_2SO_4.(NH_4)H_2PO_4$.

**Mixed fertilizer.** EMIL COLLETT. Norw. 48,573, Oct. 20, 1930. Substances contg. $NH_4H_2PO_4$, $(NH_4)_2HPO_4$ or both as chief constituents are mixed with $CaCO_3$ in amts. of 20% of the finished product.

**Mixed fertilizer.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 48,701, Nov. 24, 1930. A soln. of $Ca(NO_3)_2$ is treated with $NH_3$ and $CO_2$ in suitable proportions, with agitation, until $NH_4NO_3$ and $CaCO_3$ are formed. The resulting soln. is evapd. to granule form.

**Manufacture of ammonium sulfate nitrate or of fertilizers containing it.** AMMONIAQUE SYNTHÉTIQUE ET DÉRIVÉS, SOC. ANON. Belg. 388,046, May 31, 1932. $NH_4NO_3$ in the liquid state is mixed with $(NH_4)_2SO_4$ in the solid state, the 2 compds. having been previously heated to a temp. such that their sensible heat, increased by the heat of crystn. of the double salt, is sufficient to evap. the $H_2O$ present.

**Calcium nitrate.** ČESKOSLOVENSKÉ TOVÁRNY NA DUSÍKATÉ LÁTKY AKC. SPOL. (USINES TCHECOSLOVAQUES DE PRODUITS AZOTES S. A.). Fr. 736,017, Apr. 27, 1932. Granular $Ca(NO_3)_2$ for chem. fertilizers is made by eliminating the heat of crystn. and the sp. heat in 2 periods. Almost all the heat of crystn. is eliminated in the first period, preferably with rapidity, and the rest of the heat of crystn. and all the sp. heat are eliminated slowly in the 2nd period (granulation period) in an uninterrupted movement of the mass until complete hardening.

**Superphosphates.** SOC. VILAIN FRÈRES. Fr. 40,745, Mar. 10, 1931. Addn. to 697,068 (*C. A.* **25**, 2803). Natural Ca phosphates are treated with an acid such as $H_2SO_4$, and a powd. Mg rock such as giobertite is added, whereby a fertilizer is obtained contg. $MgHPO_4$ or $Mg_3(PO_4)_2$.

**Fertilizer and fungicide.** GOTTHARDWERKE A.-G. FÜR ELEKTROCHEM. INDUSTRIE and ARTURO PAOLONI. Swiss 152,765, June 14, 1930. Addn. to 146,847. Ground crude $Ca_3P_2$ is mixed with S and heated till the S fuses and forms a skin around the $Ca_3P_2$ particles. Other fertilizers and fungicides may be admixed.

**Fungicides.** UNION CHIMIQUE BELGE (SOC. ANON.). Fr. 40,728, Dec. 21, 1930. Addn. to 723,754 (*C. A.* **26**, 4906). Alkali fluosilicates alone or with salts of Hg, As or other metals except Cu are used as fungicides.

**Anticryptogamic agents.** SOC. DE L'INSTITUT DE RECHERCHES SCIENTIFIQUES ET INDUSTRIELLES (FONDATION GEORGES JACQUEMIN). Fr. 736,165, Aug. 1, 1931. A mixt. of $CuSO_4$ and an alk. earth acetate is dissolved at the moment of use in water, preferably alk., and the reaction furnishes sol. $(AcO)_2Cu$ in the nascent state and insol. colloidal Cu. Colloidal S, arsenates, etc., may also be added.

**Anticryptogamic product.** ACHILLE CARUGHI, CARLO PAOLONI and SOCIETÀ ELETTRICA ED ELETTROCHIMICA DEL CAFFARO. Fr. 736,040, May 4, 1932. The compd. $3CuO.CaCl_2.xH_2O$ is obtained mixed with $CaSO_4$ by treating milk of lime with a mixt. in aq. soln. of $CuSO_4$ and NaCl. The $CaSO_4$ may be removed by repeated washings with water.

**Insecticide and fungicide.** MARTIN HOVDE. Norw. 50,486, April 4, 1932. A S compd., preferably an alkali sulfide, is dissolved in a saponified resin soln. obtained from sulfite cellulose waste liquor.

**Insecticide.** ERIC T. HESSLE (to Mid-West Chemical Co.). U. S. 1,887,156, Nov. 8. An oil mixt. suitable for spraying plants and contg. cyclic hydrocarbons having S in the ring and open-chain hydrocarbon sulfides is prepd. by adding 5–10% mol. S to oil contg. cyclic hydrocarbon-S compds., heating the mixt. to 200–250° with indirect heat, cooling to crystallize out the dissolved S and recovering the liquid mixt. substantially free from mol. S but relatively high in combined S.

**Insecticide.** FORREST B. MCLANE. U. S. 1,888,097, Nov. 29. An insecticide suitable for use on plants comprises nicotine sulfate and sugar in soln. with a much larger quantity of a fluid carrier such as water. Cf. *C. A.* **26**, 3866.

**Insecticides.** SOC. NOUVELLE DES MINES DE SAINT CHAMP. Fr. 40,881, Mar. 25, 1931. Addn. to 724,848 (*C. A.* **26**, 4905). The presence of CaS in the product is assured by adding $CaSO_4$ to the bituminous limestone. If necessary coal is added for the reduction.

**Process and product for destroying harmful insects.** G. DE VUYST. Belg. 386,740, March 31, 1932. The product consists of a mixt. of benzine, paraffin, *p*-$C_6H_4Cl_2$, *o*-$C_6H_4Cl_2$ and $CCl_4$.

**Preparation for combating caterpillars.** D. S. VELIKOVSKII. Russ. 21,286, Aug. 10, 1929. Pb naphthenate, obtained by double decompn., and a small amt. of Al naphthenate are melted with a small amt. of ceresin, naphthenic acid glycerides and castor or mineral oil.

**Preparation for combating caterpillars.** D. S. VELIKOVSKII. Russ. 25,224,

Feb. 5, 1931. Addn. to Russ. 21,286 (preceding abstract). Pb naphthenate is replaced by Zn and Sn naphthenates.

**Destroying weeds.** CHEM. FAB. LUDWIG MEYER (Fritz Wolff, inventor). Ger. 567,305, June 27, 1929. For the selective destruction of weeds in cereals, use is made of solns. contg. $SO_3$ at a concn. below 3%.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Production of industrial alcohol from grain by amylo process.** W. L. OWEN. *Ind. Eng. Chem.* **25**, 87–9(1933).—This process involves the saccharification of grain mashes by molds of the *Mucor* group, and either simultaneous or subsequent fermentation by pure cultures of yeast. Operating details of the process as well as its advantages are described. C. N. FREY

**The action of ultra-violet rays on alcoholic fermentation by Saccharomyces cerevisiae. I.** V. GRONCHI. *Boll soc. ital biol sper.* **7**, 957–60(1932).—The systems were irradiated during the process of fermentation for 45 min. at a distance of 40 cm. from the source of radiation. The amt. of $CO_2$ developed was taken as the index of activity. The results show: (1) that irradiation with Wood's light influences favorably the fermentative action of *S. cerevisiae* and this influence is manifested for some time after irradiation ceases; (2) that irradiation with the short ultra-violet rays excites the fermentative action of *S. cerevisiae* but the influence is of short duration and ceases after irradiation is interrupted. From this point, the fermentative action is markedly diminished. **II.** *Ibid* 960–3.—The short ultra-violet rays exert an inhibiting action on the fermentative power of *S. cerevisiae*. With short exposures the inhibition is merely functional and transitory but with long exposures marked changes are produced in the cellular elements of the organism which are not transitory. PETER MASUCCI

**Effect of ash and glutose upon the alcohol yield of cane molasses.** W. KILP. *Z. Spiritusind.* **55**, 188–9(1932).—Seventeen samples were examd. with ash contents ranging from 5.19 to 10.35. Samples with high ash content gave lower alc. yield. It is believed that the lower yield of alc. is also due to the presence of glutose, which is nonfermentable, however, there is no accurate method for the estn. of glutose formed in sugar juices through the action of alkalies. S. JÓZSA

**Consumption of fuel in the distillation of alcohol from molasses.** RICCARDO MOLARI. *Chim. ind. agr. biol.* **8**, 414–16(1932).—A review with calcns. of the costs. G. A. BRAVO

**Methods and processes for obtaining acetone and butyl alcohol.** I. S. GORBUNOV AND I. S. LOGOTKIN. *J. Chem. Ind.* (Moscow) **1932**, No. 10, 53–66.—A discussion and description of the fermentation process. H. M. LEICESTER

**The principles of Pasteur applied to the distillation of grapes.** N. J. M. BRELAZ. *Chem. Eng. Mining Rev.* **25**, 95–8(1932).—Sources of contamination of the grapes during delivery and fermentation are pointed out. Yeasts must be acclimated to resist doses of antiseptics, which molds, wild yeast, bacteria, etc., cannot tolerate. Certain compds. of F prepd. in a special manner are the most desirable. Doses up to 10–12 oz. (284–340 g.) have secured this effect. Present yields of converting grape sugar into EtOH is not more than 10.3 proof gal. per cwt. of sugar fermented. With a nutrient antiseptic fluoride a 10% greater yield is effected. W. H. BOYNTON

**Tables for the determination of the Plato extract of malts.** F. HELIN. *Bull. assoc. élèves inst. sup. fermentations Gand* **33**, 287–309(1932).—Tables are given showing directly the degree of extn. of malt, both on the dry basis and on the moist material, for $d_{17}^{17}$ of 1.0305 to 1.0350 and moisture contents of 1.5 to 10.0%. A. P.-C.

**The diastatic power of malts.** WANAVERBECQ. *Bull. assoc. élèves inst. sup. fermentations Gand* **33**, 279–81(1932); **34**, 14–22(1933).—Diastatic power (D. P.) was detd. by the Windisch-Kolbach method, which W. considers to be the most accurate. With wheat the D. P. increases with the time of soaking, reaches a max. at a normal soaking period (56 hrs.) and then remains practically const. (up to at least 66 hrs. of soaking); with barley max. D. P. is obtained by soaking for about 52 hrs., longer or shorter periods resulting in lower D. P. The D. P. increases with time of germination of wheat at least up to 12 days, the increase being particularly rapid from the 5th to the 6th day and slowing down thereafter; with barley, the most rapid increase takes place from the 5th to the 8th day. Germination carried out at lower temp. results in a smaller numerical increase in D. P., but again the greatest increase occurs at about the

5th to 7th day. These facts, in conjunction with the fact that raw barley has an appreciable D. P., confirms Ohlson's hypothesis as to the existence of β-amylase (which pre-exists in barley and increases regularly during germination) and XX-amylase (which appears toward the 5th day of germination, but disappears soon after). With both wheat and barley malts, the D. P. decreases rapidly with increase in the drying temp. Barleys of 8 different origins had D. P. values varying from 158 to 605. With both barley and wheat malts max. D. P. is developed at $p_H$ 4.4; it is destroyed above about 9.0 and below about 2–2.5, the limits varying somewhat with the origin of the grain. A. PAPINEAU-COUTURE

**Albuminoid matter in white wines.** J. RIBÉREAU-GAYON. *Ann. fals.* **25**, 518-24, 602–9(1932).—A discussion of the state in which albuminoid matters are present in white wines, of the action of temp., acids, tannin, aldehydes and fermentation on their elimination, and of their removal by ultrafiltration, by heating, or by adsorption by mineral substances. The most satisfactory and practical method is considered to be a treatment with 2.5–10 g. per l. of kaolin previously washed with dil. HCl to prevent eventual deacidification of the wine and to remove the earthy odor of wet kaolin to which is added a small amt. (0.1 g. per l. of wine) of bone black. A. P. C.

**Distinguishing between raisin wines and natural wines prepared from fresh grapes.** JOSEPH KHOURI. *Ann. fals.* **25**, 583-91(1932); cf. Chauveau and Vasseur, C. A. **23**, 4767; **25**, 5502; Moredod, C. A. **24**, 1461.—An exptl. study of the various tests which have been proposed. Conclusions: (1) Detn. of the principal natural constituents of wines and their usual consts. (more particularly reducing matter and α), and special color reactions (nitromolybdic, resorcinol HCl, $Me_2CO$-HCl (for white wines)) generally give useful information, but are not conclusive by themselves. (2) A strong blue fluorescence (type V or over on Werder's scale) under ultra-violet light filtered through a Wood screen and a pos. Gayon test are specific and identify raisin wines with certainty. (3) A weak fluorescence (type O-II) is often obtained with wines from Greece and from the Mediterranean Coast, and probably also from other regions which have not yet been studied; or it may indicate blending of natural wine with raisin wine. (4) An intermediate fluorescence (above type II) gives suspicion of the presence of raisin wine, and the results of the chem. analysis should also be taken into account in drawing final conclusions. A. PAPINEAU-COUTURE

**The skimming of light beers.** P. PETIT. *Brasserie & malterie* **22**, 322-6(1932). A brief discussion of the merits and disadvantages of the skimming during fermentation of top and bottom fermentation beers. A. PAPINEAU-COUTURE

**The measurement of beer foam.** F. M. WEININGER. *Hochschr. Brau.* **49**, 273–8(1932).—The modified Luers method was used to det. foam capacity and head retention of normal and decarbonated beer. The Berkefeld filter was replaced in this new method by a porous glass plate of definite porosity. The instrument and its operation are described. Various methods are compared and criticized. Foam formation was greater with lager beers than with export beers and pale beer gave more foam than the dark. The head retention was greatest on dark export, followed by pale lager, dark lager and pale export. S. JOZSA

**The white casse.** J. RIBÉREAU-GAYON AND E. PEYNAUD. *Rev. vit.* **76**, 309-14, 341–7, 379–83(1932).—The power of casse, the influence of quantity and chem. form of Fe present and methods of detn. of iron complex (I) are discussed. O is essential to the formation of I. The amt. of I is linked to the ferric Fe, which is itself related to the total amt. of Fe. The amt. of I is unchanged by sunlight but rises with temp. The Cu content of wine is important in the power of casse. $H_2SO_3$ diminishes the casse intensity and may check it. Deacidification favors the formation of I but has the opposite effects on casse. The action of acid is often masked by its nature. The results of the study of I are given and methods of elimination of Fe discussed. F. W. MARSH

**Potato flakes for yeast manufacturing.** KILP. *Z. Spiritusind.* **55**, 201(1932). The advantage of potato flakes is emphasized in respect to its value as yeast food.

Influence of $P_2O_5$ fertilization on the yield and quality of malting barleys (KRUGER, *et al.*) **15.** Effect of temperature on speed of drying of Corinthian grapes (ROUSSOPOULOS) **12.** Dehydrating fruit juices, etc. (Fr. pat. 736,342) **12.** Purification and decolorization [treatment of wine, cider, etc.] (Belg. pat. 387,742) **13.**

HADJI PARASKIS, ALEX.: **Die Gehalt der Zwischen- und End-produkte der Bierbereitung an Vitamin-C.** Thesis, Dresden, 1931. 45 pp.

NEUMANN, GEORG: **Die quantitative Bestimmung der Weinsäuren im Wein.** Thesis, Dresden, 1931. 67 pp.

---

**Alcohol from cellulose.** ADOLPH PLACEK. U. S. 1,888,935, Nov. 22. Cellulosic material is saccharified with an excess of inorg. acid such as $H_2SO_4$ capable of hydrolyzing the material and liberating org. acids from their salts and the resulting liquor is mixed with material such as cane molasses to neutralize excess acidity and the mixt. is fermented with yeast.

**Bacteriological oxidation of alcohols to sugars.** THOMAS H. VERHAVE, SR. Dutch 27,804, Sept. 15, 1932. Bacteriol. oxidation of alcs. (*e. g.*, glycerol to dihydroxyacetone) is accelerated by the presence of a large no. of bacteria and vigorous aeration. The first mixt. in which sufficient bacteria have developed during slow aeration (20 hl. of a 2% glycerol soln. + malt ext., 20 kg. diatomaceous earth, sterilized, cooled to 30°, inoculated with *Acetobacter suboxidans*, and treated with 10 cu. m. air per hr. for 36 hrs.) is provided with an absorbent material (diatomaceous earth, silica gel, etc.) so that the clear resultant soln. after rapid aeration (growth inhibiting) (240 cu. m. air per hr. for 24 hrs.), with 95% dihydroxyacetone yield, can be decanted from the solid with all the bacteria. Fresh sterilized amts. of 2% glycerol soln. can then repeatedly be added to the solid and immediately treated with rapid aeration to give 92 to 97% yield in 20 to 24 hrs.

**Obtaining alkali metal compounds from fermentation residues, etc.** GUSTAVE T. REICH. U. S. 1,886,045, Nov. 1. $(NH_4)_2SO_4$ is added to an aq. soln. of the residues and the soln. is concd. to about 1.25–1.35 sp. gr. whereby alkali metal sulfate and $NH_4Cl$ are pptd.; the ppt. is sepd. from the soln., and the alkali metal sulfate is sepd. from the $NH_4Cl$ by use of EtOH as a selective solvent.

**Process and apparatus for purifying air for breweries.** EDMUND H. TETLEY. Brit. 363,124, Dec. 9, 1930.

**Beverages.** FRIEDRICH SCHICK. Ger. 567,194, Aug. 1, 1928. In the manuf. of alc. beverages with the aid of yeast, the fermentation is accelerated by generating in the fermenting liquid an elec. current at less than 1 v. When a metallic vat is used, the wall of the vat may serve as one electrode, and the heating or cooling coil as the other electrode.

**Apparatus for distilling low wines.** SOC. DES ÉTABLISSEMENTS BARBET. Fr. 40,880, Mar. 23, 1931. Addn. to 664,585 (C. A. **24**, 915).

---

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Synthesis, chemical and pharmacological properties of the phenylurethan morphine.** MARIO AIAZZI MANCINI. *Chim. ind. agr. biol.* **8**, 411–12(1932)(abstr.).—From the reaction of PhNCO and anhyd. morphine in the presence of benzene a compd., $C_{24}H_{24}O_4N_2$, m. 127–130°, mol. wt. 404, was obtained and identified as the phenylurethan of morphine. Some pharmacol. and physiol. researches on this new product are described. G. A. BRAVO

**Belladonna of Avio, Trento [Italy].** VITTORIO ZANOTTI. *Officina* **5**, 142–6(1932).—Wild and cultivated belladonna grows in this zone. The former contains 0.32% alkaloids, the latter 0.35% (detd. by the U. S. P. method). G. A. BRAVO

**Chlorine as a disinfectant.** WALLACE L. CHANDLER. *J. Am. Vet. Med. Assoc.* **35**, 95–9(1933).—The use of freshly acidified hypochlorite solns. for destroying coccidial oöcysts and bacteria in the presence of org. matter is discussed. RACHEL BROWN

**The identification of adulterated lemon extract prepared by adding pressed extract to the sponge-extracted oil.** GIOVANNI ROMEO, N. GALLETTI AND J. AMOROSO. *Giorn. chim. ind. applicata* **14**, 397–400(1932).—Expressed lemon oil differs in compn. from sponge-extd. oil in that its citral content is lower, the residue on evapn. is higher, and the content of stearoptene is also higher. Frequently, the expressed oil is steam-distd. and the citral and stearoptene collected as by-products are utilized in prepg. a false or adulterated sponge-extd. oil. The adulteration may be detected by measuring the index of refraction of the stearoptene, the index of the press-extd. essence being much lower than the sponge-extd. essence. A 10% soln. in terpene is used, the index for the soln. ranges from 80.1–82.8 for sponge-extd., and 76.3–79.6 for the pressed essence (Wollny refractometer). A. W. CONTIERI

**A synthetic estrus-exciting compound.** J. W. COOK, E. C. DODDS AND C. L. HEWETT. *Nature* **131**, 56–7(1933).—Expts. show that 50–100 mg. of 1-keto-1,2,3,4-

tetrahydrophenanthrene (I) is capable of inducing estrus of an exactly similar type to that obtained by the injection of estrin. Sesame oil is found to be a much better vehicle than olive oil. Since I is of known constitution, these studies help to define the mol. conditions necessary for this type of physiol. activity and from I compds. of greater activity may be synthesized. 4-Keto-1,2,3,4-tetrahydrophenanthrene and 3-hydroxyphenanthrene gave no estrus response in 50-mg. doses. A. W. DEXTER

**Examination of perfumes by ultra-violet light by a method which is simple and inexpensive.** PIERRE MULLER. *Ann. chim. anal. chim. appl.* **15**, 11–12(1933).—The sun's rays are utilized after reflection by a metallic mirror through a Wood's glass into a box painted black on the inside. W. T. H.

**Ethylene oxide.** F. ZERNIK. *Gasmaske* **5**, 3–6(1933).—A brief review of the chem. and phys. properties of ethylene oxide, its physiol. effects and its use as a disinfectant. A. L. KIBLER

**Pharmacognostic study of liver oil of Japanese cod. XIII.** K. KAWAI. *J. Pharm. Soc. Japan* **52**, 949–60(1932); cf. *C. A.* **25**, 5736.—The cholesterol content of the non-saponifiable constituent of the cod-liver oil and its color intensity are detd. F. I. NAKAMURA

**Pharmacognostic study of the bark of an Acanthopanax specie.** T. MUNESADA AND S. YAMAMOTO. *J. Pharm. Soc Japan* **52**, 979–86(1932). F. I. NAKAMURA

**Alkaloids of Chinese drug, "Chin-Shih-Hu." I.** HIDEKI SUZUKI, ICHIRO KITAMATSU AND MIKIZO ITO. *J. Pharm. Soc. Japan* **52**, 996–1009(1932) (in German 162–5). A preliminary report. F. I. NAKAMURA

**A so-called Guinea oil of geranium.** ÉTABLISSEMENTS ANTOINE CHIRIS. *Parfums de France* **10**, 349(1932).—Attention is drawn to a product recently marketed as Guinea oil of geranium, which is an artificial product of poor quality, and which has the following analytical characteristics: $d_{15}$ 0.9085, $[\alpha]_{18}$ —2° 20′, $n_{20}$ 1.4730, acid no. 2.38, ester no. 81.2, esters (as geranyl tiglate) 34.2%, ester no. after hot formylation 136.5, apparent rhodinol-citronellol 40.8%, menthone (via hydroxylamine) 12.4%, insol. in 68% alc., sol. in 0.8 vol. of 80% alc. with turbidity above 4 vol., sol. in 0.1 vol. of 90% alc. with slight opalescence above 8 vol., sol. in 0.1 vol. or more of 95% alc. A. P.-C.

**Chemical investigation of Indian medicinal plants. I. Preliminary chemical examination of the root bark of Capparis horrida.** SATYENDRANATH CHAKRAVARTI AND A. VENKATASUBBAN. *J. Annamalai Univ.* **1**, 176–80(1932).—These studies have been undertaken as a systematic investigation of the chem. structure of the active principles of these plants for the purpose of correlating chem. constitution with physiol and chemotherapeutic action. The root bark of *Capparis horrida* has been used as a cure for cholera, sedative, stomachic and anti-idriotic. Extns. with ligroin, $Et_2O$, $CHCl_3$, abs. EtOH, 70% EtOH, $H_2O$ and 1% HCl showed the presence of a phytosterol, a K salt, a water-sol. acid, a mucilaginous substance, an alkaloid and a hexose which gives glucosazone. The alkaloid was best extd. by cold percolation of the root bark (100 g.) with 1.6% HCl, followed by addn. of $KI_3$ to the ext. to obtain the periodide (2 g.), m. above 300°. The periodide, treated with $SO_2$, formed the iodide which with $NH_4OH$ gave the alkaloid, m. above 260°. It forms a picrate which decomposes at 225°. **II. Preliminary chemical examination of the leaves of Pithecolobium bigeminum.** SATYENDRANATH CHAKRAVARTI AND KRISHNAMURTI GANAPATI. *Ibid* 181–5.—The leaves of the tree, *Pithecolobium bigeminum*, have been used as a cure for leprosy and as a stimulant of hair growth. Preliminary tests of the leaves showed the presence of acids, saponins, enzymes and traces of an essential oil, but alkaloids, glucosides and tannins were absent. Extns. were made with ligroin, $Et_2O$, $CHCl_3$, abs. EtOH, 70% EtOH, $H_2O$ and 1% HCl. The active principle is a mixt. of 2 acids, one of which was water-sol. and was obtained by extn. of the leaves with hot water and pptn. as the Pb salt. The free acid was unsatd. and contained N. It darkened on exposure and could not be crystd. The second acid was obtained by extn. of the residue from the $H_2O$ extn with hot alc. and concn. of the alc. Repptn. of the acid from alk. soln. gave a product which decompd. at 272°. It was unsatd. and decompd. readily on exposure. E. W. SCOTT

**Catalytic properties and aging of mineral waters of Vinjacka Banja, Arachelovac and Mladenovac.** GUSTAV SCHILDER. *Lijecnicki Vjesnik* (*Croatian Med. J.*) **54**, 243–61(1932).—The phenomenon of lowering of the therapeutic effect of some mineral waters with age was investigated by subjecting the water to Glénard's reaction for catalytic action, to the acid and basic benzidine reaction for peroxide action and to the measurement of $p_H$ value. The results do not justify the conclusion that those characteristics are responsible for aging and decline of therapeutic action. Other factors must be sought. J. G. TOLPIN

Determination of $CHCl_3$ (MOFFITT) **7.** Sucrose extraction from materials [and nicotine, saponin extraction from tobacco, quillaja bark] (U. S. pat. 1,887,050) **28.** Complex metal derivatives of aromatic polyhydroxy acids (U. S. pat. 1,889,383) **10.** Depilatories (Fr. pat. 736,019) **29.** Unilaterally acylated diamines (U. **Synthetic drugs.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 154,433 to 154,436, Aug. 28, 1930. Addns. to 152,087. A reactive ester of diethylaminoethanol is treated with 2-hydroxy-4-methoxyacetophenone in the presence of an acid-binding agent The product *2-diethylaminoethoxy-4-methoxyacetophenone*, $b_3$ 186–7° (154,433). The prepn. is also described of (*2-diethylaminoethoxy-4-methoxyphenyl*) *benzyl ketone*, $b_{0.1}$ 210–11° (154,434), *p-dicyclohexylaminoethoxybenzophenone*, whose picrate m. 157–8° (154,435), and *2-diethylaminoethoxy-4-benzyloxyacetophenone*, $b_{0.2}$ 206.5–7° (154,436) These products are used in therapy.

**Magnesium hydrate tablets.** WM. C. MCGOWAN (to Milnesia Laboratories, Inc.) U. S. 1,889,366, Nov. 29. MgO is hydrated to form a moist hydrate and the latter is then granulated after admixt. with a diluent and a binder such as $CaCO_3$ and gum acacia and the granulated mixt. may be formed into tablets.

**Soluble preparations of cinchona alkaloids.** I. G. FARBENINDUSTRIE A.-G. Brit 363,001, Sept. 17, 1930. Addn. to 327,428 (*C. A.* **24**, 5112). Compressed tablets contg cinchona alkaloid salts are rendered rapidly sol. in water by incorporating sarcosine anhydride, or a homolog, with the salt before compression. Among examples a mixt contains quinine-HCl 30, $H_3BO_3$ 4, sorbitol 2, sarcosine anhydride 70 and amylose 14 parts.

**Acetylsalicylic acid.** KEIKO ISHIHARA (to Sankyo K. K.) Japan. 93,490, Nov 6, 1931. Acetylsalicylic acid is prepd. by heating a mixt. of salicylic acid and $Ac_2O$ in the presence of AcCl in a closed vessel or under pressure at low temp.

**Purification of acetylsalicylic acid.** KEIKO ISHIHARA (to Sankyo K. K.). Japan. 93,486, Nov. 6, 1931. On crystg. from a soln. in non-hygroscopic solvent (such as $C_6H_6$ or toluene) contg. 20–60% $Ac_2O$, acetylsalicylic acid is obtained in a pure and stable state.

**Acetylsalicylic acid composition.** AKTIESELSKAPET APOTHEKERNES LABORATORIUM FOR SPESIALPREPARATER. Norw 51,210, July 25, 1932. Acetylsalicylic acid is mixed with small amts. of basic Bi salicylate.

**Compound of hexamethylenetetramine and diphosphoric acid.** ERICH FREUND (to Heyl & Co., Chemischpharmazeutische Fabrik, A.-G.). U. S. 1,889,090, Nov. 29 Equimol. proportions of $(CH_2)_6N_4$ and methylenediphosphoric acid are combined in an inert solvent such as alc. and the pptd. compd. is sepd. It is suitable for treating affections of the uropoietic system.

**Mono-4-chlorothymyl phosphates.** BUITIRO AYUKAWA. Japan. 93,182, Oct. 9, 1931. 4-Chlorothymol is heated with $POCl_3$, and the product is then heated with alkali carbonates, producing alkali mono-4-chlorothymyl phosphates, tasteless and odorless, white needles, sol. in $H_2O$ and hot alc. They have therapeutic properties

**γ-Dialkylamino-α-methylisoamyl *p*-aminobenzoates.** KATUZAEMON KEIMATU Japan. 93,404, Oct. 26, 1931. Addn. to 89,838. Diacetone alkamine is converted by heating with EtI to 4-diethylamino-4-methyl-2-pentanol, b. 204–6°. This is made to react with $p$-$O_2NC_6H_4COCl$ in $CHCl_3$ soln. producing γ-diethylamino-α-methylisoamyl *p*-nitrobenzoate (hydrochloride, m. 216°). By reducing with $H_2$ in the presence of Pt catalyst, γ-diethylamino-α-methylisoamyl *p*-aminobenzoate, plates, m. 143°, is produced. It is used as a *local anesthetic*.

**Monoethers of resorcinol.** EMIL KLARMANN and LOUIS W. GATES (to Lehn & Fink). U. S. 1,888,827, Nov. 22. Ethers are formed which are of high bactericidal efficiency, such as the amyl ether ($b_5$ 140°), the benzyl ether ($b_5$ 200°), the cyclohexyl ether ($b_5$ 160°), and phenylethyl ether ($b_5$ 205°).

**Butylphenol composition.** ROLAND R. READ (to Sharp & Dohme). U. S. 1,887,

662, Nov. 15. A compn. contg. a substantial amount of *o-sec*-butylphenol and b. 220–265° and *having antiseptic properties* is formed by condensing BuOH and PhOH in the presence of $ZnCl_2$ and HCl.

**Organometallic compounds.** CHEMISCHE FABRIK VORM. SANDOZ. Fr. 736,715, Nov. 9, 1931. Complex salts of glucosaminic acid and heavy metals or their neutral derivs., with the exception of salts of Cu, Zn and Ag, are prepd. by the reaction of glucosaminic acid with heavy metal salts of weak acids and treating the products with inorg. or org. bases. Thus, the compd. $(C_6H_{12}O_6N)_2Ni$ is obtained from $NiCO_3$ and glucosaminic acid, and gives a compd. $[(C_6H_{12}O_6N)_2Ni]Na$ when treated with NaOH. Ni may be replaced by Co, Fe, SbOH, $Sb(OH)_3$ and the Na by Ca, Mg, pyridino, anilino, piperazino, etc. The products have *therapeutic application* and are also useful in *dyeing, printing, mordanting*, etc.

**Insoluble bismuth compositions.** V. A. IZMAILSKII Russ. 24,881, Jan. 14, 1926. A freshly prepd paste or suspension of complex bismuth acids with hydroxy acids of the fatty series, such as tartaric or citric acids, is treated in cold or with the application of heat with freshly prepd bismuth hydroxide in an amount that corresponds to the number of carboxyl groups of the complex acid

**Organic compounds containing arsenic and antimony.** I. G. FARBENIND. A.-G. (Hans Schmidt, inventor). Ger. 567,274, Aug 2, 1931 Water-sol. *products of therapeutic value* are prepd. by the action of formaldehydesulfoxylate on compds. of the formula $(H_2NArAs)_nSb_m$, where Ar is an aryl residue and $n$ and $m$ are generally 3 and 2, resp. Examples are given. Cf *C. A.* **27**, 810.

**Organic compounds containing arsenic and bismuth.** I. G. FARBENIND. A.-G. (Hans Schmidt, inventor). Ger. 567,275, Aug. 7, 1931. Water-sol. *compds. of therapeutic value* are prepd by treating aminoaryl compds. contg As and Bi with formaldehydesulfoxylate or bisulfite. Suitable starting materials may be prepd. by treating aminoarylarsines with Bi compds in alk soln. or with $BiCl_3$ in acetone soln, in each case with exclusion of O. Examples are given.

**Caffeine sodium camphorate.** YOSIHIDE SIMADA. Japan 93,482, Nov. 6, 1931. Camphoric acid is neutralized with 0.1 *N* $Na_2CO_3$ and the salt is warmed with a slight excess of an equiv. amt. of caffeine at about 80°, producing the white amorphous product.

**Spinal anesthetic.** GEORGE P. PITKIN and CHARLES W. HOOPER (to H. A. Metz Laboratories, Inc.). U. S. 1,888,934, Nov. 22. A spinal anesthetic such as procaine is used with a glue-like adhesive such as wheat-flour mucilage which is insol. in the spinal fluid and serves to regulate the time, extent and intensity of anesthesia.

**Concentrating vitamins.** BARNETT SURE. U. S. 1,889,427, Nov. 29. A crude vitamin-B ext such as may be obtained from rice polishings or yeast or wheat embryo is treated with glacial HOAc, acetone is added as a diluent to form a mixed solvent capable of dissolving the vitamin and incapable of dissolving some impurities in the crude ext., the vitamin soln. is sepd. from the solid impurities, acetic acid and acetone are volatilized at a temp. not destructive to the vitamin, the residue is suspended in water, the $p_H$ is adjusted to permit selective adsorption of the vitamin by adsorbent C and the material is treated with adsorbent C, the C-contg. vitamin is sepd. from assocd. liquid, and the vitamin is washed from the C by successive use of HCl and alc., the washing liquids are combined, and the liquid is volatilized from the vitamin-contg. material.

**Concentrated vitamin extract from fruits, etc.** ELLIOT R. ALEXANDER (to Vitamin Co. of America). U. S. 1,886,931, Nov. 8. A concd. vitamin ext. is incorporated into a vitamin-preserving acidic fruit mass and the product may be chocolate coated.

**Vitamin-C-like preparation.** NYEGAARD & CO. A/S. Norw. 51,347, Aug. 22, 1932. Narcotine is demethylated in the meconin component of narcotine, and, if desired, in the cotarnine component also, *e. g.*, by treatment with acids or enzymes, or by irradiation with ultra-violet light.

**Vitamin D.** N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Fr. 737,234, May 17, 1932. Vitamin D is preserved against change by exposing a soln. of ergosterol to ultraviolet light and adding oil or fat to the soln. before, during or immediately after irradiation. The process is carried out in the absence of O. Cf. *C. A.* **26**, 1715.

**Hormones.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Ger. 567,365, Oct. 30, 1930. The growth-promoting hormone, obtained in water-sol. form by extn. of the thymus gland in known manner, is purified by pptg. it from an aq. albumin-free soln. with an org. solvent, *e. g.*, MeOH or EtOH. The ppt. may be repeatedly dissolved in water and repptd. Cf. *C. A.* **27**, 1096, 1097.

**Separating hormones.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,860, Sept. 8, 1930. Solns. of the active substances from the posterior lobe of the hypophysis are

subjected to a limited or fractionated treatment with an adsorbent, *e. g.*, silicic acid or bentonite, at a feebly acid reaction and, after sepn. of the solid matter from the soln. contg. the uterus-affecting hormone, the blood-pressure-affecting hormone is extd. at feebly alk. reaction.

**Disinfectants.** WALTER B. GARNER and EDWIN L. TYLER. Australia 30,735, Dec. 16, 1930. Disinfectants of high carbolic coeff. are prepd. by treating tar acids (preferably from bituminous coal) with halogens (Cl or Br) and removing free acids produced by washing. The products are mixed with sulfonated oils, etc.

**Disinfectants.** WALTER WEIGERT. Ger. 567,178, Dec. 25, 1929. Disinfectant solns. comprising a hypochlorite, with or without caustic alkali, are improved by addn. of waterglass soln. Cf. *C. A.* **26**, 258.

**Vermicidal iodine composition.** WM. H. ENGELS (to Merck & Co.). U. S. 1,889,195, Nov. 29. A compn. suitable for use in veterinary practice is prepd. from a protein material such as that from eggs contg. chemically combined Cl and adsorbed I. Cf. *C. A.* **27**, 375.

**Vermifuge for roundworm.** KATUTA TAGUTI. Japan. 93,328, Oct. 22, 1931. *Melia japonica*, Don. or *Melia toosendan* S. et Z. is extd. with 90% MeOH or alc. and the solvent is distd. off. The residue is treated with $H_2O$ and 1% NaOH. The insol part is used as the vermifuge.

**Vermifuge and insecticide containing ground "cubé" root with the fibrous portion removed.** WM. J. DENNIS. U. S. reissue 18,667, Nov. 22. A reissue of original pat. No. 1,621,240 (*C. A.* **21**, 1517).

**Dentifrices.** HENKEL & CIE G. M. B. H. Fr. 737,220, May 17, 1932. Sulfuric esters of higher aliphatic alcs. such as lauric or myristic alc. are added to dentifrices as froth-forming agents.

**Tooth paste.** MITUO IYODA (to K. K. Siseido). Japan. 93,325, Oct. 22, 1931. A partially sapond. stearin or stearic acid is mixed with $CaCO_3$, MgO, talc, etc.

**Emulsion suitable for use as a shaving cream.** EDWARD L. MACK and CHARLES W. BENNETT (to Bennett-Mack Corp.). U. S. 1,888,601, Nov. 22. Ingredients are used such as stearic acid 9–12, coconut oil 6–8, paraffin 6–8, Zn stearate 0.15–0.20, ethyl *p*-aminobenzoate 0.80–3.0, glycerol 5.5–7.5, borax 0.8–1.1, ammonia 0.3–0.4, and water 56–75 parts.

**Soap powder.** A. J. M. VAN DEUREN. Belg. 387,723, May 31, 1932. An antiseptic soap consists of $Na_2CO_3$ 75–85, powd. soap 14–18, $Na_2O_2$ or $BaO_2$ 1.6–2, trioxymethylene 0.1–0.35%.

**Treating tobacco.** AKTIESELSKAPET SI-KO. Norw. 51,160, July 11, 1932. The tobacco is treated with colloidal solns. of $SiO_2$, $Fe_2O_3$, $Al_2O_3$ or similar substances which coagulate when mixed with the tobacco, or during the drying of the latter, by which an adsorbent substance for the burning and distn. products of the tobacco is produced

**Treating tobacco leaves for improving pliability and combustion properties, etc.** STROUD JORDAN (to Applied Sugar Laboratories, Inc.). U. S. 1,888,173, Nov. 15. The leaves are sprayed with a mixt. such as may be formed from invert sugar sirup 260, cryst. $Ca(NO_3)_2$ 100 and water 260 parts.

**Composition for improving tobacco.** GYULA VÁNGEL. Hung. 104,458, April 14, 1931. Invert sugar or honey (100–500), $K_2C_2O_4$ 3–6, $ZnSO_4$ 2–6, NaCl 4–8, glycerol 30–60 and saffron 1–2 parts are dissolved in 1000 parts $H_2O$.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**Innovations in inorganic chemical industry in 1927–31. III.** A. BRÄUER, J. REITSTÖTTER AND H. SIEBENREICHER. *Angew. Chem.* **46**, No. 1, 7–15(1933); cf. *C. A.* **27**, 812.—*Ammonia synthesis* and *cyanogen* compds. are reviewed, and 202 literature references given. KARL KAMMERMEYER

**Industrial hydrogenation.** J. B. PHILLIPS. *Chemistry and Industry* **52**, 51–3 (1933). E. H.

**The theory of obtaining nitric acid from oxides of nitrogen and its application to the intensification of the process. I. M. LIBINSON.** *J. Chem. Ind.* (Moscow) 1932, No. 10, 66–73.—By making several corrections in the math. theory of the process, L. concludes that very high pressures in the oxidation of NO are not economical. When pressure is used, and in oxidations at atm. pressure on a small scale, a sep. tower for oxidation of NO, as opposed to absorption of $NO_2$ by $H_2O$, is unnecessary. If acid or

alkali is used to absorb $NO_2$, such a tower is essential. The optimum diln. of the gases by air is that which supplies 5.2% excess $O_2$. In practice, this figure becomes 3% at atm. pressure and 1.5–2% when higher pressures are used. H. M. LEICESTER

**Making strong phosphoric acid at Trail.** WM. C. WEBER. *Chem. Met. Eng.* **39**, 659–62(1932).—Montana phosphate rock is ground in weak phosphoric acid, then $H_2SO_4$ acid is added. The phosphoric acid filtrate from the pptd. gypsum contains 30–32% $P_2O_5$. The gypsum is first washed with weak acid, then with water. The equipment is acid-proof throughout. H. E. MESSMORE

**Esters derived from tetrathioorthosilicic acid.** H. J. BACKER AND F. STIENSTRA. *Rec. trav. chim.* **51**, 1197–9(1932).—Na mercaptide is caused to react with $SiCl_4$ in benzene. The method of prepn. is described. Phys. properties and analytical data found for Me, Et, Pr and iso-Pr esters are given. They are fairly stable to heat in aq. soln. and to concd. HCl. RAYMOND H. LAMBERT

**The lead-chamber process. II. The violet acid A.** E. BERL AND H. H. SAENGER. *Z. anorg. allgem. Chem.* **208**, 113–23(1932); cf. *C. A.* **26**, 2014.—A description of the prepn. of $SO_5NH_2$ (violet acid) by (*1*) electrolyzing $SO_5NH$, (*2*) causing $N_2O_4$ and ice to react with an excess of liquid $SO_2$, (*3*) causing NO to react with $H_2SO_4$ under pressure; this requires high pressures and concd. $H_2SO_4$. $SO_5NH$ is not reduced by $SO_2$ in the absence of $H_2O$. $SO_5NH_2$ is proved an important intermediate compd. in the $H_2SO_4$ process. **III, B.** E. BERL AND K. WINNACKER. *Ibid* **208**, 124–33.—The formation of $SO_5NH_2$ from NO and $H_2SO_4$ has been confirmed and more carefully studied. The claim of Manchot (*C. A.* **21**, 477) that $SO_5NH_2$ is only an incidental compd. is refuted. **III. The synthesis of nitrosylsulfuric acid from silver acid sulfate and nitrosyl bromide.** E. BERL, F. BECKER AND W. BEGEROW. *Ibid* **209**, 264–6.—The nitroso character of $SO_2NH$ is confirmed. J. V. VAUGHEN

**Dehydration of magnesium chloride.** I. G. SHCHERBAKOV AND A. K. RASPOPINA. *Kalii* (U. S. S. R.) **1932**, No. 8, 25–9; No. 9, 23–5.—A low-temp. method (300–400°) for dehydration of $MgCl_2 \cdot 6H_2O$ is shown. $MgCl_2 \cdot 6H_2O$ was fused to convert the salt to $MgCl_2 \cdot 2H_2O$ and intimately mixed with charcoal before it solidified. Then $Cl_2$ gas was passed through the mixt., which was first heated to 300° to complete dehydration. The salt at this stage contained 10–15% MgO. Then the temp. was raised to 400° to convert MgO to $MgCl_2$: $2HCl + MgO = MgCl_2 + H_2O$, $2MgO + C + 2Cl_2 = 2MgCl_2 + CO_2$. The final dehydrated product contained 0.5–1.00% MgO, with no loss of $Cl_2$ in outgoing gases. The quantity of $Cl_2$ required for the chlorination of MgO in dehydrated $MgCl_2$ in the presence of charcoal is detd. Dehydration with $Cl_2$-air mixt. is studied. JAMES SORREL

**Manufacture of cuprous oxide.** TOSHIO WATANABE AND SABURO AWAZU. *Suiyokai-shi* **7**, 278–85(1932).—Cement Cu and $CuCl_2$ contg. Cu, both intermediate products in the Ramenia plant, are mixed and CuCl is pptd. CuCl is sepd. from the excess of the impure cement Cu by decantation, or more completely by application of the difference between the soly. of CuCl in hot concd. soln. and the cold dil. soln. of $CuCl_2$. CuCl thus obtained is digested in slightly acid water and kept near the boiling point. By adding a finely powdered salt of weak basicity, such as $CaCO_3$, NaOAc, etc., slowly to this soln. while hot, $Cu_2O$ is obtained. HIDEO NISHIMURA

**Manufacture of bromine.** LUCIEN MANGÉ. *Rev. ind.* **62**, 574–6, 610–11(1932).—The compn. is given of brines from Alsace and elsewhere, used for the com. production of Br. General principles and the app. employed are described. A. W. FURBANK

**Active charcoal.** ERHARD LANDT. *Kolloid-Beihefte* **37**, 1–55(1932).—A review of the prepn. and properties of various forms of activated charcoal, with more than 200 literature references. K. V. THIMANN

**Preparation of activated carbon from spent olive pulp.** L. BERMEJO AND L. BLAS. *Anales soc. espaň. fis. quím.* **31**, 65–7(1933).—Activated C was prepd. by various methods from spent olive pulp. The C treated by $ZnCl_2$ absorbed 12.3% phenol, that treated by $CaCl_2$ 8.7% and the untreated C absorbed 0.78%. E. M. SYMMES

**The purification of red phosphorus from yellow.** G. I. VILESOV AND S. F. PROTASOV. *J. Chem. Ind.* (Moscow) **1932**, No. 10, 73–6.—The mixt. of red and yellow P is heated to 250° in a current of inert gas. The yellow P volatilizes and is completely removed. H. M. LEICESTER

**World production, sources and consumption of sulfur.** FRITHIOF H. STENHAGEN. *Tek. Tid. Uppl. A* **61**, 457–60, 503–4(1931); cf. *C. A.* **25**, 5236.—A review. D. T.

**Chromite in 1931.** L. A. SMITH. Bur. Mines, *Mineral Resources of the U. S. 1931*, Pt. I, 103–16(preprint No. 8, published December 19, 1932). E. H.

**Gypsum.** C. L. HADDON. *Chemistry & Industry* **52**, 24–7(1933).—An outline

of the development and present status of the use of gypsum and other Ca sulfates for the production of plaster cements. A. PAPINEAU-COUTURE

**Gypsum in 1931.** R. M. SANTMYERS AND JEFFERSON MIDDLETON. Bur. Mines, *Mineral Resources of the U. S. 1931*, Pt. II, 191–203(preprint No. 13, published December 15, 1932). E. H.

**Asbestos in 1931.** OLIVER BOWLES AND B. H. STODDARD. Bur. Mines, *Mineral Resources of the U. S. 1931*, Pt. II, 205–13(preprint No. 14, published December 15, 1932). E. H.

**Tests on carbonate formation in glycerol-litharge cements.** TYPKE. *Angew. Chem.* **46**, 20–1(1933).—Carbonate formation is favored by an increase in the proportion of glycerol to litharge and increasing water content of the glycerol. Temp. also influences it KARL KAMMERMEYER

**Water content of certain fire-protective media.** M. G. MELLON AND J. R. HECK. *Ind. Eng. Chem.* **25**, 94–5(1933).—Various fireproof cements or fillers used in safes lost from 30 to 72% of their weight upon standing for 2.5 years. Ignition losses 3 yr. after prepn. varied from 25.9 to 42%. H. E. MESSMORE

**Chemical fireproofing agents.** HERMANN STADLINGER. *Synthetic and Applied Finishes* **3**, 91–4, 102(1933). E. H.

**Boric acid.** ALFRED NEWMAN (to Pacific Coast Borax Co.). U. S. 1,888,391, Nov. 22 $H_2SO_4$ is added to solid borax suspended in water, the quantity of water present being insufficient to dissolve the borax or the boric acid formed but sufficient to dissolve the Na sulfate formed by the reaction.

**Arsenic acid or arsenate.** TAKISABURÔ IKEBE and TAITÛ OTANI (to Mitui Kôzan K. K.). Japan. 94,024, Dec. 21, 1931. $As_2O_3$ is introduced into a mass of $Fe_2O_3$ or $Al_2O_3$, etc., at above 218° with air or $O_2$, by which arsenic acid is formed and fixed in the mass, which is extd. with dil. acid or alkali.

**Reducing chromic acid or its salts.** S. P. LANGOVOI and A. R. REIZNEK. Russ. 7, Apr. 8, 1921. $KCr(SO_4)_2.12H_2O$ is prepd. by reducing $CrO_3$ in $H_2SO_4$ soln. and at a suitable temp. by disintegrated fiber, the latter being applied in the form of sawdust, wood wool, etc.

**Hydrocyanic acid.** WALTER WETTSTEIN (to Soc. pour l'ind. chim. à Bâle). U. S. 1,887,608, Nov. 15. See Fr. 717,999 (*C. A.* **26**, 2829).

**Hydrocyanic acid and cyanogen chloride.** HANS LEHRECKE (to Deutsche Gold & Silber Scheideanstalt vorm. Roessler). U. S. 1,886,487, Nov. 8. In the manuf. of a liquid mixt. of these compds. contg. less than 6% water, Cl is passed into liquid concd. HCN contg. less than 6% water at a rate above 60 g. Cl per kg. of HCN per hr., while the soln. is cooled and the HCl formed by the reaction is removed by bringing the reaction mixt. into contact with weakly alk. substances such as $CaCO_3$.

**Prussic acid.** I. G. FARBENIND. A.-G. Fr. 40,993, Nov. 19, 1931. Addn. to 715,052 (*C. A.* **26**, 1719). Corrosion of the catalysts and deposition of soot thereon is avoided by sweeping the places where the catalysts come in contact with the container by gases contg. no component capable of forming soot. The sweeping gases may contain a small amt. of O.

**Apparatus for making hydrofluoric acid from fluorides and mineral acids.** FRIEDRICH SCHUCH. Ger. 567,328, Oct. 4, 1927.

**Phosphoric acid.** BAYERISCHE STICKSTOFF-WERKE A.-G. Fr. 737,080, May 13, 1932. P is caused to react with aq. solns. or suspensions of alkali or alk. earth hydroxides at 100–300° (preferably 140–220°) and under pressures of up to 600 atm. Insol phosphites are pptd. from the soln. of phosphites obtained by the addn. of an appropriate metal compd., and the phosphites are decomposed to $H_3PO_4$ by a mineral acid.

**Recovering sulfuric acid from acid sludge.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,205, Jan. 31, 1931. Acid sludges obtained in the refining of liquid hydrocarbons are dild. with water and then centrifuged or filtered, the operations being preferably conducted with cooling to 15–30°.

**Duplex sulfuric acid chamber.** RICHARD T. MAUDSLEY. U. S. 1,887,816, Nov. 15.

**Titanic acid and titanium pigment.** TITAN CO. A/S. Norw. 51,236, Aug. 1, 1932. $TiO_2$ or Ti pigments are produced by hydrolytic pptn. by heating purified, reduced, concd. Ti solns. of low acid content. The hydrolysis is initiated or promoted by addn. of acid-binding substances. The ppt. is afterward washed and dried or ignited. Cf. *C. A.* **26**, 4969.

**Ammonia synthesis.** WALTER WETTSTEIN (to Soc. anon. pour l'ind chim. à Bâle). U. S. 1,887,475, Nov. 8. See Brit. 359,378 (*C. A.* **26**, 4918).

**Apparatus for the synthesis of ammonia under very high pressure.** PATENTVERWERTUNGS-A.-G. "ALPINA." Ger. 567,329, Aug. 15, 1924.

**Oxidation of ammonia.** DENGORO MORI (to Dai Nippon Zinzôhiryô K. K.). Japan. 93,556, Nov. 11, 1931. In the oxidation of $NH_3$, the catalyst is preheated by burning near it a solid condensation product of $NH_3$ with HCHO or of HCHO.

**Apparatus for oxidation of ammonia.** ZENZO HIRAKAWA and YÛKITI TOBA (to Dai Nippon Zinzo Hiryo K. K.). Japan. 93,671, Nov. 21, 1931.

**Drying alkali hydroxides by treatment with alkali oxides.** DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM. ROESSLER. Ger. 567,445, Aug. 22, 1930.

**Alkali nitrates.** KALI-FORSCHUNGS-ANSTALT G. M. B. H. Fr. 40,815, Sep. 24, 1931. Addn. to 708,006 (*C. A.* **26**, 1401). Alkali nitrates are prepd. by treating alkali chlorides with nitrous gases in the presence of nitrates of Mg, Fe or Al.

**Alkali nitrates.** PAUL KUBELKA and WILHELM SCHNEIDER. Fr. 736,815, May 7, 1932. Alkali nitrates are made by treating $Ca(NO_3)_2$ in aq. soln. with an alkali chloride and sepg. a part of the alkali nitrate by cooling the reaction mixt. The $CaCl_2$ formed is pptd. and sepd. from the mother liquor by the addn. of $Ca(OH)_2$, after which further amts. of alkali nitrate are extd. by cooling.

**Alkali sulfates.** CHEMIEVERFAHREN G. M. B. H. Ger. 567,088, Nov. 19, 1927. An alkali chloride is treated with $MgSO_4$ in an aq. ammoniacal soln. to which sufficient $NH_4Cl$ has been added to prevent pptn. of $Mg(OH)_2$.

**Trialkali phosphates.** CONWAY VON GIRSEWALD, HANS WEIDMANN and GERHARD ROESNER (to American Lurgi Corp.). U. S. 1,887,445, Nov. 8. See Ger. 535,950 (*C. A.* **26**, 1399).

**Carbonates.** ÉDOUARD URBAIN. Fr. 40,612, Feb. 20, 1931. Addn. to 725,818 (*C. A.* **26**, 4919). Engel salt is pptd. by treating sylvinite with hydrated MgO and $NaHCO_3$; the supernatant liquors should contain at least 15% of their wt. of NaCl.

**Fine powder of metals and their oxides.** TUTOMU SIOMI (to Furukawa Denki Kogyo K. K.). Japan. 93,875, Dec. 10, 1931. Fused Al, Mg, Cu, Zn, Sn, Bi, Sb or Cd or their alloys are mixed with corresponding oxides or the fused metals are agitated in contact with air. The fine grains thus obtained are easily ground by ordinary methods to fine powder.

**Oxides of fourth-group metals such as titanium oxide.** MAX MAYER (to Krebs Pigment & Color Corp.). U. S. 1,885,934, Nov. 1. A fluid halogen compd. of a fourth-group metal such as $TiCl_4$ is incorporated in solid salt material such as $K_2SO_4$ which is nonreactive on the oxides to be produced and decompn. is then effected by treating the mass with steam.

**Apparatus for refining volatile oxides obtained by roasting ores.** PAUL SUTTER. Fr. 736,196, Aug. 6, 1931.

**Soluble titanium compounds.** WILLIS F. WASHBURN (to Titanium Pigment Co.).

U. S. 1,889,027, Nov. 29. In forming sol. products from a mixt. of titaniferous materials such as ilmenite and strong $H_2SO_4$, water is added to the mixed charge to initiate reaction.

**Halogen compounds of phosphorus.** EDGAR C. BRITTON and HAROLD R. SLAGH (to Dow Chemical Co.). U. S. 1,888,713, Nov. 22. In forming a compd. such as $POCl_3$, reaction is effected between P and a halogen in a liquid medium including at least one halogen P compd. such as $PCl_3$ or $POCl_3$.

**Alumina.** LONZA-WERKE ELEKTROCHEMISCHE FABRIKEN. G. M. B. H. Ger. 563,831, Dec. 23, 1930. Addn. to 561,981. The method of 561,981 (*C. A.* **27**, 1104) for producing $Al_2O_3$ by decompg. alk earth aluminates by Al salts is improved by treating the aluminates first with acid to form an Al salt and then treating further aluminate with the Al salt so formed. Alternatively the amt. of acid may be regulated so that a basic Al salt is formed, the $Al_2O_3$ being then worked up from this. Thus, Ca aluminate is treated with $HNO_3$ to give (*a*) $Al(NO_3)_3$ and $Ca(NO_3)_2$, or (*b*) $Al(OH)_2NO_3$, according to the amt. of acid present. In the first case, the $Al(NO_3)_3$ is added to further aluminate to give $Al(OH)_2NO_3$. In both cases, the $Al(OH)_2NO_3$ is worked up into $Al_2O_3$.

**Alumina.** JEAN C. SÉAILLES. Ger. 567,114, July 6, 1928. Addn. to 564,059 (*C. A.* **27**, 1104). The method of Ger. 564,059 is modified by using a small amt. of an alkali or alk. earth hydroxide forming a sol. aluminate, in assocn. with the alk earth hydroxide forming an insol. aluminate.

**Alumina.** HISASI HUKAMI and TAKESI ARIMORI (to South Manchurian Railway Co.). Japan. 94,049, Jan. 6, 1932. Ores contg. $Al_2O_3$ are heated with F compds. and $H_2SO_3$ to form a mixt. of $Al_2(SO_3)_3$ and $Al_2(SO_4)_3$. Alkali sulfite corresponding to $Al_2(SO_4)_3$ in the product is mixed with the product and the whole is heated, by which basic Al salts are obtained, which are easily changed into $Al_2O_3$ in good yield.

**Aluminum chloride.** WM. H. SHIFFLER and WARD P. ANDERSON (to Standard Oil Co. of Calif.). U. S. 1,887,566, Nov. 15. A coke contg. alumina is introduced into a reaction chamber in which a bed of such coke is maintained, with continuous introduction of gases contg. Cl and O sufficient to maintain reaction temp. in the reaction chamber, the gases are passed through the bed of coke and gases and vaporized reaction products are continuously discharged from the upper portion of the chamber, and ash and spent coke are discharged from the bottom portion of the reaction chamber, condensible products being recovered from the vapors and gases. App. is described.

**Aluminum hydroxide.** SVEND S. SVENDSEN (to Clay Reduction Corp.). U. S. 1,889,080, Nov. 29. Alumina- and silica-contg. material such as clay is treated with $NH_4F$ in a substantially dry state, the Si is removed by volatilization from the material in the form of $NH_4$-Si-F compds., alumina of the material is converted into $Al_2(SO_4)_3$ and the latter is converted into $Al(OH)_3$ in the presence of the residual fluoride compds. (suitably by $NH_3$).

**Ammonium chloride.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 363,687, June 20, 1929. Impurities, *e. g.*, Fe and Al salts, are removed from $NH_4Cl$ solns., preferably contg. free $NH_3$, by adding a Pb oxide, *e. g.*, PbO, $PbO_2$, and sepg. the clear liquor from the ppt.

**Ammonium phosphate and calcium nitrate.** NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB. Norw. 50,720, April 25, 1932. Raw phosphate is dissolved in $HNO_3$ and the $H_3PO_4$ obtained is pptd. as $CaHPO_4$, which is partly converted into $NH_4$ phosphate by treatment with $(NH_4)_2CO_3$. A part of the residue, consisting of $CaCO_3$ and unchanged $CaHPO_4$, is used to ppt. $CaHPO_4$, while the remaining part is treated repeatedly with $(NH_4)_2CO_3$, by which practically all of the $H_3PO_4$ can be obtained in the form of ammonium phosphate.

**Ammonium sulfate or salts containing it.** SHOICHIRO HORI. U. S. 1,888,633, Nov. 22. $(NH_4)_2SO_3$ is dissolved in a satd. soln. of $(NH_4)_2SO_4$, the proportion of $SO_2$ to $NH_3$ is kept slightly in excess of that corresponding to normal sulfite, and the soln is subjected to the action of O under pressure in the presence of catalysts such as salts of Cu, Ni or Fe.

**Refining crude antimony sulfide.** JAMES E. BURNS and WATSON H. WOODFORD (to Remington Arms Co.). U. S. 1,887,920, Nov. 15. The material is melted in the presence of S in a crucible and the molten product is drawn off as it is melted. App. is described.

**Barium sulfate.** SACHTLEBEN A.-G. FÜR BERGBAU UND CHEM. IND. (Manfred Müller, inventor). Ger. 567,348, Apr. 29, 1930. See Fr. 715,740 (*C. A.* **26**, 2021).

**Beryllium fluoride.** I. G. FARBENIND. A.-G. (Rudolf Schulze and Walter Brause, inventors). Ger. 567,270, Aug. 14, 1931. In a continuous process for the manuf. of $BeF_2$ from beryl, the latter is treated at 350–600° in a rotary tube furnace with va-

porized $NH_4F$ or $NH_4F.HF$. $SiF_4$ and $NH_3$ are evolved, and a residue of $BeF_2$ and $AlF_3$ is obtained. The evolved gases are cooled to 150° and treated with an excess of $NH_3$, whereby a solid compd. $SiF_4.2NH_3$ and excess of $NH_4F$ are pptd. $NH_4F$ and almost pure $SiO_2$ are then recovered by treating $SiF_4.2NH_3$ with excess of $NH_3$ in the presence of water. The furnace residue ($BeF_2$ and $AlF_3$) is worked up in known manner. to recover $NH_4F$ from the sepd. $AlF_3$, the latter is treated with concd. $H_2SO_4$ and $SiO_2$, and the $SiF_4$ so obtained is added to the gases evolved from the furnace.

**Bismuth oxide.** YOSISATO TAWARA (to Mitui Kozan K. K.). Japan. 93,504, Nov. 6, 1931. $Bi_2O_3$ (3.32 parts) is manufd. from Bi (3) by the action of $NaNO_3$ (1, less than the theoretically required amt.) in the presence of NaOH (12) and alkali chromate (0.2). $NaNO_3$ is added intermittently to a melted mixt. of NaOH, Bi and $K_2CrO_4$ at 350°. Cf. *C. A.* **26**, 1723.

**Calcium chlorate.** SHELDON B. HEATH (to Dow Chemical Co.). U. S. 1,887,809, Nov. 15. For sepg. $Ca(ClO_3)_2$ from a soln. also contg. $CaCl_2$, the chlorate is crystd. as a dihydrate from a soln. in which the mol. ratio of chloride to chlorate is between 2:1 and 1:1.

**Calcium molybdate.** I. YA. BASHILOV and P. S. KINDYAKOV. Russ. 26,701, May 16, 1931. Ca molybdate is prepd. from a soln. of $NH_4$ molybdate by the action of CaO or $Ca(OH)_2$ at a temp. at which the $NH_3$ that seps. during the reaction is continuously expelled from the soln.

**Granular calcium nitrate.** NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB. Norw. 51,527, Sept. 5, 1932. The hot concd. soln. of $Ca(NO_3)_2$ contg. some $NH_4NO_3$ and having a total content of 15.5–16% of N is subjected to a preliminary solidification on a cooled surface and is then conveyed through a heated homogenizing app. Here, under const. temp., it is converted into a homogeneous pulp, which is finally converted into granules by the falling-drop method.

**Granular calcium nitrate.** NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB. Norw. 51,683, Sept. 26, 1932. Addn. to Norw. 51,527 (preceding abstract). The pulp from the homogenizing app. is conveyed down upon a rotary disk where it takes the form of drops that spread down through the falling chamber. The disk is heated and kept at a temp. equal to, or a little higher than, the solidification temp. of the mixt.

**Calcium sulfate.** SYDNEY F. W. CRUNDALL, IVAN P. LLEWELLYN and PETER SPENCE & SONS, LTD. Brit. 363,347, July 12, 1930. See Fr. 719,903 (*C. A.* **26**, 3883).

**Calcium sulfate.** PETER SPENCE & SONS, LTD. Ger. 562,385, July 9, 1931. See Brit. 363,347 (preceding abstr.).

**Dibasic calcium magnesium phosphate.** MME. P. VAN DEN ABEELE. Belg. 386,670, March 31, 1932. Solns. of $H_3PO_4$ obtained by treating phosphates with a mineral acid (HCl or $HNO_3$) are treated with a quantity of natural Ca and Mg carbonates, preferably converted into oxides or hydroxides, sufficient to ppt. a dibasic Ca-Mg phosphate. The remaining free $H_3PO_3$ is pptd. by means of an excess of pptg. reagent, and the ppt. is added to a fresh portion of soln. to be neutralized.

**Treatment of tricalcium phosphates.** F. CHAFFETTE. Belg. 387,625, May 31, 1932. The phosphatic material is treated with an acid such as $HNO_3$; the soln. is treated with $NH_4OH$ so as to recover by filtration $^2/_3$ of the $P_2O_5$ as $CaHPO_4$; the filtrate is neutralized with $NH_4OH$ so as to obtain a white $CaHPO_4$ suitable for use in stock feed.

**Preventing oxidation of cuprous oxide.** YUZURU KARASIMA (to Mitubishi Kogyo K. K.). Japan. 93,349, Oct. 22, 1931. Addn. to 88,178. The oxidation of $Cu_2O$ by air is prevented by addn. of less than 1% of one or more of the following: phenols, alcs., mono- and di-saccharides, glycerol esters, solid or liquid paraffins, petrolatum, glycocoll, tannin and alkali salts of formic, acetic, citric, tartaric or sulfurous acid.

**Lead arsenate.** TATURO ADATI (to K. K. Okada Kagaku Kozyo). Japan. 93,352, Oct. 24, 1931. Lead arsenate is manufactured by passing steam into a chamber in which a mixt. of $As_2O_3$ and PbO is heated.

**Lead oxide powder.** CLARENCE A. HALL. U. S. 1,888,823, Nov. 22. A Pb oxide powder of olive-gray color and amorphous structure is obtained by subjecting balls or lumps of metallic Pb to mutual attrition by rumbling them while confined in a closed vessel through which a stream of air is passed (cooling fluid being applied to the exterior of the vessel to control the temp.). App. is described.

**Manganous carbonate.** KENNETH A. KOBE (to Bradley-Fitch Co.). U. S. 1,889,021, Nov. 29. Material contg. manganous oxide is digested with an $NH_4$ salt soln. such as $(NH_4)_2SO_4$ and gaseous $NH_3$ is simultaneously removed; the resulting soln. is sepd. from residue and is treated with $CO_2$ and $NH_3$ for simultaneous pptn. of $MnCO_3$ and regeneration of the $NH_4$ salt.

**Potassium phosphate.** NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB. Norw. 49,160, March 30, 1931. KCl is heated with an excess of $H_3PO_4$ to 200°. After HCl has been driven off, $H_2O$ is added to the mass and the phosphate is sepd. by crystn. The mother liquor contg. undecomposed KCl after addn. of new amts. of KCl and $H_3PO_4$ is heated again to drive off HCl, thus constantly circulating in the process.

**Silica.** KOITI KAZI and SEITA MORIVASU (to the Minister of Communications). Japan. 93,543, Nov. 11, 1931. Materials contg. silicates are fused and quickly put into water. The product is crushed and warmed in 10–30% $H_2SO_4$ at 90–110°. $SiO_2$ is pptd. as white mass.

**Sodium carbonate.** ÉDOUARD URBAIN. Fr. 40,563, Jan. 3, 1931. Addn. to 724,539 (*C. A.* **26**, 4921). The double carbonate $(MgCO_3)_3.NH_4HCO_3.4H_2O$ is formed from $NH_4HCO_3$ and hydrated MgO and treated with NaCl in the presence of enough water to dissolve the $NH_4Cl$ formed. The Na is transformed entirely to the double carbonate which is afterward decomposed by hot water.

**Caustic soda.** DAVID A. PRITCHARD (to Pennsylvania Salt Mfg. Co.). U. S. 1,888,886, Nov. 22. For producing NaOH solns. and solid NaOH therefrom of a high degree of purity, concd. NaOH liquors or solns. are treated with $Na_2SO_4$ or a reagent such as $H_2SO_4$ which will increase the amount of $Na_2SO_4$ in the liquors or solns. to such an extent that the major portion of the NaCl originally present is pptd.

**Sodium hyposulfite.** I. G. FARBENIND. A.-G. Fr. 737,328, May 19, 1932. The stability of anhyd. $Na_2S_2O_4$ is increased by mixing it with alkali metal compds. of alk reaction such as hydroxides, carbonates, phosphates or silicates in amt. of at least 2 mols. for each mol. of $Na_2S_2O_4$.

**Sodium nitrate and ammonium chloride.** BAMAG-MEGUIN A.-G. Ger. 567,363, Mar. 5, 1930. A wet mixt. of $NaNO_3$ and $NH_4Cl$, obtained from NaCl and $NH_4NO_3$, is sepd. into its components by sifting. $NH_4Cl$ passes through the sieve.

**Apparatus for production of volatile chlorides such as titanium tetrachloride.** RALPH J. MCINERNY, EUGENE F. WILLIAMS and HERBERT L. GLAZE (to Minerals Increment Co.). U. S. 1,888,996, Nov. 29. Various details are described of an app comprising a retort connected with an expansion chamber, filter and condenser construction suitable for use in forming $TiCl_4$ from Cl and $TiO_2$ mixed with carbon.

**Tungsten carbide.** ORRIN F. MARVIN (to Mills Alloys, Inc.). U. S. 1,887,729, Nov. 15. A molten mass of W carbide is cast into a massive mold made of substantially pure Cu, in forming articles such as bars for use in manuf. of cutting tools, etc.

**Purification of fluorspar.** HARALD SKAPPEL. Norw. 48,166, July 21, 1930. The raw material is ground to a suitable max. grain size and sieved to eliminate the fines and is then classified and sepd. into several classes of grain size. Each class is heated separately to decrepitation and after cooling is again classified by sieving or in other ways, by which treatment the material is sepd. into a coarse-grained product contg. most of the impurities and a fine product or a number of different fine classes contg. the fluorspar in concd. purified state.

**Apparatus for hydrating lime.** P. N. BORISENKO. Russ. 26,954, Oct. 27 and 28, 1931.

**Apparatus for manufacturing slaked lime.** DENTA AKIZUKI. Japan. 93,914, Dec. 12, 1931. Powd. $Ca(OH)_2$ and steam are collected by filter app. and slaking water is preheated by the steam.

**Dehydrating Glauber salt.** JAMES B. PIERCE, JR. (to Barium Reduction Corp.). U. S. 1,886,580, Nov. 8. There is mixed with $Na_2SO_4.10H_2O$, while in liquid phase, a sufficient quantity of dehydrated $Na_2SO_4$ to convert the mass into a substantially solid phase condition (corresponding substantially to that of damp sand) so that liquefaction of the mass when heated above 32° is substantially prevented and the mixt. is then continuously fed into a furnace heated to about 600° while the dehydrated salt is continuously removed from the furnace.

**Treatment of crude phosphate.** ODDA SMELTEVERK A/S and ERLING JOHNSON Ger. 559,073, Oct. 25, 1930. See Brit. 357,814 (*C. A.* **26**, 4926).

**Treating raw phosphate.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 48,644, Nov. 10, 1930. Raw phosphate is dissolved by treating with 35–75% $HNO_3$, preferably 45–65%, in amts. nearly corresponding to the CaO content of the raw material. The soln. is cooled until the major part of the $Ca(NO_3)_2$ is crystd. out, while the mother liquor is filtered off and worked up for P and N products.

**Treating raw phosphate.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,186, Feb. 8, 1932. The Ca and $P_2O_5$ are sepd. by treating the raw phosphate with $HNO_3$ according to Norw. 48,644 (preceding abstr.). Mother liquor obtained by the crystn. and sepn. of $Ca(NO_3)_2$ is added in suitable amts., the amt. added being pref-

erably divided into 2 parts, one part being added before or during the decompn. of raw phosphate with $HNO_3$, the other immediately before or during the crystn. of $Ca(NO_3)_2$.

**Dicalcium phosphate and nitrogen products, or mixed fertilizer.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,205, Feb. 15, 1932. The $P_2O_5$-contg. mother liquor obtained by decompn. of raw phosphate and crystn. of the formed $Ca(NO_3)_2$ is neutralized with $NH_3$, $(NH_4)_2CO_3$, or alkali carbonates in such amts. that the Ca present is pptd. as $CaHPO_4$, which is filtered off and worked separately. The filtrate is evapd. and worked up for N-contg. products, or for N and $P_2O_5$ products. Norw. 50,207, Feb. 15, 1932. The Ca phosphates obtained according to the process described above are returned to the process, and again decomposed with $HNO_3$.

**Preventing froth formation in the treatment of raw phosphate with nitric acid.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,466, April 4, 1932. Before the decompn. with $HNO_3$ the raw phosphate is heated to 180–300°.

**Purification of the products obtained by decomposition of raw phosphates with nitric acid.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,560, April 11, 1932 The $Ca(NO_3)_2$ obtained by decompn. of raw phosphates with $HNO_3$ and subsequent crystn is sepd. from the mother liquor by centrifuging or filtration through a coarse filter cloth permitting a substantial part of the finely divided insol. impurities to escape together with the $P_2O_5$-contg mother liquor while the coarser impurities are retained. The resulting products, $Ca(NO_3)_2$ (in liquefied or dissolved state) and soln. contg. $P_2O_5$, are separately freed from their content of insol impurities by filtering, centrifuging, or sedimentation. Cf. *C. A.* **26**, 4926.

**Decomposition of raw phosphates with nitric acid.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,666, April 18, 1932. The acid is added to the raw phosphate in 2 or more portions, the first of which is by far insufficient for complete decompn. but exceeds the amt required for decompn. of the gas-forming impurities, in order that the gas formation can take place chiefly in a mass of plastic or highly viscous consistency. By this means the undesirable formation of froth is prevented.

**Phosphoric acid.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,754, May 2, 1932. Raw phosphate is decompd. with $HNO_3$ and $Ca(NO_3)_2$ is crystd. out by freezing. The $Ca(NO_3)_2$ crystals with or without a preliminary washing are melted in their water of crystn with or without addn. of extra amts. of water or dil. washing soln. The $P_2O_5$ of the soln. is then pptd. by treating with $NH_4OH$ or $Ca(OH)_2$ preferably at a temp. of 50–60°, after which the ppt. of di- or tri-calcium phosphate is filtered off.

**Treating calcium phosphates with nitric acid.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,924, Dec. 5, 1932. $HNO_3$ is used for the decompn., etc., of raw phosphate in which have been dissolved nitrates of alkali, $NH_4$, or alk. earth metals, or such nitrates are dissolved in the soln. obtained after the decompn. of raw phosphate with $HNO_3$.

**Cooling solutions of raw phosphate in nitric acid.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 51,032, June 20, 1932. Raw phosphate is decompd. with $HNO_3$ and $Ca(NO_3)_2$ is crystd. out from the soln. The soln. is cooled in absorption towers by means of a countercurrent of cold air or cooled gases. The $HNO_3$ vapor and N oxides escaping with the cooling gases are utilized in the manuf. of $HNO_3$, either by absorption in $H_2O$ or an alk liquid to produce absorption liquid for $HNO_3$ absorption towers, or, if oxygen-contg. gases have been used, by using the escaping gas for the oxidation of $NH_3$.

**Treating raw phosphates with nitric acid.** ODDA SMELTEVERK A/S and ERLING JOHNSON. Norw. 50,514, April 4, 1932. The lasting "secondary" froth formed during the decompn. which contains a substantial part of the insol. impurities is withdrawn from further reaction with the acid by being skimmed off immediately after the main decompn. process has been finished. The sepd. froth is subjected to a sep. treatment, preferably a continuous washing or decantation after first having been dild. with $H_2O$ or other suitable washing liquid.

**Drying moist phosphatic material such as phosphate rock.** STAPLETON D. GOOCH (to Coronet Phosphate Co.). U. S. 1,888,919, Nov. 22. P is mixed with the material and then burned in contact with it at a temp. below that at which P in the phosphate rock is reduced and volatilized.

**Crystallizing salt solutions.** NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB. Norw. 48,958, Feb. 9, 1931. Mech. features are described of an app. with rotary cooling bodies keeping the mass in const. motion. The cooling bodies are sur-

rounded by a dense suspension of crystals, so the crystn. will take place not on the cooling surfaces but chiefly upon already existing crystals.

**Utilizing titaniferous raw materials containing iron.** TITAN CO. A/S. Norw. 47,333, Jan. 6, 1930. The raw materials are subjected to a reducing heating without fusion. The product, contg. metallic Fe, is heated with acid, for instance $H_2SO_4$ of such concn. and at such a temp. that practically only Ti is dissolved and converted into a water-sol. form while the Fe remains undissolved and can be sepd. by magnetic or mech. processes.

**Removing silica from brine solutions, etc.** ARSEN H. AVAKIAN. U. S. 1,888,484, Nov. 22. For removing $SiO_2$ from materials such as alkali brines, the $HCO_3$ radical is produced in the soln. (suitably by adding $NaHCO_3$) and the pptd. $SiO_2$ is then mechanically sepd. (as by filtration).

**Conversion of ferrophosphorus.** NILS C. LINDBERG (to Victor Chemical Works). U. S. 1,888,003, Nov. 15. For producing sol. compds. such as phosphates, briquets are formed of comminuted ferro-P, alkali metal carbonate and caustic alkali and are heated to a reacting temp. below the fusion point.

**Kaolin earths.** ÉMILE SOYEZ and MARCEL CHÉROUVRIER. Fr. 736,198, Aug. 6, 1931. Kaolin earths are dried, disintegrated, screened and driven by a current of air through centrifugal separators, the fine kaolin escaping at the top.

**Activation of Japanese acid clay.** MASAKITI MIZUTA and SIGERU HAYASI (to Nippon Sekiyû K. K.). Japan. 93,654, Nov. 19, 1931. New or waste Japanese acid clay is activated by treatment with acetone or a mixt. of acetone and a solvent such as naphtha.

**Fluorine.** KARL FREDENHAGEN. U. S. 1,888,118, Nov. 15. F is produced by electrolysis of a substantially anhyd. soln. of K bifluoride in HF which contains more than 1 but not more than 1.8 mol. proportions of HF to each mol. proportion of KF. Cf. *C. A.* **26**, 4544.

**Amorphous carbon and hydrogen.** JOSEPH V. G. VAN DEN DRIESSCHE. U. S. 1,887,792, Nov. 15. Water gas and steam are caused to react upon $CaC_2$ heated to about 250° in an air-tight retort and the lime, C and H formed are sepd.

**Carbon black suitable for use in ink, rubber compositions, etc.** WM. B. WIEGAND and LOUIS J. VENUTO. U. S. 1,889,429, Nov. 29. Carbon black is agitated with two immiscible liquids such as water and gasoline one at least of which may contain dissolved accelerators, softeners, antioxidants or the like, so that the carbon black forms pellets in or with one of the liquids with adsorption of such added ingredients from the liquid.

**Purification of hydrogen.** ALBERT A. FREY (to The Canadian Westinghouse Co., Ltd.). Can. 329,232, Jan. 10, 1933. Com. H is passed over granular Mg or suitable Mg alloys at 100–120°. Impurities such as moisture, O, N, C compds. and gases contg. S are removed.

**Apparatus for producing hydrogen.** P. A. MOLCHANOV. Russ. 26,699, April 11, 1931. In the production of H by interaction of alumino-ferrosilicon with NaOH the material is charged into the reaction chamber through a horizontal tube connected on one end with a funnel for the raw material, which after entering the tube is moved by a worm drive toward the inner end of the tube placed in the reaction vessel.

**Installation for producing hydrogen by the contact method.** A. P. LOSHKAREV and E. M. PETROV. Russ. 26,698, Mar. 30, 1931. An app. for prepg. H from water gas consists of 3 units, *i. e.*, a contact furnace, a gas preheater and a steam superheater. The catalysts can be removed from the furnace through an opening in the bottom. Heat exchange is effected by a connection of the lower part of the furnace with the upper part of the preheater while combustion gases from the furnace are passed to the steam superheater and the superheated steam is passed from the upper part of the superheater into the upper part of the the contact furnace.

**Utilizing the hydrogen and chlorine obtained by electrolysis of alkali chloride for the production of ammonium phosphate.** NORSK HYDRO-ELEKTRISK KVAELSTOFAKTIESELSKAB. Norw. 47,380, Jan. 20, 1930. (*a*) Alkali chloride is electrolyzed to produce alkali hydroxide, Cl and $H_2$. (*b*) The $H_2$ is used in the synthesis of $NH_3$. (*c*) The Cl is used for the production of $POCl_3$, by treatment of raw phosphate with CO in the presence of Cl; the $POCl_3$ is converted into $H_3PO_4$ and HCl. (*d*) CO is regenerated from the $CO_2$ obtained under (*c*). (*e*) $NH_4$ phosphate is produced from the $NH_3$ and the $H_3PO_4$ obtained under (*b*) and (*c*).

**Separation of iron from solutions of nickel salts.** FALCONBRIDGE NIKKELVERK A/S. Norw. 51,736, Nov. 7, 1932. The Ni salt soln. is neutralized with strongly reactive metallic Ni produced by gaseous reduction of Ni compds. at low temp., preferably between 350° and 450°. The neutralization of the free acid of the soln. by means

of the said Ni material is carried so far that the Fe is pptd. by the subsequent blowing with air.

**Removing iron from aluminum sulfate.** B. I. ZBARSKII. Russ. 47. Mar. 23, 1920. The impure soln. is first treated with $Al(OH)_3$ or $Ca(OH)_2$ to neutralize the excess of $H_2SO_4$, followed by a treatment with $Cl_2$. The product is then boiled together with the product obtained by the action of $Cl_2$ on a soln. of a Mg salt; the ppt. is sepd. The soln. is again treated with $Al(OH)_3$ or $Ca(OH)_2$, and then with $Cl_2$; $SO_2$ gas is passed through the liquid after the sepn. of the ppt. The soln. is finally evapd. to dryness.

**System for preparing compressed oxygen or other gases under high pressure form liquefied gases.** CHRISTIAN W. P. HEYLANDT (to Fluga A.-G.). U. S. reissue 18,646, Nov. 1. A reissue of original pat. No. 1,773,140 (*C. A.* **24**, 4964).

**Phosphorus and phosphoric acid.** WM. H. WAGGAMAN and STAPLETON D. GOOCH (to Coronet Phosphate Co.). U. S. 1,888,896, Nov. 22. A sintered mass of phosphate and siliceous material together with fuel is charged into a furnace zone, and the charge is built up until its height is over 7.5 times the width of the charge; the charge is ignited, and generated gases and vapors are passed upwardly through the elongated columnar charge, under a high velocity of flow and with a prolonged heat-exchange period with the upper section of the charge. App. is described.

**Separating free sulfur from gases.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Ger. 552,148, May 31, 1931. See Brit. 355,832 (*C. A.* **26**, 4425).

**Apparatus for continuous sublimation of sulfur.** K. D. SABANEEV and A. I. CHERTOK. Russ. 26,700, Oct. 19, 1929. In an app. comprising a bunker for the raw material, a distg. column heated by combustion gases, a chamber for the sublimed S and a receiver for the S-free residues the distn. column is equipped with a number of conical inverted plates attached to a rotating shaft and a corresponding number of stationary plates placed in an upright position.

**Carbon monoxide detection.** JOANNY VERGNAIS. Fr. 736,243, Aug. 12, 1931. An app. is described for denoting at a distance the presence of CO in a gas by the heating of a Pt wire.

**Carbon dioxide.** MAURICE CHAFFETTE. Fr. 737,210, May 17, 1932; Belg. 388,493, June 30, 1932. $CO_2$ is sepd. from $H_2S$ by burning the $H_2S$ with O at 600–800° in the presence of contact materials. The $SO_2$ is dissolved in water under pressure or sepd. as sulfite or bisulfite.

**Gas mixtures rich in hydrogen, carbon monoxide and carbon dioxide.** M. CHAFFETTE. Belg. 287,296, April 30, 1932. $CH_4$, or gases contg. it, are decompd. at a temp. of at least 500° in presence of a catalyst consisting of a mixts. of salts of Ni and of rare earth metals, particularly those belonging to the Ce group.

**Production of gas mixtures suitable for various syntheses.** M. CHAFFETTE. Belg. 387,055, April 30, 1932. A mixt. of H, CO and $CO_2$ is obtained from $CH_4$, $H_2O$ and $O_2$ by effecting incomplete combustion of $CH_4$ at high temp. and passing the resultant gas mixt., after addn. of $H_2O$ vapor, over a catalyzer at a temp. not less than 500°.

**Recovering sulfur dioxide.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 736,074, Apr. 28, 1932. $SO_2$ is recovered from gases contg. it by an aq. soln. of an alkali hydroxide and (or) an alkali sulfite contg. a substance such as $AlCl_3$ which gives rise to an acidity increasing with the temp. and which does not give rise to a permanent ppt. under the conditions of working.

**Catalyst carrier.** MONSANTO CHEMICAL WORKS (Lloyd F. Nickel, inventor). Russ. 25,111, Mar. 6, 1930. A carrier is prepd. from porous silicic material such as kieselguhr, which is mixed with a soln. of water glass, formed into globules and dried. The water glass is then decomposed by acidic gases or acid and the silicic material calcined at about 400°, whereby a base of silica is obtained.

**Catalyst suitable for oxidation of ammonia.** IVAR W. CEDERBERG (to Oxyammon A.-G.). U. S. 1,889,463, Nov. 29. See Fr. 716,344 (*C. A.* **26**, 2286).

**Vanadium catalyst suitable for sulfur trioxide production, etc.** HENRY JOSEPH (to General Chemical Co.). U. S. 1,887,978, Nov. 15. A V catalyst is prepd. contg. Na and K in such quantities that the ratio of Na to K, calcd. as sulfates, is not substantially greater than 0.5 and not substantially less than 0.25. The catalyst may be used on a finely divided carrier such as kieselguhr. The catalysts are suitable also for org. oxidation reactions.

**Active molybdenum trioxide catalyst.** GARLAND H. B. DAVIS (to Standard-I. G. Co.). U. S. 1,888,978, Nov. 29. $MoO_3$ is dissolved in an alkali such as $NH_3$ soln. and molybdic acid is pptd. from the alk. soln. by adding an excess of acidic material

such as HCl and the ppt. is sepd. and heated for a prolonged period (suitably about 2–10 hrs.) at about 400–800°. The resulting material is suitable for use as a catalyst in reactions such as hydrogenation of carbonaceous materials.

**Silica gel.** "SALVIS" A.-G. FÜR NÄHRMITTEL UND CHEMISCHE INDUSTRIE. Fr. 737,316, May 19, 1932. The activity of $SiO_2$-gel is increased by adding to the reaction constituents or to the reaction mass during manuf. but before drying of the gel, about 5% of a fibrous material, *e. g.*, hair.

**Condensation products from urea, etc., and aldehydes.** WILFRED S. ROTHERA, STANLEY BLYTHEN and HENRY R. GILLESPIE. Ger. 567,271, Feb. 3, 1925. See Brit. 238,904 (*C. A.* **20**, 2052).

**Phenolic condensation products.** LAWRENCE BYCK (to Bakelite Corp.). U. S. 1,887,833, Nov. 15. A reaction is effected between a phenol such as PhOH and a fatty oil such as tung oil in the presence of a small proportion of an agent such as $AlCl_3$ which promotes the reaction, and a methylene-contg. hardening agent such as formaldehyde is added to the resulting compn. The resulting product may be used for molded articles, etc.

**Phenol-formaldehyde condensation products.** AUG. NOWACK A.-G. and KARL A. SCHUCH. Ger. 567,072, Apr. 20, 1930. Fusible condensation products from PhOH and $CH_2O$ are mixed with a hydrogenated cyclic ketone, *e. g.*, cyclohexanone, in an amt sufficient to combine with free PhOH and $CH_2O$. The mixt. is then molded and hardened, preferably at a gradually rising temp.

**Plasticizing urea-formaldehyde condensation products.** LEONARD SMIDTH and RAY H. CRIST (to Luco Products Co.). U. S. 1,886,600, Nov 8 A previously cast product is dried and aged for removing strains, then heated to a high temp. (suitably about 165°) for a short time and shaped while in plastic condition.

**Plastic materials.** DEUTSCHE GASGLÜHLICHT-AUER-GES. M. B. H. Fr. 40,924, Oct. 14, 1931. Addn. to 688,962 (*C. A.* **25**, 1046). Azelaic acid is replaced by other homologous polybasic acids having a longer C chain, the suppleness of the product increasing with the development of the C chain.

**Plastic materials.** ALEXANDER WACKER GESELLSCHAFT FÜR ELEKTROCHEMISCH INDUSTRIE G. M. B. H. Fr. 737,005, May 12, 1932. C obtained by the thermal decompn. of graphitic oxides is used in the manuf. of plastic materials.

**Adhesive** REINHOLD LEIBFARTH. Brit. 362,011, Sept. 10, 1930. An adhesive especially for sealing paper bottles, consists of 1 kg. acid-free casein, 30 g. crystd borax, 55 g. $NH_4Cl$, together with albumin, white sugar and water.

**Adhesive for index tabs, etc.** MORLAND & IMPEY, LTD. and A. G. RENDALL. Brit. 345,066, Feb. 27, 1930. A non-drying detachable adhesive is used such as may comprise unvulcanized rubber together with oil and zinc white and is covered or omitted from portions of the surface to facilitate detachment and reuse of the label, etc., when desired.

**Casein adhesive.** GEORGE M. SHISLER (to Casein Mfg. Co. of America). U. S. 1,886,750, Nov. 8. A glue which has good fluidity comprises casein 100 and an amide dispersing agent such as urea 15–100 parts, with sufficient water to serve as a solvent

**Casein adhesive.** ZINTARO KONISI (to Katuzi Utumi). Japan. 93,523, Nov. 10, 1931. A mixt. of casein 75, $Ca(OH)_2$ 15, and kieselguhr 5 parts, contg. 7 parts of NaF or the like, is used by merely mixing with water.

**Increasing the waterproofing power of casein paste.** TURUO ARAKI (to Aiti Tokei Denki K. K.). Japan. 93,988, Dec. 18, 1931. The waterproofing power of casein paste is increased by adding basic Cu carbonate. *E. g.*, the following mixt. is strongly waterproofing: $Na_2CO_3$ 15, Na acetate 6, NaF 5, $Ca(OH)_2$ 45, casein 140 and basic Cu carbonate 3 parts.

**Treating vegetable casein from soy bean.** P. F. D'YACHENKO. Russ. 26,702, Aug. 12, 1931. Vegetable casein prepd. from soy bean is freed of tanning resinous substances by treatment with alkali peroxides or peroxides of alkaline earth metals

**Impregnating or binding product.** J. VISCHOFF and G. ROPPENECKER. Belg. 388,636, June 30, 1932. Shellac is dissolved in a mixt. of alc. and $C_7H_8$ with addn. of ammonia; wax and rosin are dissolved in gasoline with addn. of NaOH soln.; the 2 solns. are mixed with a 3rd soln. obtained by dissolving glue in water and adding sulforicinate. Linseed oil and drier are added to the mixt. The product is suitable as an insulator as a binder, as impregnating mixt. for filling the pores of wood, etc.

**Washing preparations.** G. S. PETROV. Russ. 1448, Sept. 7, 1923. Polymerized drying or semidrying oils are mixed with petroleum, or aromatic, or fatty aromatic sulfonic acids.

**Washing and cleaning composition.** KARL L. ANDERSEN. Norw. 47,504, Feb.

10, 1930. To a comparatively dil. soln. of soap and $NH_3$ is added a small quantity of turpentine and ethanol.

**Wetting, cleansing and dispersing agents.** I. G. FARBENIND. A.-G. Fr. 40,985, Nov. 16, 1931. Addn. to 682,227 (*C. A.* **24**, 4364). Mixts. of amides of fatty acids or their *N*-alkyl, *N*-aralkyl or *N*-aryl derivs., with the sulfonation products of aliphatic hydrocarbons of high mol. wt., satd. or not, or of oleic acid amide, or its *N*-alkyl, *N*-aralkyl or *N*-aryl derivs., are used as wetting, etc., agents.

**Wetting, emulsifying, dispersing, etc., agents.** DEUTSCHE HYDRIERWERKE A.-G. Fr. 736,771, May 6, 1932. The products obtained by esterifying unsatd. aliphatic alcs. having at least 8 C atoms with $H_2SO_4$, and afterward halogenating, or by halogenating before esterification, are used as wetting, etc., agents.

**Wetting, purifying and peptonizing agents.** DEUTSCHE HYDRIERWERKE A.-G. Fr. 736,655, May 4, 1932. Acid esters from higher alkylene glycols and polybasic acids, particularly $H_2SO_4$, as well as salts of these compds., are used as wetting, etc., agents. Alkylene glycols include the products of fixation of water on unsatd. alcs. of high mol. wt. which are obtained from spermaceti and other oils.

**Detergent composition.** OSCAR TEXTOR and BERT CRITES. U. S. 1,888,334, Nov. 22. A compn. suitable for cleaning stone, marble, porcelain, etc., comprises $H_2SO_4$ 9, diatomaceous earth 3 and $Na_2SO_4$ 88%.

**Lime kiln.** JÁNOS SZABON. Hung. 104,432, Mar 30, 1931. The kiln consists of several units connected by channels. Boilers are located above the kiln. Structural details are given.

**Rotary kiln for lime, cement, etc.** ALBIN NILSSON. Norw. 49,973, Dec. 28, 1931.

**Rotary furnace suitable for use in calcining gypsum.** A. BOURDET. Brit. 359,900, Dec. 19, 1929. Various details are described of a furnace with 2 tubular chambers through which the material is passed in series in direct contact with heating gases. The first chamber is heated to a higher temp. than the second, and the material and the heating gases move in the same direction through the first and in opposite directions through the second chamber.

**Synthetic piezoelectric crystal.** ALEXANDER MEISSNER (to Telefunken Ges. für drahtlose Telegraphie m. b. H.). U. S. 1,886,234, Nov. 1. A synthetic crystal is formed of powder-like dielectric particles such as quartz the elec. axes of which are oriented in similar sense. U. S. 1,886,235 relates to a piezoelec. element including materials such as a resin, wax, asphaltum or "electret" and powd. quartz.

**Material for molded valve disks.** CLARENCE A. NASH (to Bakelite Corp.). U. S. 1,888,179, Nov. 15. Valve disks are molded from resinoid-impregnated asbestos fabric in sheet form cut to size for the exterior surfaces and a filler between of asbestos fibers also impregnated with resinoid.

**Sheet material suitable for gaskets or seals.** ELMER C. SCHACHT (to Behr-Manning Corp.). U. S. 1,888,409, Nov. 22. Resilient and flexible sheet material is formed with a body comprising comminuted cork and interlaced fibers assocd. with a binder such as a glue, glycerol and formaldehyde product which is resistant to water and mineral oils. U. S. 1,888,410 relates to similar material with a united surface layer of a paper-like material.

**Brake-lining material.** ADOLPH ROSNER (to Bendix Brake Co.). U. S. 1,887,981, Nov. 15. A woven fabric matrix is impregnated with a cyanide salt such as Cu ferrocyanide, castor oil, synthetic resin and lead.

**Magnetic cores.** TELEFONAKTIEBOLAGET L. M. ERICSSON. Fr. 736,964, May 11, 1932. An alloy contg. Mn 17 and Ni 83% is used in powd. form as cores particularly for loading coils for telephone cables.

**Standardizing magnetic cores.** WLADIMIR J. POLYDOROFF (to Johnson Laboratories, Inc.). U. S. 1,887,380, Nov. 8. A magnetic core contg. insulated finely divided particles is standardized by passing an elec. discharge through a path within the core.

**Cores of magnetic material.** STANDARD ELECTRIC A/S. Norw. 48,178, July 21, 1930. A finely divided magnetic material is mixed with an acid and an alkali in such proportions that the acid and the alkali together with another insulating material acting as a carrier for these substances form an insulating substance in amts. sufficient to obtain an efficient insulation of the magnetic particles from each other. The acid should be of the Cr or the As group, for instance molybdic, tungstic, antimonic, phosphoric, antimonious, arsenious or chromic acid.

**Packing material.** AUGUST NIELSEN. Norw 51,497, Sept. 26, 1932. Cords, strings or ribbons of wool, linen, hemp, coconut fibers, cotton, paper or cellulose are impregnated first with linseed oil or a mixt. of linseed oil and tar and afterward with a putty substance, *e. g.*, ordinary window putty or red-lead putty.

**Loose packing material for pistons, etc.** CLARENCE D. MCPHERSON (in part to Eugene S. Heiberger). U. S. 1,889,287, Nov. 29. Molten Pb is dropped upon the surface of a body of liquid such as water to cause the molten Pb to spread out to an attenuated and porous form having irregular and ragged edges. . Highly heated heavy lubricating oil is poured upon shredded asbestos mildly heated so that the asbestos takes up a large quantity of the oil, and graphite and the attenuated Pb pieces are mixed with the oil-satd. asbestos.

**Rod and shaft packing.** HERBERT S. WALKER (to Allpax Co.). U. S. 1,886,993, Nov. 8. Packing is formed contg. 98% of soft metal fragments, yieldable fiber and lubricant such as graphite and oil and about 2% of an unvulcanized rubber binder.

**Shoe stiffener material.** JOSEPH M. LURIE (to Arden Box Toe Co.). U. S 1,886,345, Nov. 1. A stiffener material comprises a fibrous foundation carrying pulverized celluloid bonded to it by rosin size and dried, water-dispersed rubber (the material being quickly permeable throughout by celluloid solvents).

**Attachment for removing eternite from the forming drum.** S. A. BARANNIKOV. Russ. 25,474, May 7, 1930.

**Fibrolite.** P. V. LAPSHIN and K. V. BARSUK. Russ. 25,473, Feb. 23, 1930. Fibrolite mass, prepd. by known methods, is heated in a special oven to 300° to 900° immediately after pressing. The mass is then finally dried in a special drier.

**Apparatus for mixing fibrolite.** A. YA. UNGER and G. YA. UNGER. Russ. 25,085, May 29, 1931.

**Transparent mass from potatoes.** I. L. DRIGO and A. S. GULYAEV. Russ. 24,963, Dec. 26, 1930. Potato flour is treated with an aq. soln. of $Al_2(SO_4)_3$, tannin and $K_2Cr_2O_7$ or aq. $H_2O_2$ soln., $Ca(NO_3)_2$, urotropine or aq. $NH_3$, hyposulfite, MeOH and triphenyl phosphate.

**Polishing composition for varnished and other smooth surfaces.** JACQUES A. J COLLARD. Brit. 363,036, Oct. 15, 1930. See Belg. 374,148 (*C. A.* **26**, 1459).

**Cleaning composition for glass, etc.** MARGIT LIE Norw. 48,119, July 7, 1930 A compn. suitable for cleaning glass and other materials, contains an aq. soln. of $NH_3$ together with turpentine, benzine or other fat solvent, and albumin.

**Cleansing composition for tapestry, ceiling, and wall surfaces, paintings, etc.** HANS EKJORD and G. HORSTMANN. Norw. 50,662, April 18, 1932. A basic mass of flour and water contains admixtures of NaCl and small amts. of HCl and phenol, heavy petroleum and methyl orange dye.

**Coating for writing tablets or boards, etc.** J. B. E. LAMBRECHT and SOC. ANON. CHEMIFAX. Brit. 344,489, Dec. 2, 1929. A coating permitting removal of matter written in ink contg. only water-sol. ingredients consists of a mixt. of solns. (preferably in different org. volatile solvents) comprising a material such as a cellulose compd forming an elastic surface and a substance such as resin resistant to chemicals. Instead of the cellulose compd. there can be used rubber and softening and modifying agents and the resin may be replaced by, or admixed with, paraffin and solid inert fillers or pigments. Paper is coated with the compn and attached to cardboard.

**Renewing ink-repelling surfaces on mercury printing plates.** HEINRICH RENCK. U. S. 1,889,374–5–6, Nov. 29. Various details of app. and operation are described, involving use of either atomized Hg or Hg salts.

**Waterproof coating material suitable for use on wall board, sheet metal, etc.** CHARLES F. MAUER. U. S. 1,888,560, Nov. 22. Clay and a carbohydrate binder such as cooked starch, glucose or dextrin are used with a waterproofing compn. formed from dissolved Na phosphate, vegetable wax such as Japan wax, glue and alum.

**Transfers for decorating pottery or other smooth surfaces.** LEONARD ALLEN and ERNEST C. DEERING. U. S. 1,888,154, Nov. 15. Transfer paper is printed with finely divided metals in admixt. with essential oils.

**Mixed solution of colloidal mercury and silver.** HUKUYASU HARASAWA. Japan. 93,608, Nov. 16, 1931. The soln. is prepd. by mixing dil. $HNO_3$ solns. of $HgNO_3$, $AgNO_3$ and $Sn(NO_3)_2$.

**Reflector for ultra-violet ray.** KITUZO FUWA (to Tokyo Denki K. K.). Japan. 93,961, Dec. 17, 1931. The reflector surface is coated with a mixt. (the main constituent of which is MgO), by using an artificial resin (prepd. from urea and HCHO), waterglass, borax or their mixt. as the adhesive.

**Carbon remover.** THOMAS A. BOYD (to The General Motors Research Corp.) and EARL BARTHOLOMEW (to The Ethyl Gasoline Corp.). Can. 329,139, Jan. 3, 1933. A C-removing compn. contains furfuryl alc. together with xylene, ethylbenzene or toluene. Cf. *C. A.* **26**, 1101.

**Clarifying agent for liquids.** M. JADOUL. Belg. 387,937, May 31, 1932. A

coagulating gel is produced by treating a concd. soln. of amylaceous material with alk. products; a small amt. of a decolorizing agent is added. An app. is specified.

**Capsule composition for sealing bottles and other glassware.** B. STRÖM and W. OBERMANN. Norw. 49,447, Oct. 19, 1931. Gelatin and glue are dissolved in hot water to a sticky soln. to which is added raw rubber dissolved in benzene or a similar solvent. At a temp. of 70–80° under const. stirring are added in succession metal oxides, glycerol, paraffin wax, more glycerol, linseed oil, copal, formaldehyde soln., and turpentine, after which the stirring is continued for several hrs. at a temp. of 50–60°.

**Anticorrosion and antifreeze liquid, especially for wet gas meters.** JÓZSEF BECZKÓY and GYULA KERTÉSZ. Hung. 104,241, March 26, 1931. Dry chlorides of alk. earth metals are added to dry chromates or dichromates of alkali metals and the mixt. is moistened with an emulsion of heavy hydrocarbons.

**Imitation earthenware.** L. BERTINCHAMPS. Belg. 386,910, April 30, 1932. The product consists of cement, marble dust, asbestos, talcum, casein, color and distd. $H_2O$.

**Inflating plugs for tennis balls, etc.** L. E. WILLIAMS and G. E. JAMES. Brit. 341,550, Oct. 19, 1929. Inflating plugs are formed with superposed layers of rubber of different degrees of vulcanization (an intermediate layer being less highly vulcanized or unvulcanized). Various structural details are described. Brit. 341,551 relates to generally similar devices.

**Composition for golf-ball cores.** DUNLOP RUBBER CO., LTD., S. G. BALL and E. W. ALLEN. Brit. 341,163, Nov. 5, 1929. A soln. of $CaCl_2$ is used with or without addn. of glycerol, dyes or protective colloid stabilizers such as gelatin, gum acacia, gum tragacanth, Iceland moss, carrageen, algin or agar agar (the soln. having a sp. gr. of about 1.4).

**Thermophoric mixture.** THOMAS P. BELL (to Thermophor Mfg. Co.). U. S. 1,887,618, Nov. 15. A mixt. of $Na_2SO_4$ and $Na_2SO_4.10H_2O$ (suitably in the proportions of 2 and 3 parts, resp.) is used with NaOAc 92 and glycerol 3 parts. Cf. *C. A.* **26**, 2833.

**Chewing-gum base.** GEORGE A. HATHERELL (to Frank A. Garbutt). U. S. 1,887,930, Nov. 15. A chewing gum-material is formed comprising rubber, a protein material such as an alc.-sol. cereal protein material and a resin such as coumuarone resin.

**Composition for use on rubber printing blankets.** GEORGE W. BENNETT. U. S. 1,888,109, Nov. 15. A compn. which serves to facilitate "making ready" in offset printing contains as a vehicle a mineral-oil product such as kerosene less volatile than gasoline but more volatile than spindle oil, spirits of turpentine, a "penetrating oil" consisting largely of hydrocarbons, oil of sassafras and oil of cloves (a small proportion of powd. S and powd. orris root being also carried by the vehicle).

**Dental cement.** OTTO SIMON. U. S. 1,886,982, Nov. 8. A usual silica or phosphate dental cement is combined with a sulforicinate or sulfonated castor oil.

**Vermin-destroying compositions.** CHEM. FAB. IN BILLWÄRDER VORM. HELL & STHAMER A.-G. (Hanno Geller, inventor). Ger. 567,402, June 20, 1931. Pastes contg. $CS_2$ or $CCl_4$ are prepd. by adding $CS_2$ or $CCl_4$ to a mixt. of a fatty acid salt, *e. g.*, K oleate, with pyridine or a homolog or deriv. thereof.

**Compositions such as those of cellulose acetate.** GEORGES E. ZELGER (to DuPont Film Mfg. Corp.). U. S. 1,886,775, Nov. 8. An ester such as diethyl ester of the acid $C_6H_5PO(OH)_2$ is used as a *plasticizer* and *fireproofing agent.*

**Foam distribution for extinguishing fires in tanks.** BENJAMIN A. MOELLER. U. S. 1,889,101, Nov. 29. A partially confined foam stream is flowed horizontally onto the surface of liquid such as oil in a tank. App. is described.

**Acid cylinder for a foam fire extinguisher.** G. A. SHTEKER. Russ. 25,047, Dec. 20, 1930.

**Fire-extinguishing apparatus using pressure fluid for ejecting extinguishing fluid or foam.** ROLAND MORTON. Brit. 363,235, Feb. 27, 1931.

**Fire extinguisher.** KARL ANDVIG. Norw. 45,749, Dec. 29, 1930. Structural features.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Progress of the glass industry in 1931.** OSCAR KNAPP. *Glashütte* **62**, 897–8 (1932); cf. *C. A.* **27**, 388. M. V. KONDOIDY

**Relation between the shape and size of a glass-melting pot and its durability.** MASANOBU NAKATSUJI. *J. Japan. Ceram. Assoc.* **40**, 511–15(1932). S. KONDO

**Factors affecting the life of glass pots.** JOHN M. NEFF. *Ceram. Ind.* **19**, 270–2 (1932).—Glass-pot compns. and methods of prepn. are discussed. E. E. L.

**Technic of glass-pot arching and melting practice.** JOHN M. NEFF. *Ceram. Ind.* **20**, 13–15(1933). ELTON E. LENT

**Avoiding defects in glassware by correct batch mixing.** F. GELSTHARP. *Ceram. Ind.* **19**, 231–4(1932).—Suggestions are given for mixing materials to avoid stones in glass, reaming, stringing and other defects. ELTON E. LENT

**Working glass with Widia tools.** A. FEHSE AND B. KINDT. *Glastech. Ber.* **10**, 193–200(1932).—A description of the difficulties which occur in working glass, the difference between the working of metal and that of glass, and the use of "Widia," a hard metal, for tools for working glass, glass boring and glass cutting. Illustrated. ELTON E. LENT

**Austenitic alloy irons and their application in the glass industry.** GERALD S BELL. *Glass* **9**, 474–7(1932). ELTON E. LENT

**Decrease in the iron content of glasses decolorized by means of selenium.** EMILIO DAMOUR AND ALEXANDRE NADEL. *Chimie & industrie* **28**, 1283–8(1932).—See *C. A.* **26**, 5184. A. PAPINEAU-COUTURE

**The influence of cerium and arsenic on the photochemical behavior of silica glasses.** F. ECKERT AND K. SCHMIDT. *Glastech. Ber.* **10**, 80–5(1932).—(1) The intensity and velocity of discoloration of Ce glasses in ultra-violet light depend on the Ce content These values vary between a max. with 2.56% $Ce_2O_3$ and almost no effect with 0.005% $Ce_2O_3$. Discoloration is from yellow to yellow-brown. (2) To obtain the same discoloration glasses prepd. from ordinary raw materials melted in a blast furnace require shorter exposure than those from pure raw materials melted in an elec. kiln. (3) In an alkali-lime glass contg. Ce, $NaNO_3$ does not discolor in ultra-violet light, but As does $NaNO_3$ used in the presence of As accelerates discoloration. $Na_2SO_4$, $Na_2SO_4$ + $NaNO_3$, NaCl and $B_2O_3$ do not discolor without As. (4) $Sb_2O_3$, $Bi_2O_3$ and $V_2O_5$ produce a discoloration equal to that of As in the presence of Ce. These elements belong to the same group of the periodic system but the velocity and intensity of discoloration decrease with increased at. wt. (5) $As_2O_3$ and $Bi_2O_3$ without addns. of Ce affect the discoloration in ultra-violet light also. Its velocity and intensity, however, are lower than with Ce. Discoloration occurs with use of C. P. as well as tech. raw materials (6) Glasses with $Pr_2O_3$ or $Nd_2O_3$, without Ce but with an As content, discolor in ultra-violet light somewhat more slowly than the corresponding Ce glasses. No discoloration appears in the presence of $As_2O_3$. (7) Addn. of $TiO_2$ to $As_2O_3$-$Ce_2O_3$ glasses doubles the velocity of discoloration. No discoloration occurs in $TiO_2$-$Ce_2O_3$ glasses in the absence of $As_2O_3$. (8) A glass melted in a reducing atm. does not discolor in ultra-violet light but its blue-green coloration changes to colorless. (9) A glass melted in an oxidizing atm. discolors toward yellow and its velocity is increased five-fold. (10) By reduction in an atm. of H at the softening temp. glasses contg. As color into brown, those contg. Sb into gray-brown, while the proper green and blue-green color tones of all other glasses, whether contg. Ce or not, change to yellow-green and light green-yellow. The Ce content does not influence this change in color. All these glasses do not change on exposure to ultra-violet light. (11) Oxidation in an atm. of O at softening temp. of these glasses changes the green color to yellow and light yellow. They discolor in ultra-violet light. (12) The intensity of fluorescence of Ce glasses depends on the Ce content Phosphorescence could be detd. only in glasses which contain As. Thermoluminescence was observed in all glasses. ELTON E. LENT

**Ultra-violet radiation and U-glass.** HARALD LUNELUND. *Teknillinen Aikakauslehti* **22**, 414–18(1932).—A summary of the phys. and biol. properties of rays is given Ordinary window glass does not begin to transmit ultra-violet light until the region of 310 $\mu\mu$ is reached, while the new U-glass transmits at 260 $\mu\mu$. In the region of the Dorno interval (320–290 $\mu\mu$) the new U-glass transmits from 40 to 80% of the ultra-violet light The importance of the Dorno interval in biol. work is stressed. S. A. KARJALA

**Spectacle glasses.** TORU TAKAMATSU. *J. Japan. Ceram. Assoc.* **40**, 642–5 (1932).—Spectacle glasses are optically anisotropic and consist of parallel layers. Consequently, they are made of sheet glass composed of silica 70–75, soda 12–14 and lime 10–12%. Most of the glasses have $n_D$ 1.519. Their durability was examd. as follows: The glass was powdered to particles of 0.25–0.4 mm. and a wt. in g. equal to the sp. gr. of the glass was heated with 50 cc. of water on a water bath for 1 hr. The dissolved alkali was titrated. The amts. of dissolved alkali in mg. were: 7 imported glasses 0.50–0.77, Japanese P 0.60, Japanese C.O.T. 0.51, 6 Japanese glasses 1.52–3.57. S. K.

**The replacement of window glass in vehicles by other materials.** O. KAUSCH. *Kunststoffe* **23**, 10–12(1933).—Certain artificial materials, *e. g.*, cellite or Pollopas, are recommended as giving a pane having the advantages over glass of being somewhat more elastic and of not forming sharp splitters on breaking. The cost is also said to permit competition with glass. J. W. PERRY

**Character, importance and requirements of safety glass. I.** C. H. ZEFER. *Glashütte* **62**, 590–3, 678–9, 694–6(1932).—The development, manuf. and testing of safety glass are discussed. **II.** *Ibid* 836–8.—German and foreign patents for safety glass are reviewed and discussed. M. V. KONDOIDY

**Should safety glass have one or more layers?** HERZOGENRATHER GLASWERKE BICHEROUX UND CIE., G. M. B. H. AND M. VOGT. *Kunststoffe* **22**, 271–2(1932).—A polemical discussion of Vogt's article (*C. A.* **27**, 171). J. W. PERRY

**Utilization of waste heat in the clay industry.** C. HÜTTER. *Tonind. Ztg.* **56**, 1074–6, 1098–9(1932). H. F. K.

**Cleaning low-grade clays.** M. C. SHAW. *Ceram Age* **20**, 220–1(1932). ELTON E. LENT

**Clay flow.** E. H. FISCHER. *Ceram. Age* **20**, 136–9(1932).—A photographic study of some common flow phenomena in hot-pressing elec. porcelain. E. E. LENT

**Developing of high-fired terra-cotta.** W. F. STEARNS *Ceram. Age* **20**, 177–8, 204(1932). ELTON E. LENT

**Ceramic bodies of low absorption maturing below 1000°.** R. F. GELLER AND D. N. EVANS. *Ceram. Ind.* **20**, 32–35, 48(1933). A study of whiteware bodies contg. synthetic flux. ELTON E. LENT

**The effect of evacuation of jigger bodies.** G. A. LOOMIS. *Ceram. Ind.* **19**, 236–9 (1932). ELTON E. LENT

**Foundry practice in sanitary ware.** LOUIS WOLFF. *Ceram. Ind.* **20**, 22–5(1933). ELTON E. LENT

**Soldered porcelain and glass in the electrical industry.** E. H. FRITZ. *Ceram. Ind.* **19**, 279 83(1932). ELTON E. LENT

**Alumina as a highly refractory substance.** H. GERDIEU. *Z. tech. Physik* **13**, 586–90(1932).—App. made of "Sinterkorund," a highly sintered pure $Al_2O_3$, is resistant to reducing and oxidizing atm. and is gas tight to 1800°. ARTHUR FLEISCHER

**Monolithic refractory concretes.** H. T. COSS AND N. J. KENT. *Ceram. Age* **20**, 212–14, 241(1932). ELTON E. LENT

**Refractory service with particular reference to boiler furnaces.** JOHN WALKER. *Sprechsaal* **64**, 976(1931); *Engineering* **135**, 4–7, 34–7(1933). R. F. FERGUSON

**Dry-process enamels for signs.** LUDWIG STUCKERT. *Ceramic Age* **20**, 140–2, 160–2(1932). ELTON E. LENT

**Production and firing of enameled products.** [**Bricks and sanitary products.**] ALBERT GRANGER. *Ceram. et verrerie* **1932**, No. 845, 597–602; cf. *C. A.* **27**, 173.—Formulas are given for various engobes or slip paints, including red, pink, salmon, blue, green, chocolate, gray, pale green and black. In relation to glazes, various types of frits, such as alkaline and boric acid frits, are used, either as fluxes or as constituents of the glaze. Glazes for white products are colorless or opaque and white, placed on a colored mass or on a white engobe covering a colored mass. Formulas are given. ALICE W. EPPERSON

**The adhesion of glue and fused alumina abrasives.** HENRY R. POWER. *Metal Cleaning and Finishing* **4**, 611–12(1932); cf. *C. A.* **26**, 642.—Adhesion is improved by exposing abrasives to oil fumes. D. THUESEN

**Glass.** JOSHUA MARK WILSKER. Brit. 362,938, Sept. 8, 1930. See Australian 29,080 (*C. A.* **26**, 5189).

**Glass-making or metallurgical furnace.** HANS M. ESCHENBACHER. Ger. 567,386, Oct. 7, 1930. A hood for collecting hot air from the furnace is described.

**Glass-furnace forehearth.** K. E. PEILER (to Hartford-Empire Co.). Brit 359,489, Aug. 21, 1929. Various structural features are described, suitable for use with a suction-gathering machine.

**Floater for use in glass tank furnaces.** ENOCH T. FERNGREN (to Libbey-Owens Ford Glass Co.). U. S. 1,888,496, Nov. 22. A refractory clay float has an interior chamber lined with SiC through which a cooling fluid may be passed.

**Replaceable floating abutment bodies for the floaters in glass furnaces.** FIN MAGNE. Norw. 49,555, Nov. 2, 1931.

**Continuous heating and cooling furnace for glass.** F. BINON. Belg. 387,734, May 31, 1932. Structural features.

**Melting pots.** O. KRÖGER and O. OSWALD. Brit. 380,290, Sept. 4, 1931. Glass melting pots of chamotte are protected from action of molten glass or combustion products by rubbing dry powd. talc into the surface or by applying a thin coating of talc mixed with $H_2O$ or water glass.

**Apparatus for feeding mold charges of molten glass.** KARL E. PEILER (to Hartford-Empire Co.). U. S. 1,888,963, Nov. 22. Mech. features.

**Apparatus for manufacture of glassware.** ALGY J. SMITH (to Hartford-Empire Co.). U. S. 1,888,438, Nov. 22. Mech. features.

**Apparatus for forming molded glassware.** EDWARD H. LORENZ (to Hartford-Empire Co.). U. S. 1,888,199, Nov. 15. Mech. features

**Apparatus for forming hollow glass articles such as bottles and jars.** VICTOR E. HOFMANN (to Owens-Ill. Glass Co.). U. S. 1,888,318, Nov. 22. Mech. features.

**Sheets of glass.** FORGES ET ATELIERS DE CONSTRUCTIONS ÉLECTRIQUES DE JEUMONT. Fr. 736,368, Aug. 26, 1931. Means are described for pouring the molten glass.

**Take-off apparatus for sheet-glass-forming machines.** EUGENE GENTIL (to American Bicheroux Co.). U. S. 1,889,065, Nov. 29. Mech. features.

**Apparatus for rolling glass sheets.** LEANDER N. POND (to Blue Ridge Glass Corp.). U. S. 1,886,302, Nov. 1. Details of a hollow roll cooling system are described.

**Sheet-glass-drawing apparatus.** EDMOND L. LEROY. U. S. 1,887,414, Nov. 8 Mech. features of an app. in which wooden blocks are held against the glass to coat it with soot which is polished off by rollers.

**Apparatus for annealing sheets of glass.** FORGES ET ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE JEUMONT. Fr. 736,726, Sept. 4, 1931.

**Continuous apparatus for rolling glass strip.** PILKINGTON BROS., LTD. Ger 562,331, Dec. 20, 1930. See Brit. 347,585 (*C. A.* **27**, 1127).

**Refractory glass.** MASAHIDE KAMIYAMA (to K. K. Simazu Seisakuzyo). Japan 94,042, Dec. 26, 1931. The glass is made of $SiO_2$ 65–75, $B_2O_3$ 10–15, $Al_2O_3$ 2–5, alkali oxide 4–10 and ZnO 3–10%. The linear expansion coeff. is $4 \times 10^{-6}$. It is resistant to acids and alkalies.

**Barium glass for electric insulation.** KÔZÔ TABATA and KENSUKE EGAMI (to the Minister of Communications). Japan. 93,969, Dec. 18, 1931. The glass contains $K_2O$ 0.2–0.9, $Na_2O$ 0.1–0.8, BaO 1.5–3.0 and $SiO_2$ 5.0–10.0 mol.

**Glass transmitting ultra-violet rays.** FRED M. LOCKE and FRED J. LOCKE (to Corning Glass Works). U. S. 1,886,280, Nov. 1. A colorless glass having high ultraviolet transmission is formed by melting a F-contg. batch in a carboniferous container. The batch may comprise $SiO_2$ 35.5–40, $H_3BO_3$ 16.5–32.5, $Al_2O_3$ 21–27 and CaO 11–17% together with $CaF_2$. Cf. *C. A.* **26**, 821.

**Revivifying ultra-violet-transmitting glass.** HARRISON P. HOOD (to Corning Glass Works). U. S. 1,889,067, Nov. 29. The transmitting properties of the glass are restored by heating to approx. the annealing temp.

**Apparatus for pressing graduated containers.** S. I. KOROLEV and S. S. OTREBELEV. Russ. 26,778, May 27, 1929. Construction details.

**Ornamenting glassware.** E. A. HAILWOOD. Brit. 344,157, Jan. 29, 1930. The surface is covered with paper, foil or the like and a design is marked out by a hot needle or wire and paint is sprayed into the spaces formed. The covering material may be impregnated with $KNO_3$ or the like to facilitate burning out the design.

**Glass tiles.** JOHN H. KNAUER (to Rene G. Le Brosi). U. S. 1,887,135, Nov. 8. Various mech. details of manuf. of reënforced cast glass tile are described.

**Composite silicate articles such as astronomical telescope mirrors.** GUNNAR A. F. WINCKLER (to General Elec. Co.). U. S. 1,888,341, Nov. 22. Angular pieces of vitreous silica are united with one another by use of a H-O flame at isolated regions of contact only so that spaces constitute a large fraction of the total vol. of the material and a support of such material carries a layer of cavity-free silica united with the support.

**Apparatus for air-tempering glass.** COMPAGNIES RÉUNIES DES GLACES ET VERRES SPÉCIAUX DU NORD DE LA FRANCE. Fr. 736,421, Sept. 2, 1931.

**Non-shatterable glass.** C. M. I. WINTER. Belg. 388,148, May 31, 1932. Glass is rendered non-shatterable by applying a sheet of cellulose acetate in a bath contg. a fatty solvent of high b. p.

**Safety glass.** LOUIS C. F. PECHIN. Fr. 40,684, Aug. 20, 1931. Addn. to 721,095 (*C. A.* **26**, 4147). More than 3 sheets of glass are joined together by a synthetic balsam having an $n$ near that of glass. Fluorescein or halogenated fluoresceins are incorporated with the balsam to intercept the chemically active rays.

**Safety glass.** SOCIETÀ ANONIMA V. I. S. (VETRO ITALIANO DI SICUREZZA). Fr. 736,028, Apr. 27, 1932. A safety glass resistant to pressure and shocks is composed of a plate of tempered glass covered on each face by a sheet of ordinary thin glass, with the interposition of plates of celluloid or like material, the various plates being assembled by known processes.

**Safety glass.** MIROITERIE "LE LION," SOC. ANON. Belg. 387,943, May 31, 1932. A sheet of celluloid is interposed between two sheets of glass and the assembly is immersed in a chem. bath and subjected to high pressure and temp.

**Transparent sheets for making safety glass.** FRIEDRICH MEYER. Fr. 737,042, May 13, 1932. Sheets for use alone or in making safety glass are made by mixing or dissolving hard substances such as celluloid, acetylcellulose, viscose, gelatin or hardened resin, in a solvent of high b. p. with soft or viscous substances such as rubber, soft resins or balsams, artificial gum-lac or vinyl acetate. As solvents butyl stearate, dibutyl phthalate, tricresyl phosphate, glycol, glycerol and castor oil may be used.

**Uniting sheets of glass with reënforcing material such as celluloid.** EARL L. FIX and MAURICE L. MACHT (to Duplate Corp.). U. S. 1,887,550, Nov. 15. Sheets of glass with an intervening sheet such as celluloid are pressed together with the edges of the intervening sheet exposed, and the assembly is submerged in a liquid and the liquid is subjected to heat and pressure while the mech. pressure on the sheets is also maintained. App. is described.

**Purifying and decolorizing clay.** GEORGE SIMCOE (to Edgar Bros. Co.). U. S. 1,888,701, Nov. 22. The clay is subjected to at least partial deflocculation in the presence of water and some insol. impurities are removed by gravity settling to produce a partially purified slip; the slip is treated with $SO_2$ to solubilize insol. Fe compds. present, remove org. coloring substances and effect strong flocculation, and the slip is subsequently treated partially to re-deflocculate it and eliminate sulfurous odors, as by use of $Na_3PO_4$.

**Porous clay products.** AAGE NIELSEN. Fr. 735,954, April 26, 1932. The clay mass, before being made porous in known manner, is rendered liquid by the addn. of alkali hydroxides or salts of alk. products and weak acids. The mass after being made porous is brought to a consistency suitable for molding by the addn. of chem. products such as NaCl, $Na_2SO_4$, $CaSO_4$, $CaCl_2$ or $MgCl_2$, or by chem. transformations.

**Resistance devices.** VEGA LABORATORIES CORP. Brit. 363,017, Sept. 24, 1930. In prepg. an insulated conductor element for a resistance device the conductor base is coated with a layer of refractory oxide, *e. g.*, $Al_2O_3$, mixed with a soln. of a halogen compd., *e. g.*, 25% aq. $AlCl_3$ soln., and a chem. change is caused therein whereby the halogen compd. is convered into refractory oxide, *e. g.*, by baking.

**Metals on porcelain.** LA PORCELAINERIE DE LESQUIN. Fr. 737,035, May 13, 1932. Ag is pptd. from an acid soln. of $AgNO_3$, washed, mixed with Bi subnitrate and applied as a paint to porcelain. The whole is calcined at about 800°.

**Gas-fired tunnel kiln for manufacture of tiles, pottery, etc.** H. STEELE. Brit. 358,292, Oct. 15, 1930.

**Heating gas-supply system for tunnel kilns.** HARROP CERAMIC SERVICE CO. Brit. 359,428, April 10, 1930.

**Down-draft brick kiln.** C. R. IVORY. Brit. 358,053, July 2, 1930.

**Muffle kiln suitable for burning ceramic products.** LEO W. MANION. U. S. 1,886,491, Nov 8.

**Apparatus and process for the continuous baking of ceramic and other products.** FOURMENT & LADUREE. Brit. 362,896, June 7, 1930. Void.

**Kiln for firing abrasive articles.** M. D. KAMENSKII. Russ. 25,477, Sept. 28, 1930. Construction details.

**Rotating kiln for firing alabaster.** M. B. POPLAVSKII Russ. 25,479, Nov. 16, 1927.

**Crate for firing porcelain goods in a muffle furnace.** I. A. MELNIKOV. Russ 25,480, June 27, 1930.

**Refractory material.** BORGESTAD FABRIKKER Norw. 47,286, Dec. 28, 1931 The material is characterized by a content of chrome-free and titanium-free oxidic Fe compds. in amts. of 5–50% together with $Mg_2SiO_4$ in amts. of 30–95%.

**Refractory material.** BORGESTAD FABRIKKER Norw. 49,682, Nov. 16, 1931 Addn. to Norw. 47,407 (*C. A.* **27**, 1478). More or less finely divided chrysolite rock is mixed with a binder, formed and burned.

**Refractory materials.** BORGESTAD FABRIKKER Norw. 50,149, Feb. 1, 1932 Iron-contg. Mg silicates, particularly natural rocks rich in $Mg_2SiO_4$ and contg substantial amts. of Fe, such as certain chrysolites, with or without other Mg silicates such as serpentine, are mixed with adequate amts. of Mg compds. such as MgO, $MgCO_3$ and similar substances and hardened by heating to high temps. without fusion in order to convert Fe into Mg ferrite and the free or liberated $SiO_2$ into $Mg_2SiO_4$

**Refractory brick.** RUSSELL P. HEUER (to General Refractories Co.). U. S. 1,886,185, Nov. 1. In making refractory brick from hydrous alumina-silica mineral contg. less than 60% of silica, the mineral such as flint clay is calcined at a temp. above 1400° and at least 85% of the calcined material is used (suitably with an admixt. of raw hydrous material) for molding under a pressure of 1000 lb. per sq. in. or higher

**Refractory blocks, plates, etc.** ARTHUR SPRENGER. U. S. 1,886,268, Nov. 1 Molten material from a smelting process contg magnesia and alumina as the main constituents is granulated and mixed with Cr-Fe-Mg compds such as a chromite and magnesite mixt. in small proportion and the mixt is molded and burned Cf. C. A. **27**, 391.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**Finely ground cement.** ANTONI EIGER. *Tonind.-Ztg.* **56**, 1158–9(1932); cf *C. A.* **26**, 6091. H. F. K.

**Properties of natural and artificial cements as shown by long-date tests.** C. VIGLIANI. *Assoc. intern. essai matériaux congr. Zurich* I, 687–98(1931).—Tests which were carried out with standard 1:3 mortars of numerous Italian and foreign cements are reported. Addns. of pozzuolana, slow-setting cement or metallurgical slags appear to increase the long-date strength and raise the resistance of mortar and concrete to the attack of aggressive solns KARL KAMMERMEYER

**Cement containing added hydraulic materials.** R. GRÜN. *Assoc. intern. essai matériaux congr. Zurich* I, 778–845(1931).—A very extensive report on the effects of various addns. of hydraulic materials called "*hydraulites*" upon the strength, hardness and resistance to corrosion of cement. KARL KAMMERMEYER

**Gaize cement.** G. BAIRE. *Assoc. intern. essai matériaux congr. Zurich* I, 908–18 (1931).—Test results with gaize, a siliceous argillaceous rock, as raw material for cement, are reported and compared with those of a high-class portland cement. Gaize cement does not contain any free lime, and is superior to portland cement in corrosive resistance to vegetables and mineral oils, gasoline, weak acids, various chlorides, sulfates and nitrates. KARL KAMMERMEYER

**Attempts to standardize the setting temperatures of cements.** S. HERZ. *Tonind.-Ztg.* **56**, 1204(1932).—Since the mineral compn. of the cement affects its setting temp., a calorimetric detn. of the setting cement roughly indicates the quantities of its constituents. H. F. K.

**Is the use of standard sand still helpful?** FRANZ BENDEL. *Tonind.-Ztg.* **56**, 1252 (1932).—B. suggests the variations induced by the use of sand in the comparative tests

of cements as reason for its omission. KARL A. GOSLICH. *Ibid.* G. states that these conditions should be met in the test procedures since they occur in practice. H. F. K.

**Improvement of the strength of cements. III.** TOSAKU YOSHIOKA AND HIROO IIJIMA. *J. Soc. Chem. Ind., Japan* **35**, Suppl. binding 563(1932); cf. *C. A.* **27**, 1130.—Twenty % by vol. of inert mineral materials contg. a large percentage of grains finer than 15 $\mu$ are effective in improving the strength of portland cement mortars.

H. C. PARISH

**Effect of variations of temperature during mold-hammering and seasoning, on the strength of cements.** A. PERFETTI AND E. PALUMBO. *Assoc. intern. essai matériaux congr. Zurich* **I**, 699–705(1931).—Exptl. results obtained from different types of cements show that while the temp. of seasoning has a great effect on the mech. strength of mortars, the temp. of mold-hammering has practically none. KARL KAMMERMEYER

**Reaction between aluminous cement and water. Theory of hardening.** HANS KÜHL AND HANS BERCHEM. *Zement* **21**, 547–53, 561–7(1932); cf. *C. A.* **26**, 1743.—Suspensions of $Al_2O_3$ cements which were shaken for periods from 1 hr. to 77 days were examd. for their sol., gel and crystal constituents The mono-Ca aluminate dissolves readily, hydrates and forms di-Ca hydroaluminate and $Al(OH)_3$ which are colloidal at first but later become cryst Hydrolysis yields free $Ca(OH)_2$ in soln., the concn. remaining slight with a $p_H$ value of 11.6. The di-Ca aluminate is much more sol. than the hydration products of portland cement in lime water. The silicates hydrate to form gel masses surrounding the cement particles and delaying complete hydration.

H. F. K.

**Using cement in pickling installations.** A. JAESCHKE. *Glashütte* **62**, 901–2 (1932).—The disintegration of concrete or cement in pickling installations is due to the attack of acids, moisture, etc. The sulfate ions are especially destructive because of the action of $CaSO_4$ and Ca aluminate, known as the "cement bacillus," which crystallizes, absorbing large quantities of water of crystn. and expanding so as to destroy concrete. This can be partly prevented by: (1) converting the free lime into carbonate by exposure to air, (2) addns. of trass, (3) use of cements poor in lime, as blast-furnace cement, (4) treating walls with water glass solns.

M. V. KONDOIDY

**Determination of sulfur present as sulfide in portland cement.** D. I. WATSON. *Cement and Cement Manuf.* **5**, 49–51(1932).—The usual evolution method is modified by adding a considerable excess of $SnCl_2$ to the cement before liberation of $H_2S$ by the addn. of acid; this prevents oxidation of sulfides by any $Fe^{+++}$ salts present. More highly concd. HCl is used to ensure the decompn. of SnS, together with a larger vol. of liquor to prevent trouble with gelatinous $SiO_2$.

B. C. A.

**Determination of the content of basic slag in portland cement.** P. N. GRIGOR'EV AND S. E. CHAIKINA. *Tonind.-Ztg.* **56**, 1206–7(1932).—The sepn. is accomplished by dissolving the cement from the slag by alc. AcOH soln. as proposed by F. Hart (*Tonind.-Ztg.* No. **65**(1904)) except that the liberated $SiO_2$ which remains on the filter is dissolved in 0.1 *N* NaOH. The results show less than $\pm 1\%$ variation in the slag contents which ranged from 9 to 15%.

H. F. K.

**High-lime portland cements. I. Preliminary experiments.** SEIJI KONDO AND HIROSHI YOSHIDA. *J. Japan. Ceram. Assoc.* **40**, 500–6(1932).—Six ordinary high-lime portland cements and 2 high-lime portland cements contg. $Cr_2O_3$ were prepd. They were examd. for content of free lime and small-piece compressive strength. In those cements with hydraulic modulus (H. M.) 2.4, the influences of silica modulus (S. M.) and iron modulus (I. M.) upon the amt. of free lime were remarkable, and those raw mixts. showing the min. contents of free lime for a given firing temp. decreased their I. M. with an increase of S. M. The replacing of some $Al_2O_3$ or $Fe_2O_3$ by $Cr_2O_3$ seemed rather to retard the combination of lime. In the cements with H. M. 2.4, the relation between the strength and the chem. compn. varied with the age of the test pieces and the method of curing. $Cr_2O_3$ in place of some of the $Al_2O_3$ seems to improve the strength on both water and combined curing.

S. KONDO

**The effect of small amounts of magnesia on the color of portland cement clinker and on the formation of alite. II.** MITSUZO FUJII AND KATSUNIKO ASAOKA. *J. Japan. Ceram. Assoc.* **40**, 291–8(1932); *C. A.* **26**, 2841.—In clinkers contg. no MgO, the development of alite was very poor and that of belite was very good, while the celite was colored yellow; in clinkers contg. 0.56 and 6.47% MgO, however, alite crystals were abundant and developed well and the amt. of belite was small, while the celite was black or blackish brown. Mn oxide or alkali did not act like MgO with respect to the formation of alite and the color of celite. The strength agreed with the hydraulic moduli regardless of the content of MgO or the development of alite. The resistance of clinker to abrasion and grinding was not influenced by MgO. The colors of clinker M 1

($SiO_2$ 23.40, $Al_2O_3$ 6.96, $Fe_2O_3$ 3.38, CaO 65.68 and MgO 0.56) fired at 1000°, 1150°, 1300° and 1500° were light yellow, slightly grayish green, green and grayish green, resp. According to C. Hansen, no solid soln. or liquid is formed up to 1300° in the system: $SiO_2$–$Al_2O_3$–$Fe_2O_3$–CaO; therefore the production of green shades must be due to the chem. reaction of MgO with $Fe_2O_3$ to form Mg ferrite. A study of the effect of MgO on the color of $2CaO.Fe_2O_3$ showed that very probably the MgO combines at first with $Fe_2O_3$, coloring it blackish, and then changes the color of $2CaO.Fe_2O_3$ from yellowish brown to blackish brown. Balls contg. $SiO_2$ 23.04, $Al_2O_3$ 6.31, $Fe_2O_3$ 3.58 and CaO 67.08 heated in $MgCO_3$ powder were black on the surface and yellow in the interior.

S. Kondo

**The magnesia content of portland cement.** Seiji Kondo and Sadatsugu Wada. *J. Japan. Ceram. Assoc.* **40**, 769–79(1932).—Portland cements with varying compns were prepd. The ratio $SiO_2$:$Al_2O_3$:$Fe_2O_3$ remained the same for all clinkers. In Group 1, MgO contents varied from 1.25 to 12.00%, hydraulic modulus (H. M.) being 2.00 for all clinkers. In Group 2, H. M. was changed from 1.77 to 2.10, the MgO content being kept const. at 8.00%. The clinkers and the cements were examd. for their qualities prescribed in the specification, strength and expansion on heating in autoclaves and microstructures. MgO seems rather to promote the chem. combination of CaO. In Group 1, the cement contg. 8% MgO was as strong as those having less MgO, and as a com. cement. In Group 2, the strength varied with H. M., the cement with 2.10 H. M. showing the highest strength among all those prepd. Briquets cured in water for 4 weeks were heated for 6 or 16 hrs. at 139–40° in autoclaves, and then were tested for strength. In Group 1, the cement contg. 12% MgO disintegrated. In Group 2, that with 1.77 H. M. deteriorated. However, all the others showed marked increase in strength, the cement with 2.10 H. M. and 8% MgO still being strongest. Expansion tests were made with neat cement bars cured 1 day in molds and 1 day in air. They were heated for 20–1290 minutes at 139–40° in an autoclave. In Group 1, the expansion increased with the MgO content; the cement with 12% MgO expanded over 3%, while the linear expansions of the others were under 0.4%. In Group 2, the expansion was rapidly reduced with increase of H. M. No new crystals or periclase was observed. Conclusions: Up to 8% MgO can safely be allowed. Part of the MgO probably reacts with $Fe_2O_3$ at first, the remainder forming a solid soln. with tri-Ca silicate up to a certain limit.

S. Kondo

**Hydration of alumina cement. I.** Katsuzo Koyanagi. *J. Japan. Ceram Assoc.* **40**, 489–99(1932).—Hitherto 2 equations have been proposed on the hydration of alumina cement: (*a*) Le Chatelier and Duhameaux (1927) $2(5CaO.3Al_2O_3) + 38H_2O = 5(2CaO.Al_2O_3.7H_2O) + 2Al(OH)_3$; (*b*) K. (1930) $2(CaO.Al_2O_3) + 11H_2O = 2CaO.Al_2O_3.8H_2O + Al_2O_3.3H_2O$. In a further study ciment fondu contg. $SiO_2$ 8.80, $Al_2O_3$ 39.64, $Fe_2O_3$ 8.84, CaO 42.30, MgO 0.56 and $SO_3$ 0.09 was used. The soly. of the cement in water, the compn. and optical properties of the crystals pptd. from the soln. at first, the ratio of CaO to $Al_2O_3$ in the soln. at the later stages and the compn. of crystals and Al hydroxide pptd. at the later stages were detd. Results: (1) On the hydration of the cement, a little $Ca(OH)_2$ produced by the decompn. of Ca silicates contained in small amt. in the cement reacts with $CaO.Al_2O_3$ in the soln. as follows: $CaO.Al_2O_3 + Ca(OH)_2 + 6.5H_2O = 2CaO.Al_2O_3.7.5H_2O$. This reaction proceeds very quickly when enough $Ca(OH)_2$ is in the soln. However, since the content of silica is small in the cement and not much $Ca(OH)_2$ is produced in the hydration, the concn. of lime is small; therefore the above reaction occurs comparatively gradually and ends soon. (2) After all the $Ca(OH)_2$ in the soln. has been exhausted, the main hydration begins: $2(CaO.Al_2O_3) + 10.5H_2O = 2CaO.Al_2O_3.7.5H_2O + Al_2O_3.3H_2O$. The hardening is due chiefly to this reaction. (3) The hydrated di-Ca aluminate dissolves in water, though very slightly, and changes to tri-Ca aluminate: $3(2CaO.Al_2O_3) + 3H_2O \longrightarrow 2(3CaO.Al_2O_3) + Al_2O_3.3H_2O$. The tri-Ca aluminate remains in the soln. and is perhaps decompd. to hydroxides of Ca and Al: $3CaO.Al_2O_3 + 3H_2O \longrightarrow 3Ca(OH)_2 + Al_2O_3.3H_2O$. The last 2 reactions take place to a very small extent; hence their effects on the hardening of the cement are practically negligible. Also in *Concrete* (Mill Section) **40**, No. 8, 40–6(1932).

S. Kondo

**Calcium aluminates. III. Microscopic investigation of their hydration.** Seiji Kondo and Toshiyoshi Yamauchi. *J. Japan. Ceram. Assoc.* **40**, 212–33(1932); *cf. C. A.* **26**, 2666–7.—The processes which take place in the hydration of 4 Ca aluminates with varying amts. of water were followed carefully for a month. Those of samples fired insufficiently were also roughly observed. Three different crystal forms of hydrated Ca aluminates were found: (*A*) needles, columns or hexagonal plates; $n_D$, $\omega$ = 1.498, $\epsilon$ = 1.507, optically uniaxial and pos.; (*B*) needles, columns, hexagonal plates

or spherulites; $n_D$, $\omega$ = 1.524, $\epsilon$ = 1.506; optically uniaxial and neg.; (*C*) needles or hexagonal plates; $n_D$, $\omega$ = 1.535; $\epsilon$ = 1.511; optically uniaxial and neg. In pure samples, the hydration proceeded as follows: (1) $3CaO.Al_2O_3$. At first, crystals *A*, then crystals *B* and a small amt. of $Al(OH)_3$, and finally crystals *C* were produced. (2) $5CaO.3Al_2O_3$. First a trace of *A*, then *B*, lastly $Al(OH)_3$ and *C*; sometimes slender needles were observed. (3) $CaO.Al_2O_3$. Slender needles and *B*, then much $Al(OH)_3$ and *C*. (4) $3CaO.5Al_2O_3$. *B*, much $Al(OH)_3$ and *C*. Insufficiently fired samples hydrated like $3CaO.Al_2O_3$ at early stages, producing crystals *A*, and then like each corresponding pure aluminate, though much more slowly. The crystals *A*, *B* and *C* may be considered as $3CaO.Al_2O_3.xH_2O$, although indications are that the crystals *A* produced in the hydration of $3CaO.Al_2O_3$ and all samples contg. free lime over certain amts. are probably $4CaO.Al_2O_3.xH_2O$ or solid solns. of $3CaO.Al_2O_3.xH_2O$ and $Ca(OH)_2$. Photomicrographs (51) are given. IV. Time of setting and compressive strength. *Ibid* 349–58.—The time of setting, the rise of temp. in the setting, and the small-piece compressive strength of the samples obtained by heating 4 mixts., $3CaCO_3.Al_2O_3$, $5CaCO_3.3Al_2O_3$, $CaCO_3.Al_2O_3$ and $3CaCO_3.5Al_2O_3$, at temps. ranging from 1200° to 1500° were measured. The relation between the strength and the microstructure is also discussed. All of the 3:1 and 5:3 samples began to set rapidly, regardless of the content of free lime, although the final setting suddenly became slow when the free lime exceeded certain amts. The 1:1 and 3:5 samples set rapidly as long as they contained free lime, but their final setting was retarded by an excess of free lime. The strength of the 5:3 samples increased almost in direct proportion to the degree of chem. combination, while that of the 1:1 and 3:5 samples increased rapidly when the combination surpassed certain degrees. In general, curing in air was more favorable than that in water. Probably those samples which produce needle-shaped crystals in the early stage of hydration are apt to set in an instant. Weak test pieces contained many needle-shaped crystals and small amts. of gel. Strong test pieces contained many spherulites consisting of radiating fibrous crystals and gel. The gel is produced by the hydration and also by the reaction between the hydrated aluminates and $CO_2$, and acts to increase the strength. S. KONDO

**The influence of chromic oxide and alumina upon the formation of tricalcium silicate.** SEIJI KONDO AND KESAKICHI MOTEKI. *J. Japan. Ceram. Assoc.* **40**, 559–64 (1932).—Raw mixts. composed of C. P. materials were heated at 1530° for 2 hrs., and the products were examd. for chem. compn., small-piece compressive strength and microstructure. Addn. of $Al_2O_3$ in amts. over 0.5% caused rapid decrease in the contents of free lime and rapid increase in the formation of $3CaO.SiO_2$. The formation of the silicate was markedly raised by the addn. of 0.5% $Cr_2O_3$ and was markedly lowered by 3%. $Al_2O_3$ increased the 28-day strength slightly, while $Cr_2O_3$ increased the 3- to 28-day strengths greatly. With 3% addn. of the latter, the 3-day strength was great, but the rate of the increase of the strength was small in comparison with 0.5% addn. The results do not agree well with the theory that $3CaO.SiO_2$ controls the early strength of portland cement. Microscopic observation indicates that $Cr_2O_3$ forms a solid soln. with tri-Ca silicate. This may be a cause of the high strength of the products. S. KONDO

**Practical lime burning.** GERHARD SEEGER. *Tonind.-Ztg.* **56**, 1077–8(1932). H. F. K.

**Natural gas for cement kilns.** ALBERT HEISER. *Tonind.-Ztg.* **56**, 1180–1(1932). H. F. K.

**Cement and well cementing. Effect of chlorides on the setting and hardening of cement.** A. REID AND J. T. EVANS. *J Inst. Petroleum Techn.* **18**, 992–1006(1932).—The effect of a 0.6% NaCl soln. upon the tensile strength and setting time of fluid cement used in wells shows that such a soln. increases the strength slightly in the early stages of setting but decreases it during the hardening period. This retrogression is more marked if salt water is used in the mixing operations. The max. strength is usually reached within 7 days, irrespective of conditions; hence, prolonged shut-down periods are not necessary. Salt solns. cause a small decrease in the initial and final setting time, but this setting time is about the same for any given salt concn. for various gagings. It was also detd. that an increase in setting temp. of 5.5° results in a shortening of the initial setting time by about 15–20 min. for the various grouts used in the field. A max. temp. of 60° was found to be satisfactory, thus permitting a 40% gage grout to be used. J. L. E.

**Physical properties of mixtures of bitumen and finely divided mineral matter.** A. EVANS. *J. Inst. Petroleum Techn.* **18**, 957–91(1932).—The relationship between the properties of various mixt. of bitumens and fillers such as ordinary and fine portland

cement, ground chalk and limestone, slate dust, colloidal silica, epure filler, micro-asbestos and china clay and the properties of the fillers themselves shows that the m. p., hardness and tensile strength are raised and that the ductility is decreased by the following factors of which 2 or more may operate simultaneously: increase in the proportion of the filler, hardness of the bitumen, fineness of the filler, fibrous or lamellar structure of the filler, and increase in the bitumen-adsorption power of the filler. The chem. compn. of filler has practically no relationship to the strength of the asphaltic cement. The ductility decreases so rapidly with addn. of the filler that the ductility of the original bitumen is no criterion of what the ductility of the asphaltic cement will be. When mfg. an asphaltic cement, it is best to use as hard a bitumen as possible and as low a proportion of filler as possible to obtain the required strength and hardness and high m. p. of the finished asphaltic cement. This ratio of filler to bitumen should be held to very narrow limits to prevent the usual service defects such as marking under heavy loads. The china clay (Stockolite), micro-asbestos and epure fillers are the 3 most efficient from the standpoint of increasing m. p. and tensile strength and decreasing penetration and ductility. J. L. E.

**Cement testing using mortar having a high water content.** G. HAEGERMANN *Assoc. intern. essai matériaux congr. Zurich* I, 669–72(1931).—As sand for a mortar, which can hold large amts. of water, a mixt. of 2 sizes of grains is proposed. Choice of grain size depends on the quantities of water to be used. KARL KAMMERMEYER

**Test on the controllability of Roumanian trass in trass-lime mortars and trass-cement mortars.** A. STEOPOE. *Assoc intern. essai matériaux congr. Zurich* I, 918–24 (1931); cf. *C. A.* **26**, 5398.—The controllability of Roumanian and probably of all other trass is not const. It depends on the type of the mortar, its trass content and the manner of storage. KARL KAMMERMEYER

**Chemical actions detrimental to cement and concrete in the ground.** G WIEGNER *Assoc. intern. essai matériaux congr. Zurich* I, 620–43(1931).—Chem. attack is due mainly to $H^+$, $Mg^{++}$ and $SO_4^{--}$, acting either alone or, more strongly, combined Data obtained in Switzerland are reported with the limit figures of noxious concns. The connection between resistance to chem. action and phys. properties was investigated 16 literature references. KARL KAMMERMEYER

**Corrosion of different cements and concretes.** C. TH. KAWASSIADIS. *Praktika (Akad. Athenon)* **6**, 468–73(1931)(in French).—Comparative lab. studies were made on the action of $Al_2(SO_4)_3$ on portland cement, foundation cement, slag cement and quick-setting portland cement. LUCIEN Y. DYRENFORTH

**Influence of quantity of mixing water on the crushing strength of concrete.** D TOMITCH AND P. VASSITCH. *Assoc. intern. essai matériaux congr. Zurich* I, 1022–6 (1931).—The granular compn. of the sand and gravel dets. the best quantity of mixing water. The crushing strength of plastic concrete never attains, with age, that of earth-moist concrete. KARL KAMMERMEYER

STAMATIU, M. J.: **Die Verfestigung und Abdichtung von Gesteinen und Beton auf chemischem Wege.** Thesis, Freiberg, 1931. 70 pp.

**Cement.** METALLGESELLSCHAFT A.-G. Fr. 737,345, May 20, 1932. An aluminous cement is obtained by agglutination, by heating the charge mixed with 5–14% of carbonaceous material, in a furnace such as a Dwight-Lloyd app. and afterward burning it by a current of air passed through the charge. An indifferent material such as blast-furnace slag may be added to increase the porosity and a fine sulfidic material such as pyrites may be used with the carbonaceous material.

**Cements, etc.** "STRABA" STRASSENBAUBEDARFS-A.-G. Fr. 736,103, Apr. 29, 1932. A bituminous substance (pitch, tar, asphalt, etc.) is made liquid, transformed into a mist and powd. cement is blown in An intermediate support such as CaO or blast-furnace slag in powd. form may be brought into contact with the mist before introducing the cement.

**Cement, etc.** "STRABA" STRASSENBAUBEDARFS-A.-G. Fr. 736,461, Apr. 30, 1932. Mortar or concrete which is absolutely resistant to variations of temp. is made by adding less than 6% of bitumen (pitch, tar, asphalt, etc.) to the lime, cement, etc., used.

**Cement.** AKTIESELSKAPET DALEN PORTLAND-CEMENTFABRIK. Norw. 47,408, Jan. 20, 1930. Hematite is added as a coloring agent during the fine grinding of the clinker.

**Glassy drying product from cement.** HENRI M. DE LANGE (to John F. Barr and Dirk de Lange). U. S. 1,886,379, Nov. 8. An addn. for cement is prepd. by slaking lime with a soap soln. and mixing the dry material thus obtained with a soln. formed of $CaCl_2$, HCl, Al and water.

**Rotary furnace for calcining cement, etc.** F. KRUPP GRUSONWERK A.-G. Brit. 359,277, Dec. 6, 1929. A damper is described for control of the outflow of gases from the furnace.

**Apparatus [and process] for burning materials such as raw materials for cement.** ARNO ANDREAS. Brit. 362,517, Sept. 1, 1930. Divided out of 360,547 (*C. A.* **27**, 453).

**System for firing crude cement mixture and like slurries.** G. POLYSIUS A.-G Ger. 567,101, May 11, 1930.

**Means for treating crude cement mixture with furnace gases.** FRIED. KRUPP GRUSONWERK A.-G. (Arno Andreas, inventor). Ger. 567,060, Aug. 30, 1931.

**Apparatus for producing highly porous cellular material from liquid blast-furnace**

**slag.** CARL H. SCHOL. U. S. 1,888,394, Nov. 22. Various details of liquid and mech. treatment are described.

**Bituminous cement mortar.** ALLERT J. DE LANGE (to Flintkote Corp.). U. S. 1,889,437, Nov. 29. Water is mixed with the dry constituents of the mortar such as sand and cement and after the mixt. is partly bound there is added a suitable quantity of an aq. asphalt dispersion.

**Cement, mortar and concrete.** CHEM. FAB. GRÜNAU LANDSHOFF & MEYER A.-G. (Walter Kirchner, inventor). Ger. 567,099, May 14, 1930. The known method of improving cement, etc., by addn. of albumins or their degradation products, may lead to the formation of foam. This is avoided by adding a small amt. of salts of higher fatty acids or their sulfonation products.

**Mortar and concrete.** JOHN ECKERT GREENAWALT. Ger. 562,485, May 25, 1930. See Brit. 351,690 (*C. A.* **27**, 394).

**Cellular concrete.** ROLF K. O. SAHLBERG (to Aerocrete Corp. of America). U. S. 1,886,232, Nov. 1. A substantial proportion of the sand used in making cellular concrete is pulverized to pass a 200-mesh screen, in order to improve plasticity and other properties.

**Concrete resistant to sea water.** PAUL ASKENASY. U. S. 1,886,933, Nov. 8. Coal-dust ash from the combustion of pulverulent coal is added to an otherwise usual cement mixt.

**Concrete resistant to sea water.** LUDWIG HEYNEMANN. Ger. 528,235, Nov. 29, 1928. About 8% of finely divided ash from coal-dust burners is added to ordinary or high-grade cement or to a cement mixt. of normal compn.

**Road-making materials.** CHEM. FAB. FLÖRSHEIM H. NOERDLINGER A.-G. Ger. 567,100, Mar. 9, 1930. Tar for use in making roads is liquefied by gentle heat or by a solvent and chlorinated for a short time, or treated with corresponding amts. of reagents yielding Cl. The treatment increases the adhesiveness of the tar without thickening it.

**Apparatus for mixing bituminous road-making materials with liquid hydrocarbons.** PAUL FRIEDRICH. Ger. 567,252, Sept. 11, 1931.

**Bituminous paving material.** SAMUEL S. SADTLER (to Amiesite Asphalt Co. of America). U. S. 1,887,518, Nov. 15. A stone aggregate is coated with a bituminous liquefier contg. an oil-sol. fatty acid such as crude oleic acid capable of combining with hydrated lime to form a water-insol. soap, and a heated normally solid bitumen binder and lime are then added.

**Coating inert materials such as slags.** SOC. ANON. POUR LE TRAITEMENT DES MINERAIS ALUMINO-POTASSIQUES. Brit. 363,151, Dec. 31, 1930. The inert material is run in molten form into an aq. soln. of the coating material, such quantities being employed that substantially all the water is evapd. Among examples slag from any metallurgical process is run into $CaCl_2$ soln. (*for roads*), slag from a $H_3PO_4$ furnace into mono-Ca phosphate soln. (*for fertilizer*).

**Material for expansion joints.** JOHN S. HIPPLE. U. S. 1,888,270, Nov. 20. Vulcanizable oils such as linseed and cottonseed oils 16 are mixed with rosin 4 and "Hydrolene" 1 part and the mixt. is liquefied by heat, followed by addn. of S 8 and pulverized silica 4 parts and further heating until vulcanization is effected; the material is then permitted to cool for pouring.

**Waterproof expansion joints.** ALBERT C. FISCHER (to Philip Carey Mfg. Co.). U. S. reissue 18,642, Nov. 1. A reissue of original pat. No. 1,807,905 (*C. A.* **25**, 4379).

**Artificial stone.** MELLE A. EISENBERG. Belg. 386,348, March 31, 1932. The stone consists of cement to which are added: NaCl, alum, and pulverized French imitation stone.

**Steaming sand-lime goods.** A. V. VOLZHENSKII. Russ. 25,090, June 11, 1930. In steaming sand-lime goods with the addn. of alkalies or salts or alk. earth metals excess of condensate and washing out of alkalies are avoided by steaming intermittently with superheated and satd. steam while toward the end of the operation air or steam superheated to 180° to 300° is admitted to effect drying.

**Building material.** BERTHOLD REDLICH. Ger. 563,271, Sept. 8, 1929. Addn to 554,995 (*C. A.* **27**, 1133). The method of 554,995 for waterproofing building material is modified by treating the impregnated material with a volatile wax solvent.

**Building material, particularly for thermic and chemical purposes.** BORGESTAD FABRIKKER. Norw. 47,407, Dec. 28, 1931. The material described consists of natural olivine rock (peridotite, dunite).

**Finely porous building materials.** CASPAR HANSEN. Norw. 48,617, Oct. 27, 1930. Gas-forming substances, such as $CaC_2$, $CaH_2$, etc., are coated with fused, water-

free substances previous to their application, in order to delay the development of gas in the mortar.

**Building bricks, paving tiles, etc.** G. A. M. GROETAERS. Belg. 386,130, March 31, 1932. The brick is formed by agglomeration in the cold of a ground mixt. of cement, Rhine sand, clinker, clay and rock alum.

**Sound-insulating fire bricks.** TORLEIF STEN. Norw. 49,339, Sept. 28, 1931. For increasing the resistivity to moisture $K_2Cr_2O_7$ is added to a mortar composed of known materials such as clay, sawdust, straw, water glass, water and size, from which bricks are made.

**Stucco compositions.** CEMENT MORTARS, LTD. Australia 28,190, Aug. 2, 1930. The compn. consists of portland cement 28, fine siliceous material 28, $CaCO_3$ 10, flour asbestos 6 and $TiO_2$ 4 lb. in an oily vehicle consisting of oxidizable vegetable oil and spirits 7.5 l. and terebine 1 l.

**Decorating marble slabs.** O. LEJOUR. Belg. 386,579, March 31, 1932. Adhesive suitable for fixing coloring matter on marble consists of Na silicate, K silicate, $BaSO_4$, chalk, CaO and Rhine sand.

**Plaster for brick or concrete surfaces.** P. A. BECH. Norw. 48,765, Dec. 15, 1930. To an ordinary lime, cement or plaster mortar is added a vegetable material which has been treated with a cold or hot soln. of a strong alkali, for instance NaOH.

**Treated fabric for imbedding in wall plaster.** ERNO PICK (to Picklin Baustoff m. b. H.). U. S. 1,887,464, Nov. 8. Truncated widenings of the fabric meshes are provided from both sides and in the entire length of the fabric, to increase the strength, and such widened meshes are filled with a compn. formed from glue, black carbolic acid, $K_2Cr_2O_7$, water glass, rubber and rock lime.

**Floor-covering material.** HAROLD L. LEVIN (to Flintkote Corp.). U. S. 1,887,979, Nov. 15. A loose or open-mesh fabric has loosely felted fibers formed with one face of the fabric and extending through the interstices of the foundation and secured by a continuous film of waterproofing material such as a bitumen, clay and pigment mixt. derived from a thickened emulsion.

**Oxidizing asphaltic oils.** TOM H. DOWLEN (to Richfield Oil Co. of Calif.). U. S. 1,886,380, Nov. 8. Various details of app. and operation are described for treating asphaltic oils while heated with air and steam, for producing oxidized products *for roofing, sealing batteries*, etc. Cf. *C. A.* **26**, 4466.

**Highly absorptive water-laid cellulose sheets.** GEORGE A. RICHTER and HENRY A. CHASE (to Brown Co.). U. S. 1,888,771, Nov. 22. Sheet material which may be impregnated with rubber, etc., is formed of loosely felted, substantially uncompacted and unbeaten wood pulp having an $\alpha$-cellulose content of at least about 93% and has an absorptivity of at least about 6 in. in terms of water crawl up a strip in 5 min. App. for manuf. is described.

**Bituminized fibrous webs for roofing, flooring, etc.** GEORGE A. RICHTER and HENRY A. CHASE (to Brown Co.). U. S. 1,888,772, Nov. 22. A material of the general character described in U. S. 1,888,771 (preceding abstr.), having a compactness within the range of about 30 to 55 as detd. by dividing its basis wt. in lbs. by its thickness in in. and multiplying by the factor $10^{-2}$, carries an impregnation of asphalt in continuous phase in a quantity at least about 2.5 times the dry wt. of the fiber.

**Paper board.** CHARLES L. KELLER (to Richardson Co.). U. S. 1,889,177, Nov. 29. In uniting outer and inner sheets of paper board, the inner sheet is coated with a heat-plastic binder such as asphalt while the latter is hot and non-solid, the coated sheet is cooled, the coating is softened by a solvent such as benzine and the outer sheets are then applied.

**Drying materials such as lumber.** HENRY W. COWAN. U. S. 1,887,581, Nov. 15. Various details of app., air circulation and temp. regulation are described.

**Artificial wood.** L. BERTINCHAMPS. Belg. 386,911, April 30, 1932. The product consists of sawdust, $MgCl_2$, $SiO_2$, a silicate, asbestos and coloring matters.

**Impregnating agent for wood, canvas, etc.** WILLIAM NAGEL. Norw. 50,481, April 4, 1932. The agent contains Cu soaps in an org. solvent, consisting of heavy benzines with an addn. of at least 15% of $CCl_4$.

**Impregnating wood.** HERMAN C. NIELSEN (to National Wood Products Co.). U. S. 1,886,716, Nov. 8. Dry wood is immersed in a liquid comprising neutral mineral oil, "mineral spirits," "Mn drying oil," turpentine, rosin, dichlorobenzene, formaldehyde and alum, in specified proportions, at a temp. of about 50° or somewhat higher.

**Impregnating wood, fabric, or paper.** I. G. FARBENIND. A.-G. (Rudolf Engelhardt, inventor). Ger. 567,261, June 4, 1931. The material is treated with an emulsion of a

chlorinated hydrocarbon of waxy character, *e. g.*, polychloro-naphthalene or -biphenyl. Fireproofing compds. may be added to the emulsion.

**Wood-veneer impregnation to render the material resistant to denting and to scorching from contact with matches or cigarets.** EMIL C. LOETSCHER. U. S. 1,887,691, Nov. 15. Substantially all the cells of a veneer are filled with a phenolic condensation product and the material is heated under pressure while in contact with a heat-dispersing backing such as a metal plate.

**Wood preservative.** WM. NAGEL and HANS LANDMARK. Norw. 50,377, March 21, 1932. The preservative is a soln. of disinfectant org. metal salts, preferably metal soaps, in org. volatile solvents, contg. substances insol. in $H_2O$ which after the evapn. of the solvent will remain in the pores of the wood together with the metal salts and reduce the hygroscopicity of the wood.

**Preserving wood.** KARL BUBLA. Brit. 363,760, Oct. 21, 1930. See Austrian 128,864 (*C. A.* **26**, 5192).

**Preserving wood.** S. B. GUTIN. Russ. 25,259, Mar. 2, 1931. The wood is first impregnated with a soln. of $CuSO_4$ and then treated with an aq. suspension of spent gas-purifying mass.

**Printing and graining wood.** LOGAN A. MIZENER (to Chicago Mill and Lumber Corp.). U. S. 1,888,864, Nov. 22. Graining is effected by printing directly upon the surface of wet wood with a water-resistant compn. comprising a starch, coloring matter, glycerol and HOAc, contg. at least 3 times as much glycerol as HOAc.

**Treating wood to improve it for violin manufacture, etc.** CHESTER D. AINSWORTH. U. S. 1,888,419, Nov. 22. There is established about the wood a high potential arc stream in a substantially inert atm. App. is described.

**Fireproof insulating material.** ANDREAS B. HANSEN. Norw. 49,044, Feb. 23, 1931. A vegetable fibrous material, such as wood pulp, cellulose, wood waste, sugar-cane fibers, or the like, is impregnated with a soln. of alkali silicate, treated with HCl to ppt. $SiO_2$, and then cast or formed into sheets.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Motor-fuel quality--a complex problem. I.** GEO. G. BROWN. *Natl. Petroleum News* **24**, No. 50, 43–7, 51(1932).—About 10% of motor fuel should be vaporized to insure satisfactory starting, and the mixt. temp. in the manifold should be ½ the temp of the 75% point in the distn. The 10% point is the guiding factor in the control of vapor lock. **II.** *Ibid* No. 51, 37–8, 40.—Reduction of S to 0.1% sometimes causes a treating loss of 10–20%, but fuels of high S content cannot be used with confidence in cold climates. R. W. KELLY

**Britain agitates for home-produced motor fuels.** C. H. S. TUPHOLME. *Ind. Eng. Chem., News Ed.* **11**, 15–16(1933).—Expts. of the Gas Light and Coke Co. and at the British Govt. Fuel Research Sta. indicate that a motor spirit of a value intermediate between gasoline and benzene can be produced by hydrogenation of coal tar and coal tar oils, the yield amounting to as much as 97% by weight of the original creosote. The spirit contains 17–40% of satd. hydrocarbons. Molybdic acid with S was found to be the best general catalyst. It was found in a continuous-operation app. that 11 6 Imp gal. motor spirit up to 200° and 8.6 gal. of Diesel oil could be produced by hydrogenation-cracking of the low-temp. tar from 1 ton of coal. D. F. BROWN

**Unburnt fuel particles in stack gases, and stoking tests.** L. H. DE LANGEN *Arch. Suikerind.* **40**, III, 1341–448(1932).—In normal installations, with proper stoking, not more than 1% of the total fuel value is lost through unburnt particles. The latter are high in ash and have a small fuel value. Air preheaters were thought to be responsible for losses through incomplete combustion, but tests have shown that the difficulties can be overcome by changes in furnace construction and by proper methods of stoking. F. W. ZERBAN

**Properties of Russian fuels.** A. I. KORELIN AND A. V. KOLLEGAEV. *Izvestiya Teplotekh. Inst.* **1932**, 923–32.—Complete chem. analyses and combustion data of 12 Russian coals, burning wood, peat, shale, fuel oil, husks from sun flowers, etc., are given. A. A. BOEHTLINGK

**Various methods for determining the moisture content in Russian coal. I.** N. V. MIKULINA, A. I. KORELIN AND A. P. SHAKHNO. *Izvestiya Teplotekh. Inst.* **1932**, 933–50 —An attempt to define the most reliable method for the detn. of $H_2O$ in various types

of coal did not produce satisfactory results, and it was decided to use the method of distg. with gasoline, which appeared to give the best results. A. A. BOEHTLINGK

**Branding and standardizing coal.** YU. A. ZHEMCHUZHNIKOV. *Khim. Tverdogo Topliva* **2**, No. 11–12, 53–5(1931).—The necessity of branding and standardizing coal on the basis of its chem. nature and its microscopical structure as well as its prepn. is emphasized. A. A. BOEHTLINGK

**A short review of foreign coal classifications.** A. P. SHAKHNO. *Khim. Tverdogo Topliva* **2**, No. 11–12, 57–70(1931).—The following classifications are discussed: Regnault-Grüner, LeChatelier, Brookman, Seiler, Ralston, Dreklay, Aufheiser, Flack, Wight, Campbell, the 12th Geological Congress, the American Government, Ashley, Fraser, Parr and Blacher. The different classifications are compared and their advantages and disadvantages as well as the conception of Fieldner are discussed. A. A. BOEHTLINGK

**Coals from Cheremkhovo.** D. I. YAKOVLEV. *J. Applied Chem.* (U. S. S. R.) **5**, 998–1024(1932).—Exptl. work showed that the coals are of bituminous type, though in certain districts they resemble lignite. A complete description of deposits and their characteristics is given. V. KALICHEVSKY

**Coal varieties from the Kizelovskii basin.** A. M. GLADSHTEIN. *Khim Tverdogo Topliva* **2**, No. 11–12, 33–52(1931).—The following operations are reported: detn. of the physicochem. properties (complete analysis), flotation tests, properties of the concentrates, oxidation tests and spontaneous combustion detns., coking tests, analyses of the ash, coking tests of mixts. of Kizelovskii and Kuznetzkii coal, low-temp. carbonization tests, analyses of products, low-temp. carbonization tar, its fractional distn., analyses of low-temperature carbonization gases. A. A. BOEHTLINGK

**The relationship between the specific gravities and the ash content in hard coal.** V. A. GUSKOV. *Khim. Tverdogo Topliva* **2**, No. 11–12, 71–9(1931).—The following conclusions are derived on the basis of expts., reported in detail: There is no direct relationship between the sp. gr. and the amt. of mineral in the admixts.; coal contg. more than 50% ash has varying sp. gr. depending upon the nature of mineral admixts. which are present as mech. admixts.; the presence of basic ingredients such as vitrain, clarain and durain causes the formation of physicochem. combinations, while the presence of mineral ingredients produces mech. mixts. A. A. BOEHTLINGK

**Present-day effects of salt in coal.** C. CAMPBELL. *Colliery Guardian* **145**, 1247–8 (1932).—Small quantities of salt present in coal corrode fire-brick and acid furnace linings. Basic linings are not corroded. Salty coal, if properly burned, will cause little effect on water-tube boilers. In pulverized coal salt tends to draw moisture, clogging pipes and burners. Cl-contg. coal must not be used in direct-firing processes for sulfate manuf., particularly for sulfates that are to be used in dyeing and calico printing. H. E. MESSMORE

**Coal hydrogenation.** IMPERIAL CHEM. INDUSTRIES, LTD. *Fuel* **10**, 481–4(1931).—A review. B. C. A.

**Softening of coal on heating.** H. A. J. PIETERS AND H. KOOPMANS. *Het Gas* **52**, 478–82(1932).—A new method for microscopic study of the softening and carbonization stages of coal is described with many series of photomicrographs. About 3 g. of coal, size 0.5–1 mm., is heated in a $CO_2$ stream for 45 min. to a certain temp. and held there until no more tar fog develops. The tube with the coal is rotated continuously, 30 revolutions per min., to prevent caking together of the grains. The reaction product is enclosed in resin, the surface ground, polished and observed. At a certain temp. the bituminous (lustrous) coal grains become rounded off, and large pieces fall apart; on raising of the temp. gas is evolved and thin-walled hollow spheres are formed; at still higher temp. several of these spheres flow together to give hollow conglomerates, and finally the walls become hard and porous. In coal particles which have visible plant residues in the homogeneous basic mass only the latter melts; they give coal spherules with internal division walls. Older, more carbonized coals, on melting, first become porous, then harden with gas evolution and finally soften; the older the coal the higher the m. p. Rapid heating will increase the fluidity and lower the temp. of its appearance. Sufficiently carbonized coal gives only gas evolution, no melting. By heating a well-coking coal to an oxidation temp. (from 150° up) for $^1/_2$ hr. in an air stream artifically oxidized coal was made and treated in the above manner. The higher the treatment temp. the more the softening point rises and the more the gas evolution is accelerated, *i. e.*, the more the character of old coal appears. The volatile products escaping from the coal sample during the $CO_2$ treatment could be used for detn. of the low-temp. tar yield and agree satisfactorily with the results by the Fischer Al retort method. B. J. C. VAN DER HOEVEN

**Continuous carbonization of finely crushed coal by radiant heat. II. Combustion characteristics of carbonized residue as pulverized fuel.** RALPH A. SHERMAN. Am. Gas Assoc., *Proc.* **13**, 1016–26(1931).—This report presents the results of an investigation to det. the relative combustion characteristics of the carbonized residues or semicokes in comparison with the coal from which they were produced in the carbonization tests described in Part I (Hobart, Demorest, *C. A.* **26**, 2035, 3645). The fuels used were powdered and burned in a furnace 18 ft. long by 3.5 ft. in diam. with a burner designed to promote max. turbulence. In general the semicokes burned less rapidly and suffered higher losses of unburned C than the coals from which they were made, but this C loss decreased with increasing distance of flame travel. With the given conditions of 10.5-ft. flame travel and a time of 0.3 sec. a given coal lost 0.7% unburned C while the corresponding semicoke lost from 1.3% to 3.0%. H. L. OLIN

**Methods for investigating the distillation properties of coals.** P. SCHLÄPFER *Assoc. intern. essai matériaux congr. Zurich* II, 389–403(1931).—Chem. compn. and structure of the original sample, preheating and manner of heating are important factors in carbonization. Test methods are cited and explained and their relative advantages are discussed. 34 literature references. KARL KAMMERMEYER

**Deterioration of coal for firing cement on drying and grinding.** KATSUZO KOYANAGI AND TAKASHI ARAI. *J. Japan. Ceram Assoc.* **40**, 234–41(1932).—An exhaustive study was made. The calorific power was detd. by a Berthelot-Mahler bomb calorimeter. Conclusions: (1) Thompson's calorimeter is unsuitable for detg. such small changes in calorific power of coal. (2) There is practically no loss in the calorific power of slack coal during drying and grinding, unless the coal is heated at a temp. like 150° which is far higher than is necessary for driving off the mechanically held water. S. K.

**Tendency of coal to spontaneous combustion. X.** D. J. W. KREULEN. *Chem. Weekblad* **30**, 103–8(1933); cf. *C. A.* **27**, 827.—A wire model shows the relation between the humic acid curves and the percentage of volatile matter. To obtain a good coke the humic nucleus must not be too little and not too far carbonized. The most probable relation between the degree of carbonization of the humic nucleus and that of the bitumen is worked out in a plaster model. With the aid of the factor *A B C* predictions can be made regarding the coking qualities of a coal. *A* is humic acid formed at 240° and *B* humic acid formed at the max. temp. *C*. The analyses of 34 samples of coal are given. E. SCHOTTE

**The tendency of coal to spontaneous combustion.** B. P. PENTEGOV AND R. N. NYANKOVSKAYA. *Khim. Tverdogo Topliva* **2**, No. 11–12, 3–12(1931).—The relative temp. of the spontaneous combustion as well as fluctuations of temp. depends upon the decrease in the adsorption ability of the coal, its oxidizability and its content of humic acids. The activity and the spontaneous combustion ability depend upon its high adsorption properties. The former depends also upon the oxidizability and the content of humic acids. A lowering of the content of humic acids as well as an increase in the relative spontaneous combustion temp. of coal is observed when a coal contg. over 18% of $O_2$ in the combustible mass is oxidized. As a rule the adsorption and oxidation abilities of coal are lowered with the progress of oxidation. A great variety of Russian coals is investigated and the results are tabulated. The expts. were carried out in an app. constructed by the authors. A. A. BOEHTLINGK

**Development of Dakota lignite. VIII. Oil-steam atmosphere for dehydrating Dakota lignite.** A. M. COOLEY, JR., AND IRVIN LAVINE. *Ind. Eng. Chem.* **25**, 221–4 (1933); cf. *C. A.* **26**, 5400.—Many expts. were carried out with different brands of motor oil, fuel oil, kerosene, linseed oil or emulsified asphalts with steam in dehydrating Dakota lignite. Modifications in the app. and procedure used (*C. A.* **25**, 578) are described and tables of exptl. data given. Some improvements were observed with certain motor oils, but the best results were obtained with a mixt. of 9.25 lb. asphalt plus 50% of its wt. of hot water and 60 lb. of lignite; this was dried from 35.2% to 18% moisture content with a min. of checking in 80% of the charge. Lumps under 3 in. in diam. dried better than larger pieces. The nature and quantity of the oil influenced markedly the character of the dried fuel. Results of drop, slacking, and stove burning tests showed the superiority of the steam-oil drying over dehydrating lignite with steam alone. The crit. oxidation temp. of the asphalt-steam-dried Velva lignite was 190°, which is very little lower than that of the nonprocessed lignite of the same moisture content; hence the addn. of oil did not increase materially the tendency of the coal toward spontaneous combustion. W. W. HODGE

**Hydrogenation of lignite.** J. M. PERTIERRA. *Anales soc. espan. fis. quim.* **31**, 53–8(1933).—Spanish lignite was hydrogenated by the Bergius method, and the effects

of variations of temp. and time of heating were detd. The yields were 40.4–53.2%.
E. M. SYMMES

**Calorific values of some Indian woods.** S. KRISHNA AND S. RAMASWAMI. *Forest Bull.* (India), No. 79, 1–27(1932).—K. and R. give the calorific values of 150 Indian woods (calcd. on the ash- and moisture-free basis). Detns. were made on wood powder passing a 100-mesh screen, in a Parr standard calorimeter. Whenever feasible, the heat values of heartwood and sapwood of a species were used in sep. detns. In general, especially in woods contg. resins, gums and tannins, the heat value of the heartwood was the higher. In 9 species, the sapwood showed a somewhat higher (unexplained) calorific value. Vacuum drying (as with *Cedrus deodara*) or extn. with org. solvents (as with *Tectona grandis*) markedly lowered the heat values of the heartwood. Marked differences, while infrequent, may occur within the same species (*e. g.*, *Pinus longifolia* samples varied from 4967 cals. for an individual sapwood to 6125 cals. in one sample of "torchwood," the latter being the highest value recorded in any species). The av. heat value for all Indian woods is 5016 cals. (9030 B. t. u.). For conifers, the av. value is 5120 cals. (9215 B. t. u.). Ash detns., made on all samples, showed variations from 0.25 to 11.0%.
LOUIS E. WISE

**Precautions needed in thermal calculations for cement rotary kilns and waste-heat boilers.** EIJI TAKAHASHI. *J. Japan. Ceram. Assoc.* 40, 285–90(1932).—Thermal studies of cement rotary kilns and waste-heat boilers based on gas analyses sometimes lead to erroneous conclusions. The chief cause lies probably in the difficulties in getting fair samples and correct temps. for the gases in question. Three examples are given.
S. KONDO

**Modern gas-heated equipment for industrial drying processes.** W. HIND. *Gas J.* 201, 47–51(1933).— See *C. A.* 27, 587.
P. J. WILSON, JR.

**Gas generators in glass plants.** A. TORLÉR. *Glashütte* 62, 786–9(1932).—Important for proper operation of generators are: (1) generator resistance, (2) generator charge, (3) steam addn., (4) gas temp., (5) gas pressure, (6) gas compn.
M. V. K.

**The production of water gas in coke ovens.** GERHARD LORENZEN. *Stahl u. Eisen* 53, 33–40(1933).—The advantages of producing water gas in coke ovens are the possibility of producing a gas rich in H, an increase in the yield of the gas and regulation of its heating value. The installation of steam pipes in new coke ovens is simple. To permit the manuf. of water gas in existing coke ovens 3 different systems are in use. Collin connects 2 adjoining chambers by a pipe so that the steam is introduced in one of the chambers and the water gas is drawn off from the other chamber. According to the Vereinigte Stahlwerke A.-G. the steam is introduced through pipes perforated at the bottom reaching into the coking material. C. Otto & Co. blows in steam by means of nozzles through the charging doors in the direction away from the ascension pipe. This last method permits the carburetion of the gas to meet the demand of peak loads, by blowing in tar oils together with the steam.
J. A. SZILARD

**Condensation of olefins from coke-oven and cracked petroleum gases.** A. D. PETROV. *Khim. Tverdogo Topliva* 2, No. 11–12, 108–20(1931).— A bibliography with 22 Russian and foreign references. The article deals with the prepn. of synthetic fuels and lubricants.
A. A. BOEHTLINGK

**Experiments on the pyrolysis of gaseous paraffins, with special reference to the production of ethylene.** ADRIEN CAMBRON. *Can. J. Research* 7, 646–61(1932).—On passing natural gas, contg. 4.8% ethane, through an electrically heated W spiral, the formation of liquid products was observed at 1050°. On passing the same gas over an electrically heated 4 mm. C rod enclosed in an uninsulated silica tube 2.0 cm. wide, 7.7% of the gas was converted to liquid and solid hydrocarbons at a rod temp. of 1050–1100°. No liquids or solids except C were formed when the silica tube was insulated. By replacing the 2.0 cm. silica tube by a water-cooled Pyrex tube, 3.2 cm. wide, no liquid or solid hydrocarbons were obtained, but 17% of the gas was converted to gaseous, unsatd. hydrocarbons at 993°. On passing ethane through the 3.2 cm. water-cooled reaction tube at a rod temp. of 989°, 50.5% of the entering gas was converted to $C_2H_4$, and 90.0% of the $C_2H_6$ decompd. did so according to the equation $C_2H_4 \longrightarrow C_2H_4 + H_2$. The dehydrogenation of $C_2H_4$ was greatly accelerated by the presence of reduced Cu in the tube, the metal being used in the form of a cylindrical wire gauze and placed around the C rod. Cu bronze coated with $MoO_3$ was also found to be active under the same conditions. The results conformed in general to those expected from the Nernst-Langmuir equil. Propane and butane when pyrolyzed in contact with a glowing C rod decompd. largely into olefins.
J. W. SHIPLEY

**Purification of anthracene with simultaneous separation of highly concentrated carbazole.** G. T. PILYUGIN. *J. Applied Chem.* (U. S. S. R.) 5, 1059–65(1932).—

Anthracene cannot be refined sufficiently by means of crude pyridine bases. The use of the fraction b. 160–70° gives a yield of at least 82–5% anthracene with simultaneous sepn. of highly concd. carbazole. Best results are obtained at low temps. of extn. Com. possibilities for the process are emphasized. V. KALICHEVSKY

**The action of catalysts in the high-pressure hydrogenation of phenols and hydrocarbons.** HANS TROPSCH AND OTTO WEINSTEIN. *Mitt. Kohlenforschungsinst. Prag.* No. **4**, 171–97(1932).—In continuation of earlier work (*C. A.* **25**, 396) it was found that in the catalytic reduction and hydrogenation of cresols under pressure, $WS_2$ was far superior to $WO_3$ as a catalyst. With $MoO_3$, $MoS_2$ and CoS the optimum temp. range was 330–400°. The residue, particularly at the lower temps., contained no alkali-sol. acid products. In the hydrogenation of gas oils the sulfides of Mo and W showed good catalytic properties; NiS had only moderate catalytic properties and $MoO_3$ and ZnS had none. In similar treatment of solid paraffins $MoS_2$ gave promising results. H. L. OLIN

**Extractions of phenols from phenolic oils.** JÓZEF DANKOWSKI *Przemysl Chem* **16**, 151–5(1932).—Phenols are extd. from phenolic oils with 10–15% aq. NaOH. The $NaOC_6H_5$ formed is often contaminated by dissolved oil, free $C_6H_5OH$ and cresol. A series of detns. is given to show the conditions under which extn. is most complete and contamination least. No contamination is noticed when aq. NaOH is used in excess FELIX P. LEE

**The phenols crystallizable from lignite tar.** FERDINAND SCHULZ AND JEAN PRUNET *Collection Czechoslov. Chem. Communications* **4**, 531–7(1932).— The authors attempted to isolate and identify higher phenols as well as pyrocatechol from the tar from low temp. distn. of lignite. Oil from a tar distillery at Teplice was redistd. and the 200–300° fraction was extd. with distd. water slightly acidified with AcOH; then the aq. ext. was treated with Pb acetate. The yield of pyrocatechol was 0.9% of the oil treated. The unknown recrystd. phenols (about 3%) gave the color reactions of pyrocatechol and its homologs: emerald green with Fe chloride, blue with ferric oxalate, red with $NH_4$ molybdate, voluminous ppt. with Pb acetate and with ammoniacal $CaCl_2$. For fractional crystn. no solvent was satisfactory, but water, ethyl acetate, ether, benzene, MeOH and methylcyclohexane were used. Several fractions were obtained which melted about 62° and these were tested for purity. They were subjected to distn. at 740 mm. pressure. Analysis of the intermediate fraction of the distillate, b. 254–7° at 740 mm., m. 59–59.5°, failed to give data corresponding to a definite compd. but indicated a mixt. of dihydroxybenzene with homologs. ANNE E. WHITE

**The composition of peat gas-producer and low-temperature carbonization tars.** V. E. RAKOVSKII AND P. M. IOFFE. *Khim. Tverdogo Topliva* **2**, No. 11–12, 93–107 (1931).—Distn. procedures for both tars, their chem. properties and the properties of products obtained are given. A spontaneous combustion of the gas-producer tar which formed 2 layers, because of the presence of a high percentage of carboxylic acids and pyridine bases, is described. The layers, namely the "asphaltene" and the "paraffin" layers, are distinguished by their chem. compn. The low-temp. tar has no spontaneous combustion properties. The "asphaltene" layer contains 80% of acidic substances which are sol. in NaOH. This layer can only be distd. under a high vacuum. A. A. BOEHTLINGK

**Modern trends in the British by-product coking industry.** G. E. FOXWELL *Chemistry and Industry* **52**, 49–51(1933); cf. *C. A.* **27**, 182. E. H

**The removal of sulfur from metallurgical coke. II. Chlorination of coke burned with the addition of inorganic substances.** E. V. BRITZKE, I. V. SHMANENKOV AND A. N. BLAZHENKOVA. *J. Chem. Ind.* (Moscow) No. **10**, 50–3(1932); cf. *C. A.* **26**, 3651.—Coal is mixed with amts. of $Na_2CO_3$, $CaCO_3$, $MgCO_3$ and Fe ore equiv. to the amt. of S present and coked at 1100°. $MgCO_3$ lowers the S content slightly in this step, but the others have no effect. The coke is then chlorinated as previously described at 700°. That which contains $Na_2CO_3$ loses the most S and that which contains $MgCO_3$ loses the least. H. M. LEICESTER

**Liquid fuels.** TCHÉDOMIR VELITCHKOVITCH. Fr. 731,941, Apr. 22, 1931. Animal-flesh waste is added to gasoline to increase the calorific power. The waste may be dissolved in a heavy oil, and sepd. again from the oil by adding EtOH, acetone, ether, benzene, etc., and distg. off all but the oil.

**Motor fuel from crude light oil obtained from coal.** FRED W. WAGNER and FOREST L. MCINTIRE. U. S. 1,886,612, Nov. 8. The light oil is washed with about 0.4% by vol. of 66° Bé. $H_2SO_4$, sludge is removed, the oil is neutralized, treated with the equiv. of about 0.4% by vol. of NaOH soln. contg. 140 g. per l. and distd. under reduced pressure while its temp. is maintained below the decompn. temp. of gum-forming constituents and S-contg. hydrocarbons.

**Fuel for internal-combustion engines.** NILS H. GULLANDER (to the firm C. & S. Clementson). U. S. 1,889,474, Nov. 29. An otherwise usual fuel is treated with about 0.25% of a mixt. formed from lubricating oil 30, hydrogenated naphthalene 35–40 and hydrogenated phenol 25–30 parts, in order to lubricate valves and upper piston rings, etc.

**Fuels for internal-combustion engines.** JEAN F. P. DE LA RIBOISIÈRE. Brit. 362,673, Dec. 11, 1930. See Fr. 710,402 (*C. A.* **26**, 1769).

**High temperatures by combustion of liquid, gaseous or pulverulent fuel.** DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM. ROESSLER. Brit. 358,507, July 8, 1929. A furnace is described in which a combustible mixt., prepd. in the combustion chamber itself, is passed through the combustion chamber in layers, bands or strips of small thickness, at least 20 sq. decimeters of contact surface being provided per l. of combustion chamber vol. A slightly superatm. pressure is maintained, and the gases do not remain in the combustion chamber longer than about 0.03 sec. The contact surface may be formed of or coated with electron-emitting materials such as the oxides of Th, Mg, Ca, Zr, Ba and Be. Cf. *C. A.* **27**, 1140.

**Solid fuels.** ALOIS J. HANKE. Fr. 736,723, Sept. 2, 1931. Fuels such as lignite are dried and improved by bringing them into direct contact with the distn. products from mineral oils, used in the liquid or vapor state. Heat under reduced pressure may be applied.

**Fuel briquets.** TRENT PROCESS CORP. Brit. 357,423, Nov. 26, 1929. Powd. coal is "amalgamated" with a light oil such as naphtha, kerosene or benzene, the "amalgam" is distd. to leave hot dry coal dust, which is then mixed with fuel oil, so that the oil is distd. and an oil residue remains as a binder, the material then being briquetted and carbonized. Various details of operation are described. Cf. *C. A.* **26**, 2038.

**Heat treatment of fuel briquets.** W. W. WHITE and H. D. PONTET. Brit. 359,476, July 23, 1930. Various details of app. and operation are described involving the placement of briquets upon a tray which is run into an oven or chamber where heating is effected mainly by radiation from the hot walls of the oven or chamber. Cf. *C. A.* **27**, 1140.

**Gasification of fuels.** FRANK C. GREENE. Ger. 559,454, Oct. 24, 1929. See Brit. 347,575(*C. A.* **27**, 1146).

**Gasification of carbonaceous fuels in situ.** HENRIK HEINRICH and BÉLA FORGÁCS. Hung. 104,289, March 26, 1930. Tunnels are filled with refractory rocks and air is led to the solid fuel layers by means of such tunnels. The gases formed are led away by similar channels.

**Combustible mixture containing magnesium stearate and alcohol.** ALBERT A. EPSTEIN (to Consolidated Patentees Corp.). U. S. 1,888,820, Nov. 22. A pasty mixt. suitable for use as a fuel comprises Mg stearate 1 and alc. 2 parts with a flame-modifying ingredient such as other combustible materials.

**Agglomerating and coking fuel.** H. HARDY. Brit. 357,330, Feb. 8, 1930. The process described in Brit. 356,236 (*C. A.* **26**, 3632) for heating coal or mixts. of coal and coke or the like to produce globular particles is modified by compressing the globular coal while still warm as it issues from the oven. App. and various details of operation are described for production of semi-coke or other products of desired characteristics.

**Fire lighters.** FERDINAND BLANKE. Ger. 567,326, Mar. 12, 1929. Peaty soil 30 and paraffin wax 16 parts are mixed in the warm, and a mixture of equal parts of sawdust and fibrous material such as peat is then added, together with sufficient crude brown coal to thicken the mixt., which is finally cooled and molded by pressure.

**Hydrogenation of carbon or carbonaceous material.** N. V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Dutch 26,313, Nov. 15, 1932. The Lux mass catalyzer for pressure hydrogenation is mixed with Mo compds. Cf. *C. A.* **26**, 2040.

**Hydrogenating coal, etc.** I. G. FARBENIND. A.-G. Fr. 736,863, May 9, 1932. Coal, etc., is freed from ash-forming substances before hydrogenation and agglutination, and swelling during hydrogenation is prevented by adding thinning agents such as poor coal or active charcoal or by removing the substance which causes agglutination or swelling. The treated coal may be impregnated with a soln. of a metal salt having a catalytic action.

**Apparatus for hydrogenating coal or heavy oils.** JOHANNES MARUHN and LUDWIG TÜBBEN. Ger. 564,677, Mar. 23, 1932. Addn. to 562,629 (*C. A.* **27**, 876).

**Introducing semi-liquid materials into high-pressure vessels as in destructive hydrogenation.** HERBERT A. HUMPHREY (to Imperial Chemical Industries, Ltd.). U. S. 1,888,953, Nov. 22. Semi-liquid material such as coal and oil is run into an auxiliary high-pressure reservoir, into which liquid such as oil under a pressure of at least about 100 atm. is forced from a liquid storage tank, the semi-liquid material is injected into the high-pressure vessel, and when the auxiliary reservoir is empty of semi-liquid material, the displacing liquid is run back, by a different path, to the storage tank. App. is described.

**Destructive hydrogenation.** PHILIP J. ASKEY, RONALD HOLROYD, CHARLES COCKRAM and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 363,445, Oct. 11, 1930. See Fr. 723,862 (*C. A.* **26**, 4939).

**Destructive hydrogenation of carbonaceous materials.** N. V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 362,354, Aug. 25, 1930. Coal, lignite, cellulose, petroleum oils, tars, etc., are treated at elevated temps. and pressures in the presence of H or gases contg. or yielding free H and in the presence of catalysts contg. Re or compds. thereof brought in colloidal form onto suitable carriers together with other metals or their compds. brought in known manner in colloidal form onto suitable carriers.

**Destructive hydrogenation of coal.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,040, Oct. 16, 1930. Caking or non-caking coals, mixed with caking carbonaceous materials, *e. g.*, bitumen or pitch, are heated rapidly in finely divided state at substantially atm. pressure to temps. at which the particles are distended by evolution of volatile substances. The particles are then treated with H under pressure in the absence of a liquid vehicle. Substances evolving gases when heated, *e. g.*, $NH_4HCO_3$, may be added to the original mixt. when non-caking coals are used.

**Destructive hydrogenation of coals.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,105, Nov. 26, 1930. Comminuted coal to be destructively hydrogenated without the addn. of liquids is mixed with residues, *e. g.*, coke or ashes, obtained in the destructive hydrogenation, extn. under pressure, low- or high-temp. carbonization or gasification of solid carbonaceous [illegible]rials in such amt. that [illegible] of the coal is prevented. Preferably 10–30% of residues is added and the coal is hydrogenated in layers not exceeding 5 cm. in depth.

**Distillation of solid carbonaceous materials with superheated steam.** H. NIELSEN and B. LAING. Brit. 357,975, June 28, 1930. In effecting distn. of solid carbonaceous material by contact with superheated steam, the latent heat of the steam is recovered from the mixt. of steam and distillates by injecting the effluent liquor obtained from

the process into the mixt. and passing it through evaporators which use the heat from the spent distg. medium. App. is described.

**Distilling coal or similar materials.** E. KROPIWNICKI. Brit. 359,818, Jan. 14, 1931. The material is distd. during its upward passage through externally heated retorts and the coke formed is passed into shafts where it is used for water-gas generation and the water gas mixes with the distillates. Various details of app. and operation are described.

**Apparatus for distilling coal, schists, peat, wood, etc.** SAMUEL MOORE. Fr. 736,459, Apr. 30, 1932.

**Distilling carbonizable materials such as coal, lignite, peat or wood.** HARALD NIELSEN. U. S. 1,886,350, Nov. 1. The raw material to be distd. is passed continuously through a retort (of a described app.) to which a controlled vol. of a non-oxidizing gas such as producer gas is admitted at a temp. of about 1200° and passed countercurrent to the material treated so that the sensible heat of the heating gas is used to expel, at low temp., vapors of oil-yielding constituents which are carried into cooler zones, and also to expel, at higher temp., gaseous hydrocarbon products, leaving a coke contg. 1.5–2.0% of volatile matter.

**Retorts for destructive distillation of carbonaceous materials.** I. G. FARBENIND. A.-G. Brit. 359,507, May 19, 1930. Primary tar is obtained by the destructive distn. of brown coal, wood, peat or the like in iron retorts coated internally with Zn, Sn or Pb The retort may be of the rotary type with a plurality of tubes extending through it.

**Plant and process for low-temperature distillation of coal, cannel coal and like fuels.** HENRI STEVEN. Brit. 362,581, Oct. 6, 1930. See Fr. 703,293 (*C. A.* **25**, 4387).

**Coal.** ÉMILE MAUBEUGE. Fr. 737,151, May 2, 1932. Coal is mixed with a powder contg. equal parts of $K_2CO_3$ and $KNO_3$, whereby an economy of coal is effected.

**Utilizing coal deposits.** ALBERTH HIORTH. Norw. 49,960, Dec. 28, 1931. The coal is burned incompletely *in situ* and the gases are conducted from the mine and burned completely to produce heat for the evapn. of sea water which first has been concd. by freezing.

**Carbonizing coal.** TRENT PROCESS CORP. Brit. 357,425, Nov. 26, 1929. Hot carbonized coal is added to raw pulverized coal to retard agglomeration of the coking coal, and the mixt. is heated to a carbonizing temp. and then cooled with water, the steam, from which is passed through the charge. App. and various details of operation are described.

**Carbonization of coal.** PIERRE EUGÈNE HENRI FORSANS. Fr. 736,302, Aug. 21, 1931. Fine coal is carbonized at a low temp. (400–700°) to produce a hard semi-coke, by using the heat from a hot coke previously made. Fr. 736,303 describes the construction of a coke-oven door. Fr. 736,306, Aug. 22, 1931. Means is described for drying, preheating and carbonizing. Fr. 736,307. Means is described for suppressing smoke and recovering gases liberated during the charging of coke ovens.

**Vertical carbonizing retorts.** WOODALL-DUCKHAM (1920), LTD., and A. M. DUCKHAM. Brit. 357,146, June 16, 1930. An intermittent 2-stage vertical carbonizing retort is divided into 2 or more superposed portions the upper of which forms a coal-carbonizing zone and is externally heated while the lower portion or portions form a zone in which water gas is formed and the coke partially cooled. Various structural and operative details are described.

**Continuous carbonization and distillation furnace.** M. LAMBOT. Belg. 387,601, May 31, 1932. At least one retort is placed in a heating chamber connected directly with the combustion chamber; the retorts are designed so that the fuel is treated continuously in thin layers.

**Apparatus for low-temperature carbonization of coal.** C. FRANÇOIS. Belg. 387,850 and 387,851, May 31, 1932. Structural features.

**Retorts for low-temperature carbonization.** INTERNATIONAL HOLDING DE DISTILLATION ET DE COKÉFACTION À BASSE TEMPÉRATURE ET MINIÈRE (HOLCOBAMI) (SOC. ANON.). Belg. 387,309, April 30, 1932. Various features are provided for the utilization of the gases for cooling and heating.

**Discharging low-temperature carbonization retorts having movable bottoms.** INTERNATIONAL HOLDING DE DISTILLATION ET COKÉFACTION A BASSE TEMPERATURE ET MINIÈRE (HOLCOBAMI) (to Intertrust compagnie générale de distillation et cokéfaction a basse température et minière, Soc. anon.). Brit. 358,385, Jan. 24, 1930. Mech. features.

**Apparatus for charging fuel-briquet carbonizing retorts.** CORBAN MINTNER (to St. Louis & O'Fallon Coal Co.). U. S. 1,887,034, Nov. 8. Mech. features.

**Briquetting coal, etc.** JOHN ROGERS. Brit. 362,570, Sept. 29, 1930. In briquet-

ting coal, etc., a froth produced by causing molten bituminous material and water to issue from sep. nozzles, either concentric or at angles to each other, so that the jets intermingle, is incorporated with the coal.

**Binder for coal briquets.** JOHN A. ERICKSON (to Viking Mfg. Co.). U. S. 1,887,183, Nov. 8. Fuel fines are moistened with a soln. of a hygroscopic salt such as $CaCl_2$, and sufficient hydraulic cement is added to serve as a binder (the soln. being applied in sufficient quantity to hydrolyze the cement and in salt concn. merely sufficient to accelerate the setting of the cement binder).

**Apparatus for continuous production and drying of briquets such as those of coal dust.** NILS FLODIN and GASTON CORNELIUS. U. S. 1,887,149, Nov. 8. Structural and mech. features.

**Treating coal or coke with oil.** FRANK C. BROEMAN. U. S. 1,886,632, Nov. 8. A light mineral oil of about "32 gravity" and having a flash point of about 175° is atomized onto agitated coal or coke so as to deposit a film on the pieces amounting to about 1 gal. of oil per ton of material, which serves to suppress dust. U. S. 1,886,633 relates to a similar product.

**Coal products.** HAROLD J. ROSE and WM. H. HILL (to The Koppers Co.). Brit. 362,934, Sept. 5, 1930. See U. S. 1,875,502 (*C. A.* **27**, 187).

**Extracting soluble products from coal.** I. G. FARBENIND. A.-G. (Josef Jannek and Otto Göhre, inventors). Ger. 567,330, Mar. 19, 1927. Brown coal or like bituminous coal is heated under pressure in the absence of a solvent and then treated with a solvent at a raised temp. and pressure. The conditions during the preliminary heating should be such that caking is avoided. The treatment of brown coal of high water content is excluded.

**Apparatus and method for compressing the charge of coal in chamber ovens.** CARL STILL (trading as Firma Carl Still). Brit. 362,783, Feb. 28, 1931.

**Apparatus [with matrices of desired size and shape carried by an endless chain] for heating coal to produce agglomerate pieces.** ARMAND CHABOT U. S. 1,887,834, Nov. 15. Structural and mech features.

**Inclined multitubular furnace for hydrogenating comminuted carbonaceous materials under pressure.** I. G. FARBENIND. A.-G. (Eduard Linckh, inventor). Ger 565,410, Jan. 27, 1929. Addn. to 562,495 (*C. A.* **27**, 829).

**Combustion regulation in furnaces.** JUNKERS-THERMO-TECHNIK GES. and C. A. HARTUNG. Brit. 358,578, July 11, 1930. Excess or deficiency of air for combustion in furnaces is instantaneously indicated by measuring the temp. in the flue or in the combustion chamber where combustion is complete and additionally influencing the temp. measuring instrument in accord with the speed of combustion, supply of fuel or flow of gases through the furnace. Various details of elec. app., etc., are described.

**Fuel from peat or the like.** DAVID W. BERLIN. U. S. 1,887,671, Nov. 15. After heating to effect wet carbonization, a large proportion of water is removed by centrifuging in an app. having drum walls impervious to water, and the material is then further centrifuged in an app. having water-pervious drum walls, and is further heated. App is described.

**Apparatus for cooling dried brown coal.** MASCHINENFABRIK BUCKAU R. WOLF A.-G. Ger. 567,172, Apr. 14, 1929.

**Gas production from light hydrocarbons.** ROSSWELL W. THOMAS (to Phillips Petroleum Co.). U. S. 1,889,161, Nov. 29. Pumped streams of gas such as air and of liquefied normally gaseous hydrocarbon material such as butane are supplied by app. such that the flow of one stream serves to vary the pumping of the other; the streams are directly contacted in such manner that the hydrocarbon fluid in vaporizing serves to dehydrate and refrigerate the gas stream, moisture is sepd. from the combined streams (suitably by freezing out) and the combined material is discharged for use. App. is described. U. S. 1,889,162 (ROSSWELL W. THOMAS and GEORGE G. OBERFELL, to Phillips Petroleum Co.) relates to a similar process involving dehydration of air and admixt. with vaporized hydrocarbon material for production of a combustible mixt., and also describes app.

**Gas from liquid or powdered fuels.** JOHN HANSFORD (to H. H. Gas Plant Syndicate, Ltd.). U. S. 1,888,123, Nov. 15. Liquid or powd. fuel is injected together with air into a partial combustion or gasifying chamber where it is subjected, in the presence of finely divided metallic iron, to partial combustion through the action of a rotary flame at 700–900°, the temp. at the center of the combustion zone being considerably higher and the proportion of air and fuel such as oil being such that a residue of magnetic oxide is formed. App. is described.

**Carbureting apparatus for making "air gas" from "petrol" or the like.** W. G.

HARROLD. Brit. 357,846, Nov. 14, 1930. Various structural, mech. and operative details are described.

**Carbureted air gas.** CARL O. WANNACK (to S. H. G. Inc.). U. S. 1,888,059, Nov. 15. Various details of app. and operation are described.

**Producer gas from anthracite coal.** TRENT PROCESS CORP. Brit. 357,424, Nov. 26, 1929. Before supplying the charge to the gas-making zone, it is heated to effect substantially complete devolatilization (the need of scrubbing or cleaning the gas being thus avoided). A water-gas generator or other suitable heating app. may be used.

**Carbureter construction and operation for enriching gases such as producer or water gas with oil.** HORACE T. DYER. U. S. 1,888,074, Nov. 15.

**Filter for house gas, etc.** WOODS S. WALKER (to Consolidated Gas Co. of N. Y.). U. S. 1,888,150, Nov. 15. Structural details.

**Washing flue gases.** G. H. C. CORNER and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 358,101, July 4, 1930. In washing flue gases for removal of dust and $SO_2$, by passage of the gas over films of water flowing down plates or tubes, the velocity of the gas is 12 ft. per sec. or less. Various details of app. and operation are described. Brit. 358,102–3 also relate to details of app. for washing flue gases.

**Gas-washing process.** HEINRICH KOPPERS A.-G. and KOPPERS COKE OVEN CO., LTD. Brit. 357,801, Oct. 9, 1930. The process described in Brit. 336,484 (*C. A.* 25, 1975), of finally cooling coal gas or the like by circulating cooling water, in which the water before being recooled is washed with tar to remove naphthalene from the water, is modified by the substitution for tar of an oil insol. in water and serving as a solvent for naphthalene. Tar oils or paraffin oil may be used.

**Washing flue gases.** G. H. C. CORNER and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 358,487, July 7, 1930. An app. is described in which water used for washing flue gases is treated for removal of part of the pptd. dust, further treated for removal or neutralization of impurities such as $SO_2$, and then recirculated. Cf. *C. A.* **27**, 1144.

**Removing sulfur dioxide from flue gases.** BRAUNSCHWEIGISCHE KOHLEN-BERGWERKE. Ger. 567,135, Mar 14 1931. The gases are brought into contact with cooled metallic tubes, whereby $SO_2$ is dissolved in the condensed water vapor and neutralized by the layer of alk. flue ash deposited on the tubes.

**Gas generator with a rotary grate and combined stepped ashpan containing water.** M. ORB. Brit. 357,768, Sept. 20. 1930. Various structural and mech. details are described.

**Gas producer.** JACQUES G. SCHULZ. Fr. 735,961, Apr. 26, 1932.

**Twin gas producer with a thermostatically controlled oxygen supply.** M. FRANKL (to Soc. oxythermique). Brit. 357,853, Dec. 2, 1929. Various structural and operative details are described.

**Method of operating slagging gas producers.** LOUIS CHAVANNE. Ger. 567,082, June 1, 1924. Conditions are adjusted so that (1) the fusion zone extends above the tuyères for about one-eighth of the height of the fuel column, and (2) the gas leaves the top of the fuel column at a temp. not above 350°.

**Stirrer for gas producer.** THEODOR DE FONTAINE, JR. Ger. 567,293, Mar. 25, 1930.

**Gas-producer grate.** C. WHITFIELD. Brit. 359,336, Jan. 27, 1931.

**Ash-discharge device for gas producer.** ARTHUR O. HUBER. Ger. 567,376, June 19, 1931.

**Scraper for cleaning tuben of a gas producer.** S. D. ASOKIN. Russ. 26,762, Apr. 3, 1931.

**System for making water gas.** JENS RUDE. Ger. 567,375, Apr. 22, 1931. Means is described for utilizing the blow gases from a water-gas producer assocd. with a pulverulent-fuel gasifier.

**Water-gas producers.** BAMAG-MEGUIN A.-G. Fr. 736,621, May 4, 1932.

**Water-gas producers.** HUMPHREYS & GLASGOW, LTD. Fr. 736,943, May 11, 1932.

**Valve-operating system for water-gas generating plants.** T. W. STONE (to Western Gas Construction Co.) Brit. 357,001, Feb. 14, 1930. Mech. features.

**Automatic valve-control system for water-gas generators.** J. PINTSCH A.-G. Brit. 359,100, Aug. 22, 1929. Various mechanical and operative details are described.

**Control device for gravity-lift gears for waterless gas holders.** WM. WADSWORTH & SONS, LTD., and FRANK EATOCK RYDER. Brit. 362,553, Sept. 23, 1930.

**Sealing fluids for gas holders of the disk closure type.** F. W. SPERR, JR., and K. E. E. LAUE (to Koppers Co.). Brit. 359,053, Oct. 2, 1929. A viscous soln. is used which has a low f. p. and is stable at low temps such as a soln. contg. $CaCl_2$ and Mg-

$(NO_3)_2$, Na thiocyanate and thiosulfate, Na thiocyanate and $Ca(NO_3)_2$, waste sulfite cellulose liquors or products from them. Sugar, glycerol, formaldehyde, $Na_2Cr_2O_7$, NaCl, lime, etc., also may be added.

**Desulfurization plant for purifying gas.** MAX KLÖNNE and MONTZ KLÖNNE (trading as the firm Aug. Klönne). Brit. 362,805, Mar. 19, 1931. See Ger. 534,938 (*C. A.* **26**, 1100) and Fr. 713,668 (*C. A.* **26**, 1480).

**Removing nitrogen oxides from gas mixtures such as coke-oven gas.** FRANKLIN A. BENT (to Shell Development Co.). U. S. 1,888,547, Nov. 22. See Can. 323,540 (*C. A.* **26**, 4424).

**Removing naphthalene from coal gas.** F. J. COLLIN A.-G. (to Gas Chambers & Coke Ovens, Ltd.). Brit. 357,847, Nov. 15, 1930. For sepg. $C_{10}H_8$ prior to $C_6H_6$ recovery, the hot gas is treated with a solvent and then cooled by contact with water to deposit the $C_{10}H_8$-laden solvent. App. is described.

**System for rectifying crude benzene.** SOC. DES ÉTABLISSEMENTS BARBET. Ger 567,334, Dec. 5, 1925. See Brit. 244,130 (*C. A.* **21**, 315).

**Tar distillation.** STUART P. MILLER (to Barrett Co.). U. S. 1,888,235, Nov. 22. Hot coke-oven gases are passed through successive sprays of coal tar immediately after the gases leave the ovens, to effect distn. of the tar, the first spray being subjected to the max. temp. of the gases and each of the succeeding sprays being subjected to gases of progressively decreasing temp., and the residue from the distn. of each of the sep. tar sprays is separately collected. An arrangement of app. is described. U. S. 1,888,236 relates to a process in which tar is sprayed into hot gases which have just come from a coke oven, to distil the tar and produce pitch, the gases being thereafter subjected to intimate contact with tar in vol. sufficient to effect substantial cooling of the gases with only a limited distn. of the tar, after which the gases and vapors which they carry are further cooled to recover condensable constituents. App. is described. Cf. *C. A.* **27**, 1142.

**Creosoting compositions.** STUART P. MILLER (to Barrett Co.). U. S. 1,886,967, Nov. 8. For producing tarry oils yielding not more than 5% distillate on distn. up to 210° in the by-product recovery system of a coal-distn. plant, the coal-distn. gases are cooled to a temp. not lower than 200° and at this temp. are passed through an elec. pptn. app. in which only partial sepn. of suspended matter is effected, and the gases are subsequently cooled to sep. a tarry oil from them of the desired specified character. App. is described.

**Coke.** G. HILGER. Brit. 353,139, May 16, 1930. See Fr. 39,841 (*C. A.* **27**, 832).

**Mineral coke.** METALLGESELLSCHAFT A.-G. Brit. 362,796, Mar. 9, 1931. See Fr. 712,480 (*C. A.* **26**, 2042).

**Coke from mixed tar and coal.** S. P. MILLER (to Barrett Co.). Brit. 358,233, Sept. 13, 1929. Independently regulated amts. of tar and coal are introduced separately and simultaneously into a coke oven, various details of construction and operation of which are described. The tar may comprise 2–4% (or in some cases up to 10%) of the charge.

**Coking apparatus.** FRANZ PUENING. Brit. 362,522, Sept. 10, 1930.

**Coke oven.** EVENCE COPPÉE & CIE. Belg. 388,196, May 31, 1932. Structural features.

**Coke oven.** G. P. PANIOTOV and V. G. SAMOPALOV. Russ. 26,690, Oct. 1, 1930.

**Coke ovens.** SOC. ANON. DE CARBONISATION ET DE DISTILLATION DES COMBUSTIBLES. Fr. 736,762, May 6, 1932. Part of the burnt gases are taken off at the upper part of the heating flues and reintroduced at the base of the flues.

**Vertical coke ovens.** STETTINER CHAMOTTE-FABRIK A.-G. VORMALS DIDIER Fr. 735,989, Apr. 26, 1932. The retort has a zig-zag form so as to form a series of inclined portions. Various ways of obtaining this form are described.

**Intermittently operable horizontal coke oven.** GUSTAV LAMBERTZ (to Carl Still) U. S. 1,888,926, Nov. 22.

**Coke oven with transverse regenerators.** H. KOPPERS A.-G. Brit. 359,482, Sept. 27, 1929.

**Combined regenerative coke oven.** V. I. ZHUPKO. Russ. 25,157, Mar. 29, 1931. Construction details.

**By-product coke oven.** PAUL M. PINCKARD. U. S. 1,888,012, Nov. 15.

**By-product coke-oven plant operation.** STUART P. MILLER (to Barrett Co.). U. S. 1,888,465, Nov. 22. For producing coke and clean oils, coal is coked in a coke oven, entrained solid particles and entrained liquid particles of high b. p. are removed from the resulting hot fresh distn. gases at a temp. at which the constituents of the gas are sepd. into gases and vapors which pass off and a pitch residue which is left behind;

at least part of the pitch residue is returned in admixt. with the coal, to the oven, and coked, and oils of lower b. p. range are recovered from the gases and vapors. App. is described.

**Coke-oven battery.** FRIEDRICH TOTZEK (to Koppers Co. of Del.). U. S. 1,887,222, Nov. 8.

**Regenerative coke-oven battery.** CARL OTTO. U. S. 1,887,214, Nov. 8.

**Coke-oven operation.** C. STILL. Brit. 357,057, Feb. 11, 1930. In operation of coke ovens in which the distillates are withdrawn separately from a gas-collecting space over the charge and from ducts in the charge, the pressure in the said space is maintained const. at atm. pressure while the pressure in the said ducts is reduced as the coking process proceeds and finally again raised to atm. pressure. Various details of app. and operation are described. Cf. *C. A.* **27**, 1150.

**Apparatus [with endless conveyers] for low-temperature coking of coal, etc.** C. HONNAY. Brit. 358,450, Jan. 7, 1930. Structural and mech. features.

**Apparatus for charging coke ovens.** C. STILL. Brit. 358,330, Nov. 16, 1929. Mech. features.

**Charging hot coke ovens with pulverized coal.** ROBERT M. FOLSOM (to New England Fuel and Transportation Co.). U. S. 1,886,948, Nov. 8. App. and various details of operation are described. U. S. 1,886,949 relates to coke-oven construction.

**Anchoring devices for coke and chamber ovens.** CARL STILL (trading as the Firma Carl Still). Brit. 362,544, Sept. 17, 1930.

**Method for heating coke ovens with alternately ignited top and bottom burners.** COLLIN & Co. (to Gas Chambers & Coke Ovens, Ltd.). Brit. 363,243, Mar. 7, 1931.

**Withdrawing distillates from coke ovens.** C. STILL. Brit. 359,869, April 3, 1930. In a process such as described in Brit. 356,079 (*C. A.* **27**, 1150), a hard metallurgical coke is obtained by charging coal of high volatile content (over 30%) loosely into the oven the walls of which are maintained at temps. which do not substantially exceed 850–900°. Various details of app. and operation are described.

**Coking pitch.** M. L. HAMLIN (to Barrett Co.). Brit. 358,375, Dec. 28, 1929. See Ger. 542,513 (*C. A.* **26**, 3365).

**Container for cooling coke.** C. OTTO & Co. G. M. B. H. Ger. 567,067, May 7, 1930.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Recent investigations concerning the constituents of petroleum.** J. V. BRAUN. *Petroleum Z.* **28**, No. 50, 1–6(1932); cf. *C. A.* **26**, 1102.—Lecture. I. M. LEVINE

**Crude petroleum and its refining.** G. F. MCKILLOP. *Chem. Eng. Mining Rev.* 25, 75–8(1932).—A historical sketch, classifying petroleum, discussing detn., methods, stills and chem. treatments. W. H. BOYNTON

**Isolation of the three xylenes from an Oklahoma petroleum.** JOSEPH D. WHITE AND F. W. ROSE, JR. *Bur. Standards J. Research* **9**, 711–20(1932).—The 3 xylenes were isolated from an Oklahoma crude oil by concg. them into the 127–41° cut, extg. them with liquid $SO_2$ and alternately crystg. and distg. the ext. About 22.5% of the cut dissolved in the $SO_2$. The 3 isomers were further sepd. and their properties compared with known products. The isomers were found to exist in the ratio of 3 ortho, 3 meta and 1 para. The total content of xylenes in the crude oil amounted to 0.3%. J. L. E.

**The removal of sulfur compounds from petroleum distillates.** HARRY N. HOLMES, A. L. ELDER AND NORVIL BEEMAN. *J. Phys. Chem.* **36**, 2981–93(1932).—The gels obtained by mixing dil. solns. of $FeCl_3$ and Na silicate (*"red gels"*) were aged, treated with hot 9 *N* $H_2SO_4$ and dried at 150–200°. A white porous silica (*"white gel"*) with pores with a diam. of 8 to 10 mμ was made. This white gel was soaked in 45% $CuSO_4$ at 60°, drained, dried in N or $CO_2$, cooled to 0°, satd. with $H_2S$ gas, washed and dried in N or $CO_2$ up to 200°. To activate the CuS-silica gel it was heated at various temps. from about 200° to 500°. Free S coming from the decompn. of CuS into $Cu_2S$ + S was evapd. This white gel and red gels variously treated and activated removed S compds. from petroleum distillates. CuS is superior to other sulfides for this work, and supporting the CuS on the gel increases its efficiency. The activation temp. is an important factor. The gels may be repeatedly regenerated and reused. The loss of valuable

antiknock constituents is avoided by adsorption methods An improved form of S lamp is described. JEROME ALEXANDER

**Aerial nuisances from the refining and burning of petroleum oils.** STEPHEN DEM. GAGE. *Am. J. Pub. Health* **23**, 97–104(1933). J. A. KENNEDY

**Recovery of ceresins from petrolatum at the Max Miller plant in Baku.** D. GOLDBERG AND I. ABEZGAUZ. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1932**, No. 11, 39–45.—Cold settling is unsatisfactory for sepg. ceresins from petrolatum because of excessive time, large vol. of naphtha and low temps. required by this process. Centrifuges must be imported, which precludes their use. The Weir method is the most promising. The work on petrolatum ($d_{15}$ 0.9177, viscosity 2.69 Engler, m. 60° (Ubbelohde); paraffin content m. 60–9° 73% (Holde); penetration 160 at 25° and 100 g. load) showed that the quality of kieselguhr is important. Filtration is faster with the finer-mesh earth. The earth must be added before the crystals are formed, preferably 10° above the crystn temp. The rate of cooling in cold settling should be 2–3°/hr. while with the Weir process it can be 10°/hr. The quality of ceresin depends on temp. and quantity of diluent. More earth should be used as diln. is increased. With a diln. 1:2, 20% earth is needed; with 1:2½, 15%. The earth can be regenerated without imparing its efficiency. V. KALICHEVSKY

**The Hannover oil deposits.** ALFRED KRAISS. *Z. deut. geol. Ges.* **84**, 395–429 (1932).—Analytical data on the petroleum and brine. R. H. EWELL

**Refining machine and cylinder oils from heavy Balakhanui crude oil by caustic wash preceding the acid treatment.** N. NOVIKOV-VAKULENKO. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1932**, No. 11, 58–60.—A preliminary caustic wash improves the ash content and decreases the amt. of naphthenic acids in the refined product. For the max. recovery of naphthenic acids, the successive washings should be utilized for washing fresh portions of oil and for prepg. the caustic soln. Addn. of the NaOH ext. from kerosene prevents the formation of emulsions and increases the efficiency of the process. V. KALICHEVSKY

**Naphthenic acids from Groznui crude oil.** P. SMIRNOV AND Z. BUKS. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1932**, No. 11, 60–7.—Crude acids were refined by repeated extn., with petr. ether, of their soln. in alc. contg. 30% NaOH; distg. the alc treating with weak $H_2SO_4$; dissolving in petr. ether; washing with $Na_2SO_4$ soln. and water; drying with anhyd. $Na_2SO_4$ and $P_2O_5$; and distg. under 3 mm. Hg. The product was esterified with MeOH and $H_2SO_4$ and refractionated 8 times at 3 mm. Hg, yielding 39 fractions. After converting the esters into acids they were again refractionated 3 times, yielding 114 fractions, probably contg. 46 different compds. Analysis of the largest fractions showed that 6 naphthenic acids were sepd. V. KALICHEVSKY

**Total heats of gas oils at elevated temperatures and pressures.** W. W. GARY, L. C. RUBIN AND J. T. WARD. *Ind. Eng. Chem.* **25**, 178–83(1933).—Total heats of 4 cracking-plant gas oils have been detd. at elevated temps. and pressures in both the liquid and vapor states by a continuous-flow calorimeter. The equation, $H = (215 - 87d) + (0.415 - 0.104d)t + (0.000310 - 0.000078d)t^2$ [$H$ = total heat above 0° in B. t. u./lb., $d$ = sp. gr. at 15.5° and $t$ = Fahrenheit temp.] set up by Weir and Eaton (cf. *C. A.* **26**, 1760) for virgin stocks, was found to be in accord with the present results. It holds for cracking stocks also. A new equation for liquid gas-oil cracking stocks was developed along the same general lines: $H = (15d - 27) + (0.7615 - 0.400d)t + (0.000625 - 0.000440d)t^2$. This equation was satisfactory for stocks with gravities ranging from 40° to 15° A. P. I. An equation for total heats involving temp. and gravity must be restricted to stocks of certain similar characteristics. J. L. E.

**The production of gasoline from Hodonin crude oil by hydrogenation under pressure.** S. LANDA AND MARIE LANDOVÁ. *Petroleum Z.* **28**, No. 51, 10–2(1932).—By hydrogenating the oil at 465–70° in the presence of $(NH_4)_2MoS_4$ in a rotating autoclave, 55% of gasoline, end point 230°, was obtained. An overhead product from the residue also gave 54% of product, end point 200°, under the same conditions. The gasoline consisted mainly of naphthenes and aromatic hydrocarbons. I. M. LEVINE

**Preparation of the mononitrotoluene or dinitrotoluenes from the aromatic gasoline of the Shukkōkō crude oils by the direct nitration.** MASAKICHI MIZUTA. *J. Soc. Chem. Ind. Japan*, **35**, Suppl. binding 519(1932).—Compds. of superior quality are prepd. in good yield by direct nitration of fractions contg. over 30% PhMe. A. F. SHEPARD

**The separation of toluene from the toluene fraction of gasoline by the formation of the azeotropic mixture with methanol.** MASAKICHI MIZUTA. *J. Soc. Chem. Ind. Japan* **35**, Suppl. binding 470(1932). L. W. T. CUMMINGS

**Cracking of crude oil yields more gasoline of higher octane number.** E. F. NELSON AND G. EGLOFF. *Petroleum Z.* **28**, No. 51, 6–10(1932). I. M. LEVINE

**Effect of tetraethyllead on octane number.** L. E. HEBL, T. B. RENDEL AND F. L. GARTON. *Ind. Eng. Chem.* **25**, 187–91(1933).—Empirical curves for the relationship between the concn. of tetraethyllead and the octane no. of a gasoline have been set up and checked by the operation of a C. F. R. engine under 2 sets of conditions and a Ricardo E-35 engine. The results compare very favorably with the curve and from the data the lead susceptibility of a gasoline can be detd. when the octane no. is known. The factors affecting this relationship are the effectiveness of isoöctane at different concns. in raising the anti-knock value of isoöctane-heptane mixts.; the effectiveness of tetraethyllead at different concns.; the octane no. of the base gasoline before ethylizing; the lead susceptibility of the gasoline; and the no. of cc. of tetraethyllead added per gal. of gasoline. Treating seemed to cause a lag in the effectiveness of tetraethyllead, although this lag could be minimized by the addn. of small amts. of dimethyl sulfate. J. L. E.

**The separation of aromatic hydrocarbons from gasoline by extraction with liquid sulfur dioxide.** MASAKICHI MIZUTA. *J. Soc. Chem. Ind. Japan* **35**, Suppl. binding 469(1932).—Crude aromatic hydrocarbons may be extd. with liquid $SO_2$ at —18° [from gasoline] if the aromatic content is less than 35%. L. W. T. CUMMINGS

**Refining process with liquid sulfur dioxide.** L. EDELEANU. *J. Inst. Petroleum Tech.* **18**, 900–20(1932).—With the aid of flow charts, an outline is given of the method of continuous operation in refining both light and heavy distillates with liquid $SO_2$, and of making the $SO_2$. A bibliography of 42 references is added. $SO_2$ refining is as applicable in the making of high-grade lubricating oils, transformer, insulating and medicinal oils, and high antiknock motor fuel as it is for producing good kerosene. EMMA E. CRANDAL

**Motor fuels.** WALTER GIESMANN. *Petroleum Z.* **28**, No. 49, 1–10(1932).—The properties of motor fuels are discussed in relationship to their usefulness, particularly the antiknock value and end point of fuels for internal-combustion engines and the cetene or heptane no. for Diesel fuels The effect of the boiling range and H/C ratio has as yet not been settled. I. M. LEVINE

**The oxidation mechanism of mineral oils. IV. Effect of some alcohols, esters and other compounds.** TEIKICHI YAMADA. *J. Soc. Chem. Ind. Japan* **35**, Suppl. binding 467–8(1932); cf. *C. A.* **26**, 4703.—The effect on the oxidation of white oil and switch oil of the higher alcs., esters and ketones at 100° was measured by noting the decrease in O pressure. The higher alcs. and ketones accelerated the oxidation. Conclusion: Alcs. are the primary oxidation product, but they do not act directly as active centers. L. W. T. CUMMINGS

**The decomposition of mineral oil by heating under pressure.** STEFAN PHILIPPIDE. *Petroleum Z.* **28**, No. 51, 1–6(1932).—Kerosene was cracked in an electrically heated tube at 600° and the effects of pressure and rate of feed and the presence of $Al_2O_3$ and fuller's earth were investigated. In general, increase in gage pressure to 20 atm. caused an increase in yield and a drop in the sp. gr. and percentage of unsatd compds. in the product; this was attributed to the increase in reaction time. The yield was increased by the presence of the catalysts. I. M. LEVINE

**Role of dissolved gases in determining the behavior of mineral insulating oils.** F. M. CLARK. *J. Franklin Inst.* **215**, 39–67(1933).—The dielec. strength of mineral oil went through a min. at a certain low pressure of dissolved gas, either air, $CO_2$ or $H_2$. The fact that the dielec. strength of gases is similarly a function of the pressure suggests that the real dielec. strength of the oil was not tested and could not be except in the entire absence of dissolved gases. EMMA E. CRANDAL

**Improvement in the odor of unsaturated light oils.** HENRY VON WINKLER. *Chem.-Ztg.* **56**, 991–2(1932).—Benzine from Esthonian oil shales cannot be freed from an onion-like odor by the usual treatment with alkali, acid or Pb compds. A yellow color persists in the unsatd. fractions, and resins are deposited, even after distn. These properties militate against the general use of this benzine. The objectionable impurities can be converted into $H_2O$-sol. compds. that can be easily removed by treatment of the oil with 70% $H_2SO_4$ contg. 0.4% formalin. LOUIS E. WISE

**New methods of investigation for the determination of residue formation in motor oils.** A. V. PHILIPPOVICH. *Petroleum Z.* **28**, No. 49, *I. P. K.*, 10–11(1932).—Of the several methods suggested and used for the detn. of the value of a lubricating oil, the Conradson and Brit. Air Ministry ageing tests were found to agree best with the behavior of the oil in the motor. I. M. LEVINE

**The development of combustion equations for fuel oils in terms of specific gravity.**

J. K. FIGLMÜLLER. *Petroleum Z.* **28**, No. 47, 1–4(1932).—Equations are derived for the percentage of $CO_2$ and CO in stack gases for complete and incomplete combustion, resp., and the percentage of $O_2$ in each case, in terms of the sp. gr. and the quotient, theoretical/actual quantity of $O_2$. Directions for constructing diagrams based upon the equations are given. I. M. LEVINE

**Oil for technical heating plants.** H. v. SCHROETER. *Petroleum Z.* **28**, No. 47, *Praxis der Ölfeuerung* 5, 1–2(1932). I. M. LEVINE

**Production of sulfo acids by sulfonating the kerosene distillate.** K. P. LIKHUSHIN AND A. N. DEĬ-KARKHANOVA. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1932**, No. 11, 67–74.—Highly satisfactory sulfo acids contg. min. amts. of free oil and $H_2SO_4$ can be obtained from kerosene distillates by treating them with gaseous $SO_3$. The presence of higher-boiling fractions in kerosene increases the yield of sulfo acids. The color of the acids is improved by treating kerosene with clay before the acids are extd. with water. The burning qualities of kerosene treated with $SO_3$ are also superior to the ordinary product. Sulfo acids may be utilized for mfg. soap. V. KALICHEVSKY

**A naturally active bleaching earth.** E. BELANI. *Petroleum Z.* **28**, No. 50, 11–12 (1932).—Methods of treating heavy oils are described wherein the more active chemically treated clays are replaced in part by a naturally active earth, "Carlonit," found in Karlsbad. I. M. LEVINE

**The effect of Paraflow on wax crystal structure.** G. H. B. DAVIS. *Natl. Petroleum News* **24**, No. 52, 32, 34(1932).—Small amts. of Paraflow inhibit excessive growth of crystals and change the shape from the needle type to small equiaxial grains of uniform size. R. W. KELLY

**Preparation of paraffin from carnauba wax by means of catalytic hydrogenation.** H. I. WATERMAN, P. DE KOK AND A. J. TULLENERS. *J. Inst. Petroleum Tech.* **18**, 1007–9(1932).—It is possible to cause a 70% (by weight) conversion of carnauba wax into paraffin by expelling the O by means of high-pressure hydrogenation in the presence of catalysts such as Mo-C and Ni-guhr and at a temp. of 400°. The paraffin produced has substantially the setting point, sp. gr., *n*, sp. refraction, mol.-wt. and ratio of C/H of com. Rangoon paraffin. J. L. E.

**New developments widen the field for treating lubricating oil with sulfur dioxide.** O. P. COTTRELL. *Oil and Gas J.* **31**, No. 28, 10, 12(1932).—The addn. of benzene to liquid $SO_2$ increases its solvent power sufficiently to improve the viscosity index on all types of distillates. J. R. STRONG

**Analysis of mineral lubricating oils by fractionation with acetone.** MILLICENT NOTTAGE. *J. Inst. Petroleum Tech.* **18**, 943–52(1932).—*Extg. lubricating oils* with successive portions of acetone takes out the constituents having high surface activity and reactivity, leaving a "*diluent*" whose coeff. of friction is independent of temp. and of overlying atm. This coeff. varies considerably with the source of the oil. It was, *e. g.*, 0.200 for a Burma oil and 0.139 for a Pa. oil. EMMA E. CRANDAL

**Synthetic lubricating oils.** JACQUES WOUDHEYSEN. *Petroleum Z.* **28**, No. 49, *Motorenbetrieb und Maschinen-Schmierung* 5, No. 12, 2–3(1932).—The W. lubricating oils, prepd. wholly from vegetable products, are shown to have a low coeff. of friction, greater stability against high pressure and to produce a lower bearing temp. than mineral oils and yet cost little to produce. I. M. LEVINE

**Stability of lubricating oils.** G. R. VAĬNSHTEĬN. *Azerbaĭdzhanskoe Neftyanoe Khozyaĭstvo* **1932**, No. 11, 45–57.—Exported oils are made from better crude oils than domestic oils. Stability to oxidation was tested by using the methods of Sligh, Michie and Hackford (*C. A.* **20**, 3561). The Sligh method is preferred. The most stable oils are made from Surakhanui crude oil. Other crude oils are classified as follows: light Bibi-Eĭbat, heavy Bibi-Eĭbat, heavy Balakhanui, Binagadin (poorest). This shows that paraffin-base oils are the best, but asphalt-base oils can be improved considerably by proper chem. treatment. Oils from pipe stills are better than those from shell stills because of better fractionation. The use of $H_2SO_4$ and NaOH only yields poor products. $H_2SO_4$ and clay (contacting) give satisfactory oils but the acidity is high. $H_2SO_4$, NaOH and clay give the best oils. Clay alone yields unstable products of high acidity. A bibliography of 40 references on stability of oils is appended. V. KALICHEVSKY

**Lubricating oils with colloidal admixtures.** O. STEINITZ. *Allgem. Oel- u. Fett.-Ztg.* **29**, 35–7(1932).—At high speeds the effect of adding, *e. g.*, 2% of colloidal graphite is not very noticeable; but at low speeds, and especially in conditions of imperfect lubrication, improved lubricating power is shown in reduced friction, lower bearing temp and better adhesion of the oil film. Practical machine tests confirm these results. B. C. A.

**Viscosity and lubricating value of oils.** E. LEDERER. *Petroleum Z.* **28**, No. 49,

*I. P. K.*, 1–10(1932).—The value of L.'s equation for dynamic viscosity $\eta$, in terms of the heat of assocn. $q_0$ and abs. temp. $T$, *viz.* $\log \eta = q_0/(2.303\,RT - 2.75 \log T + ET + C)$, derived from thermodynamical considerations, was tested on the data obtained by Tausz and Staab (*C. A.* **25**, 1371). The agreement was satisfactory. The observation that $q_0$ and $E$ are much larger for mixts. than for pure substances, and that $C$ assumes large neg. values was confirmed; this indicates that not only $q_0$ but also the viscosity-temp. differential becomes larger for mixts Characteristic differences between vegetable and mineral oils in this respect were not found. In discussing the effect of diln. upon viscosity there was introduced the term, degree of solvation, $S$, *i. e.*, the quantity of solvent adsorbed by the solute (lubricant), and defined by the equation $n_1 = (p_1/M_1)/[(p_1/M_1) + (p_2/M_2S)]$, where $n_1$ is the mol. fraction, and $p_1/M_1$ and $p_2/M_2$ are the mols. solvent and solute, resp. This equation was also found to agree with the data of T. and S. with a few exceptions. For vegetable oils S is 3–5 times as large as for mineral oils. For the latter of mol. wt. to 330, $S$ is unity; it then rises with increase in wt. It varies with the structure of the diluent but in each homologous series it becomes smaller with increase in mol. wt., tending toward a limiting value. Hydrogenation of a ring increases the value of $S$ Since $S$ is some measure of the strength of the field around a mol. it becomes important in the consideration of semi-fluid lubrication. I. M. Levine

**Aging tendency of [compound] fatty lubricating oils.** G. Meyerheim. *Allgem. Oel- u. Fett-Ztg.* **29**, 31–4(1932).—The presence of fatty oils interferes with the detns. of tar no. and "Verteerungszahl"; normal figures are obtained by testing the mineral oil itself (unsaponifiable matter) after it has been sepd. from fatty matter (Spitz-Hönig method). B. C. A.

**Evaluation of extreme-pressure lubricants by use of Timken laboratory apparatus.** A. P. Frame and A. K. Graham. *Oil and Gas J.* **31**, No. 33, 14, 16(1933). J. R. S.

**Chemistry of the constituents of the wood-oil of the "callitris" pines. I. Constitution of "callitrol."** V. M. Trikojus and D. E. White. *J. Proc. Roy. Soc. N. S. Wales* **66**, 284–99(1932)(reprint).—By distg. with steam 33.95 kg. of *Callitris glauca* wood shavings and extg. the distillate with $C_6H_6$, 339 g. of crude oil was obtained, 118 g. of which dissolved in 5% NaOH. On acidification and distn., 77 g. of "callitrol," $b_{0.6}$ 116–8°, was isolated. This fraction, which is responsible for the resistance of *C. glauca* to termite and fungal attack, was believed by Baker and Smith (*C. A.* **5**, 351) to be a phenol. T. and W. show that "callitrol" is identical with *l-citronellic acid* (I), $Me_2C{:}CHCH_2CH_2CHMeCH_2CO_2H$. It is completely sol. in $NaHCO_3$ soln. and is assocd. in $C_6H_6$ (mol. wt. 292–317, depending on concn.). It $b_{0.6}$ 117.9°, $n_D^{25}$ 1.4563, $d_{25}^{25}$ 0.9274, $[\alpha]_D^{25}$ —6.60; *methyl ester*, $b_{1.1}$ 86°, mol. wt. in $C_6H_6$ 184; *silver salt*, prisms; *anilide*, needles from petroleum ether, m. 76°; *amide*, leaflets from petroleum ether, m. 84–5°; *p-toluide*, prisms from MeOH, m. 93–4°. On reduction with 1 g. Pt oxide and H, 15 g. I in 75 cc. AcOEt yielded 13.5 g. *l-dihydrocitronellic acid*, II, $b_{0.7}$ 114–5°, $n_D^{23}$ 1.4370, $\alpha_D^{23}$ —1.91 (in a 5-cm. tube). II was less satisfactorily prepd. from I by hydrogenation in AcOH or abs. alc. The *anilide* of II, needles from aq. MeOH, m. 90–1°, *amide*, leaflets from petroleum ether, m. 108–9°. By the interaction of 2.5 g. AcCl and 5 g. II during 0.5 hr. at 120–80°, 2.5 g. *anhydride* of II, $b_{0.9}$ 154–6° was formed. By evapg. to dryness 17 g. I in alc., 2.8 g. CaO and 6.5 g. $(HCO_2)_2Ca$, and distg. the mixt. with $SiO_2$, 1 g. *l-citronellal*, III, $b_{27}$ 103–8° was obtained. III forms no cryst. semicarbazone nor 2,4-dinitrophenylhydrazone, but gives an *atophan*, m. 249°. This is probably the first record of the natural occurrence of I. Color reactions supposedly characterizing "callitrol" are due to a higher-boiling impurity accompanying I. In a comparative study, T. and W. prepd. *d*-citronellic acid (IV), by the following steps (cf. Semmler, *Ber.* **24**, 208 (1891); **26**, 2255 (1893)): *d*-citronellal ⟶ oxime ($b_{22}$ 143–8) ⟶ nitrile ($b_{22}$ 115–20) ⟶ IV, $b_{0.33}$ 118–8.5°, $n_D^{19.5}$ 1.4561, *anilide*, needles, m. 75–6°, *p-toluide*, m. 93–4°. A mixt. of equal amts. of the anilides of I and IV m. 51–2°. The toxicity of II toward *Fomes annosus* is practically identical with that of I, which is somewhat more toxic than IV. Louis E. Wise

**Effect of geographical factors and of the type of forests on the turpentines from Pinus silvestris.** V. Krestinskiĭ, S. Malevskaya and F. Solodkiĭ. *J. Applied Chem.* (U. S. S. R.) **5**, 950–7(1932).—Turpentines were obtained from *Pineta hylocomiosa*, *Pineta sphagnosa*, *Pineta herbosa*, *Pineta composita* and *Pineta cladinosa*, the 5 types of forests. Their compns. were practically identical, proving that the variety of the tree and not the local conditions governs the type of the product. V. Kalichevsky

**The considerable variation which appears from one tree to another in the rotatory power of the oil of turpentine from the maritime pine [Pinus pinaster Sol.] and the relative stability of this rotatory power for a given tree.** A. Oudin. *Compt. rend.* **195**, 185–6

(1932).—A study of the rotatory power of samples of oil of turpentine taken from trees which were apparently in the same condition of vegetation showed differences varying from +11° to —41°. However, samples from a given tree remained const. over a period of several years. G. C. CROOKS

**Component distribution trend in commercial turpentine still operation.** S. PALKIN. *Ind. Eng. Chem.* **25**, 95–7(1933); cf. *C. A.* **26**, 3099.—The proportion of β-pinene was greater by 6 to 8% and the tailings were slightly concd. in the last 15% (18 gal.) of the com. run. The first fraction of 51 gallons (42.5%) was 2–6% higher in α-pinene. H. E. MESSMORE

**Processing pine pitch with caustic solutions.** E. TITOV, A. PREOBRAZHENSKIĬ AND V. PANOV. *J. Applied Chem.* (U. S. S. R.) **5**, 958–80(1932).—The mechanism of the caustic treatment consists mainly in formation of solns. of certain components of turpentine in the aq. solns. of rosin soaps which rapidly dissolve the rosin acids and saponify them afterward. Steam and caustic processes give identical products provided all of the turpentine is removed from the chips. Rosin acids have reducing properties in an alk. medium. At the plant it is best to ext. chips countercurrently at temps not above 90° and without preliminary removal of turpentine by distn. $Na_2CO_3$ is added (6–7%) to the alk. ext. and the mixt. distd. After removing the turpentine the remaining soln. is settled, the rosin soaps are sepd. and the caustic is returned to the process. For quicker sepn. of rosin acids from the pitch it is recommended to add turpentine or some of its components to caustic solns. used for extn. V. KALICHEVSKY

**Treating petroleum and petroleum products and elimination of bloom.** B. G. TUICHININ. Russ. 31, Oct. 31, 1921. Petroleum and its products are treated with $S_2Cl_2$ or other S and Cl compds. either directly or in the presence of an inert solvent.

**Treating petroleum oils to modify or remove heavy paraffinic materials, etc.** FRANK F. GORMAN. U. S. 1,886,008, Nov. 1. A compn. formed of gas oil 1 gal., soda ash 5 oz., $NaHCO_3$ 5 oz., NaOH 5 oz. and naphthalene 1 oz. is used for treating oils either in wells or in storage tanks, etc.

**Attachment for sampling petroleum from hermetically sealed containers.** S. I. BRONYAKOV. Russ. 24,989, Feb. 11, 1928.

**Electrical apparatus for petroleum dehydration.** JOHN M. CAGE (to Elec. Sepn. Co., Ltd.). U. S. 1,887,010, Nov. 8. Structural features.

**Hydrogenating hydrocarbon oils by electric treatment.** HAROLD C. WEBBER (to Universal Oil Products Co.). U. S. 1,887,061, Nov. 8. An elec. current is passed through a mixt. of hydrocarbon material such as pitchy or asphaltic material and a conducting material such as NaCl soln. or caustic alkali which is reactive with the electrodes

used (which may be formed of Fe, Cr or W) to form finely divided solid secondary reaction products insol. in the hydrocarbons which act as hydrogenation catalysts.

**Apparatus and procedure for continuous distillation and fractionation of petroleum oils.** WALTER G. WILLIAMS (to Byrnes, Townsend & Potter). U. S. 1,886,142, Nov. 1. The material is delivered upon the inner surface of a revolvable horizontal cylinder, which is externally heated, and undistd. liquid is passed to a zone of higher temp. for further treatment. Various details of app. and operation are described.

**Refining petroleum distillates.** FRANK W. HEATH (to Shell Development Co.). U. S. 1,888,382, Nov. 22. See Can. 327,496 (*C. A.* **27**, 1154).

**Recovering naphthenic compounds from petroleum oil.** STEWART P. COLEMAN (to Standard Oil Development Co.). U. S. 1,886,647, Nov. 8. The oil is distd. without alkali and a lubricating fraction contg. naphthenic compds. is taken off, alkali is added to the lubricating fraction and it is oxidized (as by air while hot) only to an extent sufficient to ensure the formation of alkali naphthenic compds. and the latter are sepd. from the oil.

**Apparatus for refining oils and petroleum products by treatment with acids.** RUBIN LIPSZYC. Fr. 737,008, May 12, 1932.

**Extracting petroleum or other sulfonic acids.** G. S. PETROV. Russ. 1449, Sept. 7, 1923. Sulfonic acids formed on treating hydrocarbon oils with $H_2SO_4$ or $SO_3$ are treated with NaOH soln. and the aq. soln. is treated with gasoline, etc., for the removal of hydrocarbons, while the dissolved sulfonates are salted out with sulfate, NaCl or other easily sol. salts followed by treatment with acid. The free sulfonic acids so obtained are extd. with gasoline, etc., and the solvents are removed by distn.

**Sulfonic acids from petroleum distillates, mineral oils, paraffin and ceresin.** G. S. PETROV. Russ. 460, Sept 12, 1912. The substances mentioned above are treated with $H_2SO_4$ and the acid sludge is settled and sepd. The oil, etc., is washed with water and the aq. ext. of sulfonic acids is treated with gasoline, $CS_2$ or with a similar water-insol. volatile solvent to remove the oils or the hydrocarbons.

**Sulfonic acids from acid sludge from petroleum or from other substances.** G. S. PETROV. Russ 1447, Sept. 7, 1923. The oil layer, which seps. from the acid sludge after diln. with $H_2O$ and treatment with steam under pressure in autoclaves, is distd. to sep. the hydrocarbon oils from resins and the fractions obtained are then sulfonated in the usual manner.

**Refining hydrocarbon oils.** MARVIN SMITH (to Universal Oil Products Co.). U. S. 1,889,388, Nov. 29. Vaporized oil such as straight-run gasoline is subjected to the action of H while in contact with a metal chromite such as Cd or Cu chromite to effect desulfurizing of the oil.

**Hydrocarbon oil conversion.** CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,888,028, Nov. 15. Oil is heated by indirect contact with gases of combustion and the heated oil and gases are then passed into direct contact with each other with vaporization of the oil, and regulated portions of the material in the treating zones are recirculated in each zone. App. is described.

**Catalytic conversion of hydrocarbon oils into products of lower boiling point.** CLYDE L. SMITH and CORNELIUS B. WATSON (to Pure Oil Co.). U. S. 1,887,047, Nov. 8. A continuously flowing stream of oil of relatively high b. p. is subjected to temps. sufficiently high to effect vaporization without substantial cracking and there is introduced into the vapors a finely divided solid catalytic material such as Ni, Pd, Th oxide, ZnO or Fe and the vapors and assocd. catalytic material are passed together at high velocity in a stream of restricted cross-sectional area through an elongated cracking zone in which the vapors are heated to above 540°; conversion reactions in the oil vapors discharged from the cracking zone are arrested by bringing the vapors into direct contact with a body of cooling oil, a portion of the vapors being thus condensed; the mixt. of condensed vapors and cooling oil is sepd. from the catalyst and may be separately returned to the system for continuation of the treatment. App. is described.

**Apparatus for hydrocarbon oil distillation and conversion.** ROBERT T. POLLOCK (to Universal Oil Co.). U. S. 1,887,039, Nov. 8. In an app. comprising a still and reflux condenser, a charging pump delivers oil into the upper portion of the reflux condenser. Connections are provided between the vapor spaces of the still and the lower portion of the reflux condenser, and a tank receives condensate and charging oil from the reflux condenser and regulated quantities of material are pumped from the tank to the reflux condenser.

**Liquid and gas or vapor contact system suitable for effecting fractional distillation of hydrocarbon oils.** EDWIN F. NELSON (to Universal Oil Products Co.). U. S. 1,888,048, Nov. 15. In the operation of an app. of the bubble-tower type, the passage

of liquid from one zone to a next lower zone is facilitated by passing a stream of vapors at relatively high velocity from a zone of relatively high pressure into the liquid passing between the said zones. App. is described.

**Steam- and vacuum-distillation system for high-boiling hydrocarbon oils.** STANDARD OIL CO. Ger. 567,288, Nov. 11, 1926.

**Hydrocarbon-oil-cracking apparatus.** AUDLEY E. HARNSBERGER and CLYDE L. SMITH (to Gyro Process Co.). U. S. 1,889,199, Nov. 29. Various details of a heating-tube system and furnace setting are described.

**Coil and expansion chamber apparatus, etc., for cracking hydrocarbon oils.** CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,886,946, Nov. 8. Various structural and operative details are described in this pat. (which is based upon an application filed in 1919).

**Cracking hydrocarbon oils.** CHARLES J. GREENSTREET (to Raymond F. Adams). U. S. 1,886,093, Nov. 1. A heavy hydrocarbon oil is forced rapidly through a long heating conduit in which it is heated to about 600° or higher to effect cracking, and the cracked products are immediately cooled to a temp. at which cracking ceases by direct contact with hydrocarbon oil contg. light hydrocarbons to effect vaporization thereof simultaneously with the cooling of the cracked oil, and the vapors of light hydrocarbons formed by the cracking reaction are further cooled as are also the vapors of the light hydrocarbons liberated from the cooling medium, to condense them. App. is described

**Cracking hydrocarbon oils.** GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,888,029, Nov. 15. Oil is distd. at a cracking temp. under pressure and the generated vapors are passed to a combined scrubbing and cracking vessel in which a predetd. supply of a second oil is maintained and the vapors from the cracking still are passed first downwardly and thence upwardly through this second oil body to scrub the vapors and crack some fractions of the oil in the vessel, scrubbed vapors are discharged, and, commingled with vapors released from the second oil, are passed to a dephlegmator, reflux condensate from which is united with charging oil for further treatment, and the dephlegmated vapors are condensed to recover a distillate App. is described.

**Cracking hydrocarbon oils.** HAROLD SYDNOR (to Standard Oil Development Co.). Brit. 362,666, Dec. 6, 1930. See Fr. 706,577 (*C. A.* **26**, 291).

**Cracking oils.** GUSTAV EGLOFF (to Universal Oil Products Co.). U. S. 1,887,083, Nov. 8. A gas oil and a fuel oil are simultaneously subjected to independent cracking operations under relatively higher and lower conditions of temp. and pressure, resp., without commingling of any liquid constituents of the different oils; vapors from the oils are commingled while at high temp. and the united vapors are subjected to dephlegmation and condensation and reflux condensate thus obtained is united with the gas oil undergoing treatment. App. is described.

**Cracking oil.** JEAN D. SEGUY (to Universal Oil Products Co.). U. S. 1,888,051, Nov. 15. Oil is heated to a cracking temp. under pressure in a coil and the heated oil is transferred to an enlarged chamber; vapors from the chamber are dephlegmated and the dephlegmated vapors are condensed; unvaporized residual oil is continuously discharged from the chamber to a settling zone for settling of free C, and substantial portions of the pressure distillate produced are distd. under a lower pressure than that maintained in the coil by passage through a zone of heat interchange with uncondensed vapors; regulated quantities of the unvaporized distillate from the zone just mentioned and C-free residual oil from the settling zone are returned to the coil for further treatment. App. is described.

**Cracking oils.** COMPAGNIE INTERNATIONALE POUR LA FABRICATION DES ESSENCES ET PÉTROLES. Fr. 40,528, Dec. 1, 1930. Addn. to 712,512 (*C. A.* **26**, 1765). The treatments are carried out in a no. of elements arranged in common chambers so that the treatment (vaporization or cracking) takes place in elements alternating in the same chamber, with elements in which regeneration of the catalyst or absorbent takes place. An economical heat exchange takes place.

**Still for cracking oil.** WM. L. BAGWILL. U. S. 1,886,621, Nov. 8. Various structural details.

**Dephlegmation system for use in an oil-cracking process.** LYMAN C. HUFF (to Universal Oil Products Co.). U. S. 1,886,957, Nov. 8. Various details of app. and operation are described.

**Vapor-phase oil cracking and vapor-phase refining of hydrocarbon materials by means of adsorptive catalyst.** EUGENE C. HERTHEL (to Gray Processes Corp.). U. S. 1,887,128, Nov. 8. Numerous details of app. and operation are described.

**Distillation of oils.** I. G. FARBENIND. A.-G. Fr. 736,557, May 3, 1932. In the

distn. of oils of different constitutions and sources such as tar oils, mineral oils, products from cracking and hydrogenation under pressure, etc., the oils are first freed from fractions, such as lubricating oils, which lose their value during the common distn. at atm. pressure and fractions, such as very volatile components, which cause disturbances during the common distn. under vacuum. An app. is described.

**Refining oils.** UNIVERSAL OIL PRODUCTS CO. Fr. 736,834, May 9, 1932. Hydrocarbon oils are freed from color, gum-forming substances and harmful S compds. by submitting the heated vapor thereof to the action of HCl in the presence of a substance contg. a metal in the free or the combined state, *e. g.*, Cu, Zn or brass.

**Refining oils.** I. G. FARBENIND. A.-G. Fr. 737,255, May 18, 1932. Residues from the distn. or cracking of mineral oils, tars, etc.. or products from the hydrogenation under pressure of coal, tars, mineral oils, etc., are refined for the production of lubricating oils, by a treatment with liquefied hydrocarbons of the $CH_4$ series, contg. principally the first 3 members of the series. The treatment may be at a high temp. and under pressure at first, and then after sepn. of asphalts and resins at a lower temp. and pressure. The products may be submitted to hydrogenation under pressure, cracking or treatment with solvents.

**Hydrogenation of oils, etc.** I. G. FARBENIND. A.-G. Fr. 737,103, May 14, 1932. Materials such as tars, mineral oils, conversion and distn. products, which contain polymerizable components such as diolefins or which give rise to such components during heating, are first passed through a heating app., preferably in the liquid state and with or without H, at a temp. and speed such that the polymerizable components are polymerized but not deposited in the heating app. The polymerization products are afterward removed and the remainder is hydrogenated under pressure at a high temp.

**Hydrogenation of heavy hydrocarbon material.** ROBERT P. RUSSELL (to International Hydrogenation Patents Co., Ltd.). Can. 329,076, Jan. 3, 1933. Heavy hydrocarbon material is subjected to the action of H in a primary reaction zone at 750–900°F. and under 20–200 atm. in the presence of catalysts. Vapors formed are removed and cooled at reaction pressure and fractions boiling above 400–600°F. are condensed. The remaining uncondensed vapors are subjected to the action of H in a secondary reaction zone at 850–970°F. and under 20–100 atms. in the presence of catalysts. The vapors are removed and cooled. *Naphtha* suited for motor fuel is recovered.

**Hydrocarbons.** GEORGE F. FORWOOD. Fr. 736,853, May 9, 1932. Hydrocarbons are converted to lighter hydrocarbons by heating them in the presence of steam and a catalyst composed of an alloy of Fe and Sn. Ni, Cr and Co may also be present in the alloy. A combined cracking and hydrogenation takes place.

**Hydrocarbons.** FRANZ FISCHER and HANS TROPSCH. Ger. 567,069, Sept. 15, 1926. Hydrocarbons are treated in known manner with steam and (or) $CO_2$ to produce a gas mixt. of the water-gas type, and this mixt. is led over a catalyst at atm. pressure to produce other hydrocarbons. An example is given in which natural $CH_4$ is led with $CO_2$ over spongy iron at 950°, and the resulting gas is led at 270° and atm. pressure over a mixt. of Co and ZnO, giving liquid hydrocarbons of the benzine type. The residual gases are returned to the process.

**Purifying hydrocarbons.** MARC D'HERCOURT. Fr. 736,378, Aug. 27, 1931. Org. or mineral impurities are eliminated from crude benzene, hydrocarbons, etc., by bringing these liquids into contact with Al previously activated by traces of Hg or salts of Hg acting as catalysts, in the presence of steam. An app. is described.

**Cracking hydrocarbons.** ULYSSES A. R. DUDLEY. Brit. 363,051, Oct. 23, 1930. See Fr. 720,290 (*C. A.* **26**, 3911).

**Cracking hydrocarbons.** LOUIS M. J. TALLON. Fr. 736,253, Aug. 13, 1931. The catalytic power of Cu in a non-reduced form at a relatively low temp. (250–350°) is used in the cracking and refining of hydrocarbons, without an increase of pressure. The activity of the Cu may be increased by a layer of platinized asbestos.

**Cracking hydrocarbons.** THE TEXACO DEVELOPMENT CORP. Fr. 737,071, May 13, 1932. Hydrocarbons of high b. p. are heated to a moderate decompn. temp. and introduced into a reaction chamber from which the vapor is directed to other reaction chambers and is easily dephlegmated to give a motor fuel and a pure condensate of gas oil. The gas oil is heated to a higher temp. than the hydrocarbons and introduced into the reaction chamber where it comes in contact with the hydrocarbons to be treated and with a residue which has been deposited in a subsequent reaction chamber and returned to this chamber. The vapors which result are combined and passed through reaction chambers and a dephlegmator. An app. is described. Cf. *C. A.* **26**, 5749.

**Cracking hydrocarbons.** CARBUROL A. G. Fr. 737,177, May 14, 1932. Petro-

leums or petroleum products are treated individually at the same time as coal oils, tars from dry distn. and other products, in one or more sep. cracking zones, and the products from all the cracking zones are fractionated together. An app. is described.

**Cracking hydrocarbons.** The Texaco Development Corp. Fr. 737,232, May 17, 1932. A hydrocarbon condensate is submitted to decompn. temp. while passing through a heated worm and the heated hydrocarbons are passed to a larger reaction zone in which decompn. temp. is maintained at increased pressure and in which a sepn. of liquid and vapors takes place. Part of the liquid is drawn off in amt. sufficient to prevent accumulation and the vapors are heated in a restricted current at a decompn. temp. higher than that to which the condensate is heated. The vapors pass to a 2nd reaction zone heated to decompn. temp. under pressure, to which the liquid withdrawn from the 1st zone is also led and in which a sepn. of liquid and vapors takes place. The heat in this zone is reduced by introducing hydrocarbons to be treated, at a relatively low temp. The liquid from the 2nd zone is withdrawn in amt. sufficient to prevent accumulation and the vapors are submitted to a fractionation to sep. a light final distillate and a condensate which is led to the heated worm. An app. is described.

**Cracking and hydrogenation of hydrocarbons.** Arthur G. L. Try and Murray Stuart. Brit. 363,360, Sept. 11, 1930. The proportion of low-boiling oil obtained by the destructive distn. of coal, lignite, peat, etc., is increased by subjecting the distillate in the vapor phase to a silent elec. discharge. Hydrogenating gases may be mixed with the vapors.

**Cracking and gasifying hydrocarbons.** John H. Anderson. U. S. 1,887,112, Nov. 8. For obtaining gaseous products from heavier hydrocarbons such as those of coal tar the material is continuously fed into the larger end of a hollow conical retort tilted upon its side with the lowermost line of its side wall in horizontal position and contg. a loose mass of metal bodies such as iron or steel and the retort is externally heated and rotated so as to tumble the metal bodies transversely while restraining them from longitudinal travel; gases generated are drawn off and the residue is automatically discharged from the opposite end of the retort. Details of app. are described.

**Treating vapors formed in cracking hydrocarbons.** Norman H. Moore (to Texas Co.). U. S. 1,887,941, Nov. 15. Vapors formed by pressure cracking are subjected to dephlegmation under superatm. pressure to form a reflux condensate and an overhead vapor fraction having an end point higher than that desired for the final product; the vapor fraction is condensed to form a distillate and the latter is partially purified by preliminary chem. treatment, rectified under a lower superatm. pressure to form a condensate of desired vapor tension, the rectified condensate is further purified, vaporized and fractionated to obtain a product of desired final end b. p. and the vapor is treated with solid adsorbent catalytic material such as fuller's earth to polymerize undesired unsatd. constituents and the remaining vapors are utilized for obtainment of the desired final product.

**Purifying cracked hydrocarbon products.** Audley E. Harnsberger (to Pure Oil Co.). U. S. 1,887,018, Nov. 8. For removing gum-forming and color-imparting compds. from vapor-phase-cracked, unsatd., low-boiling hydrocarbon oils, a stream of such oil is subjected to a low vaporizing temp. without cracking; oils and vapors are passed into a sepg. zone to sep. unvaporized higher boiling oils, and vapors are then passed to a superheating zone and contacted with a polymerizing adsorbent such as fuller's earth. The treated material is then fractionated under reduced pressure. An arrangement of app. is described.

**Refining hydrocarbons.** Compagnie des mines de Vicoigne Noeux & Drocourt. Fr. 40,543, Dec. 13, 1930. Addn. to 691,118 (*C. A.* 25, 1068). The oils, etc., are treated with hydrated halides (particularly $FeCl_3$) to remove oxygenated compds. before the treatment of Fr. 691,118.

**Refining hydrocarbons.** Edeleanu G. m. b. H. Fr. 736,344, Apr. 20, 1932. Water contained in $SO_2$ in circulation in an Edeleanu app. is eliminated by passing the vapors of $SO_2$, which escape from the evaporators (working at the pressure of the condenser and evapg. the product of extn.), through a drying app. or rectification column.

**Refining liquid hydrocarbon distillates.** Ernest B. Miller (to Silica Gel Corp.). U. S. 1,886,260, Nov. 1. The material is treated with a hard porous gel such as silica gel impregnated with a small proportion of acid such as $H_2SO_4$, $H_3PO_4$ or $HNO_3$.

**Refining benzene.** Soc. du gaz de Paris. Fr. 40,826, Nov. 29, 1928. Addn. to 678,949 (*C. A.* 24, 3639). The white benzene obtained by Fr. 678,949 is rectified to remove the more volatile portions which contain the greater part of the ethylenic hydrocarbons. Fr. 40,827. Addn. to 665,302 (*C. A.* 24, 955). The white benzene obtained by Fr. 665,302 is rectified as in Fr. 40,826.

**Solidifying hydrocarbons.** PETRO-SOL CORP. Fr. 737,178, May 14, 1932. See U. S. 1,880,211 (*C. A.* **27**, 589).

**Oil-treating composition.** ELLIOTT MORRILL. U. S. 1,886,293, Nov. 1. A compn. for breaking hydrocarbon-oil emulsions and for treating fuel oils, etc., comprises solid caustic alkali, a solid hydrocarbon such as naphthalene, anthracene or phenanthrene, and an oil-sol. metal soap such as Al oleate or Zn stearate.

**Heat-exchange apparatus suitable for use in oil refining.** RUSSELL C. JONES (to Griscom-Russell Co.). U. S. 1,886,403, Nov. 8. Structural features.

**Filter suitable for refining oil with fuller's earth.** OLIVER B. WENDELN (to Pure Oil Co.). U. S. 1,887,052, Nov. 8. Structural features.

**Fractionating tower [with spaced rotating vapor-centrifuging disks] suitable for use in oil distillation.** EDWARD C. D'YARMETT (to Fractionator Co.). U. S. 1,888,872, Nov. 22. Structural and mech. features.

**Recovering material such as solid oils from wells.** KIRKLAND KELLEY and SAMUEL J. PERKINS. U. S. 1,886,886, Nov. 8. For recovery of material such as solid oils a fluid heavier than the material, such as heated water, is passed through the material, but out of direct contact with it, and is then forced into contact with the lower portion of the material to be recovered, and the material is skimmed off while in the well. App. is described.

**Apparatus for extracting oil from shale, etc.** WM. S. CRIPPS. Australia 29,012, Sept. 15, 1930.

**Products from shale or coal; cement.** HENRY E. WHITE. Australia 27,599, July 2, 1930. In recovering oil products, etc., from shale or coal, the gases from the retorts are used as fuel in making CaO and this is used in making a clinkering mixt. with ash from furnaces fired with powd. coal. The $CO_2$ is also recovered. Australia 27,600. Portland cements are made by clinkering a mixt. of calcareous material and ash from furnaces burning powd. coal, and grinding the clinker.

**Oils from coal, shale, etc.** ARNOLD STOCKHAUSEN. Australia 30,910, Dec. 29, 1930. The coal, etc., is heated in a retort of truncated-cone shape, having means for securing progressive movement of the coal. Volatile products are withdrawn at various points.

**Sulfonic acids from mineral oils.** G. S. PETROV. Russ. 428, Feb. 22, 1911. Petroleum oils are agitated with aq. soln. of EtOH, MeOH or $Me_2CO$ after $H_2SO_4$ treatment to ext. the sulfonic acids. Cf. *C. A.* **26**, 3519.

**Sulfonic acids from mineral oils.** G. S. PETROV. Russ. 508, June 7, 1913. Addn. to Russ. 428 (preceding abstr.) Petroleum oils are agitated with a small amt. of $H_2O$ after $H_2SO_4$ treatment and MeOH, EtOH or $Me_2CO$ is added to the aq. ext. of sulfonic acids to sep. the dissolved hydrocarbons.

**Device for testing the dilution of oil in internal-combustion engines.** GEORGE W. COPLAND. U. S. 1,886,085, Nov. 1 Testing is effected between compression disks connected with an elec. indicator.

**Motor fuel.** WM. M. STRATFORD (to Texaco Development Corp.). Can. 329,302, Jan. 10, 1933. Hydrocarbon oil is cracked under pressure and the evolved vapors are fractionated to form a major fraction comprising a condensate adapted for returning to the cracking zone and a minor vapor fraction comprising essentially constituents within the boiling range desired for the gasoline product. The vapor fraction is heated under pressure to a temp. inducing polymerization and transformation of hydrocarbons into components of increased anti-detonating properties to form a product possessing a higher end point than that of the vapor fraction before said heating without increase in vol. of constituents within the boiling range of the desired gasoline product. The polymerized and transformed vapor fraction is fractionated to sep. out higher-boiling products of polymerization and form the desired gasoline distillate of high anti-knock quality.

**Straining or screening apparatus suitable for treating fuel oil.** RALPH S. WHALEY (to Petroleum Heat and Power Co.). U. S. 1,889,325, Nov. 29. Structural details.

**Catalytic hydrogenation.** CLARENCE J. FRANKFORTER. Brit. 362,967, Sept. 9, 1930. See U. S. 1,780,873 (*C. A.* **25**, 200).

**Gum inhibitor.** CARLOS L. GUTZEIT (to The Standard Oil Development Co.). Can. 328,898, Dec. 27, 1932. Gum formation is retarded in low-boiling hydrocarbon oils by the addn. of a small quantity of an inhibiting agent selected from the following types of compds.: indophenols and oxazine, indamine, eurhodine, safranine, aposafranine and aminoazo bases, bearing no sulfonic acid or thiobenzyl groups.

**Paraffin.** I. G. FARBENIND. A.-G. Fr. 737,256, May 18, 1932. Paraffin is sepd. from products contg. it by treating the products with a mixt. of chlorinated hydro-

carbons, such as $CCl_4$, with methyl ethyl ketone or alcs. such as BuOH, or a mixt. of methyl ethyl ketone with alcs.

**"Sweetening" reagent for treating gasoline.** HUGH H. CANNON (to Cannon-Prutzman Treating Processes, Ltd.). U. S. 1,888,219, Nov. 22. PbO, an alk. earth hydroxide such as $Ca(OH)_2$ and an absorbent earth are mixed in comminuted form with an aq. constituent such as dil. NaOH soln. and the resulting reagent is suspended in a small proportion of oil preliminary to the treatment of a larger body of oil with the prepd. reagent.

**Pressure-control device for tanks such as gasoline-storage tanks.** CHARLES J. SOYSTER and GORDON W. LAWN (Lawn to Soyster). U. S. 1,887,824, Nov. 15. Structural, mech. and elec. features are described.

**Refining light hydrocarbons such as gasoline or benzene.** ERNEST B. MILLER and GERALD C. CONNOLLY (to Silica Gel Corp.). U. S. 1,886,261, Nov. 1. The material is treated with 0.1–0.5% of strong $H_2SO_4$, resulting sludge is removed, and the material is further treated with a hard porous gel such as silica gel in a proportion of less than 4% to polymerize gum-forming constituents at a temp. of about 65° or higher and the material is then distd. App is described

**Breaking oil-and-water emulsions.** GOTTHOLD H. MEINZER (to L. Blake-Smith) U. S. 1,887,774, Nov. 15. A pulsating stream of the emulsion is passed through a mass of granular solid material such as silica or pyrite in a described app. and the assocd materials are sepd. U. S. 1,887,775 describes a method comprising continuously passing the oil-and-water emulsion between oppositely disposed surfaces of concrete coated with a material such as quartz which is preferentially wetted by water and a material such as pyrite which is preferentially wetted by oil, the surfaces being maintained in relative movement to each other (as by the use of closely spaced rotating plates mounted between stationary plates, in a described app ).

**Lubricating oils.** STANDARD OIL DEVELOPMENT CO Fr. 736,983, May 11, 1932 A lubricant is made by adding hydrocarbons contg paraffin to a hydrocarbon oil in a proportion to increase the coeff. of viscosity, as well as a small amt. of an antisolidifying agent

**Purifying lubricating oils.** REGINALD K. STRATFORD (to Standard Oil Development Co.). Brit. 362,600, Oct. 21, 1930. See Can. 308,405 (*C. A* 25, 1376).

**Lubricating oils from coal-tar oils.** HARALD NIELSEN and BRYAN LAING U. S. 1,886,262, Nov 1. An oil of 0.95 to 1.08 sp. gr. at 12° to 18° and having a static coefficient of friction of from 0.1 to 0.85 is obtained by a procedure involving various features of temp. regulation, etc.

**Hydrocarbon lubricating oil.** HOMER T. DARLINGTON (to Oil Corp of America) U. S. 1,888,346, Nov. 22. Oil is heated under pressure in admixt. with adsorptive material, lighter products are sepd from the heated oil, addnl. adsorptive material is added to the residual oil, and it is heated, distd. and condensed while subjected to a vacuum and to agitation with the adsorptive agent. App. is described. Cf. *C. A* 27, 1160.

**Stabilizing the color of lubricating oils.** CHESTER E. ADAMS (to Standard Oil Co of Ind.). U. S. 1,888,023, Nov. 15. A hydrocarbon lubricating oil is treated with a small proportion (suitably about 0.05–1.0%) of an aliphatic amine having an alkyl group contg. not less than 4 C atoms, such as butyldiethanolamine.

**Apparatus for continuously indicating the viscosity of lubricating oils, etc.** WALTER J. ALBERSHEIM and HARVEY S. KONHEIM. Ger. 567,309, Dec. 4, 1926. This corresponds to Brit. 263,781 (*C. A*. 22, 163).

**Dewaxing petroleum lubricating oil distillates.** HUGH LOWERY (to Standard Oil Co. of Ill.). U. S. 1,886,344, Nov. 1. A distillate having a viscosity of between 75 and 120 sec. Saybolt at 99° and contg. wax of the slop wax type is dild. with 65–80% of a naphtha of end point not over about 205°, petrolatum 1–5% is added, followed by chilling to about —12°, settling at such temp. for 60–80 hrs and removal of the supernatant layer of oil.

**Lubricant.** HARRY T. BENNETT. U. S. 1,889,168, Nov. 29. A "flange oil" comprises a high-viscosity residuum resulting from the fractional distn. under approx atm pressure mixed with a low-viscosity residuum resulting from a cracking operation

**Lubricants.** I. G. FARBENIND. A.-G. (Wilhelm Pungs and Erich Frese, inventors) Ger. 567,350, May 10, 1928. Lubricating greases are prepd. by dissolving bleached montan wax or its esterification products in a mineral, animal, vegetable or tar oil, and treating the mixt. with sufficient alkali hydroxide or carbonate to sapon. the wax acids or esters.

**Lubricant.** TUOUYOSI MITUI (to Nippon Hatudokiyu K. K.). Japan. 93,301,

Oct. 19, 1931. An animal or vegetable oil is heated at 150-310° under reduced pressure. The pressure is gradually decreased still further and the sepd. fatty acids are distd. off during the heating.

**Greases.** V. V. KARETNIKOV. Russ. 350, Apr. 18, 1912. Greases are prepd. by mixing Na soap of castor oil with mineral oil under agitation, and heating at atm. pressure, until the soap is dissolved in the oil. The amount of soap incorporated should be not less than 20% of the oil.

**Asphalt.** SAIKITI MIZUSIMA and TEIKITI YAMADA (to the Minister of Communications). Japan. 93,247, Oct. 13, 1931. Asphalt is manufd. by blowing air into a mixt. of distn. residue of crude petroleum and soaps of Cu, Fe, Mn or Co.

**Asphalt from crude asphaltic oil or residuum.** ALBERT LOEBEL (to N.-V. de Bataafsche Petroleum Maatschappij). U. S. 1,889,365, Nov. 29. A hydrocarbon oil material having an initial b. p. of at least 250° is extd. with liquid $SO_2$ and that portion of the material thus treated which is insol. in the $SO_2$ is then added to asphaltic oil or residuum and the mixt. is blown to form an oxidized asphalt. Cf. *C. A.* **26**, 3916.

**Asphaltic bitumen.** BURMAH OIL CO., LTD. Brit. 362,580, Oct. 6, 1930. See Fr. 772,882 (*C. A.* **26**, 4170).

**Asphaltic bitumen.** BURMAH OIL CO., LTD. Brit. 364,666, Oct. 6, 1930. See Fr. 722,881 (*C. A.* **26**, 4170).

**Bituminous emulsion.** PRESTON R. SMITH (to Barber Asphalt Co.). U. S. 1,888,295, Nov. 22. Bitumen is dispersed in an aq. dispersing medium including an alk. salt of a sulfonated oil and having an alky. within the $p_H$ range of 11.5 to 13.2.

**Bituminous emulsion containing rubber.** LEONARD G. GABRIEL and JOHN F. BLOTT (to Colas Roads, Inc.). U. S. 1,886,334, Nov. 1. An aq. emulsion is prepd. by agitating, in a colloid mill, a mixt. of molten bituminous material and rubber latex, without addn. of soap or other usual dispersing agent.

**Bituminous dispersions.** COLAS PRODUCTS, LTD., AUGUSTUS G. TERRY, LEONARD G. GABRIEL and JOHN F. BLOTT. Brit. 362,577, Oct. 2, 1930. Concd. aq. bituminous dispersions of low viscosity are made by forming a bituminous dispersion of normal characteristics (particle dimensions 2 $\mu$) and dispersing therein a further quantity of the same or other bituminous material, the particles of the second dispersion being 20–30 $\mu$.

**Fenchyl alcohol.** LEE T. SMITH (to Hercules Powder Co.). U. S. 1,887,171, Nov. 8. For sepg. fenchyl alc. from pine oil, the pine oil is fractionated to obtain a cut rich in fenchyl alc., tertiary alcs. present in the cut are dehydrated to effect their conversion to hydrocarbons and water without substantial dehydration of fenchyl alc., the hydrocarbons and water are fractionated off, and the residue is refrigerated to effect crystn. of fenchyl alc.

**Purifying sulfate turpentine.** V. E. TISHCHENKO and A. G. EVDOKIMOV. Russ. 25,226, Dec. 17, 1929. The crude turpentine is first exposed to the action of $H_2$ in the nascent state obtained through the action of acids on metals. The basic fraction, after washing and steam distg. is infused with a mixt. of anhyd. $CaCl_2$ and activated carbon.

**Rosin recovery from rosin-containing soap formed in pulp manufacture from resinous woods.** LEAVITT N. BENT (to Hercules Powder Co.). U. S. 1,888,581, Nov. 22. The rosin is pptd. by $CO_2$ and sepd.

**Extracting rosin from resinous wood.** LEAVITT N. BENT (to Hercules Powder Co.). U. S. 1,888,025, Nov. 15. The wood is treated with an org. aliphatic solvent for the rosin which is miscible with water such as acetone and a petroleum hydrocarbon material of low b. p. is added, such as butane which has a selective solvent action on the rosin and which is immiscible and non-reactive with the first-mentioned solvent; the low-boiling hydrocarbon solvent and dissolved rosin are sepd. from the other material and the solvent is distd. off to recover the rosin.

**Refining rosin.** IRVIN W. HUMPHREY (to Hercules Powder Co.). U. S. 1,887,007, Nov. 8. A soln. of the rosin in a solvent such as gasoline is mixed with an anhyd. metal chloride such as $ZnCl_2$ or $SnCl_4$ capable of removing coloring substances and the mixt. is heated at a temp. below that at which any substantial amount of rosin oil would be formed, the soln. is sepd. from the ppt. formed, and the solvent is sepd. from the purified rosin.

**Refining rosin.** IRVIN W. HUMPHREY (to Hercules Powder Co.). U. S. 1,887,167, Nov. 8. The rosin is subjected to the action of $CH_2O$ and $NH_3$ and then distd.

# 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Röntgenographic introduction to the cellulose symposium.** J. R. KATZ. *Chem. Weekblad* **30**, 26–44(1933).—A critical review. O. W. WILLCOX

**Biological introduction to the cellulose symposium.** G. VAN ITERSON, JR. *Chem. Weekblad* **30**, 2–19(1933).—A review (79 references) of present knowledge and theory of the mol. structure, röntgenography and phys. properties of cellulose fibers. O. W. WILLCOX

**Old and new viewpoints as to the structure of cellulose and their experimental bases.** KURT HESS. *Uspekhi Khimii* **1**, 669–91(1932).—A review. Cf. *C. A.* **25**, 202. F. H. RATHMANN

**Ethyl- and benzylcellulose—Production in Soviet Russia.** A. JAE. *Kunststoffe* **23**, 3(1933).—A brief description of Russian production methods given in "*Novosti Techniki Moscow*," No. 152, 5.8–8–32. J. W. PERRY

**Lignin and cellulose. XX. Acetolysis of cellulose.** KARL FREUDENBERG AND KARL SOFF. *Ber.* **66A**, 19–27(1933); cf. *C. A.* **26**, 3238.—On the assumption that in long chain-mols., like cellulose (I), a single kind of union between the glucose units, the velocity consts of the degradation of I fall within 2 limiting values: $k_n$ the av. const. at the beginning, when the $n$-membered chain is still intact, and $k_2$, the cleavage const. of the disaccharide, cellobiose. Of the many fragments of widely varying lengths into which the chain first breaks down and which then further breaks down into still smaller fragments, each has an av. cleavage-velocity const. intermediate between $k_n$ and $k_2$. Many possible ways in which these consts can be attained are conceivable. Two limiting cases are of special significance: (1) All the unions in a chain of a given length (*i. e.*, the 2 unions in the trisaccharide, the 3 in the tetrasaccharide, etc.) are ruptured with the same velocity, which, however, varies with the length of the chain; or (2) the individual unions in an oligosaccharide break down with different velocities; *e. g.*, (an exaggerated assumption, of course); 1 of the end unions breaks down with a velocity $k_3$ all, the others with a velocity $k_n$. If these assumptions are made, the course of the degradation of I can be calcd. quite satisfactorily. The measurement and calcn. of the kinetics of the degradation of homogeneous chains are decisively complemented by the detn. and calcn of the yields of individual fragments. It had been found that in the acetolysis of cellulose at least 61%, probably a little more but by no means 100%, of the amt. of II calcd from the equation $(C_6H_{10}O_5)_{n-1}C_6H_{12}O_6 + [(n-2)/2]H_2O = (n/2)\,C_{12}H_{22}O_{11}$ is formed throughout all the stages of the degradation. To interpret these results the above limiting case (1) was assumed; under such conditions 67% of the glucose finally obtained would have to pass through the biose stage. In limiting case (2), it is necessary, in order to calc. the biose formed throughout the course of the degradation, to know the ratio $k_n:k_2$ (cf. *C. A.* **26**, 3237; Kuhn, *C. A.* **26**, 3719). To det. this ratio, the acetolytic degradation of I and cellobiose (and the change in rotation of glucose and levoglucosan under the same conditions) were followed polarimetrically and $k_n:k_2$ was found to be 2.3, which gives 70.2% as the amt. of biose formed during the degradation (cf. the original for the method of calcn.). On the even more probable assumption that the 2 end unions of a chain break down with the velocity $k_3$ (the av. const. for the trisaccharide) and all the unions in between with the velocity $k_n$, the calcd. amt. of biose formed is very much the same as that calcd. for limiting case (2). C. A. R.

**The partition of the constituents of the cornstalk by the action of alkali.** C. J PETERSON, E. H. C. FANG AND R. M. HIXON. *Iowa State Coll. J. Sci.* **7**, No. 1, 17–24 (1932).—Original data are presented in diagrams and tables. The cornstalk can be mechanically sepd. into a pith tissue and a fibrous tissue, yielding 63% fibrous con-

stituents and 26% pith based on the weight of the original stalk. In the de Vains process, when applied to the pulping of cornstalks, the initial caustic treatment is the only variable which has any appreciable effect on the chem. compn. of the pulp. The concn. of the caustic soln. used makes very little difference so long as there is caustic enough present for pulping. The fibrous tissue of the stalk requires 12.5% NaOH, based on the dry weight of the fibers, for pulping while the pith tissue requires only 7.5% NaOH based on the dry weight of the pith. Isolated pentosan material is destroyed by pulping processes, the destruction being greater the greater the caustic concn. of the cook. The percentage of $\alpha$-cellulose as well as lignin in the pulp tends to approach a const. min. value. However, the removal of lignin is in no case complete. F. E. BROWN

**The use of ammonium hydroxide as a pulping agent for the grasses.** C. J. PETERSON AND R. M. HIXON. *Iowa State Coll. J. Sci.* 7, No. 1, 25–8(1932).—Cornstalks and oat straw were digested in closed bombs under 90–110 lb. pressure with $NH_4OH$ instead of NaOH as a pulping agent. When the bomb was opened the blow-off removed nearly all of the liquor. The remainder was washed out of the pulp. The yield of pulp was larger than with an NaOH cook and the paper stronger and less hydrated. When the liquors were evapd. and aerated nearly all of the $NH_3$ was recovered. The residue was 25% pentosans and 75% lignin. The pentosan can be sepd. from the lignin by any of the usual procedures but the thermophilic organisms which ferment isolated pentosans grew successfully in the pentosan-lignin mixture. F. E. BROWN

**Fiber fractionation as an analytical method for pulp.** CHR. ANKER AND KAARE HAUG. *Papir-J.* 20, 225–8, 269–72(1932).—Tests on the diff. fractions sepd. on Hurum's app. show that the strength of paper is detd. by the available surface in the fiber suspension. Tensile strength is dependent on the percentage of fine fiber passing through a No. 325 sieve, while the tearing factor follows the values for percentage retained on a No. 25 sieve. CLINTON L. BROOKE

**Cases of lead poisoning observed in the chemical pulp industry.** MANSFELD. *Arbeitschutz* **1932**, 142–3; *Chimie & industrie* **28**, 1332.—Pb poisoning can occur in workmen employed in lining sulfite digesters on account of the litharge-glycerol cement used. Contamination may occur either from the litharge dust or through carelessness in handling the cement before setting Attempts have been made to overcome this hazard by using special Pb-free cements, a no. of which are on the market. A. PAPINEAU-COUTURE

**Sources and limits of error in the gravimetric determination of pulp and cellulose in paper.** CHR. ANKER, KAARE HAUG AND ERIK STEPHANSEN. *Papir-J.* 20, 252–4 (1932).—When the compn. of paper is detd by the Halse method, the percentage of lignin in the chem. and mech. pulp should be detd. separately. When detns. of lignin in raw materials cannot be made, satisfactory working averages for Norwegian conditions are 2.4% in ordinary unbleached sulfite, and 25.5% in mech. spruce pulp. C. L. B.

**The reaction kinetics of sulfite-cellulose cooking.** E. STANGELAND. *Papir-J.* 20, 170–3, 193–7, 214–17, 272–4(1932); cf. *C. A.* 26, 4711.—A résumé of S.'s recent work (*Kgl. Norske Videnskab. Selskabs Skrifter* No. 1(1932)). Fourteen tables and 9 graphs are included. CLINTON L. BROOKE

**Wet charring of timber refuses and spent caustic liquors from the sulfite process of manufacturing cellulose.** N. I. NIKITIN AND N. P. NEMTZOVA. *J. Applied Chem.* (U. S. S. R.) 5, 981–90(1932).—Heating timber refuses with concd. $MgCl_2$ soln. (Schwalbe process) yields charcoal in the form of dust suitable for firing purposes. The best heating time is 6 hrs. at 180° with a 30% $MgCl_2$ soln. Resulting charcoal contains 69% C and 4.5% H and has a heating value of 5300 cal. The yield (dry basis) is 58% by wt. The yield of acids is 2.4% (calcd. as AcOH). Addn. of sulfite liquor (or the liquor alone) yields a charcoal of lower C content but with about 3% S. The yield of AcOH is slightly decreased and that of MeOH increased (from 0.4% to about 0.86%). The resulting charcoal has 34% activity ($C_6H_6$ adsorption) as compared with the best known active C. V. KALICHEVSKY

**Alterations of cellulose during grinding in the paper factory.** E. L. SELLEGER. *Chem. Weekblad* 30, 44–6(1933).—A description of the phenomena which occur in beating paper pulp and in forming the sheets. The ease with which fibers can be sepd. into fibrillae is in proportion to the degree of polarization or of dichroism in certain colors when examd. under the microscope. O. W. WILLCOX

**Present problems of importance in the paper industry.** J. O. MURTO. *Acta Chem. Fennica* 6, 1–6(1933).—A review of waste-wood utilization, with particular reference to the formation of hemi-cellulose. S. A. KARJALA

**Moisture determinations on paper during manufacture.** G. E. KROGH. *Papir-J.* 20, 234–5(1932).—Description of the Siemens & Halske "Siccometre," a device for

recording the moisture of the paper at any desired point while passing through the machines. The dielec.-const. principle is employed. CLINTON L. BROOKS

**Orientation of fibers in a sheet of paper.** L. DE WEERD. *Chem. Weekblad* **30**, 46–7(1930).—In certain cases an approx. idea of the orientation of the fibers may be had by slowly placing ink or oil on one spot and observing the form of the blot, which will be ellipsoidal. The röntgenogram of a paper which has markedly unequal breaking strengths in the long and cross-wise directions shows strong darkening in sectors on opposite sides, but when the breaking strengths are about equal the diagram is a uniformly colored circle. A no. of papers were split and the wire side and the felt side examd. röntgenographically; the Röntgen diagram shows a marked orientation of the fibers next the wire in the direction of the machine; the upper or felt layer shows very little difference in orientation. O. W. WILLCOX

**Use of latex in paper and in cardboard.** T. L. GARNER. *Caoutchouc & gutta-percha* **30**, 16260–1(1933).—A review and discussion. C. C. DAVIS

**Action of ultra-violet light on gelatin in paper.** H. A. BROMLEY. *Analyst* **58**, 29(1933).—When a tub-sized paper of good quality free from resin is irradiated by the light of a quartz Hg lamp, it rapidly loses its property of ink resistance with degradation of the surface color of the paper to a brown shade. The browning appears to be a function of the gelatin present. Tests made on the exposed paper indicate that the gelatin undergoes degradation to simple compds. W. T. H.

Cellulose. DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM. ROESSLER (Roland Runkel, inventor). Ger. 567,237, May 9, 1930. Cellulosic material is worked up under such conditions that only subordinate amts. of hemicellulose are extd. The process may comprise treatment with a mild reagent, *e. g.*, 4% NaOH soln. at 100°, followed by comminution under relatively mild conditions, *e. g.*, in a rod mill, and treatment with a chlorinating or oxidizing agent, *e. g.*, with Cl and NaOCl in turn.

Cellulose. EINAR MORTERUD. Norw. 49,240, April 13, 1931. The raw material is treated with a reaction liquid which is kept in circulation by means of a pump outside

the reaction vessels. The system has one or more reaction vessels and one or more storage containers for the reaction liquid, the latter being placed in the liquid circuit between the reaction vessels and the pump.

**Cellulosic compositions.** KODAK-PATHÉ. Fr. 736,211, Aug. 7, 1931. The compns. contain cellulose acetate and resins, waxes, etc., the cellulose acetate having an acetylation value (content of AcOH) of 53–62%.

**Purified alkali cellulose.** SYÔZÔ TATIKAWA and KIHU UEI (to Asahi Kinuori K. K.). Japan. 93,832, Dec. 8, 1931. Crushed pulp is heated with 16% NaOH at about 150° under pressure. It is then treated with 7–13% NaOH at 0–15°, to remove noncellulose materials. Finally it is treated with 18% NaOH at 0–20°, to produce purified alkali cellulose.

**Strips of regenerated cellulose or cellulose derivatives.** I. G. FARBENIND. A.-G. Ger. 567,482, Mar. 5, 1931. For the manuf. of strips carrying uniform designs, a soln. of cellulose or a cellulose deriv. is spun through a long narrow slit which is curved at the ends or intersected obliquely or at a right angle by shorter slits.

**Cellulose derivatives.** LÉON LILIENFELD. Ger. 567,364, Mar. 17, 1931. See Brit. 357,080 (*C. A.* **26**, 5753).

**Cellulose derivatives.** KODAK-PATHÉ. Fr. 736,241, Aug. 11, 1931. Cellulose acetate, nitrate, etc., in waste films are sepd. in the form of gels by immersing the derivs. in a non-solvent liquid having a d. between that of the derivs. An app. is described.

**Grinding cellulose derivatives.** BRITISH CELANESE, LTD. Brit. 380,214, July 31, 1930. Thermoplastic materials are ground in the presence of a liquefied or solidified gas at a temp. below 10°.

**Treatment of filaments, films, etc., of cellulose, cellulose hydrate or cellulose ethers.** WOLFF & CO. KOMM.-GES. AUF AKTIEN and RICHARD WEINGAND. Ger. 567,087, Oct. 13, 1927. To increase their resistance to water, the materials are treated with a water-sol. org. swelling agent, *e. g.*, AcOH, before coating with a cellulose ester soln. A water-insol. softening agent may be dissolved in the swelling agent.

**Cellulose esters of organic acids.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,489, Sept. 1, 1930. See Fr. 720,027 (*C. A.* **26**, 3918).

**Purifying cellulose solutions.** JOHANN J. STOECKLY and ERHARD WITTE (to American Glanzstoff Corp.). U. S. 1,886,504, Nov. 8. A soln. such as viscose from resinous pulp is first filtered and then a relatively small portion of the soln. is treated with an org. liquid (such as liquid paraffin) insol. in the soln. and with enough Turkey-red oil to emulsify sufficiently the entire soln. and after emulsification the treated portion is mixed with the remainder of the soln.

**Drying cellulosic or starchy materials.** W. B. CAMPBELL. Brit. 359,641, Sept. 8, 1930. Paper pulp, starchy foods or the like, which form mucilaginous surface layers when dried by direct evapn., are dried by displacing the water by one or more washings with a non-aq. liquid such as alc. or acetone (which may in turn be displaced by ether) and then drying by evapn.

**Uniting cellulose foils.** RICHARD WEINGAND. U. S. 1,888,402, Nov. 22. Cellulose foils capable of swelling in water and which have a lacquer coating are united with their lacquered surfaces juxtaposed by means of an adhesive such as a mixt. of gelatin with HOAc or lactic acid, or a similar mixt.

**Forming tubes of celluloid or like material.** SAMUEL A. NEIDICH. U. S. 1,888,045, Nov. 15. Mech. features.

**Artificial threads, films, bands, etc., from regenerated cellulose.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,785, Mar. 2, 1931. See Fr. 712,260 (*C. A.* **26**, 2055).

**Artificial products.** LÉON LILIENFELD. Fr. 41,045, Oct. 15, 1931. Addn. to 719,339 (*C. A.* **26**, 3377). In all the processes which, without the use of baths having a plastifying effect on the freshly coagulated products, give threads having a resistance in the dry state of more than 2 g. per denier, there are used, instead of viscose, the substances outlined in Fr. 719,339.

**Viscose.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,786, Mar. 2, 1931. See Fr. 712,361 (*C. A.* **26**, 2054).

**Classification of viscose.** ALGEMEENE KUNSTZIJDE UNIE N. V. Dutch 28,550, Dec. 15, 1932. Small amts. (less than 2% of the viscose) of sulfonated fatty acids or fats are used for peptization of resinous turbidities of viscose solns. The sulfonated fatty acids are prepd. by sulfonation with excess $H_2SO_4$ in the presence of acid chlorides or anhydrides; their "100%" sulfonation corresponds to 93 degrees according to Landolt (*C. A.* **22**, 4830); all fatty acid radicals are bound to $H_2SO_4$.

**Forming seamless tubular bodies from viscose or the like.** JULIUS VOSS (to Visking Corp.). U. S. 1,887,446, Nov. 8. Mech. features.

**Rayon.** HERMANN HILLRINGHAUS. Brit. 362,865, May 30, 1930. Void. In the manuf. of rayon from ammoniacal-Cu solns. of cellulose the thread from a funnel is drawn out by passing it round a drum rotating about a vertical axis and is hardened by means of hardening liquid contained inside the drum and fed to the thread through aperatures.

**Rayon.** CUPRUM (Soc. ANON.). Fr. 40,957, Oct. 27, 1931. Addn. to 721,116 (*C. A.* **26**, 4175). Construction of a centrifuge is given.

**Rayon, etc.** HENRY DREYFUS. Fr. 736,798, May 7, 1932. Threads, filaments, etc., of low denier are made by dry spinning solns. of org. derivs. of cellulose, the solns. being of relatively low concn. and high viscosity, preferably obtained by dissolving the deriv. in a solvent or solvent medium, the solvent power of which has been reduced. The viscosity is increased by the addn. of a non-solvent such as an ester, an alc. or an aromatic hydrocarbon.

**Acetate rayon by the "dry" spinning process.** N. V. DRYA, MAATSCHAPPIJ TOT EXPLOITATIE VAN KUNSTZIJDEFABRIEKEN. Dutch 28,073, Oct. 15, 1932. A spinning soln. is used with 3–5% water, at 55–65°, cellulose acetate content 23–27%, viscosity not more than 1000 (Stokes) at 20°.

**Apparatus and process for stretching filaments of rayon.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Brit. 363,238, Feb. 28, 1931.

**Spinning pot for rayon.** ALGEMEENE KUNSTZIJDE UNIE N. V. Ger. 567,383, Aug. 30, 1931.

**Rayon-spinning machine [pot type].** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. (Rudolf Etzkorn, inventor). Ger 567,295, Mar. 21, 1931.

**Apparatus for treating freshly spun rayon with liquids.** J. P. BEMBERG A.-G Ger. 567,481, Apr. 23, 1931.

**Machine for the wet treatment of rayon cakes.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. (Ferdinand Rathgeber and Adolf Rüsch, inventors). Ger. 567,352, Jan. 12, 1930.

**Drying cakes of rayon with forced air currents.** GLANZSTOFF-COURTAULDS GES Brit. 357,972, June 20, 1930. Various details of app. and operation are described.

**Lacquered spinning bobbins for the rayon industry.** BERLIN-KARLSRUHER INDUSTRIE-WERKE A.-G. Brit. 363,134, Dec. 17, 1930

**Drum for wet barking of pulp-wood logs.** GLOMMENS MEK. VERKSTED A/S. Norw 50,571, April 11, 1932.

**Rotary barking drum for pulp-wood logs.** AKTIESELSKAPET THUNES MEKANISKE VERKSTED. Norw. 50,649, April 18, 1932.

**Fiber production by mechanical disintegration of vegetable materials such as wood, bamboo, cotton stalks, etc.** FRITZ HOYER (to Akt.-Ges. für Halbzellstoff Industrie). U. S. 1,886,020, Nov. 1. The material is mixed with water having a temp not exceeding 80° and the mixt. is carried at high velocity and with the aid of centrifugal force (in a described app.) against cutting devices, a temp. not above 80° being produced in the mixt. by friction; hot steam is supplied, but not to raise the temp. above 80°, and the mech. treatment is continued until desired fiber disintegration has been effected.

**Rasping wood.** A N. RUSSELL and J. D. ROBB. Brit. 380,906, Aug. 11, 1931. Mech. construction.

**Screw press for dewatering fibrous masses.** JOHN STRINDLUND. Norw. 48,135, July 7, 1930.

**Digestion of cellulosic material for the production of paper pulp, etc.** EDMONDSON SPENCER (one half to Edward C. Benthall). U. S. 1,889,158, Nov. 29. Various details of app. and operation are described.

**Digesting materials such as wood chips.** THOMAS L. DUNBAR and ALBERT D MERRILL. U. S. 1,888,632, Nov. 22. A preheated cooking liquor of high acid content such as bisulfite liquor is prepd. and introduced into a digester contg. fibrous material such as wood chips and the liquor is pumped into the digester until the pressure in the latter rises to at least 50 lb. App. is described.

**Cellulose digester.** EINAR MORTERUD. Norw. 50,158, Feb. 1, 1932. Heating steam is introduced into a container placed in the interior of the digester; this container forms a part of an interior circulation conduit for the boiling liquid.

**Cellulose digester.** DANIEL WESTAD. Norw. 50,490, April 4, 1932. The digester is asymmetric in shape. One part of the bottom has the form of a saucer in the center of which the discharge opening is placed.

**Cellulose digester with forced circulation.** EINAR MORTERUD. Norw. 50,938, May 30, 1932.

**Cellulose digester with forced circulation.** EINAR MORTERUD. Norw. 51,189, July 18, 1932. Mech. features regarding the bottom strainer.

**Apparatus for circulating the liquid in cellulose digesters.** EINAR MORTERUD. Norw. 49,050, Dec. 28, 1931.

**Top strainer for cellulose digesters.** EINAR MORTERUD. Norw. 50,107, Jan. 25, 1932. The strainer is provided with a number of reserve overflow openings with inlets at a suitable height above the surface of the strainer.

**Bottom strainer for cellulose digesters.** EINAR MORTERUD. Norw. 48,129, July 7, 1930. Structural features.

**Bottom strainer for cellulose digesters.** KNUT M. STRAND. Norw. 48,130, July 7, 1930. Structural features.

**Treating the contents of cellulose digesters by spraying.** EINAR MORTERUD. Norw. 48,813, Dec. 29, 1930. Washing or reaction liquid is introduced into the top of the digester and sprayed over the boiled or fresh chips in portions with interruptions, so that the surfaces of the sep. particles shall be alternatingly in and out of contact with liquid.

**Washing the charge in cellulose digesters after boiling.** EINAR MORTERUD. Norw. 48,754, Dec. 8, 1930. Washing liquid at a temp. lower than that prevailing in the digester is introduced into the top part of the vessel which at the same time is put in connection with a source of an indifferent gas of desired pressure in order to maintain a const. or nearly const. pressure in the digester during the washing.

**Cooking cellulose.** ALBERT ELIAS NIELSEN. Norw. 50,044, Jan. 11, 1932. A modification of Norw. 46,601 (*C. A.* **25**, 1673). Part of the liquor circulating in the digester and the evapg. or concg. app. is taken out during cooking or evapn. and is concd. further in other app.

**Bleaching cellulose in webs.** OLAF QVILLER. Norw. 51,221, July 25, 1932. A web produced exclusively for the bleaching process is impregnated with the bleaching liquid and immediately afterward rolled up, so that the bleaching chiefly takes place while the web is in the roll form, after which the web is again torn up, distributed in water and treated further in known ways as bleached pulp.

**Bleaching wood cellulose, etc.** ERICH KAYSER (to I. G. Farbenind. A.-G.). U. S. 1,887,412, Nov. 8. The raw material is treated in the form of a paste-board sheet and in countercurrent, with bleaching solns. of successively increasing concn. of available Cl at temps. varying inversely to the Cl content of the bleaching solns.

**Cellulose pulp.** ROGER W. RICHARDSON and CLARENCE S. SHERMAN (to Canadian Industries, Ltd.). Can. 328,828, Dec. 27, 1932. Vegetable fiber material is cooked with a liquor contg. $NH_4HSO_3$, $Ca(HSO_3)_2$ and $H_2SO_3$, 5–20% of the combined $SO_2$ in the liquor being combined with $NH_3$. The pulp has high strength and is readily bleachable. Cf. *C. A.* **26**, 3112.

**Mixing tank for cellulose pulp.** AKTIESELSKAPET THUNES MEK. VERKSTED. Norw. 51,881 and 51,882, Dec. 19, 1932. Mech. features. In order to obtain a uniform consistency the pulp is kept in const. circulation in the container and is made to pass over an over-flow screen.

**Dewatering of cellulose pulp and similar fibrous masses.** JOHN STRINDLUND. Norw. 48,290, Aug. 11, 1930. The dewatering process is carried out in two steps, the sepn. of the fibers taking place before the last step of the process. App. is described.

**Apparatus for dewatering cellulose, paper and wood pulp.** SVERRE DIESEN. Norw. 48,243, Aug. 4, 1930.

**Sorting and concentrating apparatus for cellulose and wood pulp.** ARNE BLAKSTAD and WESSEL WAAL. Norw. 49,899, Dec. 14, 1931. Mech. details are given.

**Pulp.** CARL LEYST-KÜCHENMEISTER. Ger. 564,553, Apr. 4, 1929. Addn. to 562,770 (*C. A.* **27**, 1175). In working up pulp from wood, bamboo, cotton, esparto grass, straw, etc., by the app. of 562,770, the half pulp is converted to pulp by acid, neutral or alk. agents during the mech. disintegration process, mineral oil being added if necessary. The pulp is also bleached at this stage.

**Apparatus for preparing pulp from bamboo.** WM. MACKIE and A & W. SMITH & Co., LTD. Brit. 362,757, Feb. 4, 1931.

**Pulp from hard wood.** EARL P. STEVENSON (to Arthur D. Little Industrial Corp.) U. S. 1,887,863, Nov. 15. Hard wood such as oak, birch, maple or beech is digested under heat and pressure in the presence of water and an insol. carbonate such as $CaCO_3$ so that a substantially neutral condition of the liquor is maintained.

**Fiber or pulp from wood chips.** HENRY S. HOOPER (to Penobscot Chemical Fibre Co.). U. S. 1,887,241, Nov. 8. Wood chips are cooked in a $Na_2CO_3$ soln. at a temp.

of about 165° for about 0.5–1.0 hr. while permitting escape of $CO_2$ formed; a stronger soln. contg. NaOH is then added and the charge is heated at about 170° for 2–4 hrs.

**Pulping wood.** LINN BRADLEY and EDWARD P. MCKEEFE (to Bradley-McKeefe Corp.). U. S. 1,887,899, Nov. 15. Wood chips are subjected to a vacuum, gaseous $SO_2$ is introduced into the chips, and they are further supplied with an alk. cooking liquor such as NaOH to combine with the $SO_2$.

**Treating mechanical pulp from resinous wood.** HARALD JENSEN and BJÖRN RAEDER. Norw. 51,852, Dec. 12, 1932. After grinding, the pulp is extd. with a volatile solvent for resins. App. is described.

**Pressing out the water from wood pulp or cellulose.** NICOLAI ALFSEN. Norw. 50,676, April 18, 1932. The pulp is subjected to a pressure increasing automatically as the web is carried over or between the rollers in succession. Mech. features of the app. are described.

**Grinding apparatus for wood pulp.** TRYGVE KITTELSEN. Norw. 50,652, April 18, 1932.

**Grinding apparatus for wood pulp.** CHR. HURUM. Norw. 51,084, June 27, 1932. Compressed air is blown against the surface of the stone to remove the coating of fibers.

**Sorting apparatus for wood pulp.** WESSEL WAAL. Norw. 48,132, July 7, 1930.

**Vacuum sorting apparatus for wood pulp.** M. J. MAGNUSSEN. Norw. 50,320, March 7, 1932.

**Sheet-forming device for the testing of wood pulp.** PER KLEM. Norw. 49,828, Dec. 7, 1931. Details of app. are given.

**Determining the ability of wood and paper pulp to be dewatered on wire-cloth.** BRYNJULV ABRAHAMSEN. Norw. 51,695, Oct. 31, 1932. A homogeneous aq. suspension of the material is filtered under const. pressure through a small area of wire-cloth, where the pulp layer settles proportionally to the amt. of water running through the cloth. The coeff. of resistance to water through-flow of the mass can be detd. analogously to the detn. of the friction coeff. of substances. App. is described.

**Disintegrating apparatus for paper pulp.** EINAR CARLSEN. Norw. 51,394, Aug 29, 1932.

**Rotary vacuum strainer for paper pulp.** MAURITZ J. MAGNUSSEN. Norw. 47,645, March 10, 1930.

**Rotary vacuum strainer for paper pulp.** AKTIESELSKAPET MYRENS VERKSTED Norw. 47,646, March 10, 1930.

**Determining foreign substances in paper pulp.** BIRGER HURUM. Norw. 50,616, April 11, 1932. An app. is described for sepn. of substances such as sand, pulverulent matter, etc., from a sample of pulp.

**Apparatus for mixing paper pulp, etc.** AKTIESELSKAPET THUNES MEK. VERKSTED. Ger. 567,407, Oct. 25, 1931.

**Bleaching fibrous materials such as paper pulp.** EMIL EKEBERG. U. S. 1,887,587, Nov. 15. A continuous stream of pulp is mixed with a continuous stream of bleaching liquor and the mixt. is continuously discharged onto a support such as a turntable or belt which is continuously passed to deliver the mixt. of pulp and bleaching liquor to a point of discharge. App. is described.

**Suction roll for pulp.** ANFINN M. PEDERSEN. Norw. 48,244, Aug. 4, 1930.

**Suction roll for pulp.** AKTIESELSKAPET MYRENS VERKSTED. Norw. 47,836, April 28, 1930. Two or more sep. webs are produced from different points on the circumference of the roll.

**Production of thicker webs from wood pulp, cellulose, etc.** AKTIESELSKAPET MYRENS VERKSTED. Norw. 47,837, April 28, 1930. Two or more continuous webs obtained from one (cf. preceding abstract) or more suction rolls are subjected separately to a first pressing and are then joined in a common press to a thick continuous web.

**Rotary vacuum pulp strainer.** JOHN STRINDLUND. Norw. 49,538, Oct. 26, 1931.

**Treating waste liquors from soda or sulfate pulp manufacture.** ERIK LUDWIG RINMAN. Ger. 557,446, June 5, 1930. Addn. to 541,256 (*C. A.* **26**, 2056). See Brit. 354,951 (*C. A.* **26**, 4175).

**Purification of waste sodium hydroxide solution.** SEISUKE KODAMA. Japan. 93,768, Dec. 1, 1931. The waste NaOH soln. used for treatment of cellulose and contg. β- and γ-celluloses is purified by treatment with Pb, its oxide or hydroxide.

**Paper.** HAROLD R. RAFTON (to Raffold Process Corp.). U. S. 1,886,120, Nov. 1. A paper mix contg. fibrous material and alk. filler is used and is treated with a size contg saponifiable material such as rosin, a substantially preponderating amount of which is added in unsaponified form. Numerous details of procedure are described.

**Paper.** AMOS L. ALLEN (to The British Thomson-Houston Co.). Brit. 363,191, Jan. 26, 1931. See U. S. 1,850,702 (*C. A.* **26**, 2866).

**Paper.** ERIK L. RINMAN. Ger. 567,095, Apr. 23, 1926. See Brit. 269,154 (*C. A.* **22**, 1474).

**Beater or pulper for half-stuffs, etc., of the paper industry.** ANTON D. J. KUHN. Brit. 362,844, Aug. 5, 1930.

**Draw-off plugs for beaters, breakers and other paper-making machinery.** BERTRAMS, LTD., and EDWARD T. SMART. Brit. 362,822, Apr. 23, 1931.

**Paper-making apparatus.** WM. A. N. SPENCER and WILBERT A. SPENCER. U. S. 1,887,143, Nov. 8. Mech. features.

**Rolls for paper-making machinery.** FREDERICK R. WOODWARD. Brit. 363,025, Oct. 6, 1930. See U. S. 1,787,890 (*C. A.* **25**, 817).

**Breast boxes for Fourdrinier and similar paper-making machines.** HARVEY T. THORP. Brit. 362,535, Sept. 13, 1930.

**Doctor for paper-making machine.** VICKERYS, LTD. Ger. 561,239, June 10, 1931. This corresponds to Brit. 360,028 (*C. A.* **27**, 1174).

**Electrical apparatus for indicating and controlling variations of moisture content of paper webs.** FREDERICK WIERK (to Johnson & Wierk, Inc.). U. S. 1,886,508, Nov. 8.

**Apparatus for impregnating paper webs in paper machines.** JOHAN LANGUM. Norw. 49,970, Dec. 28, 1931.

**Device for preventing tearing of the web in paper machines.** ANDOR JACOBSEN. Norw. 50,493, April 4, 1932. Mech. features.

**Apparatus and process for washing paper web.** HEINRICH NICOLAUS & Co., G. M. B. H. Brit. 362,557, Sept. 24, 1930. Residual liquid used for converting the paper into parchment is removed by washing the web with friction over the whole width thereof, lengthwise of the web and in opposite directions alternately.

**Systems for removing condensed water from batteries of steam-heated drying cylinders for paper, cloth, etc.** DOUGLAS T. MACIVOR and GEORGE W. SHAW. Brit. 363,030, Oct. 13, 1930.

**Composite sheet material for playing cards, etc.** MARSHALL R. HOWARD. U. S. 1,888,672, Nov. 22. Paper stock is impregnated with a potentially reactive resin, sheeted, and the sheeted stock is coated with a pigment of white or light color and then calendered to form a printing surface; the calendered sheets are printed, a finishing coat such as a resin varnish is applied to the printed surface, followed by application of heat and pressure.

**Impregnated paper.** MARC DARRIN (to F. N. Burt Co.). U. S. 1,889,088, Nov. 29. A material such as pulp or paper is impregnated with a mixt. contg. S and chlorobiphenyl.

**Decorating paper.** WM. H. GROGAN and FRANK C. LADD (to Keith Paper Co.). U. S. 1,889,020, Nov. 29. Bubbles of colored liquid such as colored soap soln. are introduced into the paper stuff. App. is described.

**Markings and designs on paper.** OTTO KRESS. U. S. 1,887,934, Nov. 15. For marking paper in a predetd. design, a bleaching compd. such as $NaHSO_3$ is applied to predetd. areas of a damp sheet web of paper so that they will be bleached to a lighter color than the body of the sheet.

**Coloring paper on one side in the paper machine.** KRISTOFFER MÖRCH. Norw. 49,073, March 2, 1931. The paper web, still contg. 30–40% $H_2O$, is passed between a coloring roll on the under side of the web and a pressing roll on the opposite side. The color roll has an elastic, nonporous lining. The pressure between the two rolls is kept so high that any inequalities in the web are pressed down into the elastic lining of the color roll.

**Producing effects on paper, cardboard, floor-coverings, etc.** I. G. FARBENIND. A.-G. (Carl Dankert, inventor). Ger. 567,238, Oct. 30, 1930. A soln. of a cellulose ester or ether in an org. solvent is stirred into a precipitant, and the gelatinous ppt., which may be produced in the form of filaments or fibers, is added to paper pulp, preferably without drying, or to plastic masses for the manuf. of floor coverings, etc. A dye or pigment may be included in the cellulose deriv. soln. Examples are given.

**Sensitive paper.** V. ANTOINE. Belg. 388,669, June 30, 1932. Gelatin or casein is added to the stock in the beater in order to give the paper the required impermeability; a soln. of sensitizing metallic salts is applied to the sheet of paper as it is being formed; the surface of the rolls coming in contact with the impregnated face of the paper is jacketed with Ni, Al or stainless steel.

**Carbon paper.** KURT HOINKIS. Ger. 567,411, Mar. 25, 1931. The paper is

treated locally with a soln. contg. a cellulose ester, with or without a resin and a pigment whereby the paper is rendered nontranscribing at the treated parts.

**Multigraph paper.** Yu. F. Kryuger and M. P. Sviridov. Russ 25,167, Nov. 13, 1929. In the prepn. of multigraph paper with the application of Japanese silk paper and an aniline dye compn. contg. a mixt. of collodion with a vegetable oil the vegetable oil is triturated with a filler (*e. g.*, $BaSO_4$), the mixt. being dild. before use to the required consistency with a mixt of alc. and ether.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

**Recent developments in coal-mining explosives.** W. Payman. *Colliery Guardian* **146**, 153–5(1933). E. H

**Quick practical method for determining the moisture content of smokeless powder.** T. Smisniewicz and W. Wykowski *Chimie & industrie* **28**, 1289–96(1932).—The moisture content of smokeless powder depends on the relative humidity of the atm., for a given powder in a given condition of subdivision, the moisture content is const. for a given relative humidity. Conversely, in an enclosed space the relative humidity depends on the moisture content of the powder. The proposed method consists in filling a regulation-size 60-kg. powder box with the sample, inserting a Fuesse perforating hygrometer, the stem of which is provided with a stopper to close the box practically hermetically (the hygrometer is checked daily against a Lamprecht psychrometer), and reading the relative humidity at the end of 1 hr. The moisture content is then read off directly on a curve which must be established for each powder. The method is suitable for mfg. control only. A Papineau Couture

**Mechanism of the upper limit.** A. Kovalskii and P. Sadovnikov. *J. Phys. Chem.* (U. S. S. R.) **3**, 272–3(1932).—See *C. A.* **26**, 5481. E. H Rathmann

**Rise in temperature in the 110° test.** M. Desmaroux. *Mem. poudres* **25**, 100–3 (1932–33).—To establish a relationship in the stability life of powders which are heated continuously and those which are heated intermittently, the rate in rise of temp. of thermocouples in glass tubes was noted. It was found that the relation could be expressed by subtracting from the total hrs. of heating a no. of hrs. equal to one half the no. of heatings A. J. Phillips

**The question of the mechanism of the inflammation of mixtures of $H_2 + O_2$.** F. Dubovitskii. *J. Phys. Chem.* (U. S. S. R.) **3**, 270–1(1932).—See *C. A.* **26**, 5759. E. H Rathmann

**Rate of burning of colloidal propellants.** A. D. Crow and W. E Grimshaw *Nature* **131**, 60–1(1933).—Using phys data previously quoted by C. and G. (*C. A.* **26**, 2057) Hunt and Hinds (*C. A.* **27**, 1176) draw conclusions directly at variance to those of the authors with 3 of the 4 propellant compns. considered. The formula suggested by C. and G. for assigning numerical values to the energy losses at the end of the combustion cannot be used for assessing varying temp. values during the burning. Moreover, the H. and H. method of calcg. the value of the correction at each stage is open to objection. Incomplete analyses seem to indicate that the rate of burning is governed by a temp.-density and not by a pressure law. A. W. Dexter

**Explosion temperature of nitroguanidine.** H. Muraour and G. Aunis. *Mem. poudres* **25**, 91–6(1932–33).—By the use of manometric-pressure tables with corrections, the explosion temp. of nitroguanidine is calcd. to be 1990°. A. J. Phillips

**Device to isolate explosions occurring in chemical plants.** T. J. Dixon. *J. Soc. Chem. Ind.* **51**, 433T(1932).—The construction of explosion boxes is described. The portion of the gas system in which the explosion may occur must be connected to the top branch of the box. Karl Kammermeyer

Izzo, A.: **Gli esplosivi da mina per i lavori del Genio di ca[illegible]a.** Rome: E. Genio. 217 pp. L. 12. Reviewed in *Chimie & industrie* **27**, 1506(1932).

Roth, J. F.: **Über die Prüfung der Initialwirkung von Sprengkapseln und die Messung der Brisanz von Sprengstoffen mittels ihrer Initialempfindlichkeit.** Thesis, Darmstadt, 1930. 54 pp.

Wenzelberg, Otto: **Über die Schlagempfindlichkeit der Explosivstoffe.** Thesis, Darmstadt, 1930. 41 pp.

**Explosives.** LUIS E. D'A. CALLERY. Fr. 736,962, May 11, 1932. A safe explosive is prepd. by passing $NH_3$ into an aq. $CH_2O$ soln. (40–55%) at below 10°, and oxidizing the soln. with $HNO_3$ at below 5°.

**Explosive priming compositions.** EDMUND VON HERZ and HANS RATHSBURG (to Remington Arms Co.). U. S. 1,889,116, Nov. 29. Guanylnitrosaminoguanyltetracene in a proportion of about 0.5–15% is used with other ingredients such as Pb trinitroresorcinate, $Ba(NO_3)_2$, Sb sulfide, Ca silicide and glass. Cf. *C. A.* **26**, 4177.

**Explosive priming composition containing a lead salt of 3,5-dinitrobenzoic acid.** WILLI BRÜN (to Remington Arms Co.). U. S. 1,887,919, Nov. 15.

**Blasting-cap charge comprising crystallized nitromaltose.** WILLARD DE C. CRATER (to Hercules Powder Co.). U. S. 1,887,290, Nov. 8.

**Smokeless practice and sporting gunpowder.** EUGENIUSZ BAZYLEWICZ-KNIAZYKOWSKI and KAZIMIERZ PARTYKA. U. S. 1,889,462, Nov. 29. Explosive material such as a nitrocellulose mixt. is gelatinized with solvents such as alc. and ether and the gelatinized material is extruded as cylindrical threads; the threads are plunged in a fluid bath having a temp. above the b. p. of at least one of the ingredients in the thread so that such ingredient evaps. and ejects the explosive material contained in the cylindrical-shaped hardened exterior, leaving a tubular-shaped thread; the product thus formed is partially dried, cut to form thin-walled tubular grains, dried, soaked, polished and coated.

**Nitration of glycerol, etc.** NORSK SPRAENGSTOFINDUSTRI A/S. Norw. 48,252, Aug. 4, 1930. Glycerol, glycol or similar alcs. and nitration acid are introduced continuously into a reaction container contg. a mixt. of the reaction products. The liquid in the container is kept in forced circulation in closed circuit, and the finished product is discharged continuously from a point of the circuit. Mech features of the app. are described.

## 25— DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Constitution and systematic classification of sulfur dyes.** HANS ED. FIERZ-DAVID. *Naturwissenschaften* **20**, 945–7(1932).—A classification with structural formulas is given for S dyes. The first group, thiazoles with a "vat" group, also analogous thiophenes, has anthrayellow GC, indanthrene yellow, cibanone blue 3 GF, immedial yellow G (cf. Diss., J. Koch, Zürich, 1933). The second group, thiazine dyes (Bernasconi, *C. A.* **26**, 2981), has pure blue (Cassella), pyrogene indigo (CIBA), hydron blue R (I. G.) (*C. A.* **26**, 2981), pyrogene green CIBA. The third group consists of the black S dyes and is little known as to structure. This also holds for the fourth group, the indanthrene olives.

B. J. C. VAN DER HOEVEN

**Preservation of white and colored indanthrene dyes on colored indanthrene backgrounds.** J. S. TURSKI AND R. SZPECHT. *Przemysl Chem.* **16**, 86–8(1932).—A method is shown for preserving colored indanthrene backgrounds when designs of white and colored indanthrene dyes are made by means of Na dinitrophenate. The action depends on the oxidation of some of the leuco compds. of the dyes by Na dinitrophenate before it penetrates the wool.

FELIX P. LEE

**The dyeing of rayon skeins with direct dyestuffs.** ROSS M. STRIBLING. *Rayon* **13**, No. 10, 34–9, 47(1932).—The advantages and disadvantages of dyeing skeins on tubs, revolving wheel machine, revolving spindle machines and the perforated spindle machine are discussed. To test the leveling properties of a dye on rayon, test pieces are dyed at 60–5° for 5, 10, 20, 40 and 60 min., and at 27°, 49°, 71°, 82° and 100° for 45 min. One % dye, 2% olive-oil soap, 5% Glauber salts are used in a 20 to 1 dye bath. Dyes which dye as deeply in a short time as in a longer time and as deeply at 71° or under as at a higher temp. give the best results. The large-scale dyeing should be 5–10 min. at 54°, 5–10 min. at 65°, 10–15 min. at 79–82° for light shade. For medium shades 5–10% Glauber salt is added and the material is dyed an addnl. 5–10 min. at 79–82°. For dark shades 10–20% more Glauber salt is added and the dyeing continued an addnl. 10–15 min. at 82°.

A. R. MACORMAC

**Dyeing of Bemberg silk. I.** UICHIRO MIYAOKA AND TAKASHI TSUBOTA. *Shikisen (Dyeing)* **3**, 285–9(1932); *Complete Abstrs. Japan. Chem. Literature* **6**, 324(1932); cf. *C. A.* **27**, 1179.—The absorptive powers of Bemberg silk for dyes were measured with varying concns. of dyes and assistants at different temps. and times. Prolonged dyeing with heating of the silk, which has absorbed the max. amt. of dye, causes the silk to throw off the dye once absorbed, facilitates the uniform distribution of the dye and gives the silk a stronger color-absorptive power than other fibers. Hence such silk is

superior to others in the amt. of dye required to obtain the same shade, the efficiency of dyeing and the consumption of fuel. K. KONDA

**The behavior in chemicking of materials dyed with some vat and insoluble azo dyes.** D. A. DERRETT-SMITH AND C. R. NODDER. *J. Textile Inst.* **23**, 293–308T, 398T(1932).—To det. the lower limit of $p_H$ at which goods woven with colored borders can be bleached without undue degradation of the dyed yarn, cotton yarns dyed with different vat and insol. azo (Naphthol AS) dyes were treated with a range of bleaching solns. buffered at various $p_H$ values ranging between 4.5 and 11.5. Comparative tests in the daylight and in the dark indicated that the excessive tendering effect shown in daylight by the majority of the red, orange and yellow vat dyes examd. is a photocatalytic phenomenon, the dyestuff behaving in a manner analogous to that of a photographic sensitizer. The tendering in the dark was similar in amt. to that obtained with undyed yarns. Of these dyestuffs tests, Caledon Red BNS, Indanthrene Golden Orange 3G and Caledon Yellow 3GS produced the least tendering. The effect with Caledon Jade Green XS was similar to that obtained with the undyed yarn. Caledon Blue RCS and GCDS showed a protective effect. In general the tendering obtained with the naphthol combinations was not appreciably greater than that obtained with the undyed yarns, and in some instances the dyestuff exerted a protective effect. Yarn dyed with Chrysophenine, a direct dyestuff, included for comparison, showed no greater tendering than did the undyed yarn. The explanation of the difference in behavior between the vat dyestuffs and naphthol combinations is not apparent. The region of max. tendering, both in the light and in the dark, is in the neighborhood of the neutral point. With most of the red, orange and yellow vat dyes, the tendering in the light at $p_H$ values on the acid side of neutrality was excessive, but always less than at the neutral point, while comparatively little degradation occurred at $p_H$ 11.5. Indanthrene Rubine R produced increased tendering at $p_H$ 7 as the depth of dyeing was increased. Red or yellow glass screens reduced the tendering effect of this dyestuff only slightly in a 15% shade at $p_H$ 7. However, these screens reduced the tendering effect of Caledon Yellow GS considerably, the tendering under the red glass being similar to that shown in the dark by this dyestuff. Some yellowing at $p_H$ 7.0 was shown by all the green mixts. tested both in the dark and in the daylight. Anthraflavone GC-Caledon Blue GCDS was the only mixt. tested that did not tender in the daylight. As a result of this study, a hypochlorite bleach liquor not less alk. than $p_H$ 10 is recommended for the whole treatment for the safe bleaching of colored border goods. The use of certain vat dyes, such as Indanthrene Rubine R and Cibanone Yellow R, with which great tendering occurred in the presence of light at $p_H$ values above 10, should be avoided for goods which have to be bleached. RUBY K. WORNER

**Inspection in its relation to printing.** MYRON W. ALLING. *Silk Digest Weekly* **24**, No. 4, 9–12(1933); *Am. Dyestuff Reptr.* **21**, 469–76(1932).—Some causes of defects are given. H. H. MOSHER

**An elliptical wince dyeing machine for delicate fabrics.** MATHER AND PLATT. *Textile Mfr.* **57**, 444–5(1931). CHAS. E. MULLIN

**Some mistakes in the use of non-oxidizable steels in dyeing and suggestions for avoiding them.** C. M. LERICI. *Tinctoria* **31**, 445–7(1932).—To avoid intergranular corrosion of the steels in the soldered zones, it is convenient to use steels with very low C content (< 0.08–0.1%). Some other suggestions for the construction of app. are given. G. A. BRAVO

**Wetting-out rayon crepes for dyeing.** JESSE S. BROHEL. *Silk Digest Weekly* **24**, No. 4, 13–14, 16(1933).—Benefits conferred by preliminary wetting-out are listed. H. H. MOSHER

**Atmospheric control in the textile industry.** R. H. BROWN. *Proc. Am. Soc. Testing Materials* **32**, Pt. II, 733–42 (1932). E. H.

**Process heat by Krantz enclosed hot-water circulation.** H. NETZ. *Textile Mfr.* **57**, 446–7(1931).—Some applications of this system in the textile industry are described. CHAS. E. MULLIN

**Cystine and wool production.** H. E. WOODMAN AND R. E. EVANS. *Nature* 130, 1001(1932).—The 0.1% cystine content of herbage, on the basis of dry matter, is adequate to account for wool production in sheep subsisting only on pasturage. MARY E. LEAR

**A method of measuring length of wool and other fibers.** W. SEYER. *Textile Mfr.* **57**, 434–5(1931); cf. *C. A.* **26**, 5211.—A new device for measuring the length of single fibers, at the rate of about 100 per min., is described. CHAS. E. MULLIN

**Dye.** WILHELM ECKERT and HEINRICH GREUNE (to General Aniline Works). U. S. reissue 18,643, Nov. 1. A reissue of original pat. No. 1,588,451 (*C. A.* **20**, 2587).

**Dyes.** DAVID A. W. FAIRWEATHER, JOHN THOMAS and SCOTTISH DYES, LTD. Brit. 363,668, June 13, 1930. Monosulfuric esters of anthraquinoneanthranoldihydroazine and its substitution products are prepd. by treating the disulfuric esters of anthraquinoneanthrahydroquinonedihydroazine or its substitution products with reducing agents or the trisulfuric esters of anthrahydroquinoneanthranolazine or its substitution products with acids.

**Dyes.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Fr. 40,844, Oct. 5, 1931. Addn. to 702,388 (*C. A.* **25**, 4413). Mixts. of chromatable azo dyes contg. at least one of the

dyes described in Fr. 702,388, are chromed by the processes of Fr. 702,388. A chromed dye may be used as chroming agent.

**Dyes.** DURAND & HUGUENIN S. A. Fr. 737,081, May 13, 1932. Yellow mordant dyes are prepd. by condensing 3- or 4-aminonaphthalene-1,8-dicarboxylic acid or a substitution product, preferably a sulfonic deriv., thereof, or a corresponding anhydride, with an aminosalicylic acid or a homolog or substitution product thereof. Examples are given. Cf. *C. A.* **27**, 848.

**Dyes; dyeing cotton.** DAVID A. W. FAIRWEATHER, JOHN THOMAS and SCOTTISH DYES, LTD. Brit. 363,669, June 13, 1930. To obtain other than the Na and K salts of the tetrasulfuric esters of tetrahydroanthraquinonazine and its substitution products the Na and K salts are treated with reagents causing replacement of the Na or K by the desired basic radical, *e. g.*, with $MgCl_2$, $LiCl_2$, $NH_4OAc$, methylpyridinium chloride, etc. Cotton is dyed with a soln. of these salts in a bath contg. $CuSO_4$ and HCl.

**Stable dye solutions.** IMPERIAL CHEMICAL INDUSTRIES, LTD., RICHARD F. GOLDSTEIN and ALEXANDER Y. LIVINGSTONE. Brit. 362,548, Sept. 19, 1930. Stable solns of 2,3-hydroxynaphthoic arylamides are prepd. by adding gum arabic to a freshly prepd. or dild. alk. soln. of the arylamide or by dissolving the arylamide in aq. alkali in the presence of the gum.

**Azo dyes.** ERNST BODMER and FRANZ NEITZEL (to Durand & Huguenin S. A.) U. S. 1,888,903, Nov. 22. Mordant dyes are formed by the action of a suitable oxidizing agent (preferably Ca hypochlorite in an alk. medium) on compds. such as 4-amino-2-sulfobenzeneazosalicylic acid, 4-amino-3-sulfobenzeneazosalicylic acid, 4-amino-2-sulfobenzeneazo-*o*-cresotic acid, 4-amino-2-sulfobenzeneazo-*m*-cresotic acid and 4-amino-2-sulfobenzeneazo-*p*-cresotic acid. Dyes, described in examples given, dye Cr mordanted material brown or brownish yellow shades, and may be used in the form of their sol. Cr or Cu compds. if desired.

**Azo dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,513, Sept. 6, 1930. A benzidine-disulfonic or -dicarboxylic acid, or deriv. thereof, is tetrazotized, coupled with 2 mols. of a middle component (or 1 mol. of 2 middle components) capable of diazotization, again tetrazotized and coupled with 2 mols. of a similar or dissimilar *N*-alkylated or aralkylated 2,8-aminonaphthols substituted by 1 or 2 sulfonic acid groups, or derivs thereof, or alternatively by 1 mol. of such component and 1 mol. of a 2,8-aminonaphthol-disulfonic acid or deriv. thereof.

**Azo dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,987, Sept. 12, 1930. Azo dyes are formed in substance or on fiber by coupling a diazo compd. of an amino-2-alkoxycarbazole with a 2-naphthol-3-carboxylic acid arylide. Blue shades are obtained. Among examples diazotized amino-2-methoxycarbazole is coupled on cotton with 2-naphthol-3-carboxylic acid anilide.

**Azo dyes.** SOC. POUR L'IND. CHIM. À BÂLE. Fr. 735,958, April 26, 1932. Dyestuffs dyeing cotton, etc., in fast shades are obtained by diazotizing naphthalene compds. of the formula $1,8\text{-}(R^1O)C_{10}H_6(N:N.R^2\ NH_2)$ ($R^1$ is H or an acyl group, $R^2$ is a benzene or a naphthalene ring and the $NH_2$ is in the 4-position with respect to the azo chromophore) and coupling in alk. or neutral medium with azo dyes of the formula $R^4—N=N—R^3$ ($R^4$ is any diazotization component and may already contain an azo chromophore and $R^3$ is a naphthalene ring contg. $NH_2$ and OH, which has been combined in acid medium with the $R^4$ component). A large no. of examples is given.

**Azo dyes.** I. G. FARBENIND. A.-G. Fr. 736,848, May 9, 1932. 2-Amido-4,6-dinitro-1-hydroxybenzene is coupled with *m*-diamines of the $C_6H_6$ series which contain hydroxyalkyl or dihydroxyalkyl groups in one or both of the amino groups, *e. g.*, 1-amino-3-hydroxyethylamino- or 1-amino-3-($\beta,\gamma$-dihydroxypropyl)-aminobenzene.

**Azo dyes.** RINZO MINODA and YOSIMI YAMAGUTI (to Nihon Senryo Seizo K. K.). Japan. 93,357, Oct. 24, 1931. The dyes are prepd. by combining intermediates having one or more sulfonic or carboxylic groups with diazotized alkylaminodiphenylamines or alkoxydiaminodiphenylamines or their derivs., *e. g.*, methoxy- or ethoxy-aminodiphenylamine is coupled with 1,8-aminonaphthol-3,6-disulfonic acid or the like.

**Azo dyes; dyeing.** I. G. FARBENIND. A.-G. (August Modersohn and Friedrich Muth, inventors). Ger. 567,286, July 23, 1931. Diazotized 3-aminodiphenyl sulfone is coupled in substance or on the fiber with *o*-alkyl- or *o*-alkyl-*p*-chloro-anilides of 2,3-hydroxynaphthoic acid. Orange dyes are obtained.

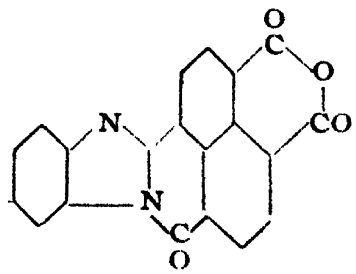
**Strongly basic azo dyes.** ACHILLE CONZETTI (to J. R. Geigy, S. A.). U. S. 1,887,289, Nov. 8. Aminated sulfo-free monoazo dyes produced from a diazotized benzene compd. coupled with $\beta$-naphthol, $\alpha$-naphthylamine or phenylmethylpyrazolone are treated successively with chloroacetyl chloride and pyridine to convert them into

basic dyes which are suitable for dyeing tannin-mordanted cotton, weighted silk, leather, etc.

**Strongly basic azo dyes.** ACHILLE CONZETTI (to J. R. Geigy, S. A.). U. S. 1,887,995, Nov. 15. Strongly basic monoazo dyes are formed by converting nitrated primary and secondary amines of the benzene series by successive treatment with chloroacetyl chloride and a compd. of the pyridine group, into a basic compd. contg. the group $(R—NA—COCH_2)ClNC_5H_5$ where R represents an aryl radical of the benzene and naphthalene series and A represents H, alkyl or aryl radical of the benzene series, reducing the nitro group of the compd. thus obtained, diazotizing and coupling same with azo components of the benzene and naphthalene series and phenylmethylpyrazolone. Pyridine may be the preferable base to be used in this process, but also quinoline or a deriv. of pyridine is usable. The new dyes in the form of their hydrochlorides are sol. in cold water and dye cotton with a tannin mordant intense and fast tints. Numerous examples are given of the production of dyes generally giving yellow to orange or red shades. U. S. 1,887,996 relates to the manuf. of strongly basic disazo dyes by starting from a diazotized aromatic amine of the benzene series, coupling with a *m*-phenylenediamine deriv. transformed by successive treatment with chloroacetyl chloride and pyridine, into a basic compd. contg. the group $(R—NA—COCH_2)ClNC_5H_5$ where R represents an aryl radical of the benzene and naphthalene series and A represents H, alkyl or aryl of the benzene series, diazotizing the monoazo compd. thus obtained and further coupling the diazo compd. with azo components of the benzene and naphthalene series and phenylmethylpyrazolone. The dye from pyridoacetyl-*p*-phenylenediamine plus pyridoacetyl-*m*-phenylenediamine plus pyridoacetyl-2,7-aminonaphthol constitutes a dark red-violet powder and yields a deep red on tannin-mordanted cotton. The dye from pyridoacetyl-*p*-phenylenediamine plus pyridoacetyl-*m*-phenylenediamine plus phenylmethylpyrazolone constitutes a yellow-brown powder and yields an orange-yellow on tannin-mordanted cotton.

**Metal compounds of azo dyes.** FRITZ STRAUB, HERMANN SCHNEIDER and HEINRICH BERNHARD (to Soc. pour l'ind. chim. à Bâle). U. S. 1,887,602, Nov. 15. Numerous examples are given of the production of products suitable *for dyeing wool, cotton, silk or leather* or for *use in varnishes* (generally blue-black or violet shades) by treating a mixt. of different azo dyes, each contg. lake-forming groups, with compds. of metals which are at least bivalent such as Cr compds. U. S. 1,887,603 relates to dyeing animal fibers such as wool by reaction, in the presence of the fiber, between *o*-hydroxyazo dyes and metal compds. (of which compds. of Cr, Fe, Mn, Ni, Co, V, U, Ti, Sn and Al are mentioned) of *o*-hydroxyazo dyes, and gives numerous details of procedure and examples. Cf. *C. A.* **26**, 3119.

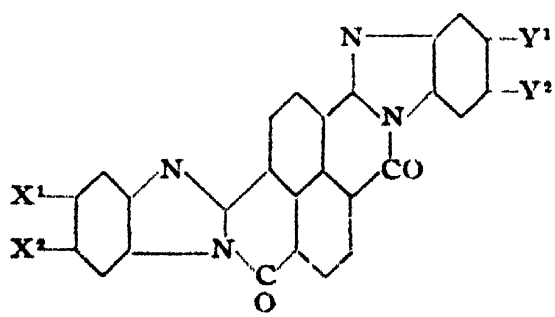
**Azo dyes containing chromium.** FRITZ STRAUB, WALTER ANDERAU and HANS MAYER (to Soc. pour l'ind. chim. à Bâle). U. S. 1,888,516, Nov. 22. Dyes of various blue shades are obtained by treating with Cr-yielding agents such as *o*-hydroxyazo dyes which are obtained by uniting diazotized 2-amino-1-hydroxybenzene of the general formula $HO\overline{C:C(NH_2)\ CX:CX.C(NO_2):CX}$ where X means H or its substituents, such as halogen, or sulfo groups, with naphthalene compds. of the general formula $2,5,7\text{-}(HO)(HO_3S)(RHN)C_{10}H_5$ where R means H, alkyl, aralkyl, aryl, alkylene, arylene or acyl, such as the *N*-methyl, *N*-ethyl, *N*-phenyl, *N*-benzyl, *N*-anisyl, *N*-phenetyl, *N*-cresyl, *N*-salicylic acid derivs. of 2-amino-5-hydroxynaphthalene-7-sulfonic acid, 2,2′-dinaphthylamine-5,5′-dihydroxy-7,7′-disulfonic acid, and the products which are obtained by condensing primary diamines with one or two mol. proportions of 2-amino-5-hydroxynaphthalene-7-sulfonic acid. Numerous examples are given.



**Black trisazo dyes.** ACHILLE CONZETTI (to J. R. Geigy, S. A.). U. S. 1,888,757, Nov. 22. See Fr. 729,323 (*C. A.* **26**, 6152).

**Azophthalein dyes.** ADOLF KREBSER (to J. R. Geigy, S. A.). U. S. 1,888,002, Nov. 15. New dyes of this series also contg. the resorcinol residue are formed by condensing an aminohydroxybenzoylbenzoic acid alkylated or arylated at the N, in equimol. proportions with an azo dye which contains resorcinol or a deriv. such that there is still a free *p*-position to one of the OH groups. In lactone form these dyes are presumed to have the general formula 2-(ArN:N)-3-(HO)-6-($RR^1N$)-fluoran in which R = alkyl, $R^1$ = alkyl or H and Ar = any aromatic residue. While the condensation products from simple resorcinol monoazo dyes are of themselves of little value as dyes, they serve as intermediate products. On the other hand, the azophthaleins obtained by means of azo dyes from resorcinol and *o*-hydroxyamino compds. are genuine mordant dyes which, when after-treated on the fiber with metal salts, yield fast dyeings of blue to greenish blue tints. Other mordant dyeing groups may be contained in the resorcinol

monoazo dyes, such as carboxyl groups or one or more carboxyl groups with a hydroxyl group in *o*-position. In the latter case the after-chromed dyeings are of reddish to brown-red tints. The condensation process may consist in heating the components with $H_2SO_4$ 66° Bé. or strongly concd. $H_2SO_4$ for some hours. Several examples are given.

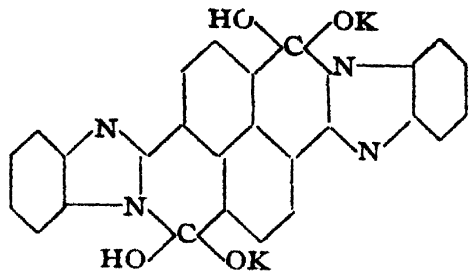


**Vat dyes.** MAX A. KUNZ, GEORG KRAENZLEIN, KARL KOEBERLE, ERICH BERTHOLD, MARTIN CORELL and HEINRICH VOLLMANN (to General Aniline Works). U. S. 1,887,812, Nov. 15. By treating 3,4,8,9-dibenzopyrene-5,10-quinone in chlorosulfuric acid successively with chlorinating and brominating agents or by similar methods vat dyes of the dibenzopyrenequinone series are formed contg. at least 2 of the halogens Cl, Br and I, which dye cotton from red to violet-red vats strong yellow to orange shades with a reddish tinge. Numerous examples are given.

**Vat dyes.** WILHELM ECKERT and OTTO BRAUNSDORF (to General Aniline Works). U. S. 1,889,279, Nov. 29. Fast dyes of various colors are obtained by condensing naphthoylenebenzimidazole-*peri*-dicarboxylic anhydride with 1,2-diaminonaphthalene and by similar condensations of a compd. of the general formula:

where X stands for H or Me, with an aromatic *o*-diamine of the benzene, naphthalene or acenaphthene series while heating in the presence of an inert diluent. Numerous examples are given. Cf. *C. A.* **26**, 3676.

**Vat dyes.** I. G. FARBENIND. A.-G. Fr. 40,505, July 17, 1931. Addn. to 693,997 (*C. A.* **25**, 2003). The isomeric mixts. of 1,4,5,8-naphthoylenediarylimidazoles prepd by Fr. 600,843 and its addns. are sepd. into their 2 constituents by transforming the mixts. in the presence of an org. diluent, into salts of org. acids such as *p*-toluenesulfonic, naphthalenesulfonic or alkylnaphthalenesulfonic acid and sepg. the salts by the difference of soly. As diluents PhCl, $PhNO_2$ or AcOH may be used. The dyes have the probable formula:



(one X and one Y are H and the other X and the other Y represent —$COCH_3$ or —$C_6H_5$, $X^1$ being identical with $Y^1$ and $X^2$ with $Y^2$) and dye vegetable fiber yellowish brown to deep brown from the vat.

**Vat dyes.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 718,154, June 4, 1931. See Brit. 358,078 (*C. A.* **26**, 5969).

**Vat dye isomers.** WILHELM ECKERT and OTTO BRAUNSDORF (to General Aniline Works). U. S. 1,888,625, Nov. 22. Isomeric dyes such as those formed together as described in U. S. 1,588,451 (*C. A.* **20**, 2587) may be sepd. into their components by use of chloroacetic acid as a selective solvent. Numerous details of procedure and examples are given for the sepn. of similar isomeric dyes. U. S. 1,888,626 also relates to generally similar dye separations.

**Vat dyes.** I. G. FARBENIND. A.-G. Fr. 41,044, Oct. 12, 1931. Addn. to 693,997 (*C. A.* **25**, 2003). Mixts. of isomeric 1,4,5,8-naphthoylenediarylimidazoles obtained by Fr. 600,843 and its addns. are sepd. into their constituents by treating the mixts. with caustic alkalies in the presence or not of a solvent or diluent, sepg. the compds. thus

formed by the differences of soly. and transforming them by hydrolysis into the corresponding dyes. The products obtained by the action of KOH are of the type below, or of the type in which the OK and OH groups are all on one side.

**Vat dye isomers of the 1,4,5,8-naphthoylenedibenzimidazole series.** WILHELM ECKERT, HEINRICH GREUNE and WILLY EICHHOLZ (to General Aniline Works). U. S. 1,888,624, Nov. 22. A dye mixt. such as is obtainable by condensing a 1,4,5,8-naphthalenetetracarboxylic acid compd. with an *o*-diamine compd. is dissolved in concd. $H_2SO_4$ and the soln. is subjected to fractional crystn. to sep. isomers.

**Derivatives of vat dyes.** SCOTTISH DYES, LTD. Ger. 567,081, Oct. 28, 1925. See Brit. 251,491 (*C. A.* **21**, 1360).

**Esters of leuco compounds of vat dyes.** I. G. FARBENINDUSTRIE A.-G. Brit. 360,958, Aug. 12, 1930. $H_2SO_4$ esters of leuco compds. of indigoid vat dyes contg. nitro groups are prepd. without reduction of the nitro groups by (*a*) the processes of Brit. 360,907 (*C. A.* **27**, 1193), (*b*) that of Ger. 556,486 (*C. A.* **26**, 5767) or (*c*) by reduction of the vat dye with a mixt. of $SO_2$ and HCOOH in the presence of a tertiary base and treatment of the product with $SO_3$ or an agent yielding $SO_3$. Among numerous examples 7,7'-dinitrothioindigo (I) is reduced with $H_2S$ in dry pyridine and the soln. esterified with chlorosulfonic acid, I is treated with chlorosulfonic methyl ester and pyridine in chlorobenzene with the addn. of powd. Cu, and the dye from 5-nitroisatin chloride and 6,7-benzo(benzyl-4-chloro)hydroxythionaphthene is reduced with $SO_2$ and HCOOH in pyridine and esterified with chlorosulfonic acid.

**Naphthalimide dyes.** WILHELM ECKERT (to General Aniline Works). U. S 1,886,797, Nov. 8. A halosulfonaphthalic acid anhydride compd. such as 4-bromosulfonaphthalic acid anhydride is caused to react with a compd. of the general formula $RNH_2$ in which R stands for H, aryl or alkyl, such as $NH_3$ or *p*-toluidine to form dyes which dye yellow or orange shades.

**Sulfur dyes.** OTTO BAYER, WILHELM HOHENEMSER and KARL LARBIG (to General Aniline Works). U. S. 1,886,365, Nov. 8. An org. compd. such as 2-methyl-3-amino-7-hydroxy-5-ethylphenazine or the like is melted with an alkali metal polysulfide in the presence of molybdic acid or other compd. of Mo, W, V, U or Sb serving to give dyes of great color intensity. Numerous examples are given.

**Dyes containing cellulose residues.** ROBERT HALLER and ALPHONSE HECKENDORN (to Soc. pour l'ind. chim. à Bâle). U. S. 1,886,480, Nov. 8. Various examples are given of the production of dyes suitable for use with mixed fabrics by causing to react compds. of the general formula: cellulose—O—C . . . . . C—halogen, where both of the C atoms belong to a 6-membered C- and N-contg. heterocyclic ring which contains at least 2 and at most 3 N atoms, on compds. of the benzene and naphthalene series which contain besides one primary amino group at least one OH group or one amino group capable of forming azo dyes, and then in converting the condensation products thus obtained into azo dyes by diazotizing and coupling with coupling components. The products thus formed may be subjected to various after-treatments such as with compds. of Cr, Cu, Fe, Mn, Ni, Co, Ti, Mo, etc., and various details and modifications of procedure are described.

**Basic dyes.** I. G. FARBENIND. A.-G. Fr. 736,079, April 28, 1932. Very sol. basic dyes are obtained by treating salts of basic dyes or the dye bases themselves with $H_3PO_4$, in the presence or not of an alkali phosphate.

**Blue basic dyes.** MORIZO YOSINO (to the Head of the Tokyo Kogyo Sikenzyo). Japan. 93,406, Oct. 27, 1931. $PhNMe_2$ is oxidized by means of a persulfate (*e. g.*, $(NH_4)_2S_2O_8$ or $K_2S_2O_8$) in a weakly acidic or neutral aq. medium, with or without catalysts (*e. g.*, $Me_2CO$, AcOH or PhOH). The product is sol. in $H_2O$ and the aq. soln. absorbs the lines ranging from 5890 to 5440 A. U.

**Dye pastes.** I. G. FARBENIND. A.-G. (Max Paquin, inventor). Ger. 567,454,

Oct. 21, 1930. Condensation products of urea or its derivs. with ammonia compds. of aliphatic aldehydes are included in pastes of anthraquinone vat dyes.

**Arylguanidines.** MARTIN BATTEGAY. Fr. 736,174, Aug. 3, 1931. Arylguanidines and their substitution products are prepd. by the reaction of $CN_2H_2.2HCl$, at high temps. in an anhyd. medium, with an arylamine or its hydrochloride, if necessary while passing a current of dry HCl gas. $CN_2H_2.2HCl$ may be replaced by substitution products of $CN_2H_2$. The products are *dyes* or intermediates. Examples are given of the prepn. of the HCl compd. of α-anthraquinonylguanidine (m. 275–280° with decompn.) and its cyclization compd., amino-*C*-1,9-pyrimidinoanthrone (m. 290–295°), the HCl compd. of β-anthraquinonylguanidine (m. 285–290° with decompn.) and amino-*C*-9,10-pyrimidino-4-nitroanthrone (blackens at 283°).

**Arylated safranines.** FRITZ HESS (to General Aniline Works). U. S. 1,886,809 Nov. 8. A reducing agent such as Fe or Zn is caused to act, while heating, upon a phenosafranine in the presence of an arylamine such as aniline, α-naphthylamine or *p*-phenylenediamine and a HCl salt of the same amine, and the mixt. thus obtained is heated to 180–260° to obtain a product which dyes silk or tanned cotton blue or violet Cf. *C. A.* **26**, 4828.

**Solid diazoazo metal halide double salts.** KARL SCHNITZSPAHN (to General Aniline Works). U. S. 1,889,298, Nov. 29. Compds. suitable for producing azo dyes on the fiber and having the general formula $[R_1N:NR(O\text{-alkyl})_nN_2]_2M(\text{halogen})_{x+2}$ where R and $R_1$ mean aryl residues, not contg. a sulfonic or carboxylic group, *n* a no. being at least 1 and *x* a no. corresponding to the valence of the metal, signified by M may be obtained by diazotizing aminoazo compds. derived from diazo compds. not contg a sulfonic or carboxylic group and amino derivs. of uni- or multi-valent aryloxyalkyl ethers, such as *o*-aminophenol ether, aminocresol ether, aminohydroquinone ethers, 1,2-aminonaphthol ethers and derivs. capable of forming *p*-aminoazo compds., and sepg the diazo salts in form of metallic double salts by adding a metallic halide salt and preferably an alkali metal halide salt, such as NaCl to the diazo solns. As such metallic halide salts those of heavy metals, such as $ZnCl_2$ or $SnCl_4$, mercury, auric and platinic chloride may be used. Several examples with details of procedure are given.

**Derivatives of the 1,2-benzanthraquinone series.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,965, Sept. 8, 1930. A *Bz*-4-halo-1,2-benzanthraquinone is treated with Cl or Br, or agents furnishing these halogens, in the presence of inorg. strongly acid agents, *e. g.*, $H_2SO_4$, halosulfonic acids and Al halides The products are *dye intermediates* Their halogen content may be increased by chlorination in an org. diluent and splitting off HCl. By heating these chlorinated products with Hg or Cu, halo-1,2-dibenzanthraquinonyls are produced which are converted into vat dyes by treatment with acid condensing agents, *e. g.*, $H_2SO_4$ and $AlCl_3$. Numerous examples are given.

**Mordants.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,501, Sept. 5, 1930. See Fr. 701,405 (*C. A.* **25**, 4135).

**Zinc mordant.** I. N. SAPGIR and N. S. RASSUDOVA. Russ. 25,225, Jan. 20, 1931 A zinc mordant is prepd. from $Na_2Cr_2O_7$, ZnO and $H_2SO_4$ or HCl characterized by a 6–8-fold excess (by wt.) of all the ingredients mentioned in comparison to ZnO.

**Colored reserves.** DURAND & HUGUENIN S. A. Fr. 40,862, Oct. 8, 1931 Addn to 721,214 (*C. A.* **26**, 4183). Fast colored reserves are obtained by prepg. the cloth with an arylide of 2,3-hydroxynaphthoic acid, printing it with a reserve contg. a salt of acid reaction, an ester of a leuco deriv. of a vat dye and Al chlorate which increases the action of the salt, developing the colored reserves, preferably with the use of an oxidation catalyst, and finally producing the color of the base by "foulardage" in a soln. of a diazo compd. Cf. *C. A.* **26**, 5216.

**Dyes and intermediates.** IMPERIAL CHEMICAL INDUSTRIES, LTD., WM. SMITH and ROBERT FRASER THOMSON. Brit. 365,165, Oct. 16, 1930. See U. S. 1,875,272 (*C. A.* **26**, 6156).

**Anthraquinone derivatives; dyes.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 735,212, Apr. 14, 1932. The disulfuric ester of 2-amino-3-fluoroanthraquinone (Brit. 365,165, cf. preceding abstr.) is made by acetylating 2-amino-3-fluoroanthraquinone, treating the resulting product with pyridine, pyridinesulfuric anhydride and Cu, steam distg. with $Na_2CO_3$ in aq. soln., filtering, treating the filtrate with CaO and NaOH at b. temp., acidifying the resulting liquid with HCl and $NaNO_2$ and sepg. the ester by crystn. Particularly sol. esters of vat dyes are prepd. by converting 2-amino-3-fluoroanthraquinone and certain of its derivs. into the corresponding disulfuric ester of the 2-amino-3-fluoroanthrahydroquinone, oxidizing with an alk. oxidizing agent in an alk. medium, and isolating the ester thus produced.

**Dyes and intermediates of the 1,2-benzanthrone series.** I. G. FARBENINDUSTRIE. A.-G. Brit. 362,482, Aug. 28, 1930. See Ger. 544,916 (*C. A.* **26**, 3678).

**Dyeing with indanthrene and similar vat dyes.** JOHN WATTERS. U. S. 1,886,857, Nov. 8. In dyeing with indanthrene and similar vat dyes developed by oxidation, the goods are subjected to loose continuous motion (in a described app.) including repeated submergence in the following baths with intermediate elevation into the air for inspection: water, a bath contg. NaOH and hydrosulfite (in excess of the amounts required to keep the dye in soln.) with addn. to this bath of the dye in dissolved form, and subsequent addn. to this bath of an oxidizing agent such as $Na_2Cr_2O_7$ to effect final development.

**Dyeing textiles.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 736,143, April 29, 1932. Good dyeings are obtained on textile fibers by applying to the fiber an *o*-aminoanthraquinonylthioglycolic acid and lactamizing this by treatment with a dil. mineral acid at a high temp. Thus the Na salt of 1-amino-4-anilinoanthraquinonyl-2-thioglycolic acid (by treating 2-bromo-1-amino-4-anilinoanthraquinone with $Na_2S$ and condensing the mercapto compd. with $ClCH_2COOH$) is applied to wool and then heated with 7% aq. HCl. The fiber is dyed grayish blue.

**Dyeing cloth, paper, etc.** ÉTABLISSEMENTS SCHAEFFER & CO. (Antoine Cassal, inventor). Fr. 736,192, Aug. 5, 1931. Cloth, paper, etc., is treated with an indigosol dye which is developed by simple exposure of all or part of its surface to solar radiations particularly ultra-violet rays. A development accelerator such as $NH_4$ molybdate, $MnCl_2$ or Na tungstate may be added.

**Dyeing cellulose derivatives.** I. G. FARBENIND. A.-G. Fr. 737,272, May 18, 1932. Cellulose acetate and other cellulose derivs. are treated with tetrahydronaphthalene-β-sulfonic acid or a salt thereof before dyeing or printing, or the acid or salt is used along with the dye.

**Dyeing cellulose derivatives.** SOC. POUR L'IND. CHIM. À BÂLE. Fr. 737,337, May 20, 1932. The products obtained by the reaction of compds. contg. active CH, or $CH_2$ groups, such as pyrazolones, dihydroxyquinolines, barbituric acids, sulfazones, methylindoles, diketohydrindenes, quinaldines, methylimidazoles, acetylacetones, benzoylacetone, dihydroresorcinols, benzyl cyanide, cyanoacetic acid, cyanoacetophenone and rhodamines, with aromatic aldehydes, nitroso derivs. or ketones are used to dye cellulose esters and ethers. A large no. of examples are given.

**Dyeing cellulose esters.** LONZA ELEKTRIZITÄTSWERKE UND CHEMISCHE FABRIKEN A.-G. Fr. 40,945, Oct. 21, 1931. Addn. to 713,908 (*C. A.* **26**, 1802). The affinity of cellulose esters for dyes is increased by incorporating therewith products resulting from the esterification of cellulose by means of anhydrides of org. acids contg. N, or anhydrides of dicarboxylic acids, or mixts. of such anhydrides with AcOH. The incorporated esters may be made simultaneously with the other esters. A subsequent treatment with oxidizing or sapong. agents may be given.

**Dyeing cellulose esters and ethers.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,846, Aug. 6, 1930. See Ger. 557,103 (*C. A.* **27**, 428).

**Dyeing cellulose esters and ethers.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,921, Aug. 6, 1930. Addn. to 272,482 (*C. A.* **22**, 1859). Cellulose esters and ethers are dyed with 1,4-diamino-2,3-dihydroxyanthraquinone etherified in both OH groups by monohydric aliphatic alcs., *e. g.*, 1,4-diamino-2,3-dimethoxyanthraquinone.

**Dyeing cellulose esters and ethers.** SOC. POUR L'IND. CHIM. À BÂLE. Brit. 363,678, June 18, 1930. Void. See Fr. 697,541 (*C. A.* **25**, 3176).

**Dyeing cellulose acetate.** JAMES S. WILSON and JOHN THOMAS (to Scottish Dyes, Ltd.). U. S. 1,886,441, Nov. 8. Cellulose acetate is impregnated with a vat dye enolic ethereal salt by heating in an aq. soln., and the vat dye is developed.

**Dyeing and printing.** I. G. FARBENINDUSTRIE A.-G. Brit. 362,061, Sept. 24, 1930. Processes for dyeing and printing textiles free from silk and dye prepns. therefor are improved by the use of morpholines free from chromophorous groups. Cf. Brit. 362,060 (*C. A.* **27**, 1208).

**Dyeing and printing textiles.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 736,463 April 30, 1932. Dry compns. for use in making azo dyes when mixed with water, comprise a *N*-sulfonic acid obtained by the action of a sulfite sol. in water on a diazonium compd., *e. g.*, diazotized chlorotoluidine, with or without subsequent reduction, and a compd. or mixt. which in acidified aq. soln. has oxidizing properties, *e. g.*, a sol. bromate or bromide.

**Dyeing and printing wool or other materials.** JULES MARTIN (DIT GAUDIT). U. S. 1,886,412, Nov. 8. A mixt. for dyeing or printing comprises acid blue, acid red or other dye usable in an acid bath, together with 10–50% by vol. of com. formic acid.

**Dyeing and printing mixed fabrics containing cotton and a cellulose ester.** HEINRICH WERDENBERG (to Durand & Huguenin S. A.). U. S. 1,886,995, Nov. 8. See Fr. 713,255 (*C. A.* **26**, 1802).

**Coloring textiles.** HENRY DREYFUS. Fr. 736,023, April 27, 1932. Aldehyde (or ketone) sulfoxylates of metals having more than one valency, *e. g.*, Sn, Ti, Cu and Fe, are used as discharge agents in the production of designs on textiles, particularly of or contg. cellulose acetate. The compds. are made by reacting an aldehyde (or ketone) sulfoxylate of an alkali metal with a chloride or other salt of Sn, Ti, Cu or Fe. Cf. *C. A.* **27**, 429.

**Discharging dyeings.** GUSTAV REDDELIEN, HANS LANGE, ALFRED FISCHRSSER and HERMANN FREUND (to General Aniline Works). U. S. 1,889,154, Nov. 29. The dyeings are treated with a quaternary dialkylphenyl-1′-methylnaphthylammonium compd. such as sulfonated dimethylphenyl-1′-methylnaphthylammonium hydroxide.

**Dye jig.** RICHARD E. RUSDEN (to Textile-Finishing Machinery Co.). U. S. 1,887,381, Nov. 8. Mech. features.

**Dye jigger.** WM. J. NORTON (to James Farmer Norton & Co., Ltd.). U. S. 1,887,462, Nov. 8. Mech. features.

**Dyeing machines.** JUAN RABASSA. Fr. 736,552, May 3, 1932. Articles are dyed in a no. of small vessels mounted so as to oscillate about an axis. The vessels may be caused to rotate rapidly about this axis for centrifugal drying of the dyed articles.

**Apparatus for dyeing fabrics.** HENRY A. WOODHEAD and MADISON R. KELLY (to Gregg Dyeing Co.). U. S. 1,889,009, Nov. 29. Structural features.

**Apparatus for dyeing furs.** ANTOINE GUINOT. Fr. 41,034, Aug. 14, 1931. Addn to 673,478 (*C. A.* **24**, 2616).

**Obtaining fibers from flax, etc.** THE ABBEY SYNDICATE, LTD., and DINSHAW RATTONJI NANJI. Ger. 567,296, June 8, 1928. See Brit. 296,333 (*C. A.* **23**, 2581–2).

**Treating vegetable fibers such as jute to resemble wool.** GINO M. ROSSATI U. S. 1,889,377, Nov. 29. The cut fibers are treated with an alkali soln. such as NaOH until binding and encrusting substances are dissolved and the individual fibers become sepd.; the fibers are then dried until they begin to crinkle, bleached, the alkali in them is neutralized and the fibers are then impregnated with a fatty acid derived from wool grease and again dried in a heated tumbler.

**Textiles.** HENRY DREYFUS. Fr. 736,073, April 28, 1932. Textiles are made from filaments and threads which have been shrunk at certain intervals of their length or which are capable of being shrunk in a differential manner at various points of their length. The shrinking agent may be $CH_2Cl_2$ or another halogenated hydrocarbon.

**Textiles.** HENRY DREYFUS. Fr. 736,860, May 9, 1932. Crepe effects are obtained on textiles made from threads of high torsion composed of filaments of cellulose acetate or other org. deriv. of cellulose, by pptg. or forming a solid or semi-solid substance on or in the threads. Fr. 736,861. Crepe effects are obtained by applying a part of the high torsion to the threads which are then treated with aq. solns. contg. acid radicals, *e. g.*, citric acid, Na citrate, dihydroxytartaric acid or $Na_2S_2O_3$, having a high coagulation of pptn. effect on the gels or solns. of cellulose ester or ether, after which the rest of the necessary torsion is applied.

**Bleaching textiles.** BLEACHING PATENT PROCESSES, LTD. Fr. 736,761, May 6, 1932. Textiles are passed into and out of a bleaching liquid over which is an inclosed atm. contg. ozonized air.

**Shrinking textiles.** HENRY DREYFUS. Fr. 736,142, April 29, 1932. Shrinkage effects are obtained on materials composed of or contg. org. derivs. of cellulose by the application of latent solvents for the derivs. The latent solvent may be $CH_2Cl_2$, $C_6H_6$ or $CCl_4$ with or without a diluent.

**Treating textiles.** CAMILLE DREYFUS. Fr. 736,670, May 4, 1932. Threads, etc., made from cellulose acetate or other org. deriv. of cellulose are conditioned by the application of an agent which is a real or latent solvent for the cellulose deriv., *e. g.*, ethyl hydroxybutyrate, to which a diluent such as a glycol and water may be added. Other solvents which may be used are benzyl alc., diacetone alc., monoacetin, diacetin, acetol, cyclohexanone, cyclopentanone, ethyl lactate and dimethyl tartrate and less advantageously triaryl phosphates and triacetin.

**Treatment of fabrics.** TYUZO SUGIMOTO. Japan. 93,485, Nov. 6, 1931. Fabrics are passed through a dil. soln. of halides of Ca, Sr or Li, passed over a hot printing roll, and then passed through anhydrous alc.

**Ornamenting fabrics containing cellulose derivatives such as ethers, acetate, etc.** WM. A. DICKIE and HAROLD HALKYARD (to Celanese Corp. of Am.). U. S. 1,889,061, Nov. 29. Fabrics contg. thermoplastic filaments such as cellulose acetate are wetted

with a volatile swelling liquid contg. a volatile liquid such as $C_6H_6$ or toluene which is a non-solvent for the cellulose deriv. and a volatile liquid such as acetone which is capable of forming a soln. with the cellulose deriv., and a design is produced by local application of heat and pressure to the fabric.

**"Frosting" articles such as textile fabrics.** MARIA L. MESA. U. S. 1,888,969, Nov. 22. An article to be treated is first dipped in a hot aq. soln. formed of gum arabic and $NH_4$ alum so that the alum crystallizes upon the article and the gum arabic seps. and hardens to serve as a binder firmly holding the crystals together; the article is then again dipped in the hot soln. and dried, to form larger crystals, and is then dipped in a coloring soln. such as an alc. soln. of aniline dye and camphor and finally again dried.

**Embossing fabrics comprising organic derivatives of cellulose.** CAMILLE DREYFUS. U. S. 1,889,045, Nov. 29. Materials such as those formed of cellulose acetate are treated with a dil. aq. soln. of acetone and then subjected to embossing under heat and pressure.

**Embossing circular knitted fabrics of thermoplastic cellulose derivatives.** CAMILLE DREYFUS. U. S. 1,889,062, Nov. 29. The material is treated with a softening agent such as aq. acetone soln. (in the treatment of cellulose acetate) and is then subjected to an embossing operation while in double thickness.

**Mercerizing composition.** CHEMISCHE FABRIK VORM. SANDOZ. Fr. 40,615, July 24, 1931. Addn. to 624,174. The wetting power of mercerizing lyes is improved by the addn. of phenols or halogenated phenols and alicyclic acids such as naphthenic acids, and, if desired, compds. not contg. $SO_3H$ or COOH but which acquire wetting properties in combination with the phenols, such as mono- or poly-hydric alcs., ketones, org. bases contg. N or hydrogenated org. compds. Cf. *C. A.* **27**, 855.

**Charging silk.** RENÉ CLAVEL. Fr. 40,791, Sept. 15, 1931. Addn. to 634,641 (*C. A.* **22**, 3997). Natural silk is charged by passing it through a bath contg. an inorg. acid, *e. g.*, 26% HCl, washing it, passing it through a bath contg. $SnCl_4$ and then through a bath contg. an alkali phosphate. Cf. *C. A.* **26**, 2605.

**Apparatus for liquid treatments of fiber hanks, etc.** AUGUST HAGGENMACHER. U. S. 1,889,048, Nov. 29. Mech. features.

**Vat, circulating pump and associated apparatus for bleaching yarn and the like.** WM. P. HORNBUCKLE and ROBERT F. CRAIG. U. S. 1,889,442, Nov. 29. Structural and mech. features.

**Drying apparatus for finishing textile materials.** EMIL J. BERGER, HOWARD W. MATTHEWS and WM. BLOCK. Brit. 362,708, Dec. 30, 1930.

**Machines for drying textile goods.** ISAAC BRAITHWAITE & SON ENGINEERS, LTD. and FRANK A. DIXON. Brit. 362,601, Oct. 22, 1930.

**Treating artificial threads, films, etc.** BRITISH CELANESE, LTD., and WM. I. TAYLOR. Brit. 362,939, Sept. 8, 1930. Threads, etc., made of or contg. cellulose acetate or other cellulose esters or ethers are improved by treatment at relatively high temps. with substances not exerting a solvent or swelling action at ordinary temp. but swelling, plasticizing or dissolving at higher temps., *e. g.*, glycerol, glycols such as ethylene glycol, diethylene glycol, etc., and ethers of glycerol and other polyhydric alcs.

**Threads or fabrics of cellulose esters.** BRITISH CELANESE, LTD., WM. A. DICKIE and ROBERT W. MONCRIEFF. Brit. 362,523, Sept. 10, 1930. Crepe threads are formed of filaments of an org. cellulose ester highly twisted together and sapond. at intervals along their length.

**Sizing textile threads.** BIANCHINI FERIER (SOC. EN NOM COLLECTIF). Fr. 40,532, Dec. 3, 1930. Addn. to 615,134. Stable aq. emulsions of drying oils for sizing threads are made by using as emulsifying agents, oleates, stearates, palmitates or linoleates of ethanolamine, and by extension, salts of fatty acids and amines in which one or more H atoms have been replaced by OH.

**Sizing textile threads.** BIANCHINI FERIER (SOC. EN NOM COLLECTIF). Fr. 40,766, Jan. 28, 1931. Addn. to 615,134. Emulsions of drying oils contg. fatty substances such as tallow, Japan wax, vegetable waxes, paraffin, non-drying oils and mineral oils are used for sizing textiles.

**Sizing textile fibers.** I. G. FARBENIND. A.-G. Fr. 41,010, Nov. 23, 1931. Addn. to 687,155 (*C. A.* **25**, 828). Polyvinyl alcs. of very high viscosity (prepd. by polymerizing a vinyl ester in the presence of a perborate and $Ac_2O$ and sapong., or by adding a small amt. of a B compd. to a polyvinyl alc. of medium or low viscosity, with or without the addn. of alkali), are used for sizing fibers. Cf. *C. A.* **27**, 854.

**Sizing artificial threads and fibers.** SOC. POUR LA FABRICATION DE LA SOIE "RHODIASETA." Fr. 736,216, Aug. 8, 1931 Threads and fibers of cellulose acetate or other org. derivs. of cellulose are sized with compns. having a basis of linseed oil, the oil having

been blown and deprived of all its drying properties. An antioxygen agent which does not afterward modify the properties of the fibers, such as hydroquinone, is added.

**Sizing rayon.** STEIN, HALL & CO., INC. Fr. 40,832, Sept. 30, 1931. Addn. to 708,249 (*C. A.* **26**, 1136). Casein alone or mixed with a hygroscopic substance such as cane sugar, glucose or glycerol and a preservative such as NaF is used instead of the compn. of Fr. 708,249, or this compn. is modified by replacing all or part of the dextrin or dextrinized starch by an animal or vegetable glue. Cf. *C. A.* **27**, 430.

**Rayon, etc.** HENRY DREYFUS. Fr. 737,226, May 17, 1932. The stretching power of rayon, ribbons, etc., made of or contg. org. derivs. of cellulose is increased by treating the threads, etc., with shrinking agents, having a swelling or latent solvent action on the cellulose deriv., *e. g.*, $CH_2Cl_2$, $C_2H_4Cl_2$, $CHCl_3$, $CCl_4$, AcOEt, etc. An org. diluent such as EtOH may be added to the shrinking agent. Cf. *C. A.* **27**, 842.

**Treatment of rayon, etc., threads.** COURTAULDS, LTD., and ERIC A. MORTON Brit. 363,064, Nov. 1, 1930. For the washing, desulfurizing, bleaching, etc., of rayon, etc., the cakes or bobbins are supported between 2 endless flexible bands by means of which they are conveyed to a source of liquid or gas under pressure, the liquid or gas being supplied to the interior of the cake or bobbin.

**Apparatus for treating wound rayon or rayon cakes with liquids.** FELDMÜHLE A.-G. VORM. LOEB, SCHORNFELD & CO. Ger. 567,380, Mar. 18, 1930, and 567,381, Apr. 8, 1930.

**Apparatus for treating wound rayon, etc., with liquids or gases in stages.** PARCOFIL A.-G. Ger. 567,379, Feb. 28, 1931.

**Apparatus for washing and after-treating spun cakes of rayon.** VEREINIGTE GLANZSTOFF FABRIKEN A.-G. Brit. 362,831, May 27, 1931.

**Apparatus for drying and treating rayon cakes.** VEREINIGTE GLANZSTOFF-FABRIKEN A.-G. Brit. 362,727, Jan. 13, 1931.

**Mothproofing wool, etc.** SOC. POUR L'IND. CHIM. À BÂLE. Fr. 735,959, April 26, 1932. Org. esters of sulfocarboxylic acids or their substitution products or salts, *e. g.*, those of Fr. 713,082, are used to protect wool, furs, etc., against moths, etc.

**Rubberized cloth.** E. I. DU PONT DE NEMOURS & CO. Fr. 41,067, Nov. 24, 1931. Addn. to 693,890 (*C. A.* **25**, 1687). The asphaltic varnish used contains an org. Fe compd. such as Fe laurate, resinate, oleate, linoleate, naphthenate, butyl phthalate or basic acetate, to aid the mixing or soln. and to act as a siccative. Natural or artificial resins may be added and a petroleum asphalt refined by steam may be used

**Silicification of fibrous materials.** OTTO STINER and LIGNAT WERKE A.-G. Brit. 362,955, Aug. 6, 1929. See Fr. 699,501 (*C. A.* **25**, 3498).

**Preservative for thread, cordage and textiles.** HANS LANDMARK and WILLIAM NAGEL. Norw. 49,855, Dec. 14, 1931. The articles are impregnated with a mixt of naphthenic acid metal salts and oil, *e. g.*, mineral or vegetable oils dissolved in a suitable solvent.

**Cleaning, emulsifying and wetting agents.** ORANIENBURGER CHEM. FAB. A.-G. (Kurt Lindner and Arno Russe, inventors). Ger. 567,361, July 29, 1926. Use is made of sulfonic acids or sulfonates derived from higher aromatic, hydroaromatic or aliphatic-aromatic ketones. Suitable agents are prepd. by sulfonating the condensation products from higher fatty acid chlorides and aromatic or hydroaromatic hydrocarbons. Examples are given of the use of the products in the *treatment of textiles and leather*.

**Wetting agents.** I. G. FARBENIND. A.-G. Fr. 40,987, Nov. 17, 1931. Addn. to 703,466 (*C. A.* **25**, 4414). Sulfonic acids or sulfuric esters of aliphatic compds. of high mol. wt. free from COOH groups, with which are incorporated a considerable amt. of compds. of polyvalent metals, *e. g.*, $MgSO_4$, $BaCl_2$, $Al_2(SO_4)_3$ or $ZnSO_4$, are used as wetting, etc., agents in the treatment of textiles.

**Treating furs, etc.** H. TH. BÖHME A.-G. Fr. 736,920, May 10, 1932. Furs are improved so as to maintain their luster when wet by impregnation with an emulsion of paraffin, wax, etc., preferably contg. a protective colloid such as gelatin, glue, tragacanth, etc. Compds. of Al sol. in water, Cl compds. such as $CCl_4$, org. acids such as AcOH and buffer salts such as AcONa are preferably added also.

**Cleaning animal fibers.** HERMANN HAAKH. Brit. 363,026, Oct. 6, 1930. See Fr. 703,379 (*C. A.* **25**, 4415).

**Weighting animal hairs.** GUSTAV SCHWEN and HANS KRZIKALLA (to I. G. Farbenind. A.-G.). U. S. 1,887,958, Nov. 15. The material is treated with an aq. prepn. contg. a water-sol. org. non-dyeing halogenated compd. of high mol. wt. such as a polyhalogenated phthalic acid which has affinity for animal fibers. Numerous examples are given.

**Fireproofing textiles.** ÉDOUARD COURBON. Fr. 736,292, Aug. 21, 1931. Textiles are rendered fireproof by treatment with a soln. contg. $(NH_4)_2SO_4$ and $(NH_4)_2HPO_4$.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Marine slime and paint chemistry.** JOHANNES B. CARPZOW. *Farben-Chem.* **3**, 453–5(1932).—Marine slime found in the North Sea is a colloidally dispersed material low in O content formed by the action of microörganisms on both org. and inorg. matter. It is highly active chemically, capable of forming complexes with metallic oxides and org. dyes. Used as a rust-preventive pigment, it combines with rust already on metal and also with the metal itself to form a protective layer of Fe silicide. Its cost is extremely low and it should develop into an important painting material. G. G. S.

**The influence of the base material on the behavior of coats of paints.** E. K. O SCHMIDT. *Oberflächentech.* **9**, 220(1932) —Surface protection by painting on wood and metal is investigated; in general, increasing the corrosion resistance of the base improves the behavior of the coat of protective paint. Anodic coatings increase the adhesive properties, as the penetration of humidity through the coating is reduced.
M. HARTENHEIM

**Developments in wood priming.** JUNIUS D. EDWARDS AND ROBERT I. WRAY. *Am. Paint J.* **17**, No. 16, 43–6, No. 17, 16–18, 42(1933).—Compared with metal, wood presents a very heterogeneous surface for painting. Moisture is a normal constituent of wood and one of the functions of paint is to reduce the rapidity of moisture changes so that checking and cracking will not take place. From a review of exposure tests of Al paint it is concluded that its sustained high-moisture impermeability is an important factor in its durability. G. G. SWARD

**Testing of waterproofing qualities of protective paints.** RICHARD GRÜN. *Tonind.-Ztg* **56**, 1087–8(1932).—A permeable disk covered with the protective coat is subjected to water at desired pressures. H. F. K.

**The influence of temperature on pigments.** GEORG ZERR. *Farbe u. Lack* **1933**, 5–6.—The adverse and favorable influences of heat treatment on pigments during both manuf. and use are briefly described. G. G. SWARD

**Dry colors.** CARL A. HENLEIN *Am. Paint J.* **17**, No. 15, 18, *et seq.; Official Digest Fed. Paint Varnish Production Clubs* No. **122**, 26–31(Jan. 1933) —The importance of testing dry colors in vehicles and in the manner in which they are to be used is illustrated by examples. The following topics relating to dry colors are considered: mixing of pigments, hiding power, light fastness, texture, flooding and identification.
G. G. SWARD

**The tinting strength of Berlin [Prussian] blue.** GEORG ZERR. *Farbe u. Lack* **1932**, 640.—Neither dry mixing of Berlin blue with the white pigment nor mixing the pastes of the blue and white pigments gives concordant tinting strength results. A recommended method is: The Berlin blue is dissolved in a dil. soln. of $(COOH)_2$ with gentle heat. To the soln is added the white pigment upon which the Berlin blue is pptd and adsorbed. The pigment is then filtered off, dried and ground in oil in the usual manner. G. G. SWARD

**Water-soluble salts in red iron oxide.** FRITZ-JÜRGEN PETERS. *Farbe u. Lack* **1933**, 3–4.—The adverse influence on rust prevention of $H_2O$-sol salts in red Fe-oxide pigments is illustrated. G. G. SWARD

**Titanium oxide.** J. GREENFIELD. *Paint Manuf.* **2**, 307–10(1932).—A brief history is given of the element Ti and of the development of Ti pigments. G. G. SWARD

**Bideford black—a new mineral black.** H. M. LANGTON. *Paint & Varnish Prod. Mgr.* **9**, No. 2, 6, 8(1933); cf. *C. A.* **25**, 423 —The pigment known as Bideford black, although known for 100 years, has only recently been produced in com. quantities. It is found near Bideford, Eng. The refined pigment contains 65% C and is classed as anthracitic rather than graphitic. Its tinting strength is twice that of ivory black, its oil absorption about 40% by wt. A no. of special uses are described, *e. g.*, printing inks, coloring concrete and rubber. G. G. SWARD

**Lead and zinc pigments and salts in 1931.** E. W. PEHRSON. *Bur. Mines, Mineral Resources of the U. S. 1931*, Pt. I, 211–25(preprint No 13, published December 19, 1932). E. H.

**Relationships of technical importance between the physical structures and the colors of lead chromate and of lead sulfate chromate.** I. SAPGIR, N. RASSUDOVA AND

F. KVITNER. *Lakokrasochnuyu Ind.* 1932, No. 1–2, 56–63.—$PbCrO_4$ can exist either in the rhombic modification having a color tone O2 or in the monoclinic modification having a color tone of 13. $PbCrO_4$ having a citron-yellow color can be prepd. from $Pb(OAc)_2$ soln. of av. concn. or from $Pb(OAc)_2.2PbO$. The best citron-yellow color is obtained when $PbO:Na_2Cr_2O_7 = 1:0.5$. If more of the basic Pb acetate is added the ppt. is brighter. The brighter-colored modification of $PbCrO_4$ can be prepd. by pptg. $Pb(OAc)_2$ of av. concn. (1:10) at room temp. The ppt. must be washed with distd. water and must be dried *in vacuo* at not more than 25°. It is stable for months, and paint made from it by incorporation with glue is not very changeable; the oil paint, however, is changeable, but can be stabilized by naphthenic acid salts. X-ray patterns indicate that the bright-colored modification of $PbCrO_4$ is rhombic and the dark yellow modification monoclinic. $nPbCrO_4.mPbSO_4$ having a bright yellow color may be either rhombic or monoclinic depending on the ratio of $m:n$. It is monoclinic if $PbCrO_4.PbSO_4$ contains 50% or more $PbCrO_4$. The color of the rhombic modification is less stable. Under the microscope the rhombic modification of $PbCrO_4$ appears as small grains, the monoclinic modification as small needles of rather irregular shape. This could be utilized as a qual. criterion of the value of $PbCrO_4$ paints from the technical standpoint. Exptl. results on lead chromate paints indicate that the rhombic modification is very much less stable than the monoclinic modification. G. S. STAMATOFF

**Some problems of the oxidation of drying oils.** R. S. MORRELL AND S. MARKS. *Paint Manuf.* 3, 10–13, 21–2(1933).—Review. G. G. SWARD

**Color measurement of oils and resins.** E. FONROBERT. *Paint Manuf.* 3, 14–17 (1933); cf. *C. A.* 26, 4724. G. G. SWARD

**Colored printing inks.** HANS HADERT. *Paint Manuf.* 3, 5–9(1933).—Litho varnish for colored inks is prepd. exactly as for black inks, the preferred method being cooking of the oil in open pots. The great variety of inks requires individual treatment for each purpose. The principal pigments in use are enumerated and their properties in inks briefly described. G. G. SWARD

**Experiments in the development of frost-finish varnishes.** KÖHLER AND B. REICH *Farbe u. Lack* 1933, 7.—To obtain a uniform frost-like finish with tung-oil varnishes, the atm. of the oven should be in motion, be devoid of $O_2$, and the temp. should not exceed 35–40. G. G. SWARD

**Varnish [and lacquer] as adhesives.** WILHELM HUTH. *Farben-Chem.* 3, 427–8, 465–6(1932).—The fundamental properties of matter related to adhesiveness, *viz.*, high mol. wt., solvation in solvents, and elasticity are possessed by numerous synthetic resins, especially the polyvinyl type. This resin is especially suitable for the manuf. of safety glass. G. G. SWARD

**The influence of orpiment in shellac on the protective properties of the varnish.** M. RANGASWAMI. *Indian Lac Research Inst. Bull.* No. 10, 7 pp.(1932); cf. *C. A.* 26, 5439.—The influence of large quantities of orpiment in shellac on some of the properties of the resulting varnish was studied by means of comparative tests made with and without the addn. of orpiment in the manuf. of shellac. Tests on the color of filtered varnishes indicate that the lighter color or orpimented shellac is only an optical effect, resulting from the suspension of fine orpiment. Varnishes contg. orpiment give films of satisfactory color and appearance, provided too much orpiment has not been used No distinct difference was noticed in the behavior of films toward water (blushing, water absorption and chalking) on either glass or wood. An excess of orpiment tends to reduce the scratch-hardness and the resistance to abrasion of the film and shortens to a small extent the life of the film on exposure to weather conditions. A fair amt. present in a fine form may not, however, adversely affect the resistance of the film The use of orpiment appears to be of no useful purpose in regard to the protective properties of the varnish film. Cf. *C. A.* 22, 3538; H. A. Nelson and F. C. Schmutz, *Proc. Am. Soc. Test. Mat.* 24, II, 920(1924). D. THUESEN

**Testing the light proofness of nitrocellulose in lacquer.** W. TOBLDTE. *Farben-Chem.* 4, 5–7(1933).—A BuOAc soln. of the nitrocellulose film is shaken with $H_2O$ and the latter submitted to Erdmann's diazo test for $HNO_2$. Brief tests are described showing the influence of dibutyl phthalate, damar and ZnO in preventing the decompn. of the nitrocellulose by light. G. G. SWARD

**Comparative tests of nitrocellulose lacquer coats on duraluminum and wood.** TICHONOV. *Malyarnoe Delo* 1932, No. 1, 36.—Nitrocellulose lacquers were tested thoroughly on duraluminum and wood parts of airplanes, and found satisfactory. Also in *Nitrocellulose* 3, 227. E. M. SYMMES

**Photogravure by means of the wet collodion process.** ANON. *British and Colonial*

*Printer* **3**, New Series No. 207, 344(1932); No. 208, 372(1932); *Nitrocellulose* **3**, 228.—Historical and descriptive. E. M. Symmes

**Airplane lacquers abroad.** H. Keyring. *Ind. Lack. Betr.* No. **11**, 136(1932); *Nitrocellulose* **3**, 206.—The degree of protection was in the order (*a*) Zn chromate-synthetic resin, (*b*) Fe oxide-synthetic resin, (*c*) oxide-oil base coat baked 2 hrs. at 107°, (*d*) synthetic resin pigmented with Al, (*e*) air-dried lampblack-synthetic resin, (*f*) air-dried oxide-oil base coat. Aniline dyes in nitrocellulose lacquer gave surprisingly good results. E. M. Symmes

**How long have nitrocellulose lacquers been known?** Anon. *Ind. Lack. Betr.* No. **17**, 201(1932); *Nitrocellulose* **3**, 205.—Historical. E. M. Symmes

**Selection of thinners [for nitrocellulose lacquers].** E. E. Halls. *Paint Manuf.* **2**, 311–15(1932).—In the selection of thinners for nitrocellulose lacquers, the following properties should be considered by the user: miscibility, evapn. rate, effect on film, effect on coated surface. Some practical notes on testing are given. G. G. Sward

**Essential requirements for quick finish.** A. W. C. Harrison. *Paint & Varnish Prod. Mgr.* **9**, No. 1, 26-8(1933).—Instances are cited showing the necessity for following exact finishing procedure in lab. testing. G. G. Sward

**Types of stoving finishes.** A. W. C. Harrison. *Synthetic and Applied Finishes* **3**, 96–8(1933). E. H.

**The solubility of rosin in benzine.** F. Sander. *Farbe u. Lack* **1932**, 643–4.—A review of the literature reveals inconsistent data on the soly. of rosin in benzine. The cause is probably assocd. with the varying colloidal states of the samples examd. **Note.** J. Scheiber. *Ibid* 644.—The colloidal state of rosin is not necessarily a source of its varying soly. It often contains oxidation products, which are less sol. than the original rosin. G. G. Sward

**Phenolphthalein as basis of a new type resin.** Walther Herzog. *Farben-Chem.* **4**, 8–9(1933).—Fused phenolphthalein, although contg. the resinophoric group -C=C—CO—, reverts to the cryst. form when used in films. On the other hand, the substitution of heavy groups for H to produce ethers and esters of phenolphthalein reduces the crystg. forces below the colloid state producing forces so that stable resins with valuable properties are obtained. G. G. Sward

**Artificial resins.** A. Salmony-Karsten. *Kunststoffe* **23**, 1–3(1933).—Baekeland's theory, that the mols. in Bakelite consist of Ph residues linked together by formaldehyde residues into a ring with a relatively small no. of members, is rejected in favor of Koebner's structural formula according to which the Bakelite mols. are built up by phenol and formaldehyde reacting together to form either long chains or complicated net-works. J. W. Perry

**Xanthorrhoea and its resins.** Helen T. Cooke. *Chem. Eng. Mining Rev.* **25**, 92–5 (1932).—These resins belong to the class of high priced aromatic resins. Xanthorrhoea resin has little body, is stained by water, is sol. in NaOH, and to a small extent in $Na_2CO_3$, borax and CaO. The soly. varies with the $p_H$ of the soln., increasing with increase in concn. of hydroxyl ion. W. H. Boynton

The structure of commercial Zn dust (Wassermann) **2**. Titanic acid and Ti pigment (Norw. pat. 51,236) **18**. Polishing composition for varnished surfaces (Brit. pat. 363,036) **18**. Metal compounds of azo dyes [for use in varnishes] (U. S. pat. 1,887,602) **25**. Oil-soluble heavy-metal salts of sulfonic acids [paint driers] (Dutch pat. 28,002) **10**. Aromatic halomethyl compounds [as initial materials for making artificial resins] (U. S. pat. 1,887,396) **10**. C black for use in ink, etc. (U. S. pat. 1,889,429) **18**.

Wolff, Hans: **Über Kombination von Nitrozellulose mit Ölen.** Ein Beitrag zur Kenntnis der Kombinationslacke. Berlin: VDI-Verlag G. m. b. H. 35 pp. M. 3.70.

Herbig, Wolfgang: **Die Quellungsprozesse bei Öl- und Öllackfilmen.** Thesis, Hanover, 1931. 109 pp.

Naltsas, Alexander: **Die Trockenprozesse fetter Öle.** Thesis, Leipzig, 1930. 54 pp.

**Heavy metal salts of ketonic benzoates.** Herman A. Bruson (to Röhm & Haas Co.). U. S. 1,880,759, Oct. 4. Salts such as the Co, Mn or Pb salts of *p*-cymoyl-*o*-benzoic acid, etc., are *driers for oils, paints and varnishes.* Numerous details of manuf. are given.

**Paint.** ITITARO SYÔZI (Gen Matumoto, inventor). Japan. 93,213, Oct. 12, 1931. A mixt. of paulownia oil and rosin ester is heated until the polymerization is completed. Another mixt. of paulownia oil, rosin ester and fatty acids of the oil is treated as above, the two heated products are mixed and litharge and pigments are added.

**Paint.** ITITARO SYÔZI (Gen Matumoto, inventor). Japan. 93,818, Dec. 4, 1931 Addn. to 93,213 (preceding abstract). The paint is made by mixing a paulownia paint, a nitrocellulose paint, a slowly evapg. solvent (such as white spirit), and a rapidly evapg. solvent (such as benzene, toluene or xylene).

**Fireproof paint.** SAKAZIRO OSIMA and SIZUO YONEDA. Japan. 93,236, Oct. 13, 1931. The paint is a mixt. of Zn dust, chalk, $Na_2CO_3$, Na silicate and Turkey-red oil.

**Hardening of silicic acid ester paint.** TUNETARO SAKAMI (to Kansai Paint K. K.). Japan. 93,484, Nov. 6, 1931. Paint film prepd. from silicate sol, pigment, oils, etc., is heated by a flame or electrically to convert the ester to $SiO_2$.

**Painting on aluminum.** ERNST MATHIEU. Fr. 736,151, Jan. 9, 1931. A mixt contg. BuOH, natural or synthetic resin and AcOMe is applied to Al before painting it.

**Antifouling composition for ship bottoms, etc.** ABRAM J. N. GRAAFLAND and FREDERIK J. NELLENSTEIN. Brit. 362,526, Sept. 10, 1930. The compn. comprises a hydraulic binder, *e. g.*, portland cement, mixed with a poisonous substance, either org or inorg., *e. g.*, $CdCO_3$, that does not act upon Fe. Fillers, *e. g*, sand, may be added.

**Base for paints, varnishes and lacquers.** EDWARD C. HOLTON (to Sherwin-Williams Co.). U. S. 1,888,595, Nov. 22. A mixt. of castor oil and a vegetable drying oil such as linseed oil having an I value above 100 is subjected to destructive distn. until the residue is 70–90% the original wt. of the mixt. and the residue is then heated with a polyhydric alc. such as glycerol.

**Ball mill for grinding paints.** DENNIS A. MCKINNEY (to Ford Motor Co.). U. S 1,888,735, Nov. 22.

**Mixing and grinding apparatus for paints, etc.** D. ANDERSON & SONS, LTD. Ger 560,303, June 19, 1929. See Brit. 302,561.

**Reactive pigment components.** TITAN CO. A/S. Norw. 51,237, Aug. 1, 1932 An alk. earth metal sulfate incorporated with oxides, hydroxides or basic carbonates of Zn and (or) Mg is produced by mixing an alk. earth metal carbonate (which may be in aq. suspension) with an aq. soln. of Zn and (or) Mg sulfate, after which the suspension is evapd. to dryness, washed if desired and ignited.

**Ferric oxide pigment.** EMIL M. LOFLAND. U. S. 1,888,464, Nov. 22. Metallic Fe is subjected to oxidation to produce hydrous FeO which is sepd. from the metallic Fe, alkalized in a body of liquid and oxidized to $Fe_2O_3$. An arrangement of app. is described.

**Titanium white.** SIMON J. LUBOWSKY (to Metal & Thermit Corp.). U. S 1,888,993, Nov. 29. A product produced by heating together oxides of Ti and Mg is dissolved with acid such as $H_2SO_4$ and the resulting Ti-Mg salt soln. is heated to above 100° and the resulting pptd. Ti compd. is digested with its mother liquor for an extended time (suitably about 4–5 hrs.) under superatm pressure and at a corresponding temp to increase the opacity and improve the pigmentary covering power of the material.

**Apparatus and process for producing zinc white.** VIKTOR SZIDON. Brit. 362,812, April 1, 1931. See Fr. 724,222 (*C. A.* **26**, 4969).

**Zinc sulfide precipitation and pigment manufacture.** NIELS C. CHRISTENSEN U. S. 1,886,165, Nov. 1. In pptg. Zn from a chloride soln., finely divided $CaCO_3$ is mixed with the soln. and Ca sulfohydrate is added in substantially equimol. proportion to the added $CaCO_3$, thus pptg. ZnS and forming $CaCl_2$ in soln.

**Colloidally dispersed white lead from lead oxide.** ERNST STELZER (to Th. Goldschmidt A.-G.). U. S. 1,886,915, Nov. 8. $CO_2$ is passed into an aq. suspension of Pb oxide contg. a small proportion of $NH_3$.

**Sunfast and inert lithopone.** KENNETH S. MOWLDS and WM. SEGUINE, JR. (to Krebs Pigment & Color Corp.). U. S. 1,885,940, Nov. 1. ZnO is removed from heat-treated lithopone by suspending the lithopone in an aq. $NH_3$ soln., passing $CO_2$ through the suspension and sepg. the ZnO-contg. soln. from the lithopone.

**Drying oil suitable for use in paints and varnishes.** LANNING P. RANKIN (to Hercules Powder Co.). U. S. 1,886,586, Nov. 8. A pine deriv. such as turpentine or pine oil is subjected to polymerization and the polymerized product is ozonized.

**Apparatus and process for the production of thickened [stand] oil by addition of wood oil.** JOSEF SOMMER and SYDNEY J. RALPH. Brit. 362,545, Sept. 17, 1930. Wood oil, heated to near the polymerization point but safely below the gelatinization point is introduced into hot polymerized linseed or like oil in such proportions and dispersion

as to be instantly heated to the polymerization point without opportunity for gelatinization, and thoroughly incorporated.

**Boiled oil.** TH. GOLDSCHMIDT A.-G. Fr. 737,275, May 18, 1932. The oils are improved by reducing the content of acids by distn. under reduced pressure, with or without the passage of inert vapors.

**Printing ink.** A. F. WARE. Brit. 346,311, Dec. 1, 1928. An ink suitable for use in color printing comprises a mucilaginous base such as a starch or modified starch produced by action of perborates, honey, dextrin, molasses, or the like which may be mixed with glycerol and coloring substances.

**Printing ink.** M. BAER. Brit. 346,313, Aug. 8, 1929. An ink suitable for label printing comprises chrome yellow and gold bronze mixed with materials such as cresylic acid, $H_2SO_4$, borax, flour, varnish and water.

**Printing ink.** E. FRENKEL. Brit. 351,824, Sept. 10, 1929. An ink, suitable for use in multicolor printing, is prepd. with blown linseed oil having an acetyl value of at least 100, so as to produce quick drying. The oil may be prepd. by heating to 60–200° and blowing with air or other O-contg. gas, and addnl. driers may be added to the ink.

**Writing ink.** R. A. BELMONT. Brit. 351,611, April 9, 1930. A freely flowing ink of non-spreading, quick drying and indelible character is formed of an aq. soln. of a coloring substance and a penetrating agent such as $Na_2S$, or other sulfide or hydrate of Na, K or Ca. Cf. *C. A.* **26**, 1459.

**Ink for printing on fruits.** MATABEI SINOZAKI. Japan. 93,651, Nov. 18, 1931. The ink is manufd. from phenolic soln. of spirit color, Bakelite A, amyl acetate, alc. or MeOH and a color lake.

**Ink for gravure printing.** TAKIZIRO MORIYASU, SYUKU YOSIDA and TAMOTU YOSINO. Japan. 93,260, Oct. 15, 1931. The ink is prepd. from cellulose esters, casein, gelatin, linseed oil, HCHO, etc.

**Waterproof ink.** KITIHEI OGAWA. Japan. 94,021, Dec. 21, 1931. The ink is prepd. by mixing hematin ext., Fe acetate or formate, sulfites or hyposulfites, acidic dye and a viscous reagent.

**Washable ink.** MATABEI SINOZAKI. Japan. 93,381, Oct. 26, 1931. The ink is prepd. by mixing spirit-sol. nigrosine, phenol, MeOH, alc. AcOH, C black, castor oil and cinnamaldehyde.

**Frosting ink.** TIYOKITI MOROBOSI. Japan. 93,295, Oct. 16, 1931. The ink is prepd. by adding a mixt. of an aq. soln. of pure white starch and Turkey-red oil to an ordinary printing ink.

**Varnish.** TURUZÔ YAGI. Japan. 93,944, Dec. 15, 1931. Varnish is prepd. by mixing benzene, PhOH, alc., shellac, collodion, amyl acetate, ether, camphor oil, etc.

**Varnishes, etc.** HENRY A. GARDNER. Ger. 563,080, April 8, 1930. See Brit. 351,637 (*C. A.* **26**, 3125).

**Varnishes, paints and plastic masses.** FIRMA THEODOR KOTTHOFF (Alexander Eibner, inventor). Ger. 567,133, Sept. 8, 1929. Solns. of stand-oil exts., prepd. as described in Ger. 546,679 (*C. A.* **26**, 3685), are used as varnishes or paint vehicles or as constituents of nitrocellulose lacquers or plastic masses.

**Varnishes, plastics, etc.** SOC. POUR L'IND. CHIM. À BÂLE. Fr. 737,338, May 20, 1932. Amides of org. acids, difficultly sol. or insol. in water but easily sol. in alc. are used for mixing coloring materials used for varnishes, plastics, etc. Compds. which may be used include *o*- or *p*-toluenesulfamide, chlorobenzenesulfamide, acetanilide, stearic acid amide, palmitic acid anilide, benzanilide, etc.

**Varnishes, lacquers, etc.** "HEROLD" A.-G. Brit. 362,728, Jan. 13, 1931. See Fr. 709,510 (*C. A.* **26**, 1459).

**The paulownia-oil varnish.** TEIZO HAGIYA (to Teikoku Toryô K. K.). Japan. 93,602, Nov. 16, 1931. A mixt. of synthetic resin and the paulownia oil is heated at high temp. with the addn. of naphthols or naphthylamines and then mixed with driers (Pb, Mn and Co resinates).

**Plant for producing printing varnishes of low acid content.** WILHELM SCHMIDDING (trading as the firm Wilhelm Schmidding) and ANDREAS SCHAEFER. Brit. 363,190, Jan. 26, 1931.

**Coating composition.** GORDON D. PATTERSON (to E. I. du Pont de Nemours & Co.). U. S. 1,889,130, Nov. 29. A compn. which is of stable character comprises a heat-sensitive polyhydric alc.-"polybasic" acid resin and a stabilized ZnS type of pigment contg. less than 0.1% HOAc-sol. substances (calcd. as ZnO). Cf. *C. A.* **27**, 1215.

**Coating composition.** WALTER NEBEL (to Canadian Industries, Ltd.). Can.

327,818, Nov. 22, 1932. A sanding sealer comprises a cellulose deriv., a sanding promoter and a resin contg. in combined form the reaction product of glycerol, phthalic anhydride, rosin and stearic acid. The resin contains glyceryl phthalate not more than 65, stearic glyceride not more than 40 and rosin glyceride not more than 60% by wt. of the resin. Cf. *C. A.* **27**, 1215.

**Coating composition.** ADOLF HECK (to Cook Paint and Varnish Co.). Can. 329,051, Jan. 3, 1933. An oxidized drying oil 80–120, a phenol 100, a natural resin 15–50 and an aldehyde 25–100 parts by wt are made to react in the presence of alk. catalysts. The product is sol. in light hydrocarbon oils and in drying oils.

**Coating compositions containing a synthetic resin.** CARLETON ELLIS (to Ellis-Foster Co.). U. S. 1,886,242, Nov. 1. Coating compns. or lacquers are formed, which contain a benzoic polyhydric alc. resin complex having an acid number below 30.

**Coating or impregnating compositions containing cellulose derivatives.** BRITISH CELANESE, LTD. and WM. H. MOSS. Brit. 362,480, Aug. 28, 1930. The compns. comprise a substantial proportion of volatile solvent with (1) a cellulose ether and more than an equal quantity of a tartrate ester plasticizer, or (2) a cellulose deriv. with more than an equal quantity of an aromatic sulfonamide or a deriv. thereof, *e. g.*, an *N*-alkylated sulfonamide. Among examples is the following compn.: cellulose acetate 100, dibutyl tartrate 150, triphenyl phosphate 15, acetone 500 and methyl acetone 500 parts.

**Protecting rubber and other insulating materials.** BRITISH CELANESE, LTD., and WM. H. MOSS. Brit. 362,481, Aug. 28, 1930. The insulation of elec. app. is coated with a compn. of the character described in Brit. 362,480 (preceding abstr.).

**Protective coatings on iron, wood or other materials.** VICTORIA VEGYESZETI MÜVEK, R. T. Brit. 348,091, June 8, 1929. Coatings are formed of oxides or hydroxides of Al or Si which are coagulated, in some cases with oxides or hydroxides of Fe or Ti, by heating and are dehydrated as required. The ground material may be applied over a coating of varnish.

**Ornamenting paper, wood, leather or other materials.** F. K. WICKEL. Brit. 347,888, May 3, 1930. The material is coated with a foundation coating such as a mixt. of powd. mica in an adhesive vehicle, then treated with a transparent coating such as one comprising a synthetic or natural resin, casein or egg albumin or a cellulose deriv., and the coating is finally rubbed with Bi or Sb oxychloride to produce a metallic luster. Various details and modifications of operation are described.

**Antioxidants for coating compositions.** JAMES K. HUNT and GEORGE H. LATHAM (to Canadian Industries, Ltd.). Can. 329,223, Jan. 10, 1933. A drier is added to an oil-type coating compn. in an amt. to induce the desired rate of drying in thin films and then creosol is added in an amt. to bring about the required degree of retardation of oxidation in bulk.

**Writing tablets.** W. THOMAS. Brit. 343,742, Feb. 19, 1930. A front transparent sheet such as celluloid or cellulose acetate is used with a back sheet of impervious material such as metal or linoleum and an intermediate paste-like compn. of contrasting color which is displaced to expose the back sheet by passing a stylus over the front sheet The intermediate material may be formed of greasy material mixed with a pigment such as zinc white, lampblack or red ocher. The markings can be erased by rubbing or rolling.

**Water-soluble resinate from rosin.** EDWARD H. FRENCH. U. S. 1,889,405, Nov. 29. Rosin such as that from "black liquor" is dissolved in a water-insol. volatile solvent such as gasoline and sufficient alk. alkali metal compd. such as $Na_2CO_3$ is added to neutralize at least the major portion of the rosin in the presence of water in insufficient quantity to cause the formation of an emulsion; the water present is distd. off while replacing any solvent also distg. and the pptd. resinate is sepd. from the remaining liquid.

**Resinous compositions suitable for coatings or molded articles.** EDWARD S. DAWSON, JR. (to General Elec. Co.). U. S. 1,888,849, Nov. 22. A drying oil such as linseed oil is dissolved in a "polybasic" org. acid such as phthalic anhydride and the soln. is reacted upon with a polyhydric alc. such as glycerol at a temp. sufficiently high (suitably about 250°) to produce resinification.

**Resin composition suitable for the production of quick-drying varnish films.** HENRY A. GARDNER. U. S. 1,887,678, Nov. 15. See Brit. 351,637 (*C. A.* **26**, 3125).

**Resin-like products from cracked hydrocarbon distillates.** JACQUE C. MORRELL (to Universal Oil Products Co.). U. S. 1,888,044, Nov. 15. Resinous substances are first removed from the distillates with an adsorbing material such as fuller's earth and are sepd. from the adsorbing material and then simultaneously treated with an oxidizing agent such as air, O or $O_3$ and with ultra-violet light.

**Resinous material.** ARTHUR M. HOWALD (to Toledo Synthetic Products, Inc.). Can. 328,910, Dec. 27, 1932. A molding powder is made by condensing $NH_4CNO$ with $CH_2O$ and a plasticizer is added. The condensate is dried, pulverized and urea added to fix formaldehyde liberated during a subsequent operation of molding under heat and pressure. Cf. *C. A.* **27**, 1219.

**Resinous product.** SOC. ANON. DE TRAVAIL INDUSTRIEL. Belg. 386,929, April 30, 1932. Copal, or similar resin, reduced to an extremely fine powder can be used as a binder in the manuf. of building materials, agglomerated fuels or elec. insulating masses.

**Molded inlaid linoleum.** EDWARD C. DEARDEN (to Sloane-Blabon Corp.). U. S. 1,888,492, Nov. 22. Various details of manuf. are described.

**Synthetic resin.** EMIL E. NOVOTNY and CHARLES J. Romieux (to John S. Stokes). U. S. 1,886,353, Nov. 1. Reaction is effected between a phenol such as PhOH and a carbohydrate such as cellulose under superatm. pressure and at a temp. above the b. p of the material. The products may be used for coating or molding.

**Synthetic resins.** ARTHUR M. HOWALD (to Toledo Synthetic Products, Inc.). Can. 328,912, Dec. 27, 1932. Synthetic resins are manufd. by forming an initial condensation product in aq. soln. from an aldehyde and $NH_4CNO$. The product is dried and powd. and admixed with a filler and a plasticizer and molded under heat and pressure. Cf. *C. A.* **27**, 1219.

**Synthetic resins.** IMPERIAL CHEMICAL INDUSTRIES, LTD., WM. BAIRD and ROWLAND HILL. Brit. 362,972, Sept. 10, 1930. Substances consisting of or contg. polyhydric alc.-polybasic acid condensation products possessing acidic functions, preferably those from glycerol and phthalic anhydride with an acid value not less than 100, are caused to react with alkyl or aralkyl halides to give resinous products that are compatible with cellulose derivs. Among examples PrI is added to a K deriv. of a glycerol-phthalate resin described in Brit. 358,095 (*C. A.* **26**, 6165) dissolved in glycol monoethyl ether and the mixt., after heating, is filtered and evapd. to give a resin which is washed with water and dried.

**Synthetic resins.** SCHERING-KAHLBAUM A.-G. Brit. 363,029, Oct. 9, 1930. Polybasic acids or their anhydrides, *e. g.*, phthalic anhydride, and polyhydric alcs., *e. g.*, glycol, are condensed in the presence of high-boiling indifferent liquids, *e. g.*, tetra- or deca-hydronaphthalene or cymene (fatty oils being excluded), the water split off passing off by distn. together with the liquid. The product may be used for gramophone records and spools for the rayon industry.

**Cutting synthetic resin.** HEROLD A.-G. Brit. 363,166, Jan. 12, 1931. Blocks of the resin are cast in molds of Pb or other soft metal and the block and mold together are then sliced into sheets on a cutting machine such as used for cutting celluloid.

**Synthetic resins.** POLLOPAS, LTD. Fr. 718,093, June 3, 1931. See Brit. 358,470. Fr. 718,094. See Brit. 358,075 (*C. A.* **27**, 436).

**Synthetic resins.** SOC. NOBEL FRANÇAISE. Fr. 736,744, Sept. 8, 1931. Condensation products of urea and $CH_2O$ having no internal tensions are made by totally or almost totally eliminating the water. This is done by the addn. of a substance of low-vapor tension, miscible with water and the colloid, *e. g.*, glycol, before the concn. by evapn. The $p_H$ value of the colloidal soln. is brought to about 7.4 before the evapn.

**Synthetic resins.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 737,301, May 19, 1932. A translucent resin is obtained by the reaction of a phenol and aldehyde in the presence of a catalyst, *e. g.*, $NH_3$, $H_2SO_4$, or triethanolamine and $CaBr_2$, the product is brought to the fusible, sol. state, the resin dissolved in a water-miscible solvent, *e. g.*, alc. or alc. and NaOH soln., and the resin pptd. from soln. by a dil. acid or salt soln. The resin is washed and dried. By redissolving in a suitable solvent an odorless *varnish* may be obtained. Examples are given. Cf. *C. A.* **27**, 1221.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**Evaluation of crude fats for soap manufacture.** E. I. BETTER. *Allgem. Oel- u. Fett-Ztg.* **28**, 379–80(1931).—The term "saponifiability" is open to misconstructions. Discriminatory analyses should return neutral fat, Ca soaps, etc., in detail. (Cf. Wizöff Standard Methods, ed. I.) B. C. A.

**Acidimetric determination of glycerol in fatty oils.** HENRIK BULL. *Tids. Kjemi Bergvesen* **12**, 78–84(1932).—The method consists in treating the sample, which must be

absolutely neutral, with an excess of EtONa, pptg. the Na glyceride formed with a large excess of petroleum ether, washing with petroleum ether, dissolving in water and alc. and titrating. (*a*) *Pretreatment of sample to remove free fatty acids.*—Weigh off exactly 4 g. of oil in a 100-cc. glass centrifuge tube, add 70 cc. of petroleum ether, then 10 cc. of an alk. soln. of glycerol (glycerol 240 cc., water 240 cc., 50% KOH 20 cc.), mix thoroughly without shaking, and centrifuge. Remove the heavy soap lye left at the bottom by means of a pipet, transfer the fat soln. quantitatively to a 100-cc. volumetric flask and fill to the mark with petroleum ether. The filling and the subsequent withdrawal of aliquot parts must be carried out at the same temp. (*b*) *Prepn. of the EtONa soln.*—Dissolve 2.3 g. metallic Na in 50 cc. abs. alc. (under reflux), and dil. the still hot soln. with 150 cc. petroleum ether, add a little $CaC_2$ and boil the soln. for 2 hrs., using a reflux condenser, to remove every trace of water. (*c*) *Pptn. of Na glyceride.*—Use an ordinary test tube, 15 cm. long, 16 mm. in diam. Measure 3 cc. of the alcoholate soln. into the thoroughly dried tube and add in about 1 min. 15 cc. of the acid-free fat soln. from a pipet clamped to a support above the test tube and having a 3-way stopcock connected to its upper end. Bubble H from a capillary tube through the soln. during the pptn. and for 1 min after the pptn. is ended, to produce the necessary stirring. Close the test tube with a good, dry wood stopper. (*d*) *Centrifuging.*— This operation may be carried out 5 min. after the pptn. Use an ordinary Gerber centrifuge, with 1000 r. p. m. Decant the supernatant liquid completely from the ppt., add 15 cc. of petroleum ether, shake the mixt. thoroughly, centrifuge again and decant the clear liquid. (*e*) *Titration.*—Dissolve the ppt. in 0.5 cc. of water and add 5 cc. of neutral alc. contg. phenolphthalein. Use a microburet for the titration with 0.1 *N* acid, and bubble H through to obtain a good mixing. It is essential to avoid every trace of moisture in the pptn. of the glyceride. To recover the petroleum ether, shake the residues 3 times with water, then dist. on the water bath. Shake the distillate with a small quantity of concd. $H_2SO_4$ and decant. From the content of glycerol, *M*, and the sapon. no., *S*, for a certain fat, its content of diglyceride may be calcd. as follows: From *S*, the glycerol content ($G_3$) of the fat is calcd. on the assumption that it is a triglyceride, and the glycerol content ($G_2$) on the assumption that it is a diglyceride. Its actual content of diglyceride is then $100(M/G_3)/(G_2/G_3)\%$. INGEBERG

**The acido-iodometric index of oils.** J. M. CLAVERA AND M. ORO LÓPEZ. *Anales soc. españ. fís. quím.* **30**, 971–4(1932).—The Ruziczka method (*Z. anal. Chem.* **81**, 252(1930)) of detg. the acido-iodometric index of solid fats is applied to oils, with the modification of the use of a reaction time of 24 hrs. with oils whose fatty acid contains 18 or more C atoms. Olive oil gives 9 8–10.2; peanut oil 8.0–8.5. The detn. is of no value with rancid oils. E. M. SYMMES

**Oil production.** E. I. BETTER AND F. MUNK. *Allgem. Ocl- u. Fett-Ztg.* **29**, 79–87 (1932).—The physicochem. aspects of the processes involved in oil expression are considered; coagulation of emulsifying agents and displacement of adsorbed oil from the cell tissues by, *e. g.*, steaming, are especially discussed in relation to the expts. of Talanzev (*Masloboino Zhirovoe Delo*, Jan., **1931**) on the treatment of preheated meal with dry steam. B. C. A.

**Oil-mill practice. Linseed industry in the East [Palestine].** E. I. BETTER. *Allgem. Oel- u. Fett-Ztg.* **29**, 6–9(1932).—Palestine linseed averages 7.5% of impurities (dirt, etc., and occasionally foreign bitter seeds). The oil (40%), $H_2O$ (6.15%) and protein (22.6%) contents are characteristic. The high protein content is also evidenced in the large proportion of mucilage (foots) in the expressed oil; this, however, seps. readily on keeping for a few days. The analytical figures for the oil resemble those for Indian oils. B. C. A.

**Kinetics of drying vegetable oils.** N. FUKS. *J. Applied Chem.* (U. S. S. R.) **5**, 1046–58(1932).—The rate of O absorption is, within certain limits, independent of the thickness of the layer of the linseed oil. The depth of the gelatinized layer does not increase if the depth of the oil is increased beyond the above limit, and the amt. of O absorbed also remains unchanged. If the rate of oxidation is *W*, the concn. of O is *C* and *b* and *d* are consts., $W = dC/(b + C)$. The const. *b* is small and the rate of oxidation in pure O is only 3% higher than in air. The equation has theoretical foundation if the oxidation of the oil is assumed to proceed in 2 phases: addn. of O to the catalyst and its transfer in an activated state to the triglycerides of the oil. The second assumption does not contradict the chain theory of the reaction. Practical applications of the equation are discussed. The theory of Blom (*C. A.* **21**, 1720) on the mechanism of drying is unacceptable. Also in *Kolloid Z.* **61**, 365–70(1932). V. KALICHEVSKY

**Formosan plant-seed oils. V.** KINZO KAFUKU, CHIUTA HATA AND MASAICHI FUJIKAWA. *J. Chem. Soc. Japan* **53**, 1115–19(1932); *cf. C. A.* **27**, 202.—Consts. (d.,

$n_D$, acid value, I no., sapon. no. and percentage of unsaponifiable substance) and properties of seed oils of the following species are given: *Thea chinensis* L., *Gordonia anomala* Spreng, *Camellia oleifera* Abel., *Hernandia ovigera* Linn., *Cinnamonium zeylanicum* Blume, *Erythrina indica* Lam., *Poinciana regia* Boj., *Urena lobota* L. *var. tomentosa* Miq., *Passiflora edulis* Sims. and *Thevetia neriifolia* Juss. **VI. Curcas oil.** KINZO KAFUKU AND CHIUTA HATA. *Ibid* 1120–3.—The seeds contain crude fat 31.2, water 6.9 and ash 3.52%. Consts. of hot press oil are: $d_4^{23}$ 0.9152, $n_D^{23}$ 1.4695, acid value 2.86, sapon. no. 195.22, I no. 102.31 and percentage of unsaponifiable substance 1.25. The oil contains 24% satd (I) and 76% unsatd. fatty acid (II). I consists of 60% palmitic acid and 40% stearic acid. II consists of 70% oleic acid and 30% linoleic acid. The oil is a suitable raw material for soaps and hydrogenation. K. KITSUTA

**The fractionation of the glycerides of castor oil by selective solution.** EMILE ANDRÉ. *Bull. sci. pharmacol.* **39**, 437–41(1932).—A. claims the priority of using the method reported by François (*C. A.* **26**, 3947). A. E. MEYER

**Constitution and possibility of utilizing "Dum" nuts from palm trees.** I. UBALDINI AND L. BISSI. *Giorn. chim. ind. applicata* **14**, 555–62(1932).—The seeds of "Dum" nuts contain about 50% mannitol, which when hydrolyzed with dil. acid furnishes reducing sugars of which 80% is mannose. The best conditions for the hydrolysis are heating to 160° in an autoclave with $H_2SO_4$ (1% soln.); ratio, wt. of seeds : wt. of acid soln. = 1:4; time of heating, 5–10 hrs. Under these conditions, a yield of 56–58% of sugars of which $^4/_5$ is mannose is obtained. The pods furnish an active charcoal which has high decolorizing and absorbing power. A. W. CONTIERI

**Edible oil from Pistacia palaestina Bois. from the island of Chios.** EMM. EMMANOUEL. *Praktika (Akad. Athenon)* **6**, 490–5(1931).—A historical survey together with a discussion of yields and properties. Color, greenish olive, in time becoming yellowish, transparent when hot, cloudy when cold. Odor, pleasantly grapelike, taste characteristic, not unpleasant; $d_{15}$ 0.9162; solidifying point (oil) —19°, (fatty acids) 29°; m. p (fatty acids) 32°; $n_D^{40}$ 1.4585; butyrorefractometer value 48.8; [α] 0; viscosity (Engler) 10 61; index (Crismer) 75.3; moisture 0.137%. Chem. reactions: Heydenreich greenish color; Allen, Hauchecorne, Halphen, Bechi, Milliau-Armani, Baudouin, Villavecchia-Fabris, Soltsien, Bellier, all neg ; Blarez, *HCN*, yellowish red ppt. I no. 87.5, sapon. no. 195.06, R.-M. no. 2.2, Polenske no. 0.75, Hehner no. 96.59, ester no. 177.3, Ac no. 6.17, acid no. 7.65 (increasing to 16.9 in a year), elaidin test pos. (solid white mass). LUCIEN Y. DYRENFORTH

**Compounds produced during the hydrogenation of fish oils. IV. Fatty acids.** SEIICHI UENO AND RIICHIRO YAMASAKI. *J. Soc. Chem. Ind. Japan* **35**, Suppl. binding 492–5(1932); cf. *C. A.* **25**, 4140.—The fatty acid of the volatile substance causing the bad odor produced during hydrogenation of fish oils is composed of $C_6$–$C_7$ and $C_{14}$–$C_{18}$ groups of satd. acids. No acid of $C_8$–$C_{12}$ was found. The odor of the fatty acids is due to the lower acid group which is produced by decompn. of the unsatd. acids. In the higher acid group, palmitic, myristic and stearic acids and a small amt of behenic acid were isolated E. SCHERUBEL

**Conjugated hydrogenation.** E. I. LYUBARSKIĬ. *J. Applied Chem.* (U. S. S. R.) **5**, 1025–45(1932).—The term applies to catalytic dehydrogenation and simultaneous hydrogenation of another substance present in the mixt. at the expense of the liberated $H_2$ but without its appearance in the vapor phase The temp. at which the 2 reactions are balanced is defined as the crit. hydrogenation temp. Cottonseed oil, cooled to 6° and decanted from sepd. solids (neutralization no. 0.87, I no 116.62) and EtOH (98.7% by wt.) were used in the presence of a catalyst from "Salolin" plant (Ni with admixt. of Fe 10.4%, infusorial earth 26.2%, cottonseed oil 63.4%). Practically identical results were obtained by hydrogenating 3 hrs. at 200° or 1 hr. at 220°, or 6 hrs. at 200° and 15 min. at 250°, etc. At the optimum temp. the degree of hydrogenation depends on time. Thus at 250–5° the same product was obtained by extending the time from 15 min. to 3 hrs. The time is greatly shortened in comparison with that required by gaseous $H_2$. The I no. could not be lowered below 64–67.6, notwithstanding the presence of excess EtOH. Increasing the amt. of catalyst up to 0.9% Ni increases the degree of hydrogenation, but further addns. have practically no effect. In the absence of catalyst the I no. was lowered to 110.8, which might be explained as caused by partial polymerization of the oil or by the catalytic effect of the glass. EtOH in excess of that required by the theory to obtain a certain degree of hydrogenation has no effect. In the absence of EtOH but in the presence of catalyst the I no. was lowered to 87.38. Repeating the expts. at 300° lowered the I no. to 66.97 which corresponds to the max. obtainable in presence of EtOH. This is due to polymerization of the oil in the presence of catalyst, as similar expts. in the absence of EtOH and catalyst did not lower the I no. In the

presence of moisture infusorial earth, and not Ni, catalyzes hydrolysis. MeOH does not hydrogenate the oil, but higher alcs. act more readily the larger are their mols. Secondary alcs. appear more promising, but it is doubtful whether hydrogenation of cottonseed oil will go to completion. V. KALICHEVSKY

**Estimation of gossypol in cottonseed meal.** J. O. HALVERSON AND F. H. SMITH. *Ind Eng. Chem., Anal. Ed.* **5**, 29–33(1933).—The ether-extd. gossypol is pptd. in a petroleum ether-ethylene glycol soln. by the addn. of aniline. The dianiline gossypol is filtered off, and wt. of ppt. × 0.775 = gossypol. A quantity of purified gossypol was prepd. for soly. tests in the reagents used in the detn. H. E. MESSMORE

**Soap-stock analysis and neutral-oil loss.** F. WITTKA. *Allgem. Oel- u. Fett-Ztg.* **29**, 9–13(1932).—In the usual com. detn. the apparent free fatty acid content of the sepd. fatty matter is too high by 0.6–6%, because of secondary hydrolysis of the neutral fat during the boiling with acid; consequently the calcd. neutral-fat loss is too low. Acidification in the cold and ether extn. is accurate but too tedious. Figures for free fatty acid only 0.2–0.7% too high are obtained by dilg. the soap stock with luke-warm $H_2O$, adding excess of dil. $H_2SO_4$, and stirring until the stiff emulsion becomes non-viscous; then the mixt. is gently heated while being stirred and is boiled until the fat layer is clear (2–5 min.). The fat is sepd., stirred twice with fresh anhyd. $Na_2SO_4$ (which also removes any free $H_2SO_4$), and filtered before detn. of the acid value. B. C. A.

**Soap-stock and detergents.** B. MENES. *Allgem. Oel- u. Fett-Ztg.* **29**, 69–72 (1932).—In suitable conditions, *e. g.*, hot-water washing, tallow-base soaps display superior colloidal properties and surpass vegetable (coconut, etc.) oil soaps; a 50% tallow soap produced much more, and more stable, lather (Stiepel test) in oily (soiled) water than a vegetable oil soap, although the 2 behaved alike in clean water at the same temp. B. C. A

**Preparation of cheap toilet soaps.** R. KRINGS. *Allgem. Oel- u. Fett-Ztg.* **29**, 72–4 (1932).—Satisfactory soaps can be made by the cheap cold process if good-quality (refined) fats are used; the stability may be increased by use of antioxidants (cf. *Allgem Oel- u. Fett-Ztg.* **29**, 40–2(1932)). B. C. A.

**Detergency of alkaline salt solutions. III. Deflocculating and emulsifying power.** FOSTER DEE SNELL. *Ind. Eng. Chem.* **25**, 162–5(1933); cf. *C. A.* **26**, 5441–2.—A new method of detn. of deflocculating and emulsifying power is suggested. The size of the suspended oil droplets is fixed by using an inert powder with a superficial coating of oil, on the assumption that this coating will not be displaced by the soln. being tested In blends of soap and alk. salts the deflocculating and emulsifying value is the sum of the values of ingredients when used singly. Of the series studied, Na oleate had the greatest value, with $Na_2SiO_3$ a close second and $Na_3PO_4$ third. Data on $Na_2HPO_4$, which is too low in $C_{OH}$ to be a true soap builder, show that it has protective colloidal properties but it is advantageous only in the absence of soap. FOSTER DEE SNELL

**Extraction of fat from animal raw materials.** JOHAN HJORT. Norw. 47,731, March 31, 1930. The finely divided raw material is heated to evapn. of a substantial part of its water content, after which the cellular tissues are sepd. from the oil. The heating is carried out in the presence of less than 5% of a water-binding salt.

**Apparatus for the extraction of fat from animal or vegetable raw materials by boiling.** AKTIESELSKAPET KAMPENS MEK. VERKSTED. Norw. 50,927, May 30, 1932.

**Treating fatty materials.** MASKIN-AKTIESELSKAPET ZETA. Norw. 49,367, Oct. 5, 1931. The mixt. of oil and water, etc., obtained by the boiling or pressing of whale speck, whale flesh, liver, herrings, etc., before being clarified by sedimentation or centrifugalization is treated with a small amt. of NaOCl or other hypochlorite to repress the bacterial action and at the same time stabilize the colloidal character of the glue components of the mixt.

**Washing fats which have been refined with alkali.** TH. ARENTZ. Norw. 48,084, June 30, 1930. Animal or vegetable fats are treated in known ways with alkali and afterward sepd. by gravity into oil and soap-stock. The oil is then introduced together with water into a centrifugal app. where water and oil are mixed intimately and taken off separately.

**Coloring fatty acids, etc.** I. G. FARBENIND. A.-G. Fr. 40,969, Oct. 30, 1931. Addn. to 660,035 (*C. A.* 24, 255). Lecithin alone or with amines which are miscible therewith is used as solvent for dyes which are not sufficiently sol. in fatty acids, fats or other org. compds. to be dyed. The colors may be changed by the addn. of lake-forming substances.

**Saponifying fats and oils.** G. S. PETROV. Russ. 500, Oct. 14, 1911. The sapon. is effected by water-sol., sulfonic acids extd. from petroleum and mineral oils with or without the addn. of mineral acids.

**Saponifying fats and oils.** G. S. PETROV. Russ. 1521, July 4, 1914. Addn. to Russ. 500 (preceding abstract). The sapon. is carried out with water-sol. sulfonic acids obtained in the sulfonation of paraffin or heavy hydrocarbon oils derived from coal tar or shale or peat tar.

**Oils and fats.** SWIFT & Co. Fr. 736,984, May 11, 1932. Edible and other oils and fats are stabilized by the addn. of a small amt. of one of the following: (1) adrenaline, (2) a non-toxic ester of a polyphenol, sol. in oil or fat but insol. in water, *e. g.*, a stearin ester of pyrogallol, (3) a non-toxic phenolic ether sol. in oil or fat but insol. in water, *e. g.*, dimethyl ether of pyrogallol, (4) a dihydroxynaphthalene, (5) a non-toxic condensation product of a ketone or aldehyde with a phenol deriv., *e. g.*, the condensation product of quinol-anisaldehyde or of pyrogallol-acetone.

**Purifying oils and fats.** I. G. FARBENIND. A.-G. Fr. 41,028, May 18, 1931. Addn. to 688,370 (*C. A.* 25, 837). Oils and fats are freed from colloidal impurities by emulsifying with aq. $H_3PO_4$ at 15–40° and coagulating at a higher temp., *e. g.*, 60–100°.

**Desulfurizing oils and fats.** I. G. FARBENIND. A.-G. Brit. 362,964, Sept. 8, 1930. Vegetable oils and fats are desulfurized by heating in the absence of oxidizing agents with compds. or aq soins of compds. of Pb, Cu or Ni, sol. in water or in the oil. Oleates, resinates, naphthenates, benzoates, enolates, *e. g.*, acetylacetonates, sulfates of Cu and Ni, and $Pb(NO_3)_2$ may be employed. The reaction may be accelerated by pptg. oxides or hydroxides from the salts within the oil or by adding reducing agents.

**Polymerization products from oils and fats.** I. G. FARBENIND. A.-G. Brit. 362,845, Aug. 6, 1930. Emulsions, *e. g.*, aq. emulsions of vegetable oils and fats or their derivs. are polymerized with unsatd. hydrocarbons, in the presence of O or O-splitting compds., if desired while heating. Thus linseed oil, butadiene and oleic acid, emulsified in water with the aid of Turkey-red oil, is polymerized in the presence of Bz peroxide at 60° in a closed vessel. The products are employed directly or after coagulation for *rubber latex mixts.*

**Derivatives of oxidized oils or fatty acids.** IMPERIAL CHEMICAL INDUSTRIES, LTD., ANTHONY J. HAILWOOD and RICHARD P. MCGLYNN. Brit. 362,971, Sept. 10, 1930. Oils, *e. g.*, tung, fish, linseed, derived from fatty acids contg. at least 2 olefinic bonds, or the acids themselves, *e. g.*, clupadonic and eleosteric, are treated with a regulated proportion of $H_2O_2$ in the presence of glacial AcOH so as to sat. a fraction of the double linkage by OH groups and to acetylate a fraction of these OH groups. The products may be treated with sulfonating agents with or without previous acylation by an acid anhydride or halide.

**Hydraulic press for vegetable oil.** K. A. DIANISHKO. Russ. 26,909, May 11, 1929.

**Apparatus for extracting oil from animal materials by steam-boiling.** HARALD W. HENRIKSEN. Norw. 49,391, Oct. 12, 1931. A device for charging and preheating the materials is described.

**Rotary boiling apparatus for fish, whale and other animal materials.** AKTIESELSKAPET KVAERNER BRUG. Norw. 50,103, Jan. 25, 1932.

**Plant for the boiling and working of herrings, whale speck and similar materials.** STAAL- & JERNINDUSTRI A/S SJIA and CARL STERNER. Norw. 51,830, Nov. 28, 1932. Mech. features of app.

**Oil-separating container for boiling apparatus for whale, fish and other animal materials.** AKTIESELSKAPET KVAERNER BRUG. Norw. 50,138, Feb. 1, 1932

**Extracting oil from marine animals.** DORTHEUS A. HANSEN. Norw. 43,420, 43,934 and 43,935, Sept. 28, 1931. Cod liver and similar materials are kept at a temp. between 30° and 50° for a period not exceeding 10 hrs. The oil is then sepd. from the tissues by mech. means. The oil thus produced is heated to a temp. not exceeding 50° to eliminate malodorous decompn. products. The fatty material to be extd. may be quickly raised to the desired temp. by means of heating surfaces or liquid or gaseous heating media with a temp. substantially higher than the extn. temp. with const agitation of the material in relation to the heating media, so that the individual particles of the material will be in contact with the heating media only for very short periods.

**Plant for extracting oil from whale speck.** EDVARD OLSEN Norw. 51,415, Sept. 5, 1932. A number of pressure boilers communicate with a common clarifying container of sufficient vol. to take up the whole quantity of liquid escaping from all the boilers in operation. The water layer is not tapped off before a complete sepn. and clarification has taken place in the container.

**Marine oils.** AKTIESELSKAPET FANGSTAPPARATUR. Norw. 49,478, Oct. 19, 1931. The aq. mixt. contg oil which is obtained by steaming of the raw materials without pressure and subsequent pressing is clarified in closed containers under increased pressure and temp. to sep. the oil.

**Apparatus for the extraction of liver oil by boiling.** OSVALD WALDERHOUG. Norw. 48,120, July 6, 1930.

**Cold clarification of liver oil.** ALFRED ANDRESEN. Norw. 48,227, Aug. 4, 1930. An app. is described, the main feature of which is a rotary vacuum filter.

**Composition for the purification of liver oil.** ALBERT A. WILLE. Norw. 51,072, June 27, 1932. An aq. suspension of $Na_2CO_3$, clay and unslaked lime is particularly suited for purifying liver oil from cod, haddock or coalfish which have fed upon red copepods.

**Treatment of waste nickel catalyst.** SABURO URANO (to Asahi Denka Kôgyô K. K.). Japan. 93,604, Nov. 16, 1931. Waste Ni catalyst used for hardening oils is dissolved in $H_2SO_4$ or HCl contg. $HNO_3$ with or without the adhering oil. NaOH or $Na_2CO_3$ is added to the soln. in amt. insufficient to ppt. Ni, for the purpose of removing Fe and other impurities. The soln. is then used for mfg. Ni catalyst.

**Candles.** IKKI HATIYA (to Gôdô Yusi Glycerin K. K.). Japan. 93,856, Dec 9, 1931. Higher fatty acids obtained from hardened oil are boiled in water or are passed through a colloid mill with water. The product, contg. 1–2.5% water, is used for making candles.

**Distilling liquids such as glycerol under vacuum with steam.** OSCAR H. WURSTER. U. S. 1,886,256, Nov. 1. Superheated steam is injected into the liquid to be distd., the mixt. of steam and vapor formed is condensed, a fraction of the condensate is evapd. *in vacuo* and the vapors thus formed are preheated by vapors from the distg liquid and then superheated by high-temp. and high-pressure steam to form the superheated steam to be injected into the liquid to be distd. (the condensate being evapd. by the high-pressure steam after being used to superheat the preheated vapors). App. is described.

**Refining and "discoloring" raw sulfate soft soap.** EVALD PYHÄLÄ (to O. Y. Methods, Ltd.). U. S. 1,887,246, Nov. 8. A soln. of the raw soap is treated with a dil. peroxide soln. while hot, the reaction soln. is salted, bottom water is tapped off, the soap is washed with a small quantity of water and is salted, and washing water is tapped from the refined and "discolored" soap.

**Soap.** I. G. FARBENIND. A.-G. Fr. 40,647, Aug. 5, 1931. Addn. to 717,976 (*C. A.* **26**, 2884). Soap is combined with products which have moth-proofing properties, other than products specified in Fr. 717,976.

**Soap.** ÉMILE NEUSY. Fr. 40,708, Sept 2, 1931. Addn. to 710,183 (*C. A.* **26**, 1147). KOCl is added to the soap of Fr. 710,183.

**Buoyant soaps.** KARL JUNGMANN. Brit. 362,754, Feb. 3, 1931. See Ger. 549,155 (*C. A.* **26**, 3949).

**Toilet soap.** PAUL VILLAIN. U. S. 1,887,743, Nov. 15. In the manuf. of solid perfumed toilet soap, during sapon. of the fat constituent with alkali, there is incorporated a compn. of aromatic odor comprising terpenes, resins and floral wax homogeneously emulsified with a suitable emulsifying agent, such as $NH_4$ sulforicinoleate. Various examples are given.

**Soap threads.** ADOLF WELTER. U. S. 1,887,474, Nov. 8. Molten soap from liquid olive oil of 60–62% fatty acid content is atomized, the resulting dry soap

particles are directly pressed and extruded through nozzles of 0.4–1.5 mm. diam., and air is passed over the threads to make them brittle.

**Soap powders.** LEVER BROTHERS, LTD. Fr. 736,024, April 27, 1932. A small amt. of a Mg compd., *e. g.*, MgO 0.1–0.3 or $MgSO_4.7H_2O$ 0.6–1.8%, is incorporated with soap powders having a basis of perborate.

## 28—SUGAR, STARCH AND GUMS

J. K DALE

**Sugar production in the 1931 campaign, and the utilization of the molasses produced [Java].** C. SIJLMANS. *Arch. Suikerind.* **40**, III, 1057–77(1932).—Statistical data are given on the total production of the various types of sugar, for each of the 178 factories and for each district; production of cane and sugar per hectare; similar data for the entire island and for each yr. since 1912; the total quantity of molasses produced by each factory, and the portions exported, used for distg. in Java, as fuel, for prepn. of caramel, as fertilizer, stored, or discharged into streams. F. W. ZERBAN

**Experiments of the 200 days sugar manufacture during the campaign of 1931-32.** I. B. MINTZ, I. Z. KHELEMSKII, I. I. SHOIKHET AND V. F. OREL. *Nauk. Zapiski Tzukrovoi Prom.* **23**, 1–42(1932).—Expts. at the sugar factory "Vozrozhdenie" under very unsatisfactory conditions proved that the manuf. of sugar from fresh raw beets for 180 days was quite possible and efficient. The processes at the different stations are the same as during a regular short campaign. Normal filtration, boiling and centrifuging with av. losses in diffusion and filter processes are good indicators of normal manuf. The white sugar obtained was of a good quality with color below one Stammer unit. At the end of the mfg season, there were some losses of sugar in stored beets and a purity decrease with increased Ca salts. The relative content of noxious N slightly increases. The final molasses and yellow sugar have an alk. reaction. When stored beets are worked, it is necessary to observe the following precautions: keep transport water at low temp.; spray the beets before slicing with the milk of lime; maintain the temp. at the diffusion battery not higher than 75°, defecate with 0.25% of CaO in measuring tanks and add the rest of the lime in the defecators at a temp. not below 85°, the total amt. of lime should not exceed 3%, and the normal alky. after first carbonation should be kept at 0.07–0.08 and decrease only in case of difficult filtration. V. E. BAIKOW

**Results of tests on time of planting of POJ 2878, made during 1927 to 1931.** E. DEMANDT. *Arch. Suikerind.* **40**, III, 1225–58(1932).—The data are given in the form of tables and graphs. Small-scale tests are subject to systematic errors, and it is recommended to det. the optimum time of planting of new varieties in the future from information obtained on the plantation scale. Even the effect of single factors influencing the yield of cane and sugar must be studied in that manner. F. W. ZERBAN

**Incrustations in the sugar industry.** J. F. BOGSTRA. *Arch. Suikerind.* **40**, III, 911–1055(1932).—A comprehensive treatise on the formation, compn., prevention and removal of scale on the liquor side and steam side of evaporator tubes, and in boilers, based on experiences in Java and in other countries. The compn. of evaporator scale varies with the method of juice clarification and for the different bodies of the multiple effect. To reduce evaporator scale, the $p_H$ of sulfitation juice should be held above 6.7; phosphate scale may also be reduced by proper defecation; sulfate scale is not easily controlled as it is largely influenced by the $SO_3$ content of the raw juice. In carbonatation factories the $p_H$ of the 2nd carbonatation juice must be well regulated. The best method for removing evaporator scale is boiling out alternately with 2–5% NaOH soln. and 0.25% HCl; for sulfite-sulfate scale, 5% NaOH soln. should be used; for silica scale, 2–5% $Na_2CO_3$ soln. Addn. of NaCl, tannin or $NH_4F$ is not to be recommended. The compn. of the scale on the steam side of evaporator tubes is entirely different from that on the juice side; it consists largely of corrosion products, sometimes mixed with entrained oil and ash constituents. Boiler scale also contains corrosion products, but consists mostly of $CaCO_3$, $CaSO_4$, $SiO_2$ and Mg salts. For its removal prepns. contg. phosphates and tannin have given good results. F. W. ZERBAN

**Sugar formation and ripening process in sugar cane. I. Preharvest sampling in 1931.** G. BOOBERG AND S. BROEKHUIZEN. *Arch. Suikerind.* **40**, III, 1259–324(1932).—A detailed account is given of the methods and cost of preharvest sampling on the Java plantations, and the utilization of the results. In most cases the correlation between predicted and actual mill results is poor or only fair; preharvest sampling must be placed on a more rational basis to bring financial returns. **II. Starch formation in the**

leaves of sugar cane. WILLEMINA M. COBLINGH AND V. J. KONINGSBERGER. *Ibid* 1325–40.—Assimilation expts. were made with cut leaves *in vitro*. Conclusions: Starch is formed in the leaves by $CO_2$ assimilation and deposited in the starch sheaths around the vascular bundles. Sugar-cane leaves are able to form starch in the dark from sucrose, glucose, fructose and maltose in a min. concn. of 0.05–0.1 and a max. concn. of 0.4–0.5 g.-mol. per l.; this starch is localized mostly or entirely in the parenchyma. But in an atm. free from $CO_2$ the starch formed from sugar in sunlight accumulates in the starch sheaths, and any starch already present migrates there from the parenchyma. A leaf placed in $H_2O$ in a $CO_2$-free atm. in sunlight, and then transferred to a sugar soln. in the dark, deposits part of the starch in the starch sheaths. These observations were made with leaves from POJ 2878, and were less pronounced in leaves from Lahaina or sorghum. F. W. ZERBAN

**Vacuum filtration in the cane-sugar industry.** P. HONIG AND W. THOMSON. *Arch. Suikerind.* **39**, III, 803–42(1932).—The Oliver filter and the Oliver-Borden thickener are described and illustrated. After a series of preliminary trials the installation was run continuously for 13 days; the control data are presented in tabular form and discussed. Tentative conclusions: The Oliver equipment has the promising features of automatic and less costly operation. However, the thickener is very sensitive to changes in the filterability of the muds; the material is in process for a longer time with consequent danger of deterioration; and the range of pressures that may be used is limited. The first difficulty can probably be overcome by better regulation of the carbonatation. This and the other 2 points mentioned require further practical study. F. W. Z.

**Experiments on continuous carbonatation and automatic vacuum filtration at the sugar factory Boedoeran, 1931.** P. HONIG AND W. THOMSON. *Arch. Suikerind.* **40**, III, 1141–80(1932).—Previous tests made at Redjoagoeng (cf. preceding abstr.) have been continued and extended. The process of continuous carbonatation, combined with the use of a Borden thickener and Oliver filter, is described; the control results are given in tables and fully discussed. Conclusions: Continuous first carbonatation, by an adaptation of the de Haan principle, gives greater uniformity in the reaction and other juice qualities than intermittent operation, and the filterability of the muds is improved; the purifying effect is also as good or better. Less labor is required and the cost of installation is not higher, perhaps even lower, for equal capacities. The power consumption is higher, but this is usually of little importance. The Oliver filter offers the advantages of automatic operation; the expense for filter cloth and HCl is probably lower than in any other system. The quality of the filtered juice is certainly not worse, and probably better than in other procedures. The capacity per unit area of filtering surface compared well with other systems, likewise the consumption of wash water and its sweetening effect. The comparative cost of the installation cannot be accurately given. The operation must be carefully controlled and the capacity of the thickener and filter must be well balanced for best results. F. W. ZERBAN

**Electrometric determination of ash in sugar-beet products.** M. Z. KHELEMSKII. *Nauk. Zapiski Tzukrovoi Prom.* **23**, 55–65(1932).—The method of ignition can be successfully replaced by an electrometric method with the app. of Tödt (*C. A.* **26**, 4999). The results are sufficiently accurate in detn. of sol. ash. The app. and the method of manipulation are described. V. E. BAIKOW

**Automatic weighing of mixed juice and of imbibition water.** E. C. VON PRITZELWITZ VAN DER HORST. *Arch. Suikerind.* **40**, III, 787–910(1932).—The advantages of weighing over measuring are pointed out. The various systems in use in Java to det. wt. of products in process are shown in tabular form. Complete descriptions, with illustrations, are given of 11 automatic juice scales, and their advantages and disadvantages are discussed on the basis of specific tests and practical experience. The Avery, Leinert, Cochius, Richardson, Libra and Strunk scales are not recommended, mainly because they make no automatic correction for mud left in the tanks. The Adam, Boulogne and Nobel scales are free from this objection. The Boulogne scale is extensively used in Java, but is not quite accurate enough; the other 2 are little used The Almerood scale has not proved entirely satisfactory, and the Java Expt. Sta. has developed an improved app., with many superior features. However, it is more complicated and slower in action, so that larger tanks must be used for the same max. capacity. Imhibition water is much easier to weigh than mixed juice because it does not contain suspended matter and need not be weighed as accurately. The Leinert, Boulogne and Almerood scales are satisfactory for the purpose. The Nobel water meter can also be recommended, but it is not much cheaper than the scales. F. W. Z.

**A new method of clarification of sirups and remelt.** A. M. PSHENICHNUII AND B. P. SHUMKOV. *Nauk. Zapiski Tsukrovoi Prom.* **23**, 73–88(1932).—The present re-

search work was conducted to det. the method for max. effect of clarification and at the same time decrease the amt. of Ca salts in juices and remelt. When CaO is added to sulfitated juices they do not darken, but the amt. of Ca salts increases. Added $Na_2CO_3$ decreases the amt. of Ca salts, but slightly increases the color of the juices. The juice of the first carbonation or remelt, when sulfitated to $p_H$ 9–8, becomes darker and further sulfitation to $p_H$ 7 or lower increases the amt. of Ca salts. To the thin or thick juices sulfitated to $p_H$ 6 is added 0.2% $Na_2CO_3$ and 0.25–0.5% CaO on the wt of juice and carbonated to $p_H$ 9.5. After this operation the juice is reheated and filtered through filter presses. The remelt is treated with 1–2% of CaO on the wt. of sugar, then carbonated to $p_H$ 9–9.5, filtered and sulfitated to $p_H$ 7.0–7.5. The purity increases 2 units, color decreases 40–50%, and 50–60% of the Ca salts is removed. The method of purification of remelt by defeco-carbonation and sulfitation, with filtration as an intermediate, increases the purity 1.5 units and color adsorbed by at least 60%. The filtration before sulfitation is absolutely necessary. Filtered and non-filtered juices sulfitated by the same amt. of $SO_2$ give a lower $p_H$ in the first case and higher in the second.
V. E. Baikow

**Experiments on drying pulp with a Büttner drier at the sugar factory "Vozrozhdenie."** I. I. Chernobuilskii and A. F. Nitchenko. *Nauk. Zapiski Tzukrovoi Prom.* **23**, 93–6(1932).—Sour pulps stored for about 1 month cannot be pressed before drying. Slightly acid pulps could be dried satisfactorily but required almost double the amt. of fuel in order to evap. the addnl. amt. of water which is ordinarily removed by presses from normal pulp. Sour pulps stored for 6 months can be dried only at high temp. (800°). The surface of the pulp is chared, but it still retains 53.9% of water.
V. E. Baikow

**Control methods for the crystallization process.** P. Honig. *Arch. Suikerind.* **40**, II, 1041–7(1932).—The principal factor influencing crystn. is the supersatn., but other phys. and chem. characteristics of the soln. are also of importance. The brasmoscope and the pan refractometer have been used to det. and control supersatn., and the latter app. has been tried in Java. It has been impossible to base on these tests any definite rules, either for the graining process or for the control of crystal growth and prevention of false grain. The difficulties are probably caused by the lack of homogeneity of the massecuite and the unavoidable irregularities in the boiling process itself. If these can be overcome such control app. will prove helpful, but it is doubtful whether they will ever entirely replace the operator's skill. F. W. Zerban

**Milling losses.** F. Hommes. *Arch. Suikerind.* **40**, II, 977–84(1932).—The ratio between the purity of the last mill juice and that of the first mill juice fluctuates widely in different factories, and a study has been made of the factors which may influence this ratio. It has been found that the fluctuations cannot be ascribed to variations in the total extn., in the 1st mill extn., or in the Brix or purity of the 1st mill juice. They are caused rather by losses during the milling process and the time factor plays an important part. Return of filter washings to the mill tends to increase the losses.
F. W. Zerban

**Interrelations of control data.** F. Hommes. *Arch. Suikerind.* **40**, II, 1048–58 (1932); cf. preceding abstr.—The milling losses previously mentioned render all the milling control data unreliable. A further study of factory reports shows that the purity of the mixed juice is often reported low; clarification causes a lower purity rise than in former yrs., but the increase in purity from clarified juice to sirup has become greater. Other control data show correlations which are difficult to explain, while for still others the correlations to be expected are not found. F. W. Zerban

**The economic production of sugar from wood.** H. Claassen. *Chem.-Ztg.* **56**, 989–91(1932).—While recognizing the tech. importance of both the Bergius and the Scholler methods, C. emphasizes some of their economic drawbacks in the production of sugar used in feedstuffs, EtOH and yeast manuf. C. claims that the variability of wood and its competition with other well-established raw materials have been minimized and that crit. analysis of production costs are lacking. Cost data computed by C. indicate that, at present, wood-sugar production is unprofitable. Louis E. Wise

**Crystallization of second-strike massecuite in molaxers.** A. Girda. *Nauk. Zapiski Tzukrovoi Prom.* **23**, 67–71(1932).—G. shows from his calcn. that the time of crystn. of second-strike massecuite can be decreased to about 20 hrs. Diln. and crystn. may be controlled by viscosity, which is measured by the resistance of the mass in molaxers. If the molaxers are driven by electric motors, the amperage will show the resistance. V. E. Baikow

**Composition of corn sirup unmixed.** A. P. Bryant and R. C. Jones. *Ind. Eng. Chem.* **25**, 98–100(1933).—The fermentation method seems to give the closest approach

to the actual proportions of maltose, dextrose and dextrins. The maltose content of the total carbohydrates remains around 30% up to the higher conversions and then appears to drop. The noticeable amts. of unfermentable reducing compds. are considered as reducing dextrins. Total reducing sugars as dextrose give a fairly close measure of the sum of maltose and dextrose. The ratio of dextrose to maltose is not far from 1:2 for ordinary conversions, but nearer 1:1 for higher conversions. For ordinary work and ordinary corn sirup $^1/_3$ of the total reducing sugars as dextrose may be taken as dextrose and $^2/_3$ as maltose and the undetd. carbohydrates may be called "dextrins." Ordinary bakers' yeast was employed. F. L. DUNLAP

**Analysis of mineral content of Steffen's waste.** EDWARD BARTOW AND H. M. BENNINGHOFF. *Ind. Eng. Chem.* **25**, 175–7(1933).—The av. content of the ash showed 34.64% K, suggesting a probable industrial use for this product. Other constituents vary with geographical location of the source of waste but the K content remains fairly const. EDW S. HOPKINS

**Analysis of starch products. IV. Ash determination.** A. P. SCHULZ AND G STEINHOFF. *Z. Spiritusind.* **55**, 178(1932); cf. *C. A.* **26**, 5448.—Seven methods of ash detn. were studied and the following procedure is suggested. From 5 to 10 g. potato starch is weighed into a quartz dish. Ten cc. of a 1.9885% Mg acetate soln. (in 80% EtOH or AcOH) is added and the ash detd. Fifty mg. has to be subtracted from the final weight. S. JOZSA

**A growth structure of starch resistant to swelling which is destroyed on making into a paste.** J. R. KATZ AND E. A. HANSON. *Rec. trav. chim.* **51**, 1207–10(1932).—Evidence is given for the theory that the starch grain has an outer membrane which is destroyed on making into a paste. On rubbing, in the presence of water, swelling and color reaction to Congo red are produced, but no changes in anisotropy or in x-ray spectrum. When strarch is made into a paste by heat or by the action of salt soln all 4 of these changes occur. RAYMOND H. LAMBERT

**Pyrocatechol and starch.** H. TRYLLER. *Z. Spiritusind.* **55**, 201–02(1932).—The pyrocatechol-starch reaction for the estn. of Fe in starch is discussed. The addn of Na hyposulfite and a few drops of $NH_4(OH)$ is suggested. The reaction is then very sensitive and might be used for colorimetric Fe detn. S. J.

**Filtration with bone char in the starch-sirup industry.** J. EBEL. *Z. Spiritusind* **55**, 189(1932).—Hinze's article (following abstr.) is criticized. E. advocates activated charcoal which is cheaper and better than bone char. S. J.

**Filtration with bone char in the starch-sirup industry.** A HINZE. *Z. Spiritusind* **55**, 166–7(1932).—H. concludes that activated bone char can be regenerated and its use is more economical than the use of ordinary activated charcoal. It is emphasized that bone char not only adsorbs coloring matter, but removes undesirable non-sucrose material. The Ca phosphate removed has a good *fertilizer value*. S. J.

**Sugar juices.** DARIO TEATINI. Fr. 40,619, July 28, 1931. Addn. to 693,437 (*C. A.* **25**, 1703). Sugar juices are purified by flocculating the colloids at their optimum isoelectric point in the alk. region and stabilizing the colloids by means of an acid such as liquid $SO_2$. If the juice contains only colloids flocculated by alkalies, the treatment with $SO_2$ may be suppressed.

**Sugar juices.** GASTON DURET. Fr. 736,254, Aug. 13, 1931. Sugar juices are sterilized by ultra-violet rays and then heated to at least 100°. CaO may be added before or after the sterilization to ppt. impurities.

**Direct extraction of sugar from raw sugar-house juices.** A. HACQUART. Belg. 387,731, May 31, 1932. The raw juice is evapd. directly to obtain an unpurified massecuite, from which the sugar is crystd. by one of the usual processes.

**Preservation of raw sugarhouse juices.** A. HACQUART. Belg. 387,765, May 31, 1932. The preferably neutralized raw juice is concd. to a predetd. sugar content; an antiseptic may be added.

**Defecating cane juice.** TRUMAN B. WAYNE (to National Aluminate Corp.). U. S. 1,887,879, Nov. 15. Defecation is effected by treating the juice with a sol. aluminate and then with lime.

**Measuring device for diffusion juice.** A. I. PUKHLIK. Russ. 26,257, April 30, 1932. Mechanical features.

**Apparatus for measuring the density of sugar solutions in refining plants, etc.** WM. H. STEPHENS and JOHN H. GRIBBIN, JR. U. S. 1,888,577, Nov 22. Various details of a diaphragm and pressure differential app. are described.

**Washing sugar crystals.** DARIO TEATINI. Brit. 362,911, Sept. 9, 1930. See Belg. 373,184 (*C. A.* **25**, 5589).

**Drying sugar-beet chips.** V. N. IVANOV. Russ. 25,106, July 20, 1931. In drying beet chips org. acids are neutralized by mixing the chips with finely disintegrated nephelite.

**Sucrose extraction from materials such as sugar-beet slices.** KARL VIERLING (to I. G. Farbenind. A.-G.). U. S. 1,887,050, Nov. 8. The material is treated with liquid $NH_3$ under superatm. pressure in order to dissolve the sugar. Nicotine, saponin or caffeine may be similarly extd. from tobacco, quillaja bark, coffee, etc.

**Invert sugar.** EUGENE N. EHRHART and LEONARD WICKENDEN (to John J. Naugle). U. S. 1,886,875, Nov. 8. An aq. soln. of raw sucrose sugar is treated with an agent such as $Ca(OCl)_2$ which is capable of liberating nascent O and purification of the resulting sucrose melt is effected with a vegetable decolorizing carbon, substantially all the sucrose is inverted and the invert sugar sirup produced is concd. and seed crystals of invert sugar are added to the concd. sirup followed by thinning of the resulting invert sugar crystals with concd. invert sugar sirup

**Carbohydrate.** TAKEO MIYAGUTI and MATUO HUKUI. Japan. 93,562, Nov. 11, 1931. Addn. to 93,024 (*C. A.* **26**, 4201). Grape sugar is gradually added to $H_2SO_4$ (55° Bé.) at low temp. The soln. is neutralized with lime water, treated with active C and evapd. to dryness *in vacuo*. The product is white, tasteless and odorless, but taste is developed when it is mixed with other substances.

**Carbohydrate.** TAKEO MIYAGUTI and MATUO HUKUI. Japan. 93,563, Nov 11, 1931. Addn. to 93,025 (*C. A.* **26**, 4201). A mixt. of grape sugar (1000 g.) and Zn dust (1 g.) is heated at 150–60° until the sweet taste is lost. The product is dissolved in $H_2O$ or alc., treated with active C and evapd. to dryness *in vacuo*. The properties of the product are almost the same as those of the product of the preceding abstract.

**Dextrose.** INTERNATIONAL PATENTS DEVELOPMENT CO. Ger. 567,065, Oct. 16, 1928. See Brit. 303,142 (*C. A.* **23**, 4591).

**Crystalline dextrose.** GEORGE E. CORSON and ARTHUR P. BRYANT (to Clinton Corn Syrup Refining Co.). U. S. 1,886,941, Nov. 8. A starch-converted dextrose soln. is concd. to 35–40° Bé., the concn. being completed at a temp. below 70°; the temp. is raised to about 70° and the soln. is thereafter quickly cooled to a temp. productive of supersatn. favorable to the rapid growth of hydrous crystals (the cooling being conducted with such rapidity as to prevent growth of anhyd. crystals and to avoid any apparent formation of crystals during the cooling); the soln. is seeded with cryst. dextrose after the cooling and is maintained quiescent at temps. below 35° until a desired amount of a uniform mass of plate-like hydrate dextrose crystals is formed and these are then sepd. by centrifuging.

**Separating starch from corn gluten, etc.** HENRY BERLIN (to International Patents Development Co.). U. S. 1,888,785, Nov. 22. A phenol such as cresol is added to the mixt. and the starch is washed out, the phenol serving to dissolve the gluten selectively. Cf. *C. A.* **26**, 869.

**Apparatus for drying starch, etc.** OSKAR BRAEUER. Ger. 567,433, Oct. 23, 1931.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**The use of extracts from pine bark.** J. A. SAGOSCHES. *Gerber* **58**, 123–4(1932).—In using tanning liquors prepd. from pine bark it must be kept in mind that their swelling action is due to acid formed by fermentation which is a time process and which proceeds more rapidly as the tannin content of the liquor decreases. J. W. PERRY

**Iron tanning by Röhm's method.** LEOPOLD POLLACK. *Gerber* 59, 8–9(1933).—The firm Röhm and Haas, Darmstadt (Germany), is said to have worked out a successful process for tanning with Fe compds. An analysis of the leather produced is given and its properties are briefly discussed. J. W. PERRY

**Tanning plants of U. S. S. R.** G. SHLUIKOV. *Vsesoyuznuii Inst. Rastenievodstva. Selkolkhozgiz Petrograd-Moscow* 1932, 190 pp.—A very large no. of plants growing in the U. S. S. R. have been investigated as to their possibilities as a source of tanning materials. Up to 8% of sugar was found in various parts of different trees. The amt. obtained can be greatly increased by pressure extn. at elevated temps. Spruce bark has the highest tannin content in April-May, while nontannins are highest in Aug.-Sept. The compn. of vegetable tanning substances varies within wide ranges. The tanning complex is considered to be a glucoside or an ether combination of condensed phenolic acids with glucose or other saccharides. Tannin contains digallic acid, pyrogallol, gallic acid, pyrocatechol, pyrocatechinic acid, catechins, quercetin, phloroglucinol, ellagic acid, etc. A. A. BOEHTLINGK

**Acidity of vegetable-tanned leathers. II.** W. R. ATKIN AND F. C. THOMPSON. *J. Intern. Soc. Leather Trades Chem.* 16, 591–608(1932); cf. *C. A.* 23, 4843.—Criticisms and proposed modifications of the original method are discussed. Bennett's view (*C. A.* 25, 2325) that the use of 0.1 *N* KCl for extn. is inadvisable is opposed, because this concn. of KCl has only a negligible influence on $p_H$ value, and because the presence of KCl equalizes internal and external $p_H$ values in the protein–acid system, improves conductance and diminishes diffusion potentials. The finding of Kubelka and Ziegler (*C. A.* 26, 2343) that the observed $p_H$ value of the leather ext. is not rigidly a linear function of log diln. is correct, and is due to increasing degree of dissocn. of weak acids and to decreasing buffering action at high diln. This tends to give "acidity values" ($p_H$ value at O diln. obtained by extrapolation) that are lower than the "true $p_H$ of the leather." Bennett's proposal that acidity value be calcd. mathematically from 2 $p_H$ values obtained at 100-fold and 1000-fold diln. is opposed, because the latter diln. is unduly great, and because the advantages of a check are lost. The Innes 10-fold diln. method (*C. A.* 23, 4367; 25, 5793) for detecting the presence of strong acid in leather also depends upon the existence of a linear relationship between $p_H$ value and log diln. In the presence of very small concns. of weak acid, the Innes difference figure may indicate the presence of a strong acid, because of the high degree of dissocn. of the acid. The slope of the $p_H$ value-log diln. curve increases with decreasing acidity value. In place of Kubelka and Ziegler's graphic construction for detg. the $p_H$ at 0 diln. when the exptl. points do not lie on a straight line, 2 simple arithmetical procedures are given. Kubelka and Ziegler's belief that acidity value of 2.5 is too low to serve as the limit between safe and unsafe leathers is opposed. These authors found that 0.75% $H_2SO_4$ could be added to leather without lowering the acidity value much below 3. But the slopes of the $p_H$ value-log diln. curves for leathers treated with such amts. of acid indicate that the acid is combined with $NH_2$ groups of the protein; so combined, it does not exist as a strong acid. Kubelka's statement that the least trace of mineral acid found in leather must be regarded as the remnant of greater amts. that may already have damaged the leather is vigorously denied. H. B. MERRILL

**Determination of free sulfuric acid in leather.** KONSTANTIN W. MAKRIS. *Z anal. Chem.* 91, 266–70(1933).—The method described is an improvement of the procedure recommended by Balland and Maljean in 1894. A sample of the leather is heated with approx. 5% NaOH in an autoclave under pressure and after the heating the soln. is dild. to a definite vol. and an aliquot part taken for the detn. of the total S. The filtered soln. is oxidized by treatment with HCl and $KClO_3$ and the S detd. as $BaSO_4$. If the S is detd. in the ash of the original leather, the difference between the 2 values will give what has been called *free* $H_2SO_4$. To det. the S of the hide substance it is recommended to proceed similarly but without oxidizing with $KClO_3$. W. T. H.

**The combination of collagen with dyes. II.** G. A. BRAVO AND F. BALDRINO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti Suppl. tec.* 7, 143–54(1932); cf. *C. A.* 26, 1472, 4501.—The expts. previously reported were continued with various dyes (Nos. 767; 703; 804 in Schultz-Farbstofftabellen) in dil. HOAc soln. Although swelling of the collagen made the interpretation of the results more difficult in these expts., the authors believe that their data indicate that collagen enters into compd. formation with the dyes studied. This would confirm the conclusions previously reached with dyes in basic soln. J. W. PERRY

**Gelatin foil.** HAYER. *Kunstoffe* 23, 13–14(1933).—A general discussion of production methods and properties. J. W. PERRY

**Determination of gelatin.** G. FARKAS. *Chim. ind. agr. biol.* 8, 409–10(1932)

(abstr.).—Gelatin and albumin can be sepd. by means of a satd. soln. of picric acid. The compd. gelatin-picric acid ppts. at 8°, but it is sol. at 40°; the compd. albumin-picric acid does not dissolve at 40°. G. A. BRAVO

**Stability of vegetable tan liquors.** JOHN A. WILSON. *J. Am. Leather Chem. Assoc.* **28**, 24–34(1933).—Effects of varying the $p_H$ value (3–5) and NaCl concn. (0–4%) upon pptn. of tan liquors at initial tannin concns. of 1 and 6% are studied by detg. changes in the vol. of sediment, and percentage of insol. matter and tannin as analytically detd. The 3 criteria give qualitatively the same results. Materials studied are "cutch" (Philippine mangrove), wattle bark, mangrove bark, hemlock bark, oak bark, chestnut bark and quebracho wood exts. Increasing NaCl concn. causes increased pptn. in all cases; the effect is very slight with Philippine cutch and wattle and is greatest for oak, other exts. occupying intermediate positions in an order depending upon the particular criterion for instability employed. Lowering the $p_H$ value from 5 to 3 very slightly increases pptn. with all exts. except chestnut, which yields less ppt. at the more acid $p_H$ value. Both NaCl and $p_H$ effects are more marked at higher tannin concn. Relative loss of tannin by pptn. parallels reported relative loss by fermentation (*C. A.* **24**, 4421). The great stability of Philippine mangrove ext. and its ability to stabilize other exts. is attributed to the presence of gums that act as protective colloids. H. B. MERRILL

**Critical study of pickling. III. Effect of time and temperature.** E. R. THEIS AND A. W. GOETZ. *J. Am. Leather Chem. Assoc.* **27**, 570–7(1932); cf. *C. A.* **26**, 2888–9.—Twenty-five g. portions of bated skin were pickled in 250 cc. portions of soln. contg. 0.025 *M* $H_2SO_4$ and 0.5 *M* NaCl, at 7, 20, 25, 32 and 37.5° for periods of 1–25 hrs. Depletion of NaCl in soln. was unaffected by temp. and was complete in 1 hr. Rate of depletion of acid in soln. increases with temp., but the same equil. concn. was reached at all temps. in 8 hrs., except that at 37.5° less acid was absorbed. $p_H$ values increased in accordance with acid absorption. Vol. and wt. of the test pieces increased in the first hr. and thereafter declined, independently of temp. up to 32°. At 37.5° initial increase in wt. was much smaller, and subsequent decline much greater than at the lower temps. Rate of soln. of N from skin in the range 7° to 25° increases slightly with temp., but the wt dissolved appears to approach the same limiting value. Rate of soln. of N increases enormously at 32° and 37.5°, and wt. dissolved per hr. becomes practically const., indicating hydrolysis of proteins of the skin. Wt. of Cr fixed by pickled skin was practically unaffected either by temp. or duration of pickling. H. B. MERRILL

**Bibliography of papers on the physical properties of leather.** V. C. H. SPIERS. *J. Intern. Soc. Leather Trades Chem.* **16**, 449–51(1932); cf. *C. A.* **26**, 1822.—Topics and no. of titles: color measurement, 3; fluorescence, 2; effect of factors on color of vegetable-tanned leather, 14; change of color by light, 28; fastness of color, 17; optical properties of collagen fibers, 13; internal structure of leather, 50; grain structure and appearance, 11; waterproofing leather, 88. VI. *Ibid* 505–11.—Waterproofing leather, 60; wettability and wetting back, 34; grease absorption, 25; deterioration and durability, 45. VII. *Ibid* 558–63(1932); **17**, 27–35(1933).—Deterioration and durability, 75; preservatives, 60; feel, 10; fullness, 5; tackiness, 3; smell, 1; taste, 1; cementability, 3; behavior to sawing, 1; fatigue, 6; thickness (measurement and effect of factors on), 28; area (measurement), 59; area (effect of factors on), 15; area (variation during wear), 7; general papers on phys. properties, 63. H. B. MERRILL

**Fish skins—a new raw material for leather substitute. Skins of cod [Gadus cillaris], wolf fish [Anarchichas minor and Anarchichas latifrons] and Gadus aeglefinus.** M. A. REIMAN, B. I. RUBIN and O. P. CHUDINOV. *Tzentral. Nauch.-Issledovatel. Inst. Koshevennoi Prom.* **1932**, 3–86.—The methods used in skinning, preserving the skins, and other operations are described. The skins of the cod have an av. of moisture 67.60, dry residue + epidermis 25.10, scale 7.00 and fat 0.3%, while those of wolf fish have moisture 72.4–78.6, fat 0.32–0.35 and dry substance 27.28–21.05%. The sp. gr. is 1.10 and 1.2, the thickness 0.52–0.68 and 0.78–1.07 mm., resp. They should be preserved in a 30% salt soln. **Histological structure of the skins of Anarchichas minor, Anarchichas latifrons, Gadus cillaris and Gadus aeglefinus.** A. A. BRAUN, M. F. IVANOV, A. A. RYABININ and R. N. ORLOV. *Ibid* 87–103. **Treating fish skins with vegetable and mineralic tanning substances.** N. GURBVICH and D. ZILBERMAN. *Ibid* 104–12.—The following treatments of scale skins are described: soaking, liming, pickling and tanning. **Topography of the skins from the wolf fish and cod.** A. GUBAREV AND E. GORYUNOVA. *Ibid* 113–52.—Skins of these species were cut into a great no. of small squares and strength and thickness detns. were carried out. The usual tanning expts., etc., were reported. A. A. BOEHTLINGK

---

**Metal compounds of azo dyes [for dyeing leather] (U. S. pat. 1,887,602) 25. Cleans-**

ing, emulsifying and wetting agents (Ger. pat. 567,361) **25.** Strongly basic azo dyes (U. S. pat. 1,887,289) **25.** Ornamenting leather, etc. (Brit. pat. 347,888) **26.**

**Treating hides.** F. N. BLISTANOV. Russ. 312, July 27, 1921. Hides used for prepg. furs, etc., are treated with a not-quite-neutral soln. obtained in treating sawdust with dil. $H_2SO_4$ or HCl accompanied by heating.

**Apparatus for treating hides, leather, etc.** M. G. LOSHKAREV. Russ. 1417, July 5, 1911. App. for treatment with tanning, dyeing, salt and other solns. is described.

**Conveyor for drying hides and furs.** A. A. POPRYADUKHIN. Russ. 19,534, Dec. 24, 1929 and addn. Russ. 26,970, April 12, 1930.

**Fat-liquoring leather.** I. G. FARBENIND. A.-G. Ger. 567,177, Dec. 29, 1926. Use is made of solns. of sulfonated wool-fat acids, prepd. as described in Ger. 531,296 (*C. A.* **25,** 5588).

**Tanning hides.** GEORG V. WRANGE (one-half to Aktiebolaget Friberg's Högvacuumpump). U. S. 1,887,972, Nov. 15. The material to be tanned is subjected to a vacuum and to a circulating tanning soln., the vapors formed are drawn off and condensed and the condensate is reintroduced while the tanning operation proceeds, to maintain the proportion of volatile acids as const. as possible. App. is described.

**Tanning agents.** J. R. GEIGY, SOC. ANON. Brit. 362,797, Mar. 10, 1931. Addn. to 305,013 (*C. A.* **23,** 4844). A sol. sulfonated phenol or deriv. thereof is condensed with $CH_2O$ or compd. yielding $CH_2O$ at a raised temp. and in strongly alk. soln. in the presence of one or more aromatic oxycarboxylic acids and urea or a compd. yielding urea. In addn. to use as tanning agents the products can be used for loading silk without a change of color. Cf. *C. A.* **27,** 860.

**Tanning extracts.** S. S. VOYUTZKII and TZENTRALNUII NAUCHNO-ISSLEDOVATELSKII INSTITUT KOZHEVENNOI PROMUISHLENNOSTI. Russ. 26,768, June 30, 1931 Tanning and non-tanning exts. obtained by pptn. from tanning saps are acted upon with $CO_2$ to dissolve the nontans while the tannides are recovered from the residues in the usual manner.

**Depilatories.** HALWIT LABORATORIUM G. M. B. H. Fr. 736,019. April 27, 1932. Depilatories are made by mixing alk. earth sulfides with albumins or nucleoalbumins, such as casein, their sol. salt compds. or their degradation compds. of high mol. wt. Sol. thiocyanates, iodides, bromides and nitrates may also be added.

**Depilatories.** HUBERT JAHARD. Fr. 736,730, Sept. 5, 1931. Depilatories having a basis of sulfides are solidified by gelifying agents such as glycerol, alcs. or sapond. fatty substances.

**Belt dressing.** E. SOL. Belg. 388,487, June 30, 1932. A product suitable for preventing the slippage of belts is obtained by boiling a mixt. of rosin and oil, adding rubber, heating till the lumps disappear, eventually with addn. of HCl toward the end of the heating, filtering and packing hot in boxes.

**Impregnating composition for leather soles.** E. ZETTERLUND. Norw. 51,102, July 4, 1932. A mixt. of 15% raw rubber, 30% resin, 35% linseed oil, 17% turpentine oil satd. with raw rubber and 3% paraffin wax.

**Leather substitute.** P. P. KONDRATZKII. Russ. 1426, April 22, 1920. Several layers of cotton fabric are treated in succession with (1) a turpentine soln. of rosin, or Japan wax, ozokerite, etc., followed by drying, (2) concd. $H_2SO_4$, followed by washing and soaking in $NH_4OH$ or $ZnCl_2$, (3) drying and rolling, (4) glue soln., (5) chromium-alum soln., (6) rolling through rollers at high pressure, (7) turpentine soln. of a drier, followed by drying and rolling and (8) rubbing with a paste composed of a drier and mineral dyes.

**Leather substitute.** K. I. TARASOV. Russ. 14,577, Feb. 25, 1928. A leather substitute is prepd. from leather waste by mixing with albumin, treating with phenol resins, drying and pressing while hot.

**Leather substitute.** K. I. TARASOV. Russ. 25,156, June 22, 1928. Addn. to Russ. 14,577 (preceding abstract). Leather waste treated with liquid or water-sol. products of condensation of phenol or its homologs with formalin is treated with alk. solns. of keratinous substances extd. from wool, horn, hoofs, etc., or their mixts. with albumin solns.

**Gelatin.** ALFRED MENTZEL. Ger. 567,476, April 13, 1930. Dried bone from which gelatin is to be recovered is pretreated with a mild alk. soln. Thus, dried defatted bone may be steeped in 0.1 *N* KOH for 15 hrs., washed and worked up to gelatin in known manner.

# 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

**Anodic deposition of rubber.** ALBERT HIRSCH. *Quarterly Rev. Am. Electroplaters' Soc.* **19**, No. 9, 39–41(1933).—The compn., prepn. and conditions of working of a soln. suitable for com. rubber deposition are given. EDWARD B. SANIGAR

**Experiments on oil-proof rubber.** KATSUMI ISHIGURO. *J. Soc Rubber Ind., Japan* **5**, 670–84(1932).—The absorption of oil by rubber was least when it was compounded with substances which gave the best mech. strength, or with vulcanization accelerators Rubbers compounded with org. substances which are sol. in oil showed the least resistance to oil; the use of soap and starch gave good results. Rubbers compounded with alkali soaps, especially soaps made from stearic acid or coconut oil, gave the least oil absorption, while insol. metal soaps gave inferior products. There was no particular advantage in using glue for increasing the oil resistance; besides it retarded vulcanization. Test of the oil resistance of rubber mixts. contg. 9 different accelerators indicated that rubbers with no particular hardness requirement can be made particularly oil resistant by the proper choice of time of vulcanization and of accelerator. The absorption of oil by vulcanized rubber diminished with increase in hardness. K. KITSUTA

**Generalities about various rubber plasticizing agents derived from the aliphatic series.** ALBERT HUTIN. *Rev. gén. caoutchouc* **9**, No. 87, 22–3(1932).—Good results can be obtained, particularly with mixts. contg. predominantly scrap rubber, by the use of softeners prepd. by the neutralization of undecylenic acid with ZnO, CaO or PbO. C. C. DAVIS

**Characteristics of semi-ultra accelerators.** KEICHI SHIMADA. *J. Soc. Rubber Ind., Japan* **5**, 695–9(1932).—"Vulkacit 576" (a condensation product of a higher aldehyde and an aromatic base) like other org. semi-ultra accelerators gave a decreased viscosity of the rubber soln. in $C_6H_6$. It belongs to a group of accelerators which cause depolymerization of rubber. Rubbers thus depolymerized react easily with S and give products with special chem and phys. properties. K. KITSUTA

**Accelerators of vulcanization.** F. JACOBS. *Caoutchouc & gutta-percha* **30**, 16258–60 (1933); cf. *C. A.* **26**, 5227.—A discussion of the results obtainable with "Barak" (cf. Hauser and Wolf, *C. A.* **26**, 874). C. C. DAVIS

**Retarders of vulcanization.** RUDOLF DITMAR *Caoutchouc & gutta-percha* **30**, 16264–6(1933).—A discussion of the results obtainable with recent com. substances. C. C. DAVIS

Use of latex in paper and in cardboard (GARNER) **23.** Acetylene polymers and their derivatives. V. Polymerization of bromoprene [new synthetic rubbers] (CAROTHERS, *et al.*) **10.** Incorporating fibrous materials in aqueous dispersions such as those of rubber (U. S. pat. 1,889,473) **13.** Bituminous emulsion containing rubber (U. S. pat. 1,886,334) **22.** Polymerization products from oils and fats (Brit. pat. 362,845) **27.** Reactions of ketones and amines [anti-oxidizing agents for rubber] (Fr. pat. 737,193) **10.** C black for use in rubber compositions, etc. (U. S. pat. 1,889,429) **18.** Sieves [rubber-coated fabric for use in] (Brit. pat. 381,596) **1.** Impregnating composition for leather soles (Norw. pat 51,102) **29.**

MARQUARD, ERICH: **Verfahren zur Prüfung der Stosshärte an Vollgummireifen.** Thesis, Aachen, 1930. 10 pp.

SCHAAL, WILLI: **Über Kautschuk, Guttapercha, Balata.** Thesis, Freiburg i. Br., 1931. 58 pp.

---

**Latex.** METALLGESELLSCHAFT A.-G. Fr. 736,838, May 9, 1932. Latex is concd. by heating it, after the addn. of the usual agents to prevent coagulation, under conditions such that no vapor is formed, and then introducing it, *e. g.*, by spraying, into a vacuum evaporator. The temp. at which the latex enters is above the boiling temp. at the pressure in the evaporator. An app. is described.

**Gel from rubber latex.** CECIL HAYES, EVELYN W. MADGE and FREDERICK H. LANE (to Dunlop Rubber Co., Ltd.). U. S. 1,887,201, Nov. 8. A concd. preserved latex is treated with a small proportion of a sensitizing agent such as $(NH_4)_2SO_4$ and $CH_2O$ in excess of that required to combine with the free $NH_3$ in the latex (such excess being about 0.3% of the latex) and the latex is permitted to stand until a gel is formed.

**Rubber.** GAIL R. YOHE (to The Goodyear Tire and Rubber Co.). Can. 329,254,

Jan. 10, 1933. Rubber is preserved by vulcanization in the presence of a reaction product of a ketone selected from a group comprising acetone, cyclohexanone and diethyl ketone and a phenol selected from a group consisting of PhOH, cresol, resorcinol, pyrogallol and xylenol.

**Electrodeposition of rubber.** DUNLOP RUBBER CO., LTD., and THE ANODE RUBBER CO., LTD. Ger. 567,392, April 23, 1931. See Brit. 358,012 (*C. A.* **27**, 442).

**Electrophoretic deposition of rubber.** ANODE RUBBER CO. (ENGLAND), LTD. Ger. 567,033, Feb. 8, 1930. Addn. to 549,219 (*C. A.* **26**, 3959). See Brit. 331,563 (*C. A.* **25**, 233).

**Rubber poor in albumin.** METALLGESELLSCHAFT A.-G. (to Revertex, Ltd.). Brit. 363,193, Jan. 28, 1931. Rubber poor in N suitable *for insulation of submarine cables*, is obtained by heating latex with dil. alkali, *e. g.*, 3–10 hrs., at temps. below the b. p., preferably 90–100°, at ordinary pressure, coagulating the rubber and washing out the coagulant and nitrogenous material rendered sol. by the heating.

**Rubber compositions.** WALDO L. SEMON (to B. F. Goodrich Co.). U. S. 1,886,310, Nov. 1. A small proportion of the reaction product formed from a primary aromatic amine such as naphthylamine and a non-volatile fatty acid or rosin with elimination of water is used to facilitate vulcanization and inhibit oxidation.

**Rubber compositions.** THE GOODYEAR TIRE & RUBBER CO. Brit. 362,814, April 7, 1931. A nail-retaining insert vulcanized in a cavity in a rubber heel comprises a mixt. of rubber, fibrous material such as obtained from discarded rubber tires and hemoglobin.

**Rubber composition.** F. DE LANNOY. Belg. 387,917, May 31, 1932. The product consists of a mixt. of pure rubber and substance of low sp. gr. such as cork.

**Treatment of rubber.** JOEL P. MCINTIRE (to The Goodyear Tire and Rubber Co.) Can. 329,255, Jan. 10, 1933. Creped sheet rubber contg. approx. 1–2% of moisture is dipped in a bath of molten stearic acid at 225° F. for a few min. The rubber is removed and subjected to a temp. of 125° F. for 5 hrs. Lauric acid, pine oil and similar oil substances employed as softeners and plasticizers may be incorporated in a similar manner. The time and labor expended to obtain uniformly blended material is greatly reduced.

**Machines for kneading rubber.** CONTINENTAL GUMMI-WERKE, A.-G. Brit 380,003, July 31, 1931. Mech features.

**Aqueous rubber dispersions.** SOC. ITALIANA PIRELLI. Ger. 567,217, Feb. 3, 1931 Crude or regenerated rubber is mixed with about 10% of an aliphatic, aromatic, hydroaromatic or terpenic alc. or a hydroaromatic or terpenic ketone, and the mixt. is kneaded with an aq. soln. of a dispersing agent, *e. g.*, soap, saponin or casein.

**Rubber articles from dispersions.** EDWARD A. MURPHY, ROBERT G. JAMES and DOUGLAS F. TWISS (to Dunlop Rubber Co., Ltd.). U. S. 1,886,351, Nov. 1. Uncoagulated layers of an aq. rubber dispersion are contacted with a bath contg. coagulating and swelling material.

**Products in continuous lengths from rubber dispersions.** DOUGLAS F. TWISS and EDWARD A. MURPHY (to Dunlop Rubber Co., Ltd.). U. S. 1,887,190, Nov. 8. An aq. rubber dispersion is extruded directly into a dehydrating fluid comprising a fused salt such as NaOAc. Various details and modifications are described.

**Rubber membranes.** HERMANN BECKMANN. Fr. 40,412, June 29, 1931. Addn. to 605,245. A membrane for filters, electrolytic elements, etc., is made by coagulating latex to a flat sheet, vulcanizing while avoiding pressure and vaporization of water, bringing it to an undulating form and vulcanizing, again avoiding vaporization of water.

**Transformation products of rubber.** I. G. FARBENIND. A.-G. Fr. 41,088, Dec. 7, 1931. Addn. to 726,961 (*C. A.* **26**, 5228). Rubber and like materials are treated with neutral aliphatic or aromatic peroxides such as acetic or benzoyl perodide.

**Molds for articles of rubber or other plastic material.** HECTOR STEPPÉ, ALPHONSE STEPPÉ and GUSTAVE STEPPÉ. Brit. 360,122, Sept. 15, 1930. Addn. to 321,009.

**Machines for plasticizing materials such as rubber.** WILLIAM A. GORDON (to Farrel-Birmingham Co., Inc.). Brit. 362,280, Mar. 16, 1931.

**Rubber articles.** DUNLOP RUBBER CO., LTD., and THE ANODE RUBBER CO., LTD. Fr. 40,940, Oct. 20, 1931. Addn. to 694,768 (*C. A.* **25**, 2021). Spongy articles are made by coating a support or basic layer with a substance capable of provoking coagulation, dehydration or setting or of all three, and bringing the support or layer into contact with emulsions or dispersions of rubber previously brought to the state of froth or foam. Cf. *C. A.* **27**, 862.

**Oil-resisting rubber articles.** BERT S. TAYLOR (to B. F. Goodrich Co.). U. S. 1,886,759, Nov. 8. Fabric-reënforced rubber articles such as belting or footwear are

coated with a layer of a tough heat-plastic rubber isomer which may be combined with Se oxychloride in diminishing proportion inwardly from the surface.

**Variegated or "jazz" colors on surfaces of articles.** The India Rubber, Gutta Percha and Telegraph Works Co., Ltd. and John Hubbard. Brit. 362,947, Sept. 11, 1930. One or more liquid coloring materials, *e. g.*, pigments and dyes in rubber solns., oils, varnishes, etc., are applied to the surface of a liquid immiscible therewith and having a disintegrating and dispersive action thereon, *e. g.*, water in which $Na_2CO_3$ is dissolved, and the surface of the article to be colored, *e. g.*, rubber ball, is then brought in contact or passed over the surface of the liquid.

**Apparatus for cooling and drying rubber strips.** D. B. Gurvich and M. A. Zhukovskii. Russ. 26,798, June 22, 1930. Mechanical details.

**Extrusion and setting bath apparatus for manufacture of rubber tapes or threads or the like.** Edward A. Murphy and Douglas F. Twiss (to Dunlop Rubber Co., Ltd.). U. S. 1,889,102, Nov. 29. Structural and mech. features.

**Apparatus for indicating the temperature of webs of material such as sheet rubber moving through calendar machines.** Paul B. Schuster (to Magnetic Gauge Co.). U. S. 1,889,385, Nov. 29. Various details of app. are described, including a heat-conductive roller for contact with the web.

**Making rubber band packages from rubber tubing and an associated backing strip.** Kenneth R. Shaw (to Easthampton Rubber Thread Co.). U. S. 1,886,842, Nov. 8. Mech features.

**Apparatus for measuring the temperature of rollers used in rolling rubber.** A. I. Zaslavskii. Russ. 26,799, Sept. 4, 1930.

**Preservation of rubber.** Imperial Chemical Industries, Ltd. Brit. 363,340, June 13, 1930. Void. The properties of rubber are improved by incorporation of a substance of formula HORR'Y, in which R and R' are aromatic hydrocarbon radicals and Y is H or OH, *e. g.*, *o*- and *p*-hydroxybiphenyls, *α*- and *β*-hydroxyphenylnaphthalenes, etc. Cf. *C. A.* **27**, 444.

**Preservation of rubber.** Imperial Chemical Industries, Ltd., Hugh M. Bunbury, James S. H. Davies and Wm. J. S. Naunton. Brit. 363,483, Nov. 22, 1930. A boric ester of naphthol, *e. g.*, tri-*β*-naphthyl borate, is added to rubber to increase its resistance to deterioration and discoloration.

**Antioxidant for rubber.** Jan Teppema (to Goodyear Tire & Rubber Co.). U. S. 1,888,705, Nov. 22. Rubber is admixed with about 1% of a compd. of the general formula $RN{:}N{-}R'NH_2$, in which R and R' are phenyl radicals such as *p*-aminoazobenzene or *p*-aminoazonaphthalene.

**Rubber antioxidant.** Lorin B. Sebrell (to The Goodyear Tire and Rubber Co.). Can. 329,261, Jan. 10, 1933. An accelerator of vulcanization and aminonaphthanthraquinone are incorporated in rubber to retard oxidation.

**Antioxidants for rubber.** Winfield Scott (to The Rubber Service Laboratories Co.). Brit. 362,907, Sept. 8, 1930. See Can. 316,564 (*C. A.* **26**, 1830).

**Rubber vulcanization accelerator.** Giuseppe Bruni and Tullio G. Levi (to Società italiana Pirelli). U. S. 1,886,636, Nov. 8. Use is made of a compd. such as methylenedimethylammonium dimethyldithiocarbamate or the like.

**Vulcanization accelerators.** Winfield Scott (to The Rubber Service Laboratories). Brit. 362,862, Sept. 8, 1930. A mixed accelerator comprises a nitrophenylarylthiazyl disulfide and a basic org. N-contg. compd., *e. g.*, an amine or salt thereof. The first may be formed by the reaction of a mercaptoarylthiazole with a nitro, or nitro and halogen, substituted deriv. of an aryl S halide. Among examples of the first are 2-nitrophenylbenzothiazyl disulfide and 2-nitro-4-chlorophenyl-6-nitrobenzothiazyl disulfide; of the second, diphenylguanidine, piperidine and Schiff's bases, *e. g.*, methylene dianilide.

**Apparatus for vulcanizing rubber tires, tubes, etc.** John R. Stricklen and Samuel A. Fraine (to Taylor Instrument Companies). U. S. 1,887,251, Nov. 8. Mech. features.

**Mold for vulcanizing rubber articles such as inner tubes for tires.** Robert W. Snyder (to Goodyear Tire & Rubber Co.). U. S. 1,888,702, Nov. 22. Structural and mech. features.

**Apparatus for vulcanizing rubber tires and tubes.** John R. Stricklen and Samuel A. Fraine (to Taylor Instrument Companies). U. S. 1,887,250, Nov. 8. Mech. features.

**Autoclave for vulcanizing rubber goods.** N. I. Posnov. Russ. 26,801, Dec. 22, 1931. Construction details.

**Vulcanizing container for tires.** A. I. Grekov. Russ. 25,267, Jan. 4, 1930.

**Collapsible chucks for constructing tires.** THE GOODYEAR TIRE & RUBBER CO. Brit. 363,241, Mar. 4, 1931.

**"Age resisting" vulcanized rubber.** JOSEPH R. INGRAM (to Rubber Service Laboratories Co.). U. S. 1,899,331, Nov. 29. Rubber and S are heated in the presence of an antioxidant comprising a reaction product of a diazotized aryl amine such as diazotized aniline and diphenylamine at a temp. below the decompn. point of the diazotized amine.

**Vulcanizing rubber.** JOHANN A. BERTSCH (to Rubber Service Laboratories Co.). U. S. 1,889,327, Nov. 29. In vulcanizing a rubber-S mixt., a cyclohexyl substituted aryl amine in which the cyclohexyl group is attached to the N atom of the amine, such as cyclohexylaniline or the like, is used as an antioxidant.

**Vulcanizing rubber.** LAURENCE A. EDLAND (to R. T. Vanderbilt Co., Inc.). Brit. 362,740, Jan 20, 1931. See U. S. 1,875,997 (*C. A.* **27**, 208).

**Vulcanization of rubber.** I. G. FARBENIND. A.-G. (Ludwig Orthner and Werner Siefken, inventors). Ger. 567,146, Apr. 4, 1930. As vulcanization accelerators for natural or synthetic rubber, use is made of condensation products from 1 mol. of an aromatic diamine, *e. g.*, benzidine or a phenylene- or naphthylene-diamine, and 2 mols. or more of an $\alpha,\beta$-dialkylacrolein, *e. g.*, $\alpha$-ethyl-$\beta$-propylacrolein.

**Reclaiming vulcanized rubber.** OLOF G. BOHLIN (to Helsingborgs Gummifabriks Aktiebolag). U. S. 1,887,898, Nov. 15. A quantity of Hg or $Hg(NO_3)_2$ amounting to "only a fraction of that equalizing the amount of S contained in the vulcanized rubber" is incorporated with the rubber refuse and the mixt. is then subjected to treatment such as heating and plasticizing.

# CHEMICAL ABSTRACTS

Vol. 27 APRIL 10, 1933 No. 7

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

**Double pipet for absorption of unsaturated hydrocarbons.** JENÖ PLANK. *Math naturw. Anz. ungar. Akad. Wiss.* **48**, 644–6(1931).—The pipet is designed for the absorption of unsatd. hydrocarbons by means of Br-water, with Hg used as sealing liquid The gas must pass over an alkali hydroxide soln., which absorbs Br vapors S. S. DE FINÁLY

**A new weighing buret.** JÓZSEF BICSKEI. *Magyar Chem. Folyóirat* **38**, 123 (1932).—The app. consists of a glass bulb with flat bottom having 2 taps. The buret can be filled with 20–50 cc soln. The taps are provided with glass covers to be used during weighing. S. S. DE FINÁLY

**New division of weights.** F. SARTORIUS *Z. anal. Chem.* **91**, 344–6(1933).—It is recommended to use 1-2-3-5 pieces in sets of wts. W T. H.

**Microbalances.** L. RAMBERG. *Svensk Kem. Tids.* **44**, 188–91(1932).—Polemic Cf. Josephson (*C. A.* **26**, 3745) A. R. ROSE

**An improved gas-density balance with an electromagnetic measuring arrangement.** E. LEHRER AND E. KUSS. *Z. physik. Chem.* **A163**, 73–81(1933); cf. *C. A* **23**, 3385.—An improved suspension balance is described for detg. gas d. Lowering of the sensibility of the balance by the presence of external magnetic fields is reduced by an astatic magnet arrangement. Shifting of the zero point is also decreased. A change of d. of $4 \times 10^{-8}$ g./cc causes a deflection of 1 scale division. This may be improved with a longer period for the pointer. The balance is no more effected by handling or vibrations than a good analytical balance. G. M. MURPHY

**Measurements with the suspension balance described in the preceding communication. Fluctuations in density and oxygen content of atmospheric air.** ALFRED STOCK, HANS RAMSER AND GERHARD EYBER. *Z. physik. Chem.* **A163**, 82–90(1933); cf. *C. A.* **21**, 679.—The balance described in the preceding abstr. was used to measure the d. of 34 samples of atm. air collected between Sept., 1931, and April, 1932. For 18 samples the O content was also detd. by reaction with hot Cu. Variations in d. of about 0 1% were found. Variation in the O content does not account for the d. change, nor does the latter show any relation to the barometric pressure. G. M. MURPHY

**Heated vacuum microdesiccators.** EUGENE W. BLANK. *J. Chem. Education* **10**, 189(1933). E. H.

**An isothermal calorimeter for slow reactions.** E. D. COON AND FARRINGTON DANIELS. *J. Phys. Chem.* **37**, 1–12(1933).—Evapn. of a weighed amt. of $CCl_4$ by a regulated air stream is used to balance the heat evolved by slow reactions conducted in an isothermal calorimeter. By employing a known elec. heat input the app. may be used for the detn. of the *heat of vaporization of liquids*, that of $CCl_4$ at 25° being 48.5 cal per g. On hydrolysis AcOMe absorbs 1052 cals. per mol. The heat of *fermentation of yeast* is 130.1 cals. per g. of glucose destroyed. Heat evolved in the growth of *Azotobacter* is too little for detn. in this app. H. A. BEATTY

**Two types of laboratory pumps for mercury.** P. ZHIVOTINSKII. *Ukraïn. Khem. Zhur.* **6**, No. 5–6, Sci. Part, 241–4(1931).—Two new types of app. for pumping Hg were constructed of glass and rubber and tried out successfully in Zh.'s lab. The action of one is based on difference in d. of water and Hg, which gives rise to a stream of Hg drops and water, the latter entering the app. from the general system under pressure and being unable to overcome the pressure of a column of Hg in a lower arm. In the 2nd pump drops of Hg are elevated in a tube and carried by water suction. J. G. TOLPIN

**Modification and calibration of Kühl's sedimentation apparatus.** K. KOYANAGI. *Cement and Cement Manuf.* **5**, 371–83(1932).—It was found experimentally that calibration could be based on Stoke's law. RAYMOND WILSON

**An apparatus for the mechanical analysis of small amounts of substance.** MIKLÓS VENDL. *Mitt. berg. hüttenmänn. Abt. ungar. Hochschule Berg. Forstw. Sopron* **4**, 104–19(1932).—A sedimentation app. is described. S. S. DE FINÁLY

**Use of small nozzles for measurement of small quantities of flowing gases and for**

**determining the density of gases.** HANS KISTNER. *Z. anal. Chem.* **91**, 321–32(1933).—By means of systematic expts. a procedure was developed for measuring very small quantities of gases based on the principle of difference in pressure. The results by this method, which is described, are better than those obtained with wet or dry meters and are within about 0.05% of the truth. The method is applicable to the flow of 3 cc.–250 l. per min. This remarkable flexibility is due to the proper choice of nozzles, through which the gas flows. W. T. H.

**Automatic regulation of the mixing proportion of gases in chemical technic.** MAYER WITTEN. *Chem. Fabrik* **1933**, 61–2.—The Askania mixer is described and illustrated by a flow sheet of the gas in the desulfurizing process in an $NH_3$ plant. J. H. MOORE

**A new apparatus for extraction with chloroform [for caffeine determinations].** J. GROSSFELD. *Z. Untersuch. Lebensm.* **63**, 555–7(1932).—The app. is illustrated and described. S. LAUFER

**Viscosity measurement of liquid substances and a new universal viscometer.** F. HÖPPLER. *Chem.-Ztg.* **57**, 62–3(1933).—The Höppler app. for liquids and gases is based on the rate of fall of a ball through the liquid contained in a glass tube inclined at 80° and surrounded by a const.-temp. bath. It is very accurate, and is described with 14 references. J. H. MOORE

**A new air classifier.** EDMUND SHAW. *Rock Products* **35**, No. 16, 52–3(1932). RAYMOND WILSON

**Historical development of furnaces.** H. SOUTHERN. *Gas J.* **201**, 318–19(1933). P. J. WILSON, JR.

**Experiences with a registering photocell pyrometer.** G. MÜLLER AND H. J. ZETZMANN. *Z. tech. Physik.* **14**, 90–4(1933).—Details of use and operation are described. ARTHUR FLEISCHER

**Spectroscope and monochromator for the visible range with mirrors with opening ratios 1 : 3.5 or 1 : 2.5.** OTTO SCHÖNROCK AND CARL LEISS. *Z. tech. Physik.* **14**, 78–80 (1933). ARTHUR FLEISCHER

**A differentiator for finding differential coefficients of curves.** TAKEMARO YAMAMOTO. *Bull. Inst. Phys.-Chem. Research* (Tokyo) **11**, 761–3(1932)(*Abstracts* (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) **17**, Nos. 359–65, 87).—A description of a differentiator for finding continuously and easily many differential coeffs. of curves with about 2% error on an av. K. KONDA

**The generation of gaseous hydrogen cyanide.** A. SOLDI AND A. REGÈ. *Ann. chim. applicata* **22**, 695–705(1932).—A new app. for generating HCN is described. It consists of 2 cylinders, 1 contg. dil. $H_2SO_4$, the other solid NaCN. There is a tube connecting the 2 to carry over acid; it is equipped with a valve to prevent HCN from being sucked back into the first cylinder. A pressure of $^2/_{10}$ atm. difference closes this valve. The $H_2SO_4$ is pumped over to the reaction cylinder. A. W. CONTIERI

**The catalytic "fragrant lamp" of J. W. Döbereiner.** A. MITTASCH. *Chem.-Ztg* **57**, 2–3(1933).—Historical, with 7 references. J. H. MOORE

Ba [for electric-discharge tubes] (Brit. pat. 367,792) **18.** Carbonizing [Ni anode plates for radio tubes] (Brit. pat. 366,236) **9.**

**Filter for air.** CHARLES DAVIES. U. S. 1,890,499, Dec. 13. Structural features.

**Air filter.** HANS WITTEMEIER. Fr. 738,346, June 9, 1932.

**Air-pressure filter.** JAMES FLANIGAN. Brit. 363,429, Sept. 26, 1930.

**Rotary pressure filter, especially for caliche fines, etc.** GEORGE E. MACWHIRTER. Brit. 363,609, June 29, 1931.

**Gas filter.** APPAREILS SAM. NIESTLÉ. Fr. 738,305, June 8, 1932.

**Filter funnel.** HENRI JACQUET. Fr. 738,310, June 8, 1932.

**Thickening filters.** JEAN B. VERNAY. Brit. 363,301, Aug. 9, 1930.

**Color-testing apparatus [suitable for testing filters for use in color photography].** F. J. CHESHIRE. Brit. 345,868, May 6, 1930. Optical features.

**Mechanical apparatus for separating solids or liquids from gases.** EUGEN HUBER Fr. 738,474, June 10, 1932.

**Interior separators for fractionating towers.** STANDARD OIL DEVELOPMENT CO. Fr. 738,276, June 7, 1932.

**Apparatus for pneumatic separation of granular material, e. g., dust from coal.** BERTRAM NORTON and JOHN N. COLLINS. Brit. 367,170, Feb. 12, 1931.

**Apparatus for pneumatic separation of powdered or granular material such as coal.** THE CLEAN COAL CO., LTD., RUDOLF LESSING and ROLAND HERBERT ALLEN. Brit. 367,482, Dec. 4, 1930.

**Apparatus for separating solid materials, such as coal from shale.** HUMBOLDT-

DEUTZMOTOREN A.-G. (formerly Maschinenbau-Anstalt Humboldt). Brit. 364,426, Mar. 20, 1930.

**Sampling coal on conveyors or other materials from traveling streams.** THORLEIF THORSTEN. U. S. 1,890,199, Dec. 6. Various details of app. and operation are described.

**Magnetic separator.** HERBERT H. THOMPSON, ALFRED E. DAVIES and WILLIAM E. BOX. Brit. 367,464, Aug. 4, 1931.

**Apparatus for magnetic separation of materials.** GEORG ULLRICH (to Fried. Krupp Grusonwerk A.-G.). U. S. 1,890,551, Dec. 13. Structural features.

**Centrifugal separators.** AKTIEBOLAGET SEPARATOR. Brit. 364,506, June 21, 1930.

**Centrifugal separator.** AKTIEBOLAGET SEPARATOR. Brit. 368,167, June 21, 1930.

**Centrifugal separating apparatus.** EUGENE C. SAINT-JACQUES. Brit. 367,194, Mar. 5, 1930, 367,196, Aug. 21, 1930 (addn. to 367,194).

**Centrifugal machines for separating solids from liquids.** THOMAS BROADBENT & SONS, LTD., and WM. HALLITT. Brit. 364,348, Jan. 12, 1931.

**Centrifugal steam separator.** HENRY W. WILDISH. Brit. 365,778, Jan. 19, 1931.

**Apparatus for collection and microscopic examination of dust in air or other gases.** H. WITTEMEIER. Brit. 345,601, July 23, 1930. Structural features.

**Regenerative refrigerating and rectification system for separation of constituents of gases such as air.** MATHIAS FRÄNKL (to American Oxythermic Corp.). U. S. 1,890,646, Dec. 13. Various details of app. and operation are described.

**Centrifugal gas cleaners.** HERMANNUS VAN TONGEREN. Brit. 364,449, April 2, 1931.

**Centrifugal gas cleaners.** INTERNATIONAL PRECIPITATION CO. Brit. 365,312, Dec. 8, 1930.

**Centrifugal gas cleaner.** ELEKTRISKA SVETSNINGS AKTIEBOLAGET. Brit. 366,926, Aug. 7, 1930. For scpg. solid or liquid impurities from gases.

**Centrifugal gas cleaner.** HEENAN & PROUDE, LTD., and GEORGE H. WALKER. Brit. 367,120, Jan. 14, 1931.

**Centrifugal machines.** AKTIEBOLAGET SEPARATOR. Brit. 363,584, April 11, 1930.

**Centrifugal machines.** AKTIEBOLAGET SEPARATOR. Brit. 366,703, Jan. 25, 1930.

**Centrifugal machine.** RAMESOHL & SCHMIDT A.-G. Brit. 366,873, Aug. 14, 1930.

**Electrically driven centrifugal machine.** AKT. GES. BROWN, BOVERI ET CIE. Brit. 361,857, July 25, 1929.

**Centrifugal machines for substances containing colloidal matter.** SOCIÉTÉ ANON. RAFFINERIE TIRLEMONTOISE. Brit. 365,989, Aug. 27, 1930.

**Centrifugal apparatus for making emulsions.** NIELS BENDIXEN and JULIUS C. VREDENBURG. Brit. 367,890, Nov. 27, 1930.

**Bowl for centrifugal machines.** AKTIEBOLAGET SEPARATOR. Brit. 365,450, May 14, 1930.

**Color analyzer and photometer.** A. C. HARDY (to British Thomson-Houston Co., Ltd.). Brit. 341,200, Nov. 21, 1928. Optical, mech. and photoelec. details.

**Comparison photometer.** J. RIPERT (to G. Bernheim). Brit. 346,170, April 10, 1930. Structural and optical features of an app. suitable for use with liquids in tubes.

**Pyrometer employing a photoelectric cell.** Soc. C. E. M. A. Brit. 346,620, July 16, 1929. Numerous structural and elec. details are described.

**Combined temperature and pressure indicator.** SCHMIDT'SCHE HEISSDAMPF-GES. Brit. 346,183, May 21, 1929. Various mech. and structural details are described.

**Temperature indicator and controller.** KEITH S. MILLS. Brit. 363,452, Oct. 18, 1930.

**Thermometer for indicating temperatures at a distance.** F. M. SLOUGH. Brit. 345,988, Nov. 30, 1928. Structural and elec. details of a device actuated by a bimetallic strip.

**Thermometer for temperature indication at a distance.** F. M. SLOUGH. Brit. 346,360, Nov. 30, 1928. Structural and elec. details of a device suitable for use with engine water jackets or the like.

**Thermometer for recording temperatures in deep wells, etc.** ANGLO-PERSIAN OIL CO., LTD., and D. COMINS. Brit. 344,851, Dec. 7, 1929. Numerous structural details are described.

**Stirring apparatus for liquids.** JOSEPH W. BRITTLEBANK and JOHN EADES. Brit. 365,712, Nov. 26, 1930.

**Mixing machines.** BERGEDORFER EISENWERK AKT.-GES. ASTRA WERKE. Brit. 366,612, Mar. 8, 1930.

**Centrifugal mixing device.** ALEKSANDER FUROWICZ and ALEXANDER BAUER. Brit. 365,420, April 7, 1931.

**Mixing or kneading apparatus.** EUGEN EPPLER and BAKER PERKINS, LTD. Brit. 364,588, May 15, 1930.

**Portable mixing appliances.** JACOB THORDSEN. Brit. 364,470, April 20, 1931. A rotating drum mounted on a portable frame which can be tilted into position for mixing.

**Device for intimately mixing, churning or agitating liquid substances.** JOHN ROBINSON and JOHN H. THOMPSON. Brit. 363,543, Feb. 6, 1931.

**Apparatus for mixing slimes.** MASCHINENFABRIK AUGSBURG-NÜRNBERG A.-G. Brit. 366,437, Oct. 22, 1931.

**Apparatus for continuous treatment of solids at high temperature and pressure with liquids, vapors or gases.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,665, Oct. 4, 1930.

**Apparatus for classification of materials by elutriation.** LEONARD ANDREWS. U. S. 1,890,206, Dec. 6. Various structural details are described.

**Apparatus for purifying steam or other vapor.** WALTER J. HUGHES (to General Zeolite Co.). U. S. 1,890,294, Dec. 6. Structural features.

**Vacuum still or vaporizer [with a steam calandria] suitable for reclaiming and purifying volatile liquids.** JOHN H. HILLS (to Bousman Mfg. Co.). U. S. 1,890,152, Dec. 6. Various structural details are described.

**Device for regulating flow of liquid, solid or gaseous matter.** HENRY C. HEAD. Brit. 363,365, Sept. 16, 1930.

**Apparatus for mixing gases in any proportion.** FRANCESCO MANGIAMELI. Fr 738,400, Sept. 30, 1931.

**Treating gases with liquids.** E. LAURENT. Brit. 380,764, May 28, 1931. Mech equipment for washing dust or smoke from gases is described.

**Apparatus for continuously determining the amount of gas dissolved in liquids.** GÉZA SZIKLA and PAUL V. VAGO. Brit. 363,369, Sept. 16, 1929.

**Apparatus for adding measured quantities of liquid reagents to water.** HUBERT G. MARIGNY and ROLAND T. PEMBERTON. Brit. 367,453, Nov. 22, 1930. Use is made of elec. means controlled by the flow of water and actuating the reagent supply.

**Apparatus for indicating or recording the specific gravity of fluids.** J. L. HODGSON. Brit. 343,218, Dec. 5, 1929. See U. S. 1,838,399 (*C. A.* **26**, 1163).

**Apparatus [having a tank with a conical bottom] for clarifying liquids.** ARTHUR H. ZEITZ. U. S. 1,890,712, Dec. 13. Various structural details are described.

**Return bend and header for tubular stills and like apparatus.** RAYMOND T. HOWES (one-half to James W. Weir). U. S. 1,890,464, Dec. 13.

**Viscometer for oils and similar liquids.** CARL D. MILLER. U. S. 1,889,996, Dec. 6. Various details are described of an app. of the constant-flow, pressure-resistance measuring type.

**Centrifugal oil cleaner.** FRITZ SCHMIDT. Brit. 367,657, May 20, 1930.

**Apparatus for determining the moisture content of wood or other materials through their electrical conductivities.** CHARLES B. LIMBRICK. U. S. 1,890,545, Dec. 13. Various structural and elec. details are described.

**Apparatus and procedure for determining water in flour or other finely ground or liquid material.** JOHN THOMLINSON and ERNEST A. FISHER. Brit. 365,247, Nov. 17, 1930. Water is determined by the loss in wt. after reaction of the $H_2O$ with $CaC_2$.

**Apparatus for emulsification of various materials.** NIELS BENDIXEN (to J. C. Vredenburg). U. S. 1,890,106, Dec. 6. Various details are described of an app. with rotating disks and concentric rings.

**Contra-flow washers for granular material.** FREDERICK PARKER, LTD., and FREDERICK W. PARKER. Brit. 363,654, Sept. 16, 1930.

**Bellows air compressors for atomizing, disintegrating and spraying liquids.** ARTHUR J. ADAMS. Brit. 363,315, Sept. 15, 1930.

**Device for prevention of back fires in gas, especially acetylene, apparatus.** ARTHUR STEPHENSON and ALLEN-LIVERSIDGE, LTD. Brit. 363,628, Sept. 12, 1930.

**Alcohol condenser [suitable for use with automobile radiator overflow pipes].** LOUIS B. GOETZMAN (one-half to John H. Rightmyer). U. S. 1,889,892, Dec. 6. Structural details.

**Spinning pots and centrifuge buckets.** ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Electric Co., Inc.). Brit. 365,963, June 14, 1930. The pot or bucket is constructed of annularly disposed cords combined together by an artificial resin.

**Molding machine for plastic material, especially margarine.** GEO. W. SAUNDERS. Brit. 363,350, Aug. 13, 1930.

**Apparatus for sealing cans in vacuo.** PIERRE G. JANOT. Brit. 363,641, Sept. 24, 1929.

**Germ-free filling and sealing of bottles, etc.** ADAM BÖHMER and GEORG GEBHARDT (to Seitz-Werke G. m. b. H.). U. S. 1,889,629, Nov. 29. Various details are de-

scribed of app. and procedure for sterilizing vessels, blowing out residual sterilizing medium and filling them successfully.

**Electric control for dispensing material [such as foods or chemicals into cartons].** EDMUND B. ILYUS (to Arenco Machine Co.). U. S. 1,889,663, Nov. 29. The dielectric characteristic of the material is utilized for elec. control of segregation of the material in unit quantities, in a described automatic system.

**Automatic pressure regulator suitable for electrically driven apparatus.** VINCENT W. LEONARD (to General Elec. Co.). U. S. 1,889,607, Nov. 29. Mech. details of a device including an elec. switch are given.

**X-ray apparatus.** N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 363,602, May 21, 1930. The installation comprises a high tension supply transformer, a variator (resistance lamp) in the primary circuit consisting of a container, *e. g.*, of glass, a suitable gas filling and a resistance wire, *e. g.*, of W or Ni, and a holder for securing the variator to the envelope of the transformer. Cf. *C. A.* **27**, 871.

**X-ray tube.** N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 363,595, April 30, 1930. Means for cooling is described.

**Producing vacuums in devices such as radio tubes or valves.** KEMET LABORATORIES CO. Brit. 365,801, Jan. 28, 1931. See U. S. 1,800,134 (*C. A.* **25**, 2883).

**Electron-discharge devices.** REVELATION PATENTS HOLDING CORP. Brit. 363,430, Dec. 16, 1930.

**Indirectly heated cathode for electron-discharge devices.** ARISTOTE MAVROGENIS. U. S. 1,890,859, Dec. 13. Structural details.

**Luminescent gas-discharge tubes.** LEO L. BECK (to Claude Neon Lights, Inc.). Brit. 363,343, Feb. 28, 1930. A luminescent pos.-column tube contains a principal filling of Ne with not more than 0.5% of A, Kr and (or) Xe, the gas filling coöperating with a thermionic cathode within the tube, and has means for transmitting to the filling currents with a d. of 0.1–1.0 amp. per sq. cm. of pos.-column cross section, which d. offsets the tendency of the A, Kr and Xe to impair the color of the Ne. Cf. *C. A.* **27**, 1243.

**Mercury luminescent-tube electrode.** MELVIN G. MORRIS (to Claude Neon Lights, Inc.). U. S. 1,890,402, Dec. 6. Structural features.

**Rotary compressor.** GAUTIER STIERLI. Brit. 363,471. Nov. 19, 1929.

**Roller-and-ring mills.** FAY H. ROSENCRANTS (to International Combustion, Ltd.). Brit. 364,213, Oct. 11, 1929.

**Roller-and-ring mills.** FAY H. ROSENCRANTS (to International Combustion, Ltd.). Brit. 364,526, Oct. 11, 1929. Divided out of 364,213 (cf. preceding abstr.).

**Roller-and-ring mill.** KRISTIAN MIDDELBOE. Brit. 367,548, Feb. 9, 1931.

**Roller-and-breast mills.** GEORGE E. KRIDER. Brit. 365,427, April 9, 1931.

**Roller-and-breast grinding or crushing mills.** OSCAR SODER. Brit. 362,159, Dec. 7, 1929.

**Roller-and-breast mills for crushing coke, coal, etc.** ISAAC H. PILOT. Brit. 363,269, April 22, 1931.

**Ball and tube mills.** GUSTAV BOJNER. Brit. 365,570, July 12, 1929. Void. Rings, balls or stones are introduced into a rotary drying, evaporating, carbonizing or steam-cooling cylinder to disintegrate the material and facilitate the passage of gases therethrough, or to increase the surface to which the liquid adheres.

**Impact pulverizers.** ALFRED W. BENNIS. Brit. 364,193, Oct. 8, 1930.

**Impact pulverizers.** PERCY W. GRIFFIN. Brit. 364,954, Mar. 27, 1931.

**Impact pulverizers.** SOCIÉTÉ ANON. D'OUGRÉE MARIHAYE. Brit. 366,001, Aug. 22 1929.

**Impact pulverizers.** AUSTIN A. HOLBECK. Brit. 368,106, April 8, 1931.

**Impact pulverizer mills.** GUSTAV H. KAEMMERLING (to Erie City Iron Works). Brit. 365,529, Sept. 2, 1930.

**Impact pulverizer mill.** CLARENCE R. TAYLOR. Brit. 367,124, Jan. 16, 1931.

**Pulverizing mills.** WILLIAM A. WHITE and WHITE'S MARINE ENGINEERING CO., LTD. Brit. 366,608, Nov. 11, 1930. A pulverized fuel and air-supply system for furnaces is described.

**Mills with gyratory crushing heads.** EDGAR B. SYMONS (to Nordberg Manufacturing Co.). Brit. 364,651, Dec. 9, 1929.

**Crushers with vibrating jaws.** F. KRUPP GRUSONWERK A.-G. Brit. 360,747, Feb. 7, 1930.

**Crushers with vibrating jaws.** H. R. MARSDEN, LTD., and NEIL TAYLOR. Brit. 367,631, April 24, 1931.

**Crushing apparatus for waste oil cans, copra, etc.** GREENWOOD & BAILEY, LTD., JOHN C. M. MACLAGAN and ANDREW PENDLEBURY. Brit. 364,169, Oct. 3, 1930.

**Feeding means for grinding and mixing machines.** BESSEMER CEMENT CORPORATION. Brit. 368,015, Jan. 26, 1931.

**Sifting apparatus.** EDWARD LARSSON and ERNST PETTERSSON. Brit. 366,886, Oct. 4, 1930.

**Sifting apparatus.** FRANCIS W. BRACKETT. Brit. 367,144, Jan. 28, 1931.

**Sifting apparatus.** THE SALT UNION LTD., and ROBERT BENNET. Brit. 368,026, Feb. 5, 1931.

**Sifting and cooling apparatus.** WM. DRYDEN. Brit. 366,922, Nov. 8, 1930.

**Sifting apparatus for potters' slip, powdered substances, etc.** WILLIAM PODMORE and OSWALD G. COLLIER. Brit. 367,047, Nov. 20, 1930.

**Sifting apparatus for sand, gravel, ashes, etc.** DUDLEY M. P. CARLETON and S. M. WILMOT & CO., LTD. Brit. 364,774, Dec. 1, 1930.

**Screening apparatus for stone, gravel, etc.** AUSTIN SHARP and HERBERT A. ASHTON. Brit. 363,994, Sept. 18, 1930.

**Furnaces.** CHAUFFAGE ET RÉCUPÉRATION THERMIQUE. Fr. 737,432, May 23, 1932. The air used for cooling objects from continuous furnaces, *e. g.*, tunnel furnaces, is used for combustion in the furnace.

**Fusion furnace.** ÉDOUARD A. BEAUGENDRE. Fr. 737,543, Sept. 14, 1931.

**Air-heating furnaces.** H. LÖSCHE. Brit. 381,304, Sept. 7, 1931. Mech. construction of a furnace for supplying drying air to a stack of wood, cement, etc.

**Tunnel kiln design.** A. G. KERSHAW and WESTINGHOUSE BRAKE & SAXBY SIGNAL CO., LTD. Brit. 381,939, July 4, 1931.

**Furnace for heat treatment of small articles in baskets or other containers.** FRANK T. COPE (to Electric Furnace Co.). U. S. reissue 18,668, Nov. 29. A reissue of original pat. No. 1,794,151 (*C. A.* **25**, 2106).

**Burners for pulverized fuel.** WM. A. WHITE and WHITE'S MARINE ENGINEERING CO., LTD. Brit. 363,396, Sept. 11, 1930.

**Air preheaters for furnaces.** THE UNDERFEED STOKER CO., LTD., and WALTER FRED HARLOW. Brit. 363,559, Mar. 2, 1931. Addn. to 346,114 (*C. A.* **27**, 873).

**Apparatus for regulating furnaces, etc., from steam pressure.** PAUL C. TEMPLE (to A. W. Cash Co.). U. S. 1,890,472, Dec. 13. Structural and mech. features.

**Checkerwork for regenerators.** R. LÜNGEN. Brit. 380,754, April 28, 1932. Mech. construction.

**Furnace walls and roofs.** H. J. GREEN. Brit. 381,619, July 14, 1931.

**Furnace walls, roofs, etc.** H. J. GREEN. Brit. 381,692, Sept. 15, 1931. Mech. features.

**Automatic draught regulator for furnace flues.** HUGO M. ENDEMAN. Brit. 363,400, Sept. 16, 1930.

**Heat-transfer apparatus [with plates and spacers].** HENRI G. CHATAIN (to Northern Laboratories, Inc.). U. S. 1,890,108, Dec. 6. Structural details.

**Heat-transferring mass for heat-exchange apparatus.** AKTIEBOLAGET LJUNGSTRÖMS ÅNGTURBIN. Brit. 363,357, May 21, 1930. Structural.

**Apparatus for carrying out heat-exchange processes.** G. BOJNER. Brit. 382,006, Aug. 15, 1931. App. is described for drying, calcining, carbonizing or cooling powd. or granular materials, evapg. liquids, cooling gases or condensing vapors.

**Heat-exchange system and apparatus for heat treatments such as oxide reduction, metal treatment, etc.** GUSTAV SCHWAB (one-third to Albert C. Nolte). U. S. 1,890,431, Dec. 6. Various details of app. and operation are described.

**Control apparatus for heavy-duty heating apparatus.** ALBERT F. SPITZGLASS and OTTO T. HANDWERK (to Republic Flow Meters Co.). U. S. 1,890,701, Dec. 13. Mech. features.

**Tubulous water and air heaters heated by flue gases.** GARDNER C. DERRY (to B. F. Sturtevant Co.). Brit. 363,379, Sept. 26, 1929.

**Thermostatically controlled heater and filter for treating insulating oils, etc.** CLARENCE J. RODMAN and RUSSELL P. DUNMIRE (to Buckeye Twist Drill Co.). U. S. 1,890,265, Dec. 6. Various structural and mech. details are described.

**Differential thermostat.** THOMAS LINDSAY. Brit. 363,630, Sept. 15, 1930.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

**The life and work of William Henry Perkin, Jr.** J. F. THORPE. *Sci. J. Coll. Sci.* **1**, 9–21(1931).

**Peter Porcupine's persecution of Priestley.** LYMAN C. NEWELL. *J. Chem. Education* **10**, 151–9(1933). E. H.

**The University of Montreal—its history, new buildings and chemistry department.** GEORGE BARIL. *Can. Chem. Met.* **17**, 23–4, 26(1933).— W. H. BOYNTON

**Signs used in chemical equations in Hungarian high schools in the 18th and 19th centuries.** LÁSZLÓ SZATHMÁRY. *Magyar Gyógyszerésztud. Társaság Értesitője* **9**, 3–20 (1933).—Historical. S. S. DE FINÁLY

**The discovery of the elements. XX. Recently discovered elements.** MARY ELVIRA WEEKS. *J. Chem. Education* **10**, 161–70(1933); cf. *C. A.* **27**, 878. E. H.

**Supplement to the history of bismuth.** EDMUND O. v. LIPPMANN. *Chem.-Ztg.* **57**, 4(1933); cf. *C. A.* **24**, 3703.—15 references are given. J. H. MOORE

**Organic technology.** R. NORRIS SHREVE. *J. Chem. Education* **10**, 181–4(1933). E. H.

**Oceanography of Las Palmas Bay [Canary Islands].** LUIS BELLÓN URIARTE AND EMMA BARDÁN MATEU. *Inst. españ. oceanograf. Notas y resúmenes.* Ser. 11, No. 61, 68 pp.(1932). **Oceanographic methods in Palma de Mallorca Bay.** FRANCISCO DE P. NAVARRO. *Ibid* No. 63, 28 pp. E. M. SYMMES

**Analyses of the water of the Baltic Sea.** H. v. WARTENBERG, H. WERTH AND A. ZODROW. *Chem. Erde* **7**, 616–19(1932).—Thirteen analyses from various points in the Baltic are given, and also 11 analyses of fresh waters near Danzig. The latter, as well as the sea water near the coast, have a low Na:K ratio. Farther from the coast, the ratio averages 31, nearly the normal value. MICHAEL FLEISCHER

**Is ammonia evolved during freezing of sea water?** G. TAMMANN AND H. J. ROCHA. *Z. anorg. allgem. Chem.* **209**, 257–63(1932).—The partial pressure curve of $NH_3$ over solns. satd. with respect to ice is calcd. from equil. data for the system: $NH_3$–$H_2O$ and from the vapor pressure curves of solns. of $NH_3$ in $H_2O$. The curve is max. at —20°, where the soln. has 15 mol. % $NH_3$ and an $NH_3$ vapor pressure of 13.3 mm. Sea water ($7 \times 10^{-6}$ mol. % $NH_3$) must freeze all but $5 \times 10^{-7}$ of its original wt. before attaining an $NH_3$ partial pressure of 13.3 mm. The vapor pressure curve of $NH_3$ solns., measured from 0° to —80°, confirms the calcd. curve. NaCl, $CaCl_2$ and $MgCl_2$ strongly depress the $NH_3$ vapor pressure, which over sea water at —20° is calcd. $2 \times 10^{-5}$ mm. The high $NH_3$ concn. in Jupiter's atm. indicates that its seas are relatively low in salinity. J. V. VAUGHEN

**Simple reversible photochemical experiment.** I. W. GROTE AND J. H. BARNETT. *J. Chem. Education* **10**, 43–4(1933).—A soln. made by mixing equal vols. of 0.5% Na nitroprusside, satd. $NaHCO_3$, and 0.5% thiourea quickly turns blue in sunlight and crimson in the dark and is used in illustrating reversible reactions in a general chemistry lab. expt. or lecture demonstration. A. LLOYD TAYLOR

**A method for interpolating data, based on Duhring's rule.** J. H. PERRY AND E. R. SMITH. *Ind. Eng. Chem.* **25**, 195–9(1933).—A linear rule for estg. engineering data, analogous to Duhring's rule, is described and tested for the following properties: vapor pressure, latent heat of vaporization, electrolytic cond., heat capacity, Joule-Thomson effect, gas soly. and power factor. This rule applies also to the induction period (gumming) of *gasoline*. H. M. STARK

**Experimental investigation of the variation with time of the Brownian motion of a torsion balance.** EUGEN KAPPLER. *Ann. Physik* **15**, 545–67(1932); cf. *C. A.* **26**, 349. J. B. A.

**Comparative study of some dehydrating agents.** E. MOLES AND C. ROQUERO. *Anales soc. españ. fís. quím.* **31**, 11–25(1933).—The literature on the effectiveness of the usual gas-drying agents is reviewed, and preliminary results are given for $SiO_2$ gel, anhyd. $Mg(ClO_4)_2$, BaO and $B_2O_3$. The method involved passing a current of air at const. temp., satd. with $H_2O$ vapor at room temp., at known velocity over a known quantity of dehydrating agent. The gas was then passed over a weighed $P_2O_5$ tube to collect the $H_2O$ not retained by the material under test. The effectiveness is expressed in %. As stated in the literature, $SiO_2$ gel is as effective as $P_2O_5$ up to the point where $2SiO_2 \cdot H_2O$ forms. Anhyd. $Mg(ClO_4)_2$ absorbs $H_2O$ completely up to the point where $Mg(ClO_4)_2 \cdot 4.5H_2O$ forms. Freshly calcined BaO compares well with $P_2O_5$ up to the point of formation of $BaO \cdot H_2O$. $B_2O_3$ is the least effective, and its prepn. and handling are very difficult. E. M. SYMMES

**Atomic weight of cesium.** G. P. BAXTER AND J. S. THOMAS. *J. Am. Chem. Soc.* 55, 858–9(1933).—Analysis of CsCl, free from K and Rb, gives an at. wt. for Cs of 132.91. C. J. WEST

**The gas-kinetic effective cross section of molecules. II. Relations with other quantities.** H. E. BINKELE. *Ann. Physik* **15**, 729–34(1932); cf. *C. A.* **25**, 5064.—By use of Trautz's suggestion (*C. A.* **26**, 349) that the crit. temp. be taken as a reference point, it can be shown that values calcd. from van der Waals' *b*, viscosity measurements.

at. radii from crystal structure, and band spectral values of internuclear distances can all be brought into fair agreement as to the effective cross sections. E. WALDBAUER

**The application of the theory of J. J. van Laar on the additivity of $b$ and $\sqrt{a}$ to boron, iron, nickel, osmium and iridium compounds.** J. A. M. VAN LIEMPT. *Rec. trav. chim.* **51**, 1108–16(1932); cf. *C. A.* **26**, 890.—By using existing data for $BF_3$, $Fe(CO)_5$, $Ni(CO)_4$, $OsO_4$ and $IrF_6$ and based on van Laar's theory of the equation of state of gases and liquids the following values for $b_k \times 10^5$ and $b_0 \times 10^5$, resp., were calcd.: B, 78; 20.6; Fe, 115; 31.7; Ni, 112; 29.4; Os, 209; 37.9; Ir, 191; 38.5; also for $b_0.10^5$: = CO, about 82.5; = O, 39.6; F, 31; and for $\sqrt{a_0} \times 10^2$: = CO, 3.2; F, 2.0. In $BF_3$, $IrF_6$, $Fe(CO)_5$ and $Ni(CO)_4$ the central atom is completely surrounded (shielded); Os in $OsO_4$ is not completely surrounded. In the carbonyls of Fe and Ni the central atom is attached directly to the CO groups. W. C. FERNELIUS

**The $b_k$-values and atomic radii of the elements in combination with the periodic system.** J. A. M. VAN LIEMPT. *Rec. trav. chim.* **51**, 1117–30(1932); cf. preceding abstr.—The $b_k$ values of the elements are graphically shown to be a periodic function of the at. nos. This relationship permits the interpolation of $b_k$ values as yet unknown. By means of the relationship $R = 0.17\ \sqrt[3]{b_k}$ (derived from the known radii of the rare gases), the radii of the neutral atoms of the remaining elements are calcd. These calcd. values agree with the known ionization potentials and electron affinities. Pos. ions are always smaller and neg. ions always larger than the corresponding neutral atoms, the difference being smaller the greater the at. nos. In each series of elements, those having the greatest difference between the radius of the sphere of action and the at. radius are superconductors. The Ce atom appears to have an unusual electron configuration in the quadrivalent state. W. C. FERNELIUS

**The application of the theory of J. J. van Laar on the additivity of $b$ and $\sqrt{a}$ to aluminum compounds.** J. A. M. VAN LIEMPT. *Rec. trav. chim.* **51**, 1131–3(1932); cf. preceding abstrs.—For Al, $b_k = 102 \times 10^{-5}$. A structural formula for $Al_2Cl_6$, in which 2 tetrahedrons have a common edge, is given. W. C. FERNELIUS

**Meaning of the so-called specific exaltation of the molar refraction and molar dispersion.** ERICH HÜCKEL. *Z. physik. Chem.* **A163**, 67–9(1932).—The sp. exaltation of the molar refraction and dispersion does not represent a characteristic quantity for the mol. This is not true for the exaltation itself and a return to its use should be made. G. M. MURPHY

**The period of establishment of the heat of vibration of diatomic molecules.** A EUCKEN, O. MÜCKE AND R. BECKER. *Naturwissenschaften* **20**, 85–6(1932).—Previously a lack of agreement was found between measurements of the vibration heat $c_v$ of $O_2$ and $N_2$ (low) and calcns. on the basis of the Planck-Einstein equation with $\theta$ values from band spectra (high). Results of the authors (also Henry, *C. A.* **26**, 889) by the Lummer Pringsheim method under pressure agreed with the theory. The failure of the former results by the velocity of sound method is due to improper allowance for time of equil establishment of vibrational heat (the errors increase with frequency). As compared with a period of $10^{-5}$ sec. for $CO_2$ (cf. Kneser *C. A.* **27**, 1249), the period will be longer for $O_2$ and $N_2$ on geometrical grounds (Oldenberg, *C. A.* **25**, 3555). It is estd. and shown in a diagram that this period may be of the order of 0.1 sec. for normal pressure and low temp.; it is less for high pressure. Similar effects are found for $Cl_2$ to a lesser extent, for $CO_2$ a lack of influence of the linear vibration is shown. B. J. C. VAN DER HOEVEN

**The acidity of thiophenol and the three isomeric dithiophenols.** GEROLD SCHWARZENBACH. *Helv. Chim. Acta* **15**, 1468–81(1932).—The acidity of *o*-, *m*- and *p*-$C_6H_4(SH)_2$ and PhSH, detd. by e. m. f. measurements in 60–100% EtOH at 20°, decreases in the above order. For the dithiophenols, the relation $\phi D$ = const. ($\phi$ = work of removing the 2nd proton; $D$ = dielec. const. of the soln.) fails because of a screening effect of the mols. H. A. BEATTY

**The electric double layer. I. Thermodynamics of the double layer.** BÉLA LENGYEL. *Magyar Chem. Folyóirat* **38**, 98–110(1932). **II. Structure of the double layer.** TIBOR ERDEY-GRUZ. *Ibid* 111–22.—A review. S. S. DE FINÁLY

**Electric field in paramagnetic crystals.** C. J. GORTER. *Phys. Rev.* **42**, 437–8 (1932).—On the basis of the recent theory of Kramers, Bethe, Van Vleck and others concerning the relation between magnetic data and spatial arrangement of atoms and mols. in a crystal, the conclusion is reached that in the hydrated salts of the Fe group the metal ion is surrounded by 6 water-dipoles in an octahedral arrangement (the neg charges inside, at the face centers of a cube about the pos. ion). A similar arrangement is probable for the alums and hepta- and hexa-hydrated sulfates (data of C. A. Beevers), and possibly for the octahydrates of Pr and Nd sulfates (Penney and Schlapp). HELEN S. HOFFIELD

**Polarization and association of ethyl ether as a function of the temperature.** MIEC-

ZYSLAW WOLFKE AND JÓZEF MAZUR. *Compt. rend. soc. phys.* (Warsaw) **5**, 357–64 (357–9 in French)(1931); cf. *C. A.* **25**, 3884; **27**, 6. J. WIERTELAK

**Polarity in certain hydrocarbon vapors.** K. B. MCALPINE AND C. P. SMYTH. *J. Am. Chem. Soc.* **55**, 453–62(1933).—The dielec. consts. of the vapors of $C_6H_6$, $C_7H_8$, $C_8H_6$ and $C_8H_8$ were measured in an app. calibrated with air and $CO_2$. The elec. moments are 0, 0.37, 0.35 and 0, resp. The polarization of $C_6H_6$ and $C_8H_8$ remains const. with increasing temp. G. M. MURPHY

**The possibility of dipole rotation in certain crystalline solids.** S. E. KAMERLING AND C. P. SMYTH. *J. Am. Chem. Soc.* **55**, 462–5(1933).—The dielec. const. of certain solids were measured from the m. p. down to lower temp. and at frequencies of 200–50,000 cycles. No rotation of the mol. or its polar group was found for $C_7H_{15}Br$, $p$-$C_6H_4(OMe)_2$ and PhOMe. The small effect found for PhOH and BzCl is attributed to an impurity. G. M. MURPHY

**Gaseous combustion at high pressures. XIV. Explosions of hydrogen-air and carbonic oxide-air mixtures at initial pressures up to 1000 atmosperes.** WM. A. BONE, D. M. NEWITT AND D. T. A. TOWNEND. *Proc. Roy. Soc.* (London) **A139**, 57–74(1933); cf. *C. A.* **23**, 5319.—Explosions of $H_2$-air, CO-air and $2CO + O_2 + 3.76CO$ were made at pressures of 75–1000 atm. in an especially designed explosion chamber (max. pressure reported was 7100 atm.). The $H_2$-air explosion time was 0.005 sec., the others 0.015–0.33 sec. In the CO-air explosion, an exothermic effect in the cooling curve indicated $N_2$ activation toward forming oxides with excess $O_2$. At pressures of 500–1000 atm. $CO_2$ was dissocd. about 5–6%. Explosions with CO as diluent above initial pressures of 250 atm. gave a small C deposit. **XV. The formation of nitric oxide in carbonic oxide-oxygen-nitrogen explosions.** DONALD T. A. TOWNEND AND LIONEL E. OUTRIDGE. *Ibid* 74–83.—A large bomb having a small explosion chamber and a rather large expansion chamber was used for $xCO + yO_2 + zN_2$ explosions. These explosions were carried out at pressures of 3–90 atm. $NO_2$ in the cooled gases varied from 0.3 to 5.1%; being in greater proportion in those charges of greater initial d. (pressure). The peroxide resulted from the NO (formed during the explosion) combining with excess O, with due consideration for the $2NO \rightleftharpoons N{:}N + O{:}O$ equil. **XVI. Nitric oxide formation in continuous high-pressure flames of carbonic oxide in oxygen-nitrogen atmospheres.** DUDLEY M. NEWITT AND FRANK G. LAMONT. *Ibid* 83–93.—A combustion chamber was designed for continuous burning of CO in an $O_2$-$N_2$ mixt. under pressure up to 100 atm. The chamber was fitted with a quartz window through which the flame and the formation of $NO_2$ could be observed. The max. $NO_2/CO_2 \times 10^2$ ratio was 8.46 in the exit gases corresponding to 2.10% peroxide. Combustion in $50O_2/50N_2$ at 100 atm. gave both highest percentage peroxide and ratio. H. E. MESSMORE

**Change of specific gravity of ethyl ether with temperature.** JÓZEF MAZUR. *Compt. rend. soc. phys.* (Warsaw) **5**, 349–56(349–50 in French)(1931); cf. *C. A.* **25**, 2343. J. WIERTELAK

**Rotation of crystals floating at the surface of liquids.** PAUL GAUBERT. *Compt. rend.* **195**, 1088–90(1932).—Any solid substance floating on the surface of a liquid at rest will turn, if it is sol. in the liquid. The translatory and rotatory movements of such substances depend on the geometrical form of the crystal and on its soly. They are attributable to the sepn. of mols. of the crystal, giving rise to diffusion currents. I. J. PATTON

**The measurement of surface tension.** T. CARLTON SUTTON. *Proc. Phys. Soc.* (London) **45**, 88–90(1933).—Two tubes, differing in size of bore, fused together are used in a convenient method for measuring simultaneously the surface tension and d. of a few mg. of liquid. The method is particularly advantageous for the measurement of the parachors, $\gamma^{1/4}/\rho$, of rare liquids. M. MCMAHON

**A study of the electrical breakdown of liquids by means of the electro-optical shutter.** HAROLD W. WASHBURN. *Physics* **4**, 29–37(1933).—The electro-optical shutter of Dunnington (cf. *C. A.* **26**, 908) was modified for use with liquids. The effects of static (time, 1 to 10 secs.) and of impulse (time, $3 \times 10^{-7}$ sec.) potentials on the breakdown of elec. resistance was studied, with paraffin oil and xylene. In static breakdown at 45,000 v., regions of high intensity of ionization usually occurred at the anode. In impulse breakdown at 35,000 v., the breakdown was more uniform throughout the path with xylene, but not with paraffin oil. There are 11 references. GERALD M. PETTY

**The diffusion of thorium in tungsten.** GORTON R. FONDA, ANDREW H. YOUNG AND AMY WALKER. *Physics* **4**, 1–6(1933).—Various lots of thoriated W wires varied widely in diffusion and activation consts. The wires were heat treated to develop grain lengths from 4$\mu$ to 3 cm. These variations produced marked changes in thermionic emissive characteristics, such as activation and deactivation rates and emissive life at normal operating temp. The heat of diffusion was unaffected. The intergranular diffusion of

Th through W is relatively too fast to measure; the observed phenomena depend entirely on intragranular diffusion. This concept agrees with the existence of a crit. grain size for max. emissive life. Th atoms were found to spread over the surfaces of W crystals. The effect of mech. strain on activation was studied. GERALD M. PETTY

**The crystal structure and morphology of gallium.** F. LAVES. *Z. Krist.* **84**, 256–98 (1933); cf. *C. A.* **26**, 4740.—Ga is orthorhombic, pseudo-tetragonal. The unit cell contains 8 atoms, with $a = b = 4.506$ A. U. and $c = 7.642$ A. U. The space group is $V_h^{18}$. At. positions are $mOp$; $m + 1/2, 1/2, \bar{p}$; $\bar{m} + 1/2, 1/2, p$; $\bar{m}O\bar{p}$; $m, 1/2, p + 1/2$; $m + 1/2, O, \bar{p} + 1/2$; $\bar{m} + 1/2, O, p + 1/2$; $\bar{m}, 1/2, \bar{p} + 1/2$, with $m = 0.080$ and $p = 0.153$. Each Ga has 1 neighbor at a distance of 2.45 A. U., 2 at 2170 A. U., 2 at 2173 A. U. and 2 at 2.79 A. U. A close relation between morphology and structure is shown. L. S. R.

**Crystal structure of indium.** FRANCIS P. J. DWYER AND DAVID P. MELLOR. *J. Proc. Roy. Soc. N. S. Wales* **66**, 234–9(1932)(reprint).—Powder photographs of carefully purified electrolytic and molten In showed the same lines. From the equation $\sin^2\theta = 0.2814 (h^2 + k^2) + 0.02423(l^2)$ and the absence of certain spectra it was concluded that the lattice of In is face-centered tetragonal. $a_0 = 4.588 \pm 0.002$ A. U.; $c_0 = 4.946 \pm 0.002$ A. U.; $a:c = 1.078 \pm 0.002$. The no. of atoms per cell is 4; calcd. d. = 7.28, exptl. d. = 7.27. The coördinates of the atoms are: 000; $1/2\,1/2\,0$; $1/2\,0\,1/2$; $0\,1/2\,1/2$. The distance between at. centers of the atoms at the centers and corners of the (001) faces is 3.28 A. U.; the corresponding distance for the atoms at the centers of the (100) and (010) faces is 3.89 A. U. Probably metallic atoms of In do not possess spherical symmetry, since the face-centered tetragonal structure is the sort that would result from the close-packing of prolate spheroids with axes in the ratio 1:1.078. In this, In resembles Zn and Cd. It would appear that Zn, Cd and In are not in the ionic state.
LOUIS WALDBAUER

**The crystal structure of sulvanite, $Cu_3VS_4$.** LINUS PAULING AND RALPH HULTGREN. *Z. Krist.* **84**, 204–12(1933) (in English).—Laue and oscillation photographs of single crystals from Mercur, Utah, give a cubic cell with $a = 5.370 \pm 0.005$ A. U., contg. 1 mol. (cf. *C. A.* **23**, 2126). The space group is $T_d^1 - P\bar{4}3m$. The at. arrangement is of a new type, with $V$ at 000; Cu at $1/2\,00$, $0\,1/2\,0$, $00\,1/2$, and $S$ at $uuu$, etc., with $u = 0.235 \pm 0.004$. Smallest interatomic distances are $V - S$ 2.186 $\pm$ 0.040 A. U. and Cu-S 2.285 $\pm$ 0.014 A. U. L. S. RAMSDELL

**The crystal structure of rubidium nitrate.** LINUS PAULING AND J. SHERMAN. *Z. Krist.* **84**, 213–16(1933)(in English).—The structure of $RbNO_3$ as reported by Zachariasen (*C. A.* **23**, 1790) is incorrect. The pseudo-hexagonal cell has the dimensions $a = 10.45$ A. U. and $c = 7.38$ A. U., contg. 9 mols. Laue data agree with an orthorhombic cell with $a = 18.08$ A. U., $b = 10.45$ A. U. and $c = 7.38$ A. U. contg. 18 mols. L. S. RAMSDELL

**The structure of rubidium ferricyanide.** W. BÜSSEM AND C. GOTTFRIED. *Z. Krist.* **84**, 317–18(1933).—$Rb_3Fe(CN)_6$ is isomorphous with the corresponding K salt, but not with the Cs. The monoclinic cell has the dimensions $a = 13.74$ A. U., $b = 10.66$ A. U. and $c = 8.63$ A. U. $\pm$ 1%. $\beta$ is close to 90°. The space group is $C_{2h}^5$ but approximates $V_h^{14}$. L. S. RAMSDELL

**The structure of the trifluorides of the transition metals.** NORA WOOSTER. *Z. Krist.* **84**, 320–1(1933); cf. *C. A.* **26**, 5468.—It is suggested that $FeF_3$ and other trifluorides of the transition metals are isomorphous with the structure of $WO_3$ proposed by Braekken (*C. A.* **25**, 5813). The structures proposed by Ebert (*C. A.* **25**, 3892) and Ketelaar (*C. A.* **25**, 5325) are shown to be unreasonable. L. S. RAMSDELL

**The crystal structure of cerussite.** M. Y. COLBY AND L. J. B. LACOSTE. *Z. Krist.* **84**, 299–309(1933)(in English).—A complete detn. of the structure of $PbCO_3$ on the basis of oscillation photographs gives a cell contg. 4 mols. with $a = 5.16_6$ A. U., $b = 8.46_8$ A. U. and $c = 6.14_5$ A. U. Space group $V_h^{16}$. The structure is essentially the same as that of aragonite (*C. A.* **19**, 1237) and $KNO_3$ (*C. A.* **26**, 1841). The parameters are: Pb-0°, 150°, 0°; C-0°, 275°, 55°; O I-0°, 327°, 55°; and O II-74°, 249°, 55°.
L. S. RAMSDELL

**An x-ray investigation of the 12-molybdophosphates and related compounds.** J. L. HOARD. *Z. Krist.* **84**, 217–30(1933)(in English).—Laue and oscillation photographs were made for $H_3PMo_{12}O_{40}.30H_2O$, $NdPMo_{12}O_{40}.30H_2O$, $SaPMo_{12}O_{40}.30H_2O$, $GdPMo_{12}O_{40}.30H_2O$, $Mg_2SiMo_{12}O_{40}.31H_2O$, $Ni_2SiMo_{12}O_{40}.31H_2O$, and $Be_2SiW_{12}O_{40}.31H_2O$. The data indicate cubic unit cells contg. 8 mols. with $a \approx 23$ A. U. The space group is probably $O_h^7$. L. S. RAMSDELL

**The crystal structure of potassium silver cyanide.** J. L. HOARD. *Z. Krist.* **84**, 231–55(1933)(in English).—Laue and oscillation photographs of $KAg(CN)_2$ indicate a

hexagonal cell with $a = 7.384 \pm 0.010$ A. U. and $c = 17.55 \pm 0.02$ A. U., contg. 6 mols. The space group is probably $D^2_{3d}$. The structural units are K ions and linear or nearly linear $[Ag(CN)_2]$ ions oriented at about 27° with the $c$ axis. Parameter values are discussed. Interatomic distances are found as follows: Ag-N 3.29 A. U.; K-N 2.97 A. U., 3.05 A. U. and 2.56 A. U. This last abnormally small value may be due to the formation of an electron pair bond between each K and one N atom. The CN groups form close-packed layers parallel to (001) and each K ion is surrounded by a distorted octahedron of N atoms. L. S. RAMSDELL

**The crystal structure of anthracene.** J. MONTEATH ROBERTSON. *Z. Krist.* **84**, 321–2(1933).—The following data were obtained for anthracene: m. 217°; monoclinic prismatic, with $a = 8.58$ A. U., $b = 6.02$ A. U., $c = 11.18$ A. U., $\beta = 125°$; space group $C^5_{2h}$ ($P\ 2_1/a$); 2 mols. of $C_{14}H_{10}$ per cell. The closest approach between atoms in adjacent mols. is about 3.67 A. U., in contrast to 1.41 A. U. between atoms within the mol. L. S. RAMSDELL

**Some naphthalene and stilbene derivatives.** JIŘÍ NOVÁK. *Z. Krist.* **84**, 310–16 (1933).—The following data were detd.: Et 2,4-dinitro-1-naphthylmalonate, m. 107–8°; $d_{25} = 1.406$; $C_{2h}$ with $a:b:c = 0.5372:1:0.6208$, $\beta = 112°14'$; optic plane (010), strong inclined dispersion with $r<v$, $2E = 21.5°$, optically neg. extinction angle on (010) is 26° in acute angle $\beta$ from $c$ axis. Et 2,4-dinitro-1-naphthylacetoacetate, m. 131°, $d_{25} = 1.368$; $C_{2h}$, $a:b:c = 1.2545:1:1.2604$, $\beta = 112°24'$; extinction parallel to $b$ axis, optic plane normal to (010), $Bx_a$ nearly normal to (100), $2E = 108°07'$, optically pos. 1-Methyl-5-nitro-8-acetamidonaphthalene, m. 193–4°, $d_{26} = 1.333$; $C_{2h}$, $a:b:c = 9.0454:1:5.7005$, $\beta = 118°48'$; hardness 1, imperfect cleavage parallel to (100) and (001); neg. elongation, extinction on faces in orthodome zone always parallel. 4-Methyl-2′,4′,6′-trinitrostilbene, m. 162.3°, $d_{26}$ 1.4908; triclinic, $a:b:c = 1.5416:1:0.6812$, $\alpha = 96°20.5'$, $\beta = 110°18.5'$, $\gamma = 90°59'$; optically pos., extinction on (100) —9° from edge between (100) and (010) and on face (010) —4.5° from the same edge. 3,4-Methylenedioxy-2′,4′-dinitrostilbene, $d_{26} = 1.5494$, $C_{2h}$, $a:b:c = 0.8419:1:1.6681$, $\beta = 95°24'$, strong pleochroism yellow-red to dark red, parallel and normal to the $c$ axis, resp. The deep color makes it impossible to det. other optical data. L. S. RAMSDELL

**The saturation pressures of steam [170° to 374°].** A. EGERTON AND G. S. CALLENDAR. *Trans. Roy. Soc.* (London) **A231**, 147–205(1932).—The satn. pressures of steam between 160° and 374° were accurately measured with app. that provides a continuous flow of steam. Both app. and the methods of temp. and pressure measurement are described. The results, accurate to 1 part in 6000, are presented in tables that give the satn. pressures in lb. per sq. in. and atms. for every 5°, together with the change in pressure with temp. Although the method was not suitable for accurate detn. of the crit. point, the indications were that above 374° the steam behaved as superheated vapor. C. C. KIESS

**The existence of a polonium acetylacetonate.** SERVIGNE. *Compt. rend.* **196**, 264–6 (1933).—When Po hydroxide which has been deposited on a neutral hydrosol is brought in contact with a layer of acetylacetone, over 90% of the Po is dissolved in the acetylacetone. When the soln. is evapd., 3 extns. with $CHCl_3$ dissolved 92% of the Po. Analogous results were obtained with EtOH, $Me_2CO$ and acetylacetone. Most of the Po was not in a colloidal state. Only 9% of the Po was withdrawn from a $CHCl_3$ soln. stirred by a Ag plate 4 hrs. The compd. is not sensibly ionized in that solvent. From a study of the acetylacetonates of Sc, Al and Th, it was found that Po has a valence of 4 in this compd. GERALD M. PETTY

**The absorption of gases and vapors by activated carbon and silica gel.** P. DEMOUGIN. *Mém. poudres* **25**, 18–90(1932–33).—Static and dynamic tests on activated carbons and $SiO_2$ gel with various gases and vapors showed that in static tests, absorption depends on temp. and pressure at equil. In dynamic tests the factors are rate of absorption, thickness of absorbing layer, d., rate of flow of gas and its concn. in absorbable products. A distinction is made between absorptive power for gases and for vapors. With absorbants of increasing activation, gas absorption goes through a max. while vapor absorption increases with increasing activation. Heat of mixing with liquids, rate of absorption and desorption pass through a max. with increasing activation. Moisture in the absorbant does not affect total absorption but retards the rate of absorption. Progressive drying of $SiO_2$ gel with development of porosity is the chief factor in its activation while strong dehydrating agents like $ZnCl_2$ and $H_3PO_4$ are most valuable in the activation of C. Adsorptive forces act only at a slight distance which is detd. by the thickness of the layer of absorbant. The fixed fluid, compressed by adsorption, is in the gaseous state for low vapor pressures and in the liquid state for vapors near satn. Capillary mono- and polymol. condensations are discussed and it is concluded that the total force acting on the absorbed mol. depends on the chem. nature of the mols.

in contact and on the surface curvature of the grains of absorbant. The mean curvature increases when the total surface per g. of absorbant is increased by activation.
A. J. PHILLIPS

**Adsorption. A study of availability and accessibility.** WM. HARDY AND MILLICENT NOTTAGE. *Proc. Roy. Soc.* (London) **A138**, 259–83(1932).—The variation with temp. of static friction of solns. of a wax, palmitic acid and hexadecyl alc. in medicinal paraffin was measured. The limits of variation were the friction of the pure solvent and the pure solute. Pure substances have no temp. coeff. of friction. Friction could therefore be used roughly to measure the ratio of solvent and solute mols. in the adsorbed layer. At any temp. the ratio is detd. by the previous history and the compn. of the soln. It is governed by the availability of the solute for adsorption and by the accessibility, which is the capacity of the solute for replacing the adsorbed solvent. L. E. STEINER

**Adsorption and wetting processes in technic and biology.** E. BERL AND B. SCHMITT. *Naturwissenschaften* **20**, 943–4(1932).—A parallel is drawn between the use of flotation agents and specific chemotherapy. B. J. C. VAN DER HOEVEN

**The thermodynamics of adsorption at the surface of solutions.** E. A. GUGGENHEIM AND N. K. ADAM. *Proc. Roy. Soc.* (London) **A139**, 218–36(1933).—The surface excess per unit area, or $\Gamma$, at the surface of a soln. was originally defined as the difference between the quantity of solute contained in a given vol. of soln. contg. unit area of free surface, and that in an equal vol. without any free surface. Four addnl. definitions of $\Gamma$ are given, with equations and calcns. showing the values of $\Gamma$ according to the definition. $\Gamma$ is calcd. for liquid-liquid interface (EtOH-$H_2O$), and the liquid-vapor interface is discussed. The relation of $\Gamma$ to osmotic pressure and dil. solns. is also given.
H. E. MESSMORE

**Active oxides. LV. Dehydration of hydrogels in the presence of various gases.** GUSTAV F. HÜTTIG AND KURT STRIAL. *Z. anorg. allgem. Chem.* **209**, 249–56(1932), cf. *C. A.* **27**, 15.—Hydrogels of $ThO_2$, $ZrO_2$ and $Cr_2O_3$ were dehydrated in $N_2$, $H_2$, $CH_3OH$, $O_2$ $NH_3$ + $N_2$ and pure dry $NH_3$ and dehydration curves are plotted. The 1st portion of $H_2O$ comes off quickly in $NH_3$ but much more slowly in $N_2$. For $Cr_2O_3.H_2O$ and $ThO_2.H_2O$ the influence of gases upon the dehydration velocity increases in the following order: $NH_3$, $CH_3OH$, $O_2$, $H_2$, $N_2$. The last traces of water were removed most easily in the presence of $H_2$ and $N_2$ and most slowly in the presence of $NH_3$ and $CH_3OH$. The general processes are discussed. H. STOERTZ

**Specific surface and the adsorbent properties of lead sulfate.** I. M. KOLTHOFF AND CHARLES ROSENBLUM. *J. Am. Chem. Soc.* **55**, 851(1933).—In agreement with the results of Paneth and Vorwerk (*C. A.* **16**, 3784) the sp. surface of $PbSO_4$ is the same in suspensions in $H_2O$ as in the presence of an excess of $Pb(NO_3)_2$ or in dil. solns. of $Na_2SO_4$ $Pb(SO_4)_2$ adsorbs only dye ions from the Na salt of Ponceau 4R; this is an exchange adsorption, sulfate ions being replaced by ponceau ions in the surface. C. J. WEST

**The glassy state.** R. O. HERZOG AND H. C. KUDAR. *Naturwissenschaften* **20**, 951–2(1932).—A classification of glassy conditions is given on the basis of mol. vol. For normal-size mols in a compressed fluid (Bridgman) a glassy state (solid amorphous) is obtained with $V - b$ (van der Waals' const.) small and $b_I < b_0$ ($b_I$ is van der Waals vol., $b_0$ mol. vol. at atm. m. p.), secondly as undercooled liquid another glassy phase is found with $V - b$ small but $b_{II}$ about equal to $b_0$. The third group, macro-mol. clusters, has $b_{III}$ near $b_0$ ($b_0$ is zero point vol.) but $V - b$ large. On crystn. the $b_{cryst.}$ of the 3 groups are, resp., $\leqq b_I$, $< b_{II}$ and $= b_{III}$. The theory is to be published soon.
B. J. C. VAN DER HOEVEN

**Separation of polydisperse systems by centrifugal force.** A. I. MOSHEV. *Proc 2nd Intern. Congr. Soil Sci., Leningrad*, **1930 I**, 66–9(1932)(in German).—A math. discussion. C. J. SCHOLLENBERGER

**Sedimentation equilibrium in the ultracentrifuge; types obtained with soap solutions.** JAMES W. MCBAIN AND M. E. MCBAIN. *Proc. Roy. Soc.* (London) **A139**, 26–37 (1933).—The concn. gradient of a neutral mol. or primary colloid at the isoelec. point is $\frac{RT}{\omega^2 x} \cdot \frac{d \ln c}{dx} = M(1 - \bar{v}\rho)$, in which $c$ = concn., $x$ = distance from axis of rotation, $M$ = effective mol. wt., $\bar{v}$ = partial sp. vol., $\rho$ = d. of the soln., $\omega$ = angular velocity. Several modifications of this equation to fit sp. cases are given, *e. g.*, sedimentation of a cation, of an anion, for cation and anion, etc. At every level the mass law must be satisfied, also the expression $\frac{\text{ionic micelle}}{\text{neutral micelle}} = K$. Ds. of certain soap solns. were so adjusted by addn. of KCl that sedimentation occurred upward, downward or in both directions. The neutral micelle rises and the ionic micelle sinks in the soap soln. according to the relative d. Microphotometric tracings are given showing absorption of ultra-violet light by soap solns. H. E. MESSMORE

**Structural viscosity in some lyophilic sols. I. The flocculation of gelatin and casein by agar.** WILFRED GALLAY. *Can. J. Research* 7, 662–70(1932).—The relative viscosities of mixts. of gelatin and agar sols were measured at varying pressures with the overflow viscometer. All the sols showed wide deviations from Poiseuille's law, with regions of structure and turbulence at low and high pressures, resp. A min. viscosity was found for an intermediate mixt., showing a dehydrating action of the agar on the gelatin. This effect was masked in a similar series with casein and agar, because of the much greater difference in relative viscosity of the 2 sols. In many cases a marked structural turbulence was found in the region of structure. The relation between velocity of flow and pressure is expressed by a parabolic equation. **II. Rubber sols.** *Ibid* 671–6.—The relative viscosities of sols of natural and purified rubber in $C_6H_6$ were measured at varying pressures with the overflow viscometer. Deviations from Poiseuille's law to varying extents were found in all cases, with regions of structure and turbulence at various pressures. The limiting concns. above which structure is evident and Poiseuille's law is not obeyed were found to agree with those calcd. by Staudinger, on the basis of his theory of the relation between the viscosity and mol. wt. of polymeric mols. Exposure to ultra-violet light considerably decreased the viscosity of a sol of purified rubber. The equation of Einstein expressing a linear relation between sp. viscosity and the vol. of the solute fails utterly in such sols as gelatin and rubber.
J. W. SHIPLEY

**The theory of the structure of colloidal systems.** HARTMUT KALLMANN AND MARGARETE WILLSTAETTER. *Naturwissenschaften* 20, 952–3(1932).—The van der Waals' attraction of mols. as developed by London is held responsible for such phenomena as the Buzagh adherence (*C. A.* 24, 3938, 4684), reversible coagulation, thixotropy and Zocher layers (*C. A.* 19, 3401). This attraction, proportional to $r^{-6}$ ($r$ = distance between particles), acting on colloid particles of diam. $r_0$ and with $r_0$ about equal to $2r$, will be of the order of a few tenths v. and will in conjunction with the electro-static repulsion forces explain the coherence effect.
B. J. C. VAN DER HOEVEN

**Determination of flocculation values from measurements of the rate of coagulation of an arsenic sulfide sol.** D. N. GHOSH. *J. Indian Chem. Soc.* 9, 591–7(1932).—Flocculation values were detd. from measurements of the velocity of increase in turbidity of $As_2S_3$ sol with different electrolytes; the observations were confined to the early stages of coagulation to avoid disturbances due to adsorption of coagulant by flocculated particles. A Nutting colorimeter was adapted to function as a tyndallmeter. Flocculation values for univalent cations were in the order $H<NH_4<K<Na<Li$ and for bivalent cations in the order $Ba<Sr<Ca<Mg$. These are the inverse of the order of adsorption values detd. by Oden. The order of flocculation is the same at all concns. of coagulator.
F. L. BROWNE

**Action of traces of sodium sulfide in the preparation of colloidal gold by the Zsigmondy method.** R. WERNICKE AND BIRABÉN LOSSON. *Folia biol.* 1, 33–4(1931). cf. *C. A.* 25, 859.—A discussion.
L. E. GILSON

**Principles of genetic formation of substances. VII. Carbonation of lead oxide. Chemistry and morphology of white lead.** V. KOHLSCHÜTTER AND H. HOSTETTLER. *Helv. Chim. Acta* 15, 1425–49(1932); cf. *C. A.* 26, 2108.—Aq. suspensions of PbO in the degree of dispersion of an aerogel behave differently and yield different products on reaction with $CO_2$ than coarser forms of PbO. With the finely divided PbO the ion reaction forming basic $PbCO_3$ takes place in dispersed layers upon the particles rather than in the "total vol." of the satd. soln. The reaction is confined to "small vol. systems" closely attached to the particles, the total system being thus subdivided into very small reaction units. The compn. and morphological nature of the layers in which reaction proceeds depend upon such conditions as the concn. of $H_2CO_3$, which in turn controls the course of the reaction and the nature of the product. The reaction layers are torn loose by the molecular-mechanical action of the medium so that a sort of "colloidization" of the original substance takes place while the reaction layers are continually renewed as long as any PbO remains. The *chamber process of white lead manufacture* depends upon a reaction of similar nature. The useful properties of white lead depend upon its morphology as governed by these conditions of ppn. in "small vol. systems" rather than upon its chem. compn. or cryst. structure. This reaction with PbO is of special interest from the point of view of general theory because the "small vol. systems" lie within the resolving power of the microscope and give some idea of the processes that may be going on in more finely divided systems, although in the latter case other factors may enter in also.
F. L. BROWNE

**Periodic structures. The Liesegang phenomenon.** M. F. TABOURY AND SALVINIEN. *Bull. soc. chim.* 51, 1340–6(1932).—Thorough washing of the gelatin prevents formation of Liesegang rings of $Ag_2CrO_4$, indicating that impurities in the gelatin play an essential role in the phenomenon. Water removes sulfates and chlorides from the gela-

tin. Addn. of sulfates to washed gelatin failed to make it form rings again, but on addn. of chlorides rings formed readily. Bromides likewise favored ring formation, but iodides and cyanides were only moderately favorable. For each "impurity" there is a characteristic range of $K_2CrO_4$ concns. through which good rings are formed. The favorable "impurities" are those that form insol. ppts. with Ag. When rings are formed in an elec. field between two electrodes various forms of distortion are produced that depend upon the strength and distribution of the current. The elec. current operates by affecting the velocity of diffusion of the ions. F. L. BROWNE

**The periodic precipitation of mercuric iodide.** SUZANNE VEIL. *Compt. rend.* **196**, 266–8(1933).—When $HgCl_2$ and KI react in gelatin, Liesegang rings are obtained. GERALD M. PETTY

**Variation of the coefficient of exchange with temperature.** M. CHENEL. *Mem. poudres* **25**, 97–99(1932–33).—In the purification of nitrocellulose by boiling with water at temps. from 40° to 130°, it was found that the rate of removal of the acid is an exponential function of the temp. A. J. PHILLIPS

**Substances permeable to fluids. I.** MASUO KAWAKAMI. *J. Chem. Soc. Japan* **53**, 1085–95(1932).—Substances permeable to fluids are considered to be composed of many capillaries of equal size. The radius, length and the no. per sq. cm. of the fictitious capillaries are called the permeability consts. Two methods for detg. the consts. are described. The permeability consts. of filter paper were measured by one of these methods. T. KATSURAI

**Preparation and properties of protein-cellulose membranes.** J. LOISELEUR AND L. VELLUZ. *Bull. soc. chim. biol.* **14**, 1210–17(1932).—See *C. A.* **25**, 1723, 1861. L. E. GILSON

**Relation between solubility and coefficient of diffusion of gases in liquids.** J. HORIUTI. *Z. Elektrochem.* **39**, 22–4(1933).—Calcns. are made for $H_2$ in $CCl_4$, $C_6H_6$ and $C_6H_5Cl$. CURTIS L. WILSON

**The partition coefficient between water and the organic solvents ethylene bromide and nitrobenzene.** G. HERRERO. *Anales soc. españ. fís. quím.* **31**, 5–10(1933).—The partition coeff. of I between $H_2O$ and $(CH_2)_2Br_2$ and $PhNO_2$ was detd. at 20°, and found to agree with the Hantzsch-Landau law (*Z. phys. Chem.* **38**, 709(1901); *C. A.* **4**, 2064), because with partition of I between 2 solvents, one giving a brown, the other a violet or dark red soln., the change of partition coeff. depends upon the concn., and *vice versa;* in systems in which both solvents are colored brown by I, the partition coeff. is practically independent of concn. The soly. of I in these solvents was also detd. E. M. SYMMES

**Equation relating density and concentration.** WM. C. ROOT. *J. Am. Chem. Soc* **55**, 850–1(1933).—The equation $D = D_0 + c_1N + c_2N^{3/2}$ where $c_1$ and $c_2$ are consts. and $D_0$ is the d. of pure $H_2O$, holds within the limits of exptl. error for solns. of the alkali (except Li) and alk. earth halides to a concn. at least as high as 10 $N$ and for $H_2SO_4$ to a concn. of about 25 $N$ (about 75%), where there was a point of inflection. The consts. $c_1$ and $c_2$ are additive. C. J. WEST

**The Ostwald rule of successive stages.** I. N. STRANSKI AND D. TOTOMANOW. *Naturwissenschaften* **20**, 905(1932).—The Ostwald rule for formation of polymorphic modifications from a supersatd. gas or liquid phase can be qualitatively interpreted by the Volmer expression for probability of nucleus formation (Volmer, *C. A.* **20**, 1928; **24**, 5208; Farkas, *C. A.* **21**, 1575). Conclusion: The probability of formation for nuclei of the metastable solid phase is higher than for the stable phase at temps. not too far below the transition point metastable to stable. B. J. C. VAN DER HOEVEN

**The oxidation of mercury by air.** ALFRED STOCK, FRANZ GERSTNER AND HERBERT KÖHLE. *Naturwissenschaften* **20**, 954–5(1932).—Previous work (*C. A.* **25**, 5110) on soly. of Hg in $H_2O$ was continued. Microdetns. of Hg were made by the distn. method (*C. A.* **25**, 2662). In the absence of $O_2$ the soly. is less than 0.03 $\gamma$ per cc.; on passing a slow $O_2$ stream through $H_2O$ with Hg layer at 30° satn. was obtained after 2 months at 39 $\gamma$ Hg per cc. On standing in air the satn. is only $^1/_2$ after 2 months. In 5% KOH the soly. is 55 $\gamma$/cc., in 10% KOH 135 $\gamma$/cc. and at satn. is more rapid. The dissolved substance is HgO; its soly. checks with the data obtained. Similar oxidation of Hg in KCl soln. gives HgCl solns., soly. in 5% KCl 22 $\gamma$/Hg/cc., in 10% KCl 46 $\gamma$/cc. The soln. as well as solid HgO gives off vapors contg. elementary Hg by dissocn.; this explains the diffusion of Hg through water. The soly. also explains various observations on Hg vapors, *e. g.*, its rapid resorption in the lungs. B. J. C. VAN DER HOEVEN

**Cryoscopic study of paraldehyde, ether and acetone in solutions of sodium acetate.** O. HUN. *Compt. rend.* **196**, 177–8(1933); cf. *C. A.* **26**, 3716.—The cryoscopic consts. of paraldehyde, $Me_2CO$, and $Et_2O$ in 0.1 *M* NaOAc aq. soln. are 23.95, 21.37 and 22.99, resp.; in 1.0 *M* NaOAc aq. soln. 30.60, 24.25, and 27.86, resp.; in 1.225 *M* NaOAc aq soln. 32.92, 25.65 and 29.90, resp. DON BROUSE

**The influence of temperature on the solution state of methylated carbohydrates.** MAX ULMANN AND KURT HESS. *Ber.* **66B**, 68–71(1933); cf. *C. A.* **26**, 6120.—The osmotic pressure of α-methylglucoside in aq. soln. was investigated with the aid of the method of isothermal distn. Assocn. sets in at a much smaller concn., 0.06%, than with hendecamethylcellotriose, 0.3%, and increases with the temp. for both compds. The mol. size of hendecamethylcellotriose depends upon $p_H$, concn. and temp. A. S. S.

**Conductivity of solutions of zinc oxide in caustic soda solution.** FREDERICK R. SNELL. *J. Indian Chem. Soc.* **9**, 583–9(1932).—The cond. of solns. of ZnO in NaOH solns. is examd. at various dilns. with the mol. ratio of ZnO to $Na_2O$ varying from 1:2.5 to 1:7. The curves for ratio-cond. show no discontinuities that might indicate complexes in the soln. F. L. BROWNE

**Optical methods for the study of solutions of electrolytes.** A. I. BRODSKII. *Uspekhi Khimii.* **1**, 712–43(1932).—Refractive index and absorption methods with ultraviolet, visible, infra-red and Raman spectra light are discussed. F. H. RATHMANN

**Classical dissociation theory.** G. TAMMANN. *Z. physik. Chem.* **A163**, 17–32 (1932).—Many difficulties of the classical dissocn. theory are removed if the internal pressure of the soln. is considered. G. M. MURPHY

**Properties of electrolytic solutions. II. The evaluations of $\Lambda_0$ and of $K$ for incompletely dissociated electrolytes.** RAYMOND M. FUOSS AND CHARLES A. KRAUS. *J. Am. Chem. Soc.* **55**, 476–88(1933); cf. *C. A.* **27**, 887.—A method is given for solving the cond. equations for incompletely dissocd. binary electrolytes and for detg. the limiting equiv. cond. and dissocn. const. The method is applied to a variety of binary electrolytes in solvents of dielec. const. from 10.4 to 79. The calcd. values agree with the observed up to ion concn. of approx. $2 \times 10^{-3}$ $N$. G. M. MURPHY

**Association of strong electrolytes.** JOHANNES ZIRKLER. *Z. physik. Chem.* **A163**, 1–7(1932).—The degree of assocn. of $Ba(NO_3)_2$ calcd. from the temp. coeff. of cond. agrees approx. with that calcd. from the temp. coeff. of heat of diln. On the assumption of an empirical justification for this relationship, heats of diln. were calcd. from cond. data and compared with the measured heats. Differences between the 2 values thus obtained are due to the heat of solvation of the ions. G. M. MURPHY

**The behavior of electrolytes in mixed solvents. IV. The free energy of zinc chloride in water-alcohol solutions.** R. T. HAMILTON AND J. A. V. BUTLER. *Proc. Roy. Soc.* (London) **A138**, 450–9(1932); cf. *C. A.* **25**, 4765.—The partial free energies of $ZnCl_2$ were detd. in a series of water-alc. solvents at concns. from 1 to 0.01 $M$. $ZnCl_2$ is practically completely dissocd. in water and practically undissocd. in alc., in agreement with the cond. of the solns. L. E. STEINER

**The Debye-Hückel ion size parameter in terms of individual ionic radii. The activity coefficient of lead chloride in solutions of cadmium nitrate.** H. D. CROCKFORD AND HENRY C. THOMAS. *J. Am. Chem. Soc.* **55**, 568–74(1933).—The mean distance of closest approach of the ions in dil. soln. of strong electrolytes was shown to be a function of quantities depending on the valence type of the solute and the individual ionic radii. Measurements of the e. m. f. of the cell: Pb-Hg (2 phase) | , $PbCl_2$ ($m_1$), $Cd(NO_3)_2$ ($m_2$) | , AgCl | Ag; $m_1/m_2$ = const. were used to obtain the activity coeff. of $PbCl_2$. The exptl. results agree with the theory. G. M. MURPHY

**The dissociation constants of organic acids. VI. Acetic acid.** GEO. H. JEFFERY AND ARTHUR I. VOGEL. *J. Chem. Soc.* **1932**, 2829–38; cf. *C. A.* **26**, 2912.—Measurements were made in the $SiO_2$ cell previously employed. New detns. of the cond. of NaOAc and KOAc were made over a concn. range of 0.0001 and 0.01 $N$ and corrections were made for hydrolysis. The results were regarded as accurate to within at least 0.1%. NaOAc gave $\Lambda_0 = \Lambda_c + 93.42\ C^{0.508} = 89.45$ and KOAc, $\Lambda_0 = \Lambda_c + 150.5\ C^{0.686} = 113.44$ leading to value of 39.7 and 40.0, resp., for the limiting mobility of the acetate ion. This leads to the value for AcOH, $\Lambda_0 = 348.0 + 39.85 = 387.85$, 348.0 being the limiting mobility of the H ion. The methods used by Shedlobsky are discussed and the use of *cond. cells with dipping electrodes is defended.* A. L. KIBLER

**The dissociation constant of acetic acid from 0 to 60°.** HERBERT S. HARNED AND RUSSELL W. EHLERS. *J. Am. Chem. Soc.* **55**, 652–6(1933); cf. *C. A.* **26**, 2912.—The e. m. f. of the cell: $H_2$ | HAc ($m_1$), NaAc ($m_2$), NaCl ($m_3$) | AgCl | Ag was measured at 5° intervals from 35° to 60°. Values of $E_0$ for the Ag, AgCl electrode were obtained at the temps. involved and the dissocn. const. of AcOH was calcd. at 5° intervals. An equation is given for its variation with temp. as well as an equation for the temp. dependence of the heat of dissocn. G. M. MURPHY

**A theory of the rate of solution of gas in liquid. II. The rate of solution of gas in liquid containing a reactive substance. A kinetic derivation of the distribution law.** SUSUMU MIYAMOTO. *J. Chem. Soc. Japan* **53**, 1005–12; *Bull. Chem. Soc. Japan* **7**, 388–98(1932); cf. *C. A.* **26**, 3970.—From the assumptions that: (1) a gaseous mol. that impinges vertically upon the surface of a liquid with a velocity greater than $u_0$ is dis-

solved in the liquid, and that (2) a dissolved gaseous mol. that impinges vertically against the boundary between the liquid and the upper gaseous phase with a velocity greater than $u_0'$ becomes a gaseous mol., the initial soln. velocity of gas in liquid, when there is a substance in the liquid that reacts with the gas, was calcd. A relation between the soly. of the gas $u_0$ and $u_0'$ was obtained. Henry's law as well as the distribution law were derived. The values of $u_0$ and $u_0'$ were calcd. when O dissolves in water at 15°. T. KATSURAI

**The rate of solution of oxygen in an alcoholic solution of anhydrous stannous chloride.** SUSUMU MIYAMOTO AND EIYO UTUNOMIYA. *J. Chem. Soc. Japan.* **53**, 1097–107(1932).—With an app. similar to that used by Ledig and Weaver (*C. A.* **18**, 1412) the rate of soln. of O in alc. $SnCl_2$ was measured. The change of initial soln. velocity with the concn. of the solute is about const. when the concn. of solute is small, and becomes smaller when the concn. of the solute becomes greater. T. K.

**Influence of anions on the velocity of solution of zinc in acids.** ERICH MÜLLER AND JOHANNES FÖRSTER. *Z. Elektrochem.* **38**, 901–6(1932).—Pt wires 50 mm. long and 0.2 mm. diam. were inserted in the ends of pure Zn rods 20 mm. long and 3 mm. in diam. The cleaned and polished combination Zn-Pt rods were then amalgamated by dipping in $HgCl_2$ soln. and then dropped into 50 cc. of various concns. of HCl, HBr, $H_2SO_4$, $HClO_4$ and $H_3PO_4$ and the H evolution per min. was measured for 10 min. Under these conditions H evolution occurs only from the Pt surface and impurities in the Zn are rendered practically without influence on account of the amalgamation so that reproduceable results were obtained. The rate of H evolution is not proportional to the acid concn., the cond. of H-ion concn. alone. The reaction velocity is proportional to the current strength in the short-circuited Zn-Pt combination element. This current strength depends on the potential of Zn, the overvoltage of H on Pt, on the $Zn^{++}$ and $H^+$ concns. and on the cond. With a given acid the last 3 change little in 10 min. Reaction velocity and current strength decrease with time and this effect must be due largely to the rise of overvoltage of H on Pt causing the e. m. f. of the short-circuited element to drop. HBr and HCl react about twice as rapidly with Zn as $H_2SO_4$ in the same mol. concns. at the $H_2SO_4$ max. (about 5.5 *M*) while $HClO_4$ and $H_3PO_4$ react only about 0.4 and 0.3 as fast at their maxima, 3.5 and 6.5 molar, resp. ODEN E. SHEPPARD

**The velocity of absorption of nitrogen oxides in sulfuric acid. II.** L. SZEGÖ AND M. LOMBARDI. *Giorn. chim. ind. applicata* **14**, 492–6(1932); cf. *C. A.* **26**, 3336.—The absorption of $N_2O_3$ and $N_2O_4$ in $H_2SO_4$ of varying concns. was investigated. $N_2O_3$ is absorbed more readily in medium to concd. $H_2SO_4$, while $N_2O_4$ is absorbed more readily in dil. acid. This is due to the fact that $N_2O_3$ reacts more readily with concd. $H_2SO_4$, $N_2O_3 + 2H_2SO_4 \longrightarrow 2HSNO_5 + H_2O$, to form nitrosylsulfuric acid, while in dil. acid the reactions, $H_2O + N_2O_4 \rightleftharpoons HNO_2 + HNO_3$ and $2NO + N_2O_4 + 2H_2O \rightleftharpoons 4HNO_2$, both of which consume $N_2O_4$, take place more readily. A. W. CONTIERI

**The velocity of solution of industrial aluminas in fused cryolite.** N. PARRAVANO AND O. D'AGOSTINO. *Atti accad. Lincei* **16**, 186–90(1932).—The time required for the 3 types of $Al_2O_3$, Bayer, Haglund and Blanc, to dissolve in fused cryolite at 1050°, was measured. The first 2 consist essentially of cryst. $\alpha$-$Al_2O_3$, Haglund showing larger and more agglomerated crystals. Blanc $Al_2O_3$, made by decompn. of Al chloride or nitrate, is not cryst., although it is anisotropic, and has a large sp. surface area. The time of soln. was measured by the change in cond. of the fused soln. of 15 g. of each $Al_2O_3$ in 100 g. cryolite. The change in resistance was measured by a bridge constructed as follows: The resistance consisted of a variable condenser, current was supplied by a thermionic valve oscillator, and a valve voltmeter with 2 stages of amplification, with a 3 v.-1000 ohm voltmeter as a milliammeter, was used in place of the telephone. In this way, 0.001 ohms could be measured. The $Al_2O_3$ was added to the fused cryolite, in a furnace held at 1050°, and the resistance of the soln. measured (cryolite = 0.1682 ohm). The time required for the resistance to become const. was 4, 6, 9 min. for Blanc (0.1757 ohm), Bayer (0.1772) and Haglund (0.1782) alumina, resp., showing Blanc to be most readily sol. The results prove that the cond. of cryolite decreases with increasing concn. of $Al_2O_3$. By extrapolation, it was calcd. that 100% $Al_2O_3$ soln. has zero cond., that is, it is not dissocd. in fused cryolite. A. W. CONTIERI

**The velocity of decomposition of dithionic acid and its volumetric determination.** FUSAO ISHIKAWA AND HIROSHI HAGISAWA. *Science Repts. Tôhoku Imp. Univ.*, 1st ser. **21**, 484–98(1932).—The decompn. of 0.1 mol. solns. of $H_2S_2O_6$ is monomolecular; $k_{70°} = 0.000197$ and $k_{100°} = 0.00757$. The $k_{t+10}/k_t$ is 3.14 at 100° and 3.85 at 60°. The effect of HCl on the decompn. at 80° is expressed by $k = 0.0184–0.01515\ C_{HCl} + 0.005297\ C^2_{HCl}$. The volumetric detn. of $H_2S_2O_6$ consists in heating in a sealed tube with concd HCl, followed by titration with $I_2$ soln. J. V. VAUGHEN

**The velocity of the reaction of potassium cyanide with thiosulfate or tetrathionate.**

FUSAO ISHIKAWA, TOYOSAKU MUROOKA AND HIROSHI HAGIHARA. *Science Repts. Tôhoku Imp. Univ.* 1st Ser., 21, 511–26(1932).—$k_{25°}$ = 0.00167 and $k_{70°}$ = 0.0458–0.0461, detd. for the bimol. reaction (*1*) $Na_2S_2O_3$ (0.05204 mol./l.) + KCN = $Na_2SO_3$ + KCNS. Depending on the initial concn. of KCN, $k_{70°}$ = 0.0269 + 0.06 $C_{KCN}$. The product, KCNS, has the same accelerating effect as KCN. NaOH speeds the reaction; $k_{70°}$ = 0.0461 + 0.033 $C_{NaOH}$. The velocity of the reaction: $Na_2S_2O_3$ + excess KCN + 2KOH = $Na_2SO_3$ + 2KCNS + $K_2SO_4$ + $H_2O$ is essentially that of reaction (*1*), accelerated by the by-product KCNS concn. J. V. VAUGHEN

**The occurrence of two liquid phases and of a minimum density in the system: $CS_2$–ethylene dichloride.** DALZIEL LL. HAMMICK AND JOHN HOWARD. *J. Chem. Soc.* 1932, 2915–16.—An investigation of liquid equilibria in the system: $CS_2$–$C_2H_4Cl_2$ showed that mixts. of the 2 liquids sepd. into 2 liquid layers and that there is a min. in the compn.-d. curve in the region of the equimol. mixt. M. MCMAHON

**Ternary systems. XVII. Sodium iodide, potassium iodide and water. XVIII. Sodium iodide, sodium iodate and water.** ARTHUR E. HILL, HERBERT S. WILLSON AND JOHN A. BISHOP. *J. Am. Chem. Soc.* 55, 520–6(1933); cf. *C. A.* 26, 1179.—The system: NaI–KI–$H_2O$ was studied at 8°, 25° and 40° and shows no compd. formation. The system: $NaIO_3$–NaI–$H_2O$ at the same temp. shows a series of solid solns. of the compn. $(NaIO_3.5H_2O)_n$–$(NaI.2H_2O)_m$ beginning at the 1:1 ratio and extending to approx. the 1:2 ratio. G. M. MURPHY

**Influence of the contact structure on the burning of carbon monoxide.** J. ECKELL. *Z. Elektrochem.* 38, 918–20(1932).—The burning of CO as catalyzed by $Fe_2O_3$ and $Fe_2O_3$–$Al_2O_3$ was studied with a view to det. the effect of surface structure, as detd. by the method of x-ray pictures and refraction of rapid electrons (cf. Eisenhut and Kaupp, *C. A.* 26, 66), on the velocity of the reaction and on the heat of activation. The catalytic burning of CO proceeds as a monomol. reaction depending on the CO pressure in the range 1–10 mm. Hg pressure while intermediate reduction products of $Fe_2O_3$ are formed. The velocity const. in the range 204–160° follows closely the relation ln $K^{-1}/T$ and the heat of activation is 20,000 to 14,000 cal. An increase of dispersity of the catalyst as shown by electron refraction pictures corresponds with a rise in the velocity const. The electron refraction method offers no explanation of the heat of activation change with varying concns. of added $Al_2O_3$ but the x-ray method suggests that the change in lattice dimension (5.47 to 5.33 A. U.) with increased $Al_2O_3$ which parallels the decrease in heat of activation to a min. at about 25 mol. % $Al_2O_3$, with increase of $Al_2O_3$, is in some way responsible. The $Al_2O_3$ (promoter) action is probably to prevent crystal growth in the reduced iron catalyst. Cf. Mittasch and Keuenecke, *C. A.* 26, 5707. O. E. SHEPPARD

**Cyanide-cyanimide equilibrium.** A. PERRET AND R. PERROT. *Compt. rend.* 196, 268–71(1933); cf. *C. A.* 26, 1870.—Reactions between NaCN and the chlorides of Li, Ca, Ba, Sr, Mg, Be and Zn were studied at temps. up to 600°. It was necessary to use metallic Fe as a catalyst in most of the reactions. The equil. amts. of the cyanimide formed were: Li, 8.4% at 570°; Ca, 19.6% at 570°; Ba, 12% at 570°; Sr, 10.9% at 570°; Mg formed the nitride with some decompn. between 400° and 560°; Be gave a similar reaction at 470°, forming no cyanimide; Zn, 19.6% at 550°, with decompn.; Cd, 2% at 550°, 19.4% at 580°. In the last case, the cyanimide decompd. to the cyanide progressively with continued heating. $ZnCN_2$ yielded gaseous decompn. products at temps. above 450°; it was 50% decompd. to the elements in 18 hrs. at 600°. GERALD M. PETTY

**Haber-Willstätter chain mechanism of organic and enzymic processes.** HUGH S. TAYLOR AND AUSTIN J. GOULD. *J. Am. Chem. Soc.* 55, 859(1933).—The photo-decompn. of peroxide sensitizes the interaction of EtOH and O; the oxidation process is a chain reaction, sensitive to inhibitors but the chain length is short. Dil. aq. aldehyde solns. behave similarly and the chain length is somewhat longer. C. J. WEST

**The action of water vapor on methane.** C. MATIGNON AND M. SEON. *Compt. rend.* 195, 1345–8(1932).—$CH_4$ pure or mixed with $H_2$, $N_2$, $O_2$ and CO yields $H_2$ and $CO_2$ when mixed with a large excess of water vapor and passed slowly over the catalysts $SiO_2$, $ZrO_2$, asbestos sprinkled or impregnated with $ZrO_2$, $ThO_2$, $Fe_2O_3$, $Fe_2O_3$ + 10% $K_2CO_3$, or $Al_2O_3$ at 860°, 960°, 1000° or 1050°. The best results for the mixt. were obtained with $ZrO_2$. With pure $CH_4$ and $ZrO_2$ at 1050° the reaction was complete. JANET E. AUSTIN

**The catalysis of hydrogen peroxide.** F. HABER AND J. WEISS. *Naturwissenschaften* 20, 948–50(1932).—The hypothesis of Manchot and Lehmann (*C. A.* 22, 2096) of unstable $Fe_2O_5$ being formed from $FeSO_4$ + $H_2O_2$ in neutral soln. is incorrect. By an extensive study of the reaction at high mixing velocities of the liquids it was found that a system of chain reactions takes place such that consumption ratios of $\Delta H_2O_2/\Delta Fe_{II}$ as great as 30 are found: (*A*) $Fe_{II}$ + $H_2O_2$ = $Fe_{III}(OH)$ + OH; (*B*) OH + $H_2O_2$ = $H_2O$ + $O_2H$; (*C*) $O_2H$ + $H_2O_2$ = $O_2$ + $H_2O$ + OH; (*D*) $Fe_{II}$ + OH = $Fe_{III}OH$ (the

$Fe_{III}OH$ symbol stands for some unionized compd. like $OH.FeSO_4$, cf. Haber and Willstätter, *C. A.* **26**, 3774). Detns. at various $p_H$ values are required to reveal the influence of $HO_2^-$ ions, etc. The reaction kinetics are further discussed and an equation is reached for the mol. consumption ratio $d(H_2O_2)/d(Fe_{II}) = 0.5 + \frac{k_B}{k_D}\frac{(H_2O_2)}{(Fe_{II})}$; this is compared with the result of M. and L. B. J. C. VAN DER HOEVEN

**The retarding action of glass on the Landolt reaction.** ANDRE JULIARD. *Compt. rend.* **196**, 179–81(1933).—Three expts. are described to show that the Landolt reaction (oxidation of $H_2SO_3$ by $HIO_3$) is catalyzed by I ions and that the phenomenon of Liebrich (retardation of the reaction by glass) is due to adsorption of a part of these ions by the glass container. DON BROUSE

**Thermal dissociation of chemically pure gypsum in the presence of oxides of iron, aluminum and chromium.** I. E. ADADUROV, A. GALAMEEVA AND D. V. GERNET. *J. Applied Chem.* (U. S. S. R.) **5**, 897–901(1932); cf. *C. A.* **26**, 5001.—The heat of the reaction is 6000–9000 cal. at 900–1000° and 35,000–48,000 at 1000–1200° which shows that its nature is different. $SiO_2$, $Fe_2O_3$ and $Cr_2O_3$ greatly increase the yield of $SO_2 + SO_3$ even below 900°. The heats of activation at 1000–1200° are: for $CaSO_4$ —99,000 cal., $CaSO_4 + SiO_2$ —27,000, $CaSO_4 + 5\%$ $Al_2O_3$ —48,000, $CaSO_4 + 3\%$ $Fe_2O_3$ —32,000, $CaSO_4 + 3\%$ $Cr_2O_3$ —40,000. Mixed catalysts are not additive in properties. $SiO_2 + Fe_2O_3$ and $SiO_2 + Al_2O_3$ mixts. are more and $SiO_2 + Cr_2O_3$ mixts. less efficient than calcd. on the additivity basis. This shows that the dissocn. of anhyd. $CaSO_4$ is a catalytic process. V. KALICHEVSKY

**Some physical-chemical constants of dioxane.** W. A. ROTH AND INGRID MEYER. *Z. Elektrochem.* **39**, 35–7(1933).—The heat of fusion of the sym. 1,4-$(C_2H_4)_2O_2$ was measured as 33.8 cal. per g.; the mol. heat of combustion as 554.6 cal.; the $d_{20}$ as 1.03326; the coeff. of expansion between 13° and 25° as 0.00109. C. L. WILSON

**Existence of the so-called heats of transfer [$Q^*$ values] in Peltier heats.** E. LANGE AND TH. HESSE. *J. Am. Chem. Soc.* **55**, 853–5(1933).—Peltier heats of the system $Ag/AgNO_3$ and $Ag/AgCl/Cl^-$ in the presence of $K^+$, $H^+$ and $Li^+$ establish the existence and the necessity for considering the $Q^*$ that Eastman introduced. The differences of partial molar entropies cannot be detd. by employing Peltier heats and thermoelec. forces alone. Details will be published in a German journal. C. J. WEST

**The heat of solution of water vapor in various solvents.** RONALD P. BELL *J. Chem. Soc.* **1932**, 2905–11.—Tabulated results are given for the soly. of water vapor in $PhNO_2$, PhCl, $C_2Cl_4$, PhMe, $CCl_4$, $C_6H_5Br$, $C_2H_4Br_2$ and diisoamyl ether at 15°, 20° and 25° with the indirect method previously described (*C. A.* **27**, 1295). M. McM.

**Determination of the heat of solution of gases.** J. HORIUTI. *Z. Elektrochem.* **39**, 20–2(1933).—From previous measurements (cf. *C. A.* **26**, 2104) it is calcd. that the heat of soln. at const. pressure may differ by as much as 200–400 cal. per mole if the vol. of the soln. is assumed to be independent of the temp. CURTIS L. WILSON

**Phosphoniates. III. The heat of formation of halide phosphoniates.** ROBERT HÖLTJE. *Z. anorg. allgem. Chem.* **209**, 241–8(1932); cf. *C. A.* **25**, 2932.—The heats of formation in kg. cal. per mol. $PH_3$ at const. pressure, of solid halide phosphoniates from solid halides and gaseous $PH_3$ were calcd. from calorimetric data as follows: $AlCl_3.PH_3$, 9.9 ± 0.2; $AlBr_3.PH_3$, 14.3 ± 0.3; $SnCl_4.1.5PH_3$, 15.9 ± 0.2; $TiCl_4.PH_3$, 16.4 ± 0.1; $TiBr_4.PH_3$, 16.0 ± 0.2; $TiCl_4.2PH_3$, 10.8 ± 0.3 (from $TiCl_4.PH_3 + PH_3$); $TiCl_4.2PH_3$, 13.6 (from $\frac{1}{2}$ $TiCl_4 + PH_3$); $TiBr_4.2PH_3$, 11.8 ± 0.3 (from $TiBr_4.PH_3 + PH_3$); $TiBr_4.2PH_3$, 13.9 (from $\frac{1}{2}$ $TiBr_4 + PH_3$). A comparison of the heats of formation of phosphoniates and corresponding thiohydrates indicates that the phosphoniates are in all cases the more stable. J. V. VAUGHEN

**Second law and entropy. II. Irreversible processes.** R. C. CANTELO. *J. Chem Education* **10**, 45–6(1933); cf. *C. A.* **26**, 365.—An extension of the previous discussion to include irreversible processes. A. LLOYD TAYLOR

**Molecular rotation in ice at 10°K. Free energy of formation and entropy of water.** W. F. GIAUQUE AND MURIEL F. ASHLEY. *Phys. Rev.* **43**, 81–2(1933).—From existing data the following values are calcd. for the free energy (in cal./mol.) and entropy (in e. u.), resp., of gaseous $H_2O$ at 298.1°K. and 1 atm. Band spectra —54669, 45.17; from the cell $H_2 + HgO = Hg + H_2O$, —54676, 45.19; from equil. in the reaction $2HCl + \frac{1}{2}O_2 = H_2O + Cl_2$, —54650, 45.1; third law of thermodynamics, —54696, 45.26; weighted average —54670, 45.17. By correcting for the effect of nuclear spin the abs. entropy is 47.92 e. u. For liquid $H_2O$ at 298.1°K., $\Delta F$ = —56720 and $S$ = 16.9. The calcns. based on the third law indicate persistence of rotation at 10°K. J. B. AUSTIN

## 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR., AND RAYMOND M. FUOSS

**Quantum of action and cosmic constants.** ARTHUR HAAS. *Naturwissenschaften* 20, 906(1932). B. J. C. VAN DER HOEVEN

**Effective cross sections of atoms toward slow and fast electrons.** R. L. ROSENBERG. *Ann. Physik* **15**, 757–86(1932).—Math. The force exerted by a plane matter wave on a spherically sym. atom of given internal potential was calcd. This was used to calc. the effective cross section of atoms toward electrons. I. J. PATTON

**Applications of the methods of impact parameter in collisions.** E. J. WILLIAMS. *Proc. Roy. Soc.* (London) **A139**, 163–86(1933).—The method of impact parameters is applied to light collisions, which are defined as those in which the momentum transfer is small compared with the momentum of the moving particle. The main problems con-

sidered are: (1) theorems dealing with the perturbation of atoms b[illegible] of forces; (2) non-relativity loss of energy in distant collisions; (3) relativ[illegible] light collisions; (4) the connection between the theory of collisions put forward by Fermi and quantum mechanics; and (5) the lateral distribution in space of the atoms ionized and excited by a moving particle. The general phys. reasons for the relativity corrections deduced in (3) are also discussed. H. E. MESSMORE

**The influence of angular distribution of scattered electrons on the measurement of effective diameter.** R. KOLLATH. *Ann. Physik* **15**, 485–515(1932).—A crit. review of existing measurements with a discussion of correction factors and the effect of diaphragm size in different methods. A detailed comparison is made of the methods of Ramsauer and Townsend. J. B. AUSTIN

**Electron scattering in helium. Absolute measurements at 90° and 45°.** SVEN WERNER. *Proc. Roy. Soc.* (London) **A139**, 113–29(1933).—Electrons emitted from an incandescent W filament were passed through rarefied He. Some electrons passed within the sphere of attraction of the He atoms and were deflected. Deflected electrons passing through a slit constituted an elec. current, the intensity of which was measured at velocities corresponding to 30–400 v. and at the two scattering angles. Above 150 v. the detd. scattered intensities agreed with nuclear scattering according to Rutherford, and with the scattering according to Mott and Bethe's calcns. Relatively large deviations occurred at smaller velocities. The method and details of the exptl arrangements are described. H. E. MESSMORE

**The collision of slow electrons with atoms. II. General theory and inelastic collisions.** H. S. W. MASSEY AND C. B. O. MOHR. *Proc. Roy. Soc* (London) **A139**, 187–201(1933).—The theory of collisions of slow electrons with atoms has been extended to include the effect of the distortion of both the incident and scattered electron waves by the static field of the atom, together with the effect of electron exchange. The general theoretical derivations include both elastic and inelastic collisions, elastic and inelastic scattering, and inelastic scattering by heavy atoms. The lack of agreement with expt. on the form of the inelastic cross-section curves is thought to be due to the neglect of other complicating factors, such as effect of polarization. H. E. MESSMORE

**An experimental study of electric discharge in gases at normal temperatures and pressures.** J. D. STEPHENSON. *Proc Phys. Soc.* (London) **45**, 20–40(1933) —By starting with a study of corona discharge in gases and then proceeding to the study of spark discharge it was detd. that there is a fixed const., the true breakdown strength of the gas for all types of gas discharge at normal pressures. M. MCMAHON

**Light emission in gas discharges particularly of resonance lines.** W. DE GROOT *Physica* **12**, 289–310(1932)(in German).—The theory of calcn. of concn. of excited atoms in a discharge tube (cf. *C. A.* **26**, 4219) is extended to give the light distribution in the resonance line and the total intensity, a problem of direct interest for the modern lamps with noble gas + metal vapor filling (cf. Reger, *C. A.* **26**, 5791; Druyvesteyn, *C. A.* **27**, 659). General assumptions made are uniform electron temp., a Schottky decrease in electron concn. near the walls, Doppler widening for the at. radiation. Conclusions The line may show strong self reversal; at sufficient vapor d. and electron concn. Lambert's law holds approx. Measurements on a pos. column in Ne-Na were used for a check on the calcd. brightness. B. J. C. VAN DER HOEVEN

**The passage of photoelectrons through mica.** NORRIS E. BRADBURY AND LLOYD A. YOUNG. *Phys. Rev.* **43**, 84–5(1933).—Expts. show that electrons emitted into a crystal (mica) from a photoelec. surface (Zn) can be drawn through to an anode by high accelerating field strengths. The results are in agreement with predictions based on the theory of gaseous scattering. J. B. AUSTIN

**The efficiency of electron release by metastable atoms.** EUGENE W. PIKE. *Phys Rev.* **43**, 144–5(1933).—A correction and defense of a previous article (cf. *C. A.* 26, 3435). GERALD M. PETTY

**Mobilities of gaseous ions in $CH_3NO_2$-$H_2$ and $CH_3CN$-$H_2$ mixtures.** ELIZABETH ANN HIGLEY AND CAROLYN C. THORSEN. *J. Franklin Inst.* **215**, 69–80(1933).—By using Loeb's method, modified to give abs. mobilities, measurements were made in mixts. of $CH_3NO_2$-$H_2$ and $CH_3CN$-$H_2$. In $H_2$, mobilities of pos. ions were 7.12 cm./sec per v./cm.; of neg. ions, 10.46. In $CH_3NO_2$, both ions gave a value of 0.221, and in $CH_3CN$, a value of 0.234. Deviation from Blanc's law, in $CH_3NO_2$ and in $CH_3CN$, indicated the formation of complexes, the pos. ion showing the readier attachment to both $CH_3NO_2$ and $CH_3CN$. These ion addn. products are larger than the normal ion in $H_2$, those in $CH_3CN$ being smaller than those in $CH_3NO_2$. L. WALDBAUER

**Recent developments in the study of the external photoelectric effect.** LEON B. [illegible] E. H. LAUFORD. *Rev. Modern Physics* **5**, 34–61(1933).

**The theory of the crystal photoeffect.** HORST TEICHMANN. *Proc. Roy. Soc.*

(London) **A139**, 105–13(1933).—If semiconducting crystals are connected into a circuit a current flows in such a direction that electrons in the semiconductor move in the direction of incident light. T. attributes this current to electrons moving from one energy level to another or from the shifting of energy levels in the dynamic case, the original electron vacancy being caused by the absorption of light quanta. Equations are given showing the potential which arises in the equil. state as a function of illumination, temp. and thickness of crystal. H. E. MESSMORE

**The reflection of light at a surface covered by a monomolecular film.** C. STRACHAN. *Proc. Cambridge Phil. Soc.* **29**, 116–30(1933). E. H.

**Magnetic rotatory dispersion of a colored diamagnetic compound—thiobenzophenone.** A. COTTON AND M. SCHERER. *Compt. rend.* **195**, 1342–5(1932); cf. *C. A.* **27**, 907.—Anomalies of magnetic rotatory dispersion are distinct on both sides of the band. $d\rho/d\lambda$ is pos. on the side nearest the violet, neg. on the other. JANET E. AUSTIN

**Determination of the energy conditions of metal electrons from optical constants.** HERBERT FRÖHLICH. *Naturwissenschaften* **20**, 906(1932).—The energy conditions of metal electrons can be found from the frequency dependence of the optical consts. of the metal. The characteristic value of $nk\nu^2$ ($n$ = refractive index, $k$ = absorption coeff., $\nu$ = frequency) has a continuous fundamental value (continuous absorption by metals) plus superimposed absorption bands as shown in a curve for Ag. From the lower limit of the band absorption follows a width of the 1st prohibited range for Ag of 3.7 v., for Au and Cu of about 2 v. From the intensity of the absorption bands it is concluded that the electrons of Cu, Ag and Au differ in behavior from free electrons much more than the electrons of the alkali metals. B. J. C. VAN DER HOEVEN

**The radiation of incandescent oxides and oxide mixtures in the visible spectrum.** H. HOPPE. *Ann. Physik* **15**, 709–28(1932).—The radiation emitted by the following oxides and mixts. was studied: $ZrO_2$, $SnO_2$, $Nd_2O_3$, $CeO_2$, $Al_2O_3$-$Cr_2O_3$, $ThO_2$-$CeO_2$ and MgO-ZnO. There was a decrease in the amt. of radiation for decreasing grain sizes below 1 $\mu$. For all oxides and mixts. (except $Cr_2O_3$) the amt. of radiation increases in the red with increasing temp. A log relationship exists between the emission of $Al_2O_3$-$Cr_2O_3$ mixts. and the $Cr_2O_3$ content, but no such relationship was observed in the $ThO_2$-$CeO_2$ mixts. In the violet, the emission of $Al_2O_3$-$Cr_2O_3$ was decreased by $^1/_2$ compared to pure $Al_2O_3$ by the addn. of several % $Cr_2O_3$. The $ThO_2$-$CeO_2$ mixts. of low Ce content give black body radiation in the short wave region, but increase of the Ce decreases the violet again. Liebmann's "Fleckmethode" of temp. measurement (*C. A.* **25**, 34) was used on single crystals of white sapphire and ruby. The emissivity of the ruby increased in the red with increasing temp. The sapphire does not radiate in the visible. L. W.

**Simple amplifier for Geiger-Müller counters.** W. F. LIBBY. *Phys. Rev.* **42**, 440–1(1932).—The amplifying circuit includes a resistance unit (soln. of isopropyl alc. in pentane), an amplifying tube (radio tube) and a telegraph relay. Counters of surface area from 5 sq. cm. to 100 sq. cm., of lengths from 1 to 10 cm. and of several different materials have been used. Counting rates from 10 per min. to 400 per min. have been observed with the various counters and appropriate resistances. H. S. HOPFIELD

**The neutron, the atomic nucleus and mass defects.** WM. D. HARKINS. *J. Am. Chem. Soc.* **55**, 855–7(1933).—Two tables are given, showing the binding energy of atoms and the mass defect or binding energy per $\alpha$-particle. The binding energy for the union of an $\alpha/2$ group is much larger (value about 20 million v.) if the final no. of such groups in the nucleus is even, than if this no. is odd (3–9 million v.). If the final no. is even, then the last $p_2e$ group presumably forms an $\alpha$-particle with the odd $p_2e$ group already present. Relatively high values are also found for the completion of an $\alpha$-particle by a proton. The mass defect per $\alpha$-particle rises rapidly with the no. of $\alpha$-particles, contrary to the assumption of Gamow's formula, up to a mass 52 and then decreases slowly with the mass no. There is no apparent discontinuity in the values where, between $A^{36}$ and $A^{40}$ according to the theory of H. and Wilson the 1st pair of cementing or "free" electrons enters, or the theory of Harkins and Masson the 1st set of "free" neutrons (4 in no.) come into the nucleus. C. J. WEST

**Relative distribution and abundance of elements in the lower chromosphere.** S. A. MITCHELL AND EMMA T. R. WILLIAMS. *Astrophys. J.* **77**, 1–43(1933).—The values of the density gradients of neutral Fe and ionized Fe, Ti, Cr and Sc, in the lower solar chromosphere, as detd. from the heights to which the multiplet lines are traced and their theoretical intensities, have all been found to be of the same order. This indicates that turbulence is responsible for keeping the elements so well mixed and that selective radiation pressure is not the factor chiefly operative for the support of the chromosphere. Except for H and He the relative abundances of the elements in the chromosphere were found to be closely parallel to those found by Russell for the sun's reversing layer (*C. A.* 24, 20). C. C. KIESS

**The mass of the neutron and the constitution of atomic nuclei.** A. v. GROSSE.

*Phys. Rev.* **43**, 143(1933).—It is suggested that the masses of neutrons vary in a small range, corresponding to the limits of energy variation in $\beta$-spectra. G. M. PETTY

**Binding energy of nuclear constituents.** H. RAUSCH VON TRAUBENBERG. *Naturwissenschaften* **20**, 934–6(1932).—By assuming nuclei to be constructed from $\alpha$-particles ($n$ in no.), neutrons, $H^2$ and $H^3$ (H isotopes of 2 and 3 protons, resp., + 1 electron) it is shown in a table that for elements up to A the series does not require any addnl. electrons in the nucleus until the $O^{18}$ isotope. When the nucleus binding energies are plotted for each of the 4 types of nuclei ($4n$, $4n + 1$, etc.) *vs.* $n$, curves are obtained which on extrapolation to $n = 0$ should give the binding energy for the resp. nuclear constituent (neutron, $H^2$, $H^3$) itself. The values for $H^2$ and $H^3$ are, resp., 5 and 15 microergs; insufficient data are available for the $4n + 1$ type (neutron curve). However, it is estd. from a curve contg. the $H^2$ and $H^3$ energy and 42.3 microergs for the $\alpha$-particle, plotted against the proton nos. 1, 2, 3 and 4 involved, that the neutron binding energy is 1.5 microergs. The values are in fair agreement with expt. B. J. C. VAN DER HOEVEN

**Interaction of neutrons and nuclei.** LISE MEITNER AND KURT PHILIPP. *Naturwissenschaften* **20**, 929–32(1932).—Expts. on neutrons were made by the Wilson method. The no. of rapid H rays produced by Be, B or Li neutrons in paraffin is per 100 Wilson tracks 43.4, 4.95 and 0.2, resp., in an air-water vapor mixt. 28.8, 4.03 and 3.68, resp. The results agree with measurements of Becker and Bothe (*C. A.* **26**, 5830) on the intensity and energy of the accompanying $\gamma$-rays for the same elements and are addnl. evidence for the production of neutrons and $\gamma$-rays in one elementary process. By stereomicrometric measurement of length and angle of photographed Wilson tracks (reproduced) produced by Be neutrons in $H_2$ and in 28% $H_2$ + 72% A the neutron energy was detd. for 42 H tracks: the min. value was 250,000 v., 14 were between 260,000 and 340,000 v., 20 between 500,000 and 2,000,000 v., and one was 6,300,000 v. From an est. of the neutron no. of Be (= $\gamma$ quanta) and the protons observed the radius of activity for neutron and proton interaction is calcd. to be $\rho = 8.10^{-13}$ cm. This is probably a lower limit. A preliminary photograph is given of an expt. on collision of neutron with N nucleus and subsequent collision of 2 N nuclei, also of disintegration of N and O. From related measurements it is concluded that the Curie-Joliot max. value of $7.8 \times 10^6$ v. for Be neutrons is probably more correct than Chadwick's value of $5.7 \times 10^6$. Many references are given. B. J. C. VAN DER HOEVEN

**The diffusion of neutrons. Inelastic collisions at the nuclei.** PIERRE AUGER. *Compt. rend.* **196**, 170–2(1933).—That the diffusing effect of Cu, Al, Fe and Pb on neutrons is to take up their kinetic energy through inelastic collisions is shown by expts. in which Be is bombarded with $\alpha$-rays. As observed with an expansion chamber the no. of short proton trajectories is reduced when a paraffin screen is interposed between source of neutrons and chamber, but is increased again with the interposition of the diffusing substance even with the paraffin still in place. C. C. KIESS

**The cosmic occurrence of the $H^2$ isotope.** A. UNSÖLD. *Naturwissenschaften* **20**, 936–7(1932).—From the solar spectrum ($H_\alpha$ line) the relative abundance of $H^2$ is less than 1:100,000. B. J. C. VAN DER HOEVEN

**Possibility of the existence of the chlorine isotope $Cl^{39}$.** MURIEL F. ASHLEY AND F. A. JENKINS. *Phys. Rev.* **42**, 438–40(1932); cf. *C. A.* **26**, 3441.—In a study of the absorption of AgCl vapor at various ds. no evidence is found for the existence of a 3rd isotope of Cl, $Cl^{39}$. This is contrary to the results of Hettner and Böhme (*C. A.* **26**, 1510) and of Becker (*C. A.* **24**, 2047, 2373), but agrees with the results of Hardy and Sutherland (*C. A.* **26**, 5494). The method of estg. the upper limit for abundance of $Cl^{39}$ is described, and gives as a result $^1/_{4400}$ for the max. value of the ratio $Cl^{39}/Cl^{35}$. HELEN S. HOPFIELD

**Extraction and purification of radium E.** PAUL FOUCAUD. *J. chim. phys.* **29**, 479–87(1932).—Since radiolead carries Ra D with it, and this latter gives rise to Ra E, it was desirable to ext. the latter from the former at intervals, preferably always under the same conditions. The $PbCl_2$ from the ore was converted to the nitrate, and then treated with $Fe(NO_3)_3$, which on being pptd. with $NH_3$, coprecipitates the Ra E. The $Fe(OH)_3$ ppt. is dissolved in HCl to remove the Pb as $PbCl_2$; the Fe is removed in $Et_2O$ extns. of $FeCl_3$. The Ra E and Pb are finally converted to sulfates, and after addn. of EtOH, the $PbSO_4$ is filtered off. I. J. PATTON

**The linear momenta of electrons in atoms and in solid bodies as revealed by x-ray scattering.** JESSE W. M. DUMOND. *Rev. Modern Physics* **5**, 1–33(1933). E. H.

**Probabilities of $K$-electron ionization of silver by cathode rays.** D. L. WEBSTER, W. W. HANSEN AND F. B. DUVENECK. *Phys. Rev.* **42**, 141–2(1932).—Previous work (*C. A.* **23**, 31; **25**, 3562) has been extended by increasing the cathode ray voltage range to $7V_K$ (where $V_K$ is the $K$-series excitation voltage). The probability of $K$-electron ionization is measured by intensity of the $K_\alpha$ lines, with the probability at $2V_K$ as a convenient standard. The ratio of the probability at any other voltage $V$ to this

standard, when plotted as a function of the ratio $V/V_K$, gives a curve which rises to a very flat max., remaining const. within 2% from $V/V_K = 3.5$ to 7. These results deviate from the theories of Rossland, Thomas, Ochiai, Bethe and Davis. Several possible explanations are suggested. The authors consider it most probable that the inverse square law fails within the atom, for some other reason than high energy, and find that Rossland's theory, with an inverse cube law substituted for the inverse square, fits the data best. HELEN S. HOPFIELD

**The $K_{\alpha_1\alpha_2}$ doublet of chlorine in several compounds.** OSVALD LUNDQUIST. *Naturwissenschaften* **20**, 905–6(1932).—Previously a shift of the $K_{\alpha_1\alpha_2}$ lines of S in sulfides (toward long waves) and in sulfites and sulfates (toward short waves) was found. The shifts were, resp., 0.3, 2.1 and 2.8 X units. Similar work was done on Cl in the compds. NaCl, $NaClO_3$ and $NaClO_4$; the exptl. arrangement was the same. The $K_{\alpha_1}$ line of Cu was used for reference. The preliminary results are a shift of $K_{\alpha_1\alpha_2}$ toward shorter waves for $NaClO_3$ and $NaClO_4$ as compared with NaCl. A spectrogram is given. B. J. C. VAN DER HOEVEN

**An anomaly in the columbium *K* absorption limit.** CECIL J. BURBANK. *Phys. Rev.* **43**, 83(1933).—The shape of the foot of the *K* absorption edge of Cb is different from that of Rh, Pd, Ag, Cd and Mo. J. B. AUSTIN

**The scattering of x-rays by the gaseous dichlorobenzenes.** W. C. PIERCE. *Phys. Rev.* **43**, 145–6(1933).—The distribution of intensity of x-rays scattered by the 3 dichlorobenzenes is shown graphically. The results agree with those predicted from a plane model of the $C_6H_6$ mol. Atoms in the *p*-position are about twice as far apart as those in the *o*-position; the *m*-distance is intermediate. GERALD M. PETTY

**Effect of particle size on intensity in x-ray spectroscopic analysis.** GORTON R. FONDA. *J. Am. Chem. Soc.* **55**, 123–7(1933).—The decrease in intensity of diffracted x-ray beams, due to surface irregularities of the target, is studied for grids of various sizes, and powders of various particle-diams. L. WALDBAUER

**The rotation goniometer diagram and the reciprocal lattice.** ERWIN SAUTER. *Naturwissenschaften* **20**, 889–90(1932).—The rotation goniometer is briefly described. A photograph is given of a monoclinic crystal (diphenylethylene sulfide) rotated around the *b* axis, Cu radiation being used. B. J. C. VAN DER HOEVEN

**Four stars whose spectra have bright helium lines.** PAUL W. MERRILL. *Astrophys. J.* **77**, 44–50(1933).—The variable stars AX Persei, RW Hydrae, CI Cygni and also MW 143 have spectra showing in emission lines of H, He I, He II, N III and probably C III. The absorption bands of TiO appear in the spectra of the first 3 in assocn. with the He II line at 4686 A. U. C. C. KIESS

**Bright sodium lines in a stellar spectrum.** PAUL W. MERRILL. *Astrophys. J.* **77**, 51–5(1933).—The spectrum of the star H. D. 190,073 was found to have the D lines of Na in emission in addn. to the bright lines $H_\alpha$, $H_\beta$, $H_\gamma$ and a few of Fe II. C. C. K.

**Hyperfine structure of the spectra of sodium, mercury and lead. Origin of the intensity variation of hyperfine structure components.** KIYOSHI MURAKAWA. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **20**, 1–12(1932).—The hyperfine structures of the first 2 members of the principal series of Na have been measured with a Lummer-Gehrcke plate and the observed patterns show definitely that Na has a nuclear moment of $^1/_2$ and not a larger value as has been inferred by others from the spectrum of the Na mol. Similar observations are reported for lines of Hg I and Pb I. A study of the intensity variations of the hyperfine structure components assigns their origin to the uneven self-absorption that occurs when the discharge current is increased from weak to strong. C. C. KIESS

**The fluorescent rays of cadmium vapor.** E. KALINOWSKA. *Compt. rend.* **196**, 168–70(1933).—Microphotometer measurements of the Cd I lines 4678, 4800 and 5086 A. U. $2^3S - 2^3P$, excited when mol. Cd vapor absorbs ultra-violet light between 1900 and 2100 A. U., show that a simple proportionality and not a quadratic relation exists between their intensities and the intensity of the exciting light. This demonstrates that the excitation of the atoms to the $^3S$ state occurs in a single act of absorption by the Cd mols. C. C. KIESS

**The electromagnetic fields due to variable electric charges and the intensities of spectrum lines according to the quantum theory.** G. A. SCHOTT. *Proc. Roy. Soc.* (London) **A139**, 37–56(1933).—S. has developed a rigorous method for calcg. the electromagnetic field of variable elec. charges on the basis of the electromagnetic theory. He makes no assumptions respecting the rate of change and spatial extent and configuration of the elec. distribution whose field is to be found. It is applied to a simple Schrödinger distribution capable of generating spectrum lines (fixed H atom). An equation is developed involving a correction factor for use in calcg. the intensities of spectral lines. These equations are applied to calcns. of intensities of the Lyman, Balmer and Paschen series. H. E. MESSMORE

**Spectroscopic applications of the electrodeless discharge.** GEORGES DÉJARDIN. *Can. J. Research* **7**, 556–70(1932).—The spectra of Ne, A, Kr, Xe, Hg and P were obtained from these elements contained in cylindrical glass tubes at low pressures and under variable intensities of elec. excitation produced without electrodes. The characteristic lines of the spark and arc spectra of these elements were obtained in intensities varying with the strength of the discharge. An analysis of the spectra corresponded very closely to what would be expected from different degrees of ionization produced in the atom. Disintegration of the walls of the tube was indicated by the presence of characteristic lines for Si, O and Cl. Plates and tables accompany the paper.
J. W. SHIPLEY

**Interpretation of line spectra in crystals.** F. H. SPEDDING. *Phys. Rev.* **43**, 143–4 (1933).—A discussion of the interpretations of Deutschbein (cf. *C. A.* **26**, 5847) and Tomaschek (*C. A.* **27**, 663.)
GERALD M. PETTY

**The pole effect of iron.** MAGDALENA ADAM. *Ann. Physik* **15**, 568–611(1932).—The Stark effect in Fe was examd. with a glass spectrograph of small dispersion. The results indicated that the pole effect is a Stark effect. A stable Fe arc was investigated with a Lummer-Gehrcke plate and it was found to be analogous to a vacuum discharge. With small currents the lines were sharp and the pole effect was still found at the cathode. At the anode no pole effect was observed with a current under 1 amp. An exhaustive study was made of the pole effect of multiplets.
J. B. AUSTIN

**The spectra emitted during the early stages of a condensed discharge through nitrogen at low pressure.** HIDENORI HAMADA. *Sci. Reports Tôhoku Imp. Univ.*, First Ser. **21**, 549–53(1932).—A Kerr-cell electro-optical shutter was used to measure the time intervals sepg. the appearance of different spectral features during the early stages of a condensed discharge through N at low pressure. It was found that both the 2nd pos. and the neg. bands begin to be emitted $0.4 \times 10^{-8}$ sec. after the discharge occurs and that their duration is $1.7 \times 10^{-8}$ sec. They are accompanied by the $\alpha$-bands of active N. The 1st pos. bands appear only $7 \times 10^{-7}$ sec. after the beginning of the discharge, and are not accompanied by the $\alpha$-bands, thus indicating that active N is destroyed by the discharge.
C. C. KIESS

**The characteristics of the metallic spectra excited by active nitrogen.** HIDENORI HAMADA. *Sci. Reports Tôhoku Imp. Univ.*, Fist Ser. **21**, 554–63(1932).—Re-examn. of the observations previously described (*C. A.* **22**, 1730; **23**, 5418) yields no evidence that lines of the principal and diffuse series of Na, K, Cs, Zn, Cd, Hg, Tl and Mg are enhanced as the result of collisions between the metallic atoms and metastable atoms or mols. of active N, possessing energies of 2.37 and 3.56 v., and of 8.2 v., resp. It is concluded that the concn. of such particles in active N must be small. With a Lummer-Gehrcke plate a half-width of 0.07 A. U. was measured for the D lines of Na excited by active N, from which it is concluded that, if the broadening is a Doppler effect, the mean kinetic energy which the N atom and N mol. receive during the collision process is 0.35 v. or less.
C. C. KIESS

**The spectrum of iron in the hydrogen flame.** MAGDALENA ADAM. *Ann. Physik* **15**, 613–18(1932).—The Fe spectrum was detd. in the H flame, with glass and quartz spectrographs. The *a* lines (low excitation levels) are more intense than the *b* lines (higher levels), as compared with the ones obtained in the Fe arc and the $H_2 - O_2$ flame. The lines of the higher excitation levels (*b* lines) increase in intensity according to the series: $H_2$ flame, outer cone of the illuminating gas flame, $H_2 - O_2$ flame, arc. A table of multiplets is given.
LOUIS WALDBAUER

**Nature and strength of bonds from continuous absorption spectra.** J. FRANCK AND H. KUHN. *Naturwissenschaften* **20**, 923–5(1932).—A discussion of the results obtained from continuous absorption spectra. Previous conclusions (*C. A.* **21**, 3023; **25**, 3242) are amended. It is no longer concluded a criterion for an ion mol. that excitation from ground level to 1st level leads to normal atoms (Heitler and Herzberg, *C. A.* **23**, 2352; Brown, *C. A.* **26**, 376). Different characteristics of the potential energy *vs.* nuclear distance curve are further discussed. It is pointed out that for the work of dissocn. only an upper limit can be found from the absorption coeff. curve and that conclusions as to character of the bond drawn from the long wave extension of the curve (Rollefson and Booher, *C. A.* **25**, 3244; Dutta, *C. A.* **26**, 5840) are incorrect. This applies as well to results of Dutta (*C. A.* **25**, 3570; **26**, 5841; **27**, 25).
B. J. C. V. D. H.

**Band spectrum, predissociation and structure of the $P_2$ molecule.** GERHARD HERZBERG. *Ann. Physik* **15**, 677–706(1932); cf. *C. A.* **26**, 3437.—The extensive ultraviolet band spectrum of the $P_2$ mol. was measured, and the vibrational structure was completely analyzed, and the rotational structure for a few bands. It is a $^1\Sigma_u^+ \longrightarrow {}^1\Sigma_g^+$ transition. The vibration quanta stop at $v' = 11$, because of predissocn.; at the last 2 vibrational states, $v' = 10$, $v' = 11$, the rotational fine structure also stops at $J = 58$ and $J = 34$, resp. Because of the different points of stopping, it was possible to ob-

tain both upper and lower limits for the heat of dissocn. for the $P_2$ mol. 40593 ± 20 cm.$^{-1}$ or 115.45 kg.-cal. The distance between the P nuclei is much greater than that between S nuclei, whereas that of $N_2$ is less than $O_2$; hence $P_2$ would be unstable.
LOUIS WALDBAUER

**The photochemical elementary process for lithium hydride.** F. BACH AND K. F. BONHOEFFER. *Naturwissenschaften* **20**, 940(1932).—LiH has a sharp absorption max. at 2517 ± 2 A. U., corresponding to electron transfer from $H^-$ to $Li^+$ with Li sepn. The process follows the Hilsch and Pohl rule for alkali halides. B. J. C. v. D. H.

**The oxygen line $2p^1D_2$-$2p^3P_{012}$ and the chemical bond.** B. KIZILBASH AND V. N. KONDRAT'EV. *J. Russ. Phys.-Chem. Soc.*, Phys. Pt. **62**, 523–4(1930).—The red line of $2p^1D_2$-$2p^3P_{012}$ was observed first by Sommers (*C. A.* **24**, 5621) and later by Paschen as a triplet 6300, 6364, 6391 A U. (*C. A.* **24**, 5621). The intensity of 6300 is half of 6308; 6364 has irregular intensity. The 3rd component was not observed. The equation $ClO_2 + h\nu_c = ClO + O(^1D_2)$ is proposed in preference to that of Goodeve and Wallace (*C. A.* **24**, 3435). The heat of reaction of $ClO + O = ClO_2$ is 75 kg. cal. and that of $Cl + O \longrightarrow ClO$ is 43 ± 5 kg. cal. From these data the heat of dissocn. of ClO is detd. as 41.5 kg. cal
G. S. STAMATOFF

**Monochromatic excitation of the fluorescence spectrum of iodine.** I. I. AGARBICEANU. *Compt. rend.* **196**, 166–8(1933); cf. *C. A.* **27**, 901.—The Hg lines at 5461, 5769 and 5790 A. U., emitted by Hg arcs in quartz and glass, were examd. with an echelon spectrograph after being transmitted through a bulb contg. $I_2$ vapor, and were found to be crossed by 4, 9 and 9 absorption lines, resp. The small sepns. of these absorption lines in cm.$^{-1}$ have been accurately measured. To each of them there corresponds, in the fluorescence spectrum of $I_2$, a series of doublets which is excited by a line of frequency identical with that of the absorbed line.
C. C. KIESS

**Term system of Ir I.** WALTER ALBERTSON. *Phys. Rev.* **42**, 443–5(1932).—An array of 16 low even terms and 77 middle and high terms, contg. 566 lines, has been obtained; the wave-length data of Meggers and of Exner and Haschek are given. The J values of the terms have been deduced. The 2 ground states have the same J value of $4^1/_2$, and are probably $^4F$ terms. A list of the strongest combinations and terms is given.
HELEN S. HOPFIELD

**The ultra-violet absorption spectra of phosphine, arsine and stibine.** G. H. CHEESMAN AND H. J. EMELEUS. *J. Chem. Soc.* **1932**, 2847–8.—A regular gradation in the absorption spectra of these hydrides with increasing mol. wt. was observed: $PH_3$ showed poorly developed bands with centers at approx. 2315 and 2290 A. U., $AsH_3$ and $SbH_3$ showed only continuous absorption. $H_2$ is formed in the photochem. decompn. of $AsH_3$.
M. MCMAHON

**New absorption bands of methane in the near infra-red.** R. MECKE. *Z. Astrophys* **6**, 144–9(1933).—New absorption bands of $CH_4$ have been observed in the near infra-red at wave lengths 8900, 8600, 8400, 7840 and 7250 A. U. The gas was at a pressure of 5 atm. in a tube 20.3 m. long. The agreement of some of the lines with bands observed in the spectrum of the planet Jupiter indicates the probable existence of $CH_4$ in its atm.
C. C. KIESS

**Raman effect and constitutional problems. III. Carboxylic acid anhydrides.** K. W. F. KOHLRAUSCH, A. PONGRATZ AND R. SEKA. *Ber.* **66B**, 1–12(1933); cf. *C. A.* **26**, 4754.—The Raman spectra of 11 acid anhydrides and of 17 other compds., of interest in relation to the anhydrides, were obtained. The frequency belonging only to the carboxyl group is discussed. The acid anhydrides show 2 different frequencies in the frequency region of the double bond; both frequencies are considerably greater than those occurring with the acids; the increase is about 40 cm.$^{-1}$ greater in the internal than in the external anhydrides, the difference between the 2 frequencies remaining the same; exceptions are shown in methylsuccinic acid anhydride which shows a 3rd C:O frequency, and in benzoic acid anhydride which shows the influence of the aryl group. The results are discussed, and detailed data concerning the measurements are given.
ALLEN S. SMITH

**Raman effect in gases: Carbon monoxide and nitric oxide.** S. BHAGAVANTAM. *Phys. Rev.* **42**, 437(1932); cf. *C. A.* **26**, 1190.—The Raman spectra of gaseous CO at a pressure of 35 atm. and NO at 20 atm. show unresolved rotational wings near the Rayleigh lines, and Raman lines corresponding to vibrational transitions. The frequency shifts agree well with the resp. vibrational frequencies of these mols. in the ground state, as obtained from absorption spectra.
HELEN S. HOPFIELD

**Raman effects with liquid and solid carbon dioxide.** J. C. MCLENNAN AND H. D. SMITH. *Can. J. Research* **7**, 551–5(1932).—In order to compare the fundamental vibrational frequencies of mols. of $CO_2$ in the 3 states of matter, liquid and solid $CO_2$ were prepd., the latter in the form of clear crystals, and the Raman spectra of the 3 states observed. The frequency shifts and intensities were practically identical and in this

respect $CO_2$ mols. behave as do other non-polar mols. Apparently the $CO_2$ mol. undergoes no change in form throughout the temp. range —92° to 20°. J. W. SHIPLEY

**Raman effect in solutions of electrolytes.** N. S. FILIPPOVA. *Uspekhi Khim.* **1**, 744–54(1932).—A review. F. H. RATHMANN

**The Raman spectrum of the sulfate ion in gypsum.** JEAN CABANNES. *Compt. rend.* **195**, 1353–5(1932); cf. *C. A.* **27**, 230.—The spectrum of the deformed sulfate ion is compared with that of a regular tetrahedron. The lines 414, 495, 620, 1009 and 1136 cm.$^{-1}$ are sym., 671 cm.$^{-1}$ antisym. to the binary axis *L*. JANET E. AUSTIN

**Triboluminescence.** S. S. BHATNAGAR, K. G. MATHUR AND K. L. BUDHIRAJA. *Z. physik. Chem.* **A163**, 8–16(1932).—The triboluminescence of $As_2O_3$, $UO_2(NO_3)_2$ and saccharin was investigated. Quant. results were obtained for its dependence on temp., aging, radiation with ultra-violet light and x-rays and the addn. of gelatin and glycerol. The theory is advanced that in the formation of crystals a small amt. of soln. forms a dispersed phase in the crystal. According to the phys. conditions, microcrystn. takes place more or less rapidly with the emission of light. G. M. MURPHY

**Methods of measurement of the intensity of ultra-violet radiation. I. Photochemical formation of molybdenum blue.** DENYSE SACHS. *J. chim. phys.* **29**, 474–8 (1932).—The best method for the prepn. of Mo blue was reduction of a soln. of $Na_2MoO_4$, acidified with HCl, with HCOOH. The blue was formed in $^1/_2$ min. of exposure to a 300 w. Hg lamp at a distance of 10 cm. I. J PATTON

**Effect of water on the photosynthesis of hydrogen chloride.** G. K. ROLLEFSON AND J. C. POTTS. *J. Am. Chem. Soc.* **55**, 860–1(1933).—It is believed that expts. performed between 145° and 200°K. show definitely that $H_2O$ vapor has no effect on the rate of photosynthesis of HCl. The dependence on the light absorbed changes from the 1st power to the square root as the temp. is lowered, according to preliminary expts. C. J. WEST

**The combination of hydrogen and oxygen photosensitized by nitrogen peroxide.** R. G. W. NORRISH AND J. G. A. GRIFFITHS. *Proc. Roy. Soc.* (London) **A139**, 147–62 (1933).—The reaction between H and O was confirmed as a chain reaction, and H and O atoms as well as mols. are involved. $NO_2$, as a photochem. catalyst, absorbs light and dissociates into NO and O atoms. As a thermochem. catalyst NO combines with O mols. giving the peroxide and an O atom. The thermocatalysis was studied by heating O, H and $NO_2$ in an elec. furnace, both in the presence and absence of ultra-violet light. H. E. MESSMORE

**The photochemical kinetics of the iodine-oxalate reaction.** I. E. ABEL, H SCHMID AND K. RETTER. *Z. physik. Chem.* **A163**, 53–66(1932).—The photochem. reaction between I and oxalic acid was studied at 25° with filtered and unfiltered Hg radiation of 3660 and 4050 A. U. The conditions were such that the incident radiation was totally absorbed, the intensity was kept const., the concn. was varied over wide limits and the photolyte was kept homogeneous. At const. I-ion concn. the rate is independent of the I content. G. M. MURPHY

## 4—ELECTROCHEMISTRY

COLIN G. FINK

**Modern large cells for the electrolytic production of hydrogen.** A. E. ZDANSKY. *Chem. Fabrik* **1933**, 49–51.—The app. (illustrated) is of the general form of a filter press and will deliver H at considerable pressure at 20°. Plant and production costs are

itemized for a production of 5000 cu. m. per hr., the latter cost being about 4.75 pfg. (1.1¢) per cu. m. with power at 0.8 pfg. (0.2¢) per kw. hr. J. H. MOORE

**Cement diaphragms. Methods of their investigation and preparation.** A. P. MASHOVETZ. *Ukrain. Khem. Zhur.* **6**, Nos. 5–6, Sci-Tech. Pt. 220–43(1931).—A new method is described for the investigation and prepn. of cement diaphragms. By this method it has been found that resistance in ohms of various diaphragms used in the electrolysis of brine can be very high, while loss of alkali through diffusion across the diaphragm is very low in comparison with the loss in elec. energy. The elec. conductance of freshly prepd. diaphragms is much higher than that of old ones. The decrease is explained as due to the change of $Ca(OH)_2$ of the cement into carbonate; this causes almost no change in the total vol. of the pores, but increases the apparent thickness of the diaphragm. The introduction of asbestos and of solid NaCl into the compn. of the diaphragm increases its elec. conductance. Leaching of cement diaphragms during their prepn. should be done with distd. water, as $CO_2$ and bicarbonates have a detrimental effect on elec. conductance. A method is given for the prepn. of diaphragms resistant to $CO_2$ action, consisting in treating them with $(NH_4)_2CO_3$ to change the $Ca(OH)_2$ of the cement to $CaCO_3$. J. G. TOLPIN

**Electrolytic production of chlorates. I. Platinum anodes.** I. S. KATZEN AND P. I. SOKOLOV. *J. Applied Chem.* (U. S. S. R.) **5**, 902–15(1932); cf. *C. A.* **26**, 657, 3731.—The work is confined to NaCl electrolysis. In the presence of 1.3% $K_2Cr_2O_7$ and with a c. d. > 0 5 amp./sq. cm., the current concn. might be up to 8 amp./l. The c. d. should be high. The electrodes must be immersed considerably below the surface of the soln. The proper acidity of the soln. must be detd. empirically, as it depends on many variables and cannot be calcd. Acidification during the electrolysis is permissible. Acidity is detd. by titration with simultaneous detn. of the hypochlorite. Concn. of NaCl should not be less than 14–15%. Satd. solns. may be used. Cu is the best cathode metal. The bath should not be made of Fe; cement appears to be a suitable material. Cr-plated cathodes are unsatisfactory. By following the recommended procedure, a current efficiency of 90–92% is obtained with a voltage of 4–4.5 v. If large quantities of Pt are available, the c. d. might be <0.5 amp./sq. cm. and voltage <4 v. **II. Graphite electrodes.** *Ibid* 916–28.—Electrodes contg. about 60% graphite may be used. The acidity of the soln. must be higher than with Pt electrodes. For a current concn. of 4 amp./l. the optimum ratio of mono- to dichromate is 1:4. Anodes of natural graphite deteriorate faster than those of Acheson graphite. The rate of deterioration of graphite electrodes increases with the increase in c. d., though less than might be expected. Deterioration is faster in solns. of low acidity and at high current concns. Raising the temp. to 50° has little effect on the deterioration of electrodes, but further increase to 70° has a marked effect. V. KALICHEVSKY

**Electrolytic production of hydrogen peroxide from sulfuric acid.** A. I. BRODSKII, A. S. AFANAS'EV AND M. G. DIKOVA. *J. Applied Chem.* (U. S. S. R.) **5**, 929–45(1932).—$H_2O_2$ may be produced commercially by electrolyzing $H_2SO_4$ solns. provided the concd. product is obtained by redistn. No diaphragms are required, and the materials used need not be particularly pure. With a Pt anode and Al cathode, 30–35% $H_2SO_4$ (com.), c. d. 200 amp./sq. in. and vol. d. 30 amp./l., the product contained 3–3.5 g./l. of active O. The current efficiency was 55–60%. The temp. was 5–15°. On distn. a pure and stable soln. contg. 1–1.5% $H_2O_2$ was obtained (85% yield, 50% current efficiency) which could be concd. to 20% or higher with only 0.5–2% loss. However, only about 70% of the concd. product was obtained, the remainder being a 0.5–1% soln. Electrolysis and primary distn. can be made continuous with a 45–50% current efficiency. Possibly further cooling of electrodes and the use of higher c. d. will increase the yield. V. KALICHEVSKY

**Powdered metals by electrolytic methods.** JOSEPH ROSSMAN. *Metal Ind.* (N. Y.) **30**, 321–2, 396–7, 436, 468–9(1932).—A review of patents. E. H.

**Electrochemical investigation of polonium.** M. HAÏSSINSKY. *J. chim. phys.* **29**, 453–73(1932); cf. *C. A.* **26**, 5240.—Decompn. voltages, soln. of electrolytic deposits, direction of migration of ions in an electric field and dialysis were studied. In alk. soln. Po is probably in the form of $PoO_3^{--}$. The decompn. voltage, with pure Au as cathode, is —0.29 v. in 0.1 *N* NaOH (*vs. N* calomel), and becomes more neg. with increased alky. It also varies with the electrode (Pt, Pd, Cu, Ag, Sn, Ni), being —0.80 v. for Ni. The decompn. voltage for anode deposit is independent of the $p_H$ and of the electrode, being +0.53 ± 0.01. I. J. PATTON

**Electrode potential and constitution of gold amalgams.** ROBERT KREMANN, ROBERT BAUM, AND LUDWIG LÄMMERMAYR, JR. *Monatsh.* **61**, 315–29(1932).—The cells $Au_xHg_{(1-x)}$|0.1 mol. $SnCl_2$, 0.1 *N* HCl||satd. KCl||1 *N* KCl, $Hg_2Cl_2$|Hg and $Au_xHg_{(1-x)}$|0.1 mol. $HgCl_2$||satd. KCl||1 *N* KCl, $Hg_2Cl_2$|Hg were measured at 25°. The amalgams exhibited the Hg potential up to about 75% Au, an indication that

possible compds. and solns. in this field are not resistant. At 75% Au the potential showed a discontinuity; this indicates that the limit of resistance lies between 21 and 25% Hg. CURTIS L. WILSON

**Electrode potential of the ternary gold-tin-mercury alloys.** FRANZ GRIENGL AND ROBERT BAUM. *Monatsh.* **61**, 330–44(1932).—Amalgams with varying Hg contents and with the Au:Sn ratio at 89:11, 60:40, 52.4:47.6, 40:60, and 17:83 were measured against the *N* calomel electrode and plotted first as pseudo-binaries and then in the ternary equilateral diagram. Only in the low Hg alloys were the potential binary discontinuities at $AuSn_2$ and AuSn noticeable in the ternary systems. Probably AuSn is not dissolved as such in Hg, but is partly dissocd. CURTIS L. WILSON

**The position of gold in the potential series in the electrolysis of molten metal alloys.** LUDWIG LÄMMERMAYR, JR., AND ROBERT KREMANN. *Monatsh.* **61**, 345–50(1932); cf. *C. A.* **21**, 3809.—Molten Au-Bi, Au-Sb, Au-Pb and Au-Al alloys were electrolyzed 4 hrs. at 680°, 400°, 450° and 700°, resp., with a c. d. of 6–8 amps./sq. mm. (cf. *C. A.* **19**, 2167). In the series: anode: He, Ne, A, Bi, Sb, Hg, Pb, Sn, Zn, Cd, Cu, Ag, Al, Na, K: cathode, Au is to the right of Pb, since it diffuses to the cathode in its alloys with Bi, Sb and Pb. Since there is little diffusion in the Au-Al alloys, it is concluded that Au stands between Ag and Al. CURTIS L. WILSON

**Electrochemical behavior of platinum. III. Platinum plating.** G. GRUBE AND D. BEISCHER. *Z. Elektrochem.* **39**, 38–45(1933); cf. *C. A.* **26**, 4259.—Various solns. were electrolyzed, with Pt anodes and cathodes and alundum diaphragms. The best deposits were obtained from solns. boiled 5 hrs. contg. $PtCl_4$ plus $Na_2PO_4$ and $PtCl_4$ plus $(NH_4)_2PO_4$, also from an ammoniacal soln. of $(NO_2)_2Pt(NH_3)_2$. The deposition proceeded with such high polarization that, even at low c. d., $H_2$ was evolved. $K_2Pt(CN)_4$ produced only $H_2$ on all cathode materials tried except Hg, on which a reduction of Pt took place. CURTIS L. WILSON

**Modern chrome-plating installations.** BIRRETT. *Oberflächentech.* **10**, 25–7 (1933).—A review. M. HARTENHEIM

**Chrome-plating electrolytes.** E. W. *Oberflächentech.* **9**, 199–201(1932).—A review. M. H.

**Gray chrome plating.** R. JUSTH. *Oberflächentech.* **10**, 27 8(1933).—Descriptive. M. HARTENHEIM

**Microörganisms in plating solutions.** E. A. OLLARD. *Metal Ind.* (London) **42**, 17–18(1933).—Three types of organisms were found in Cu- and Ni-plating solns. Two are fungi and the 3rd is a single-cell variety. Little is known of the effect upon the metallic deposit. Large quantities clog filters, etc. Spores may accumulate upon the anode by anaphoresis. H E. MESSMORE

**Electrolytic polarization. X. Ammines of copper, silver, zinc and cadmium.** S. GLASSTONE. *J. Chem. Soc.* **1932**, 2849–57; cf. *C. A.* **24**, 4206.—Solns. of Cu, Ag, Zn and Cd salts, to which an excess of $(NH_4)_2SO_4$ had been added, were titrated electrometrically with $NH_3$ soln., the appropriate metal being used as indicator electrode; from the results the existence of the ions $Cu(NH_3)_4^{++}$, $Ag(NH_3)_2^{+}$, $Zn(NH_3)_4^{++}$ and $Cd(NH_4)_3^{++}$ or $Cd[(NH_3)_3(H_2O)]^{++}$ is inferred. Cathode-potential measurements have been made in solns. contg. these ammines, and the results have been interpreted by means of the titration curves and by the theory of the limiting current. There is no reason to believe that any of the intermediate processes, *e. g.*, the dissocn. of the ammine ions, involved in the discharge of a metal-ammine cation and the sepn. of the metal on the cathode occurs slowly. C. J. WEST

**Anodic oxidation of benzene.** REGINALD M. ARCHIBALD. *Trans. Roy. Soc. Can. III*, **26**, 69–71(1932).—The electrolysis of a soln. of $C_6H_6$ in glacial AcOH gives an equil. mixt. of PhOH and higher oxidation products, the highest concn. of PhOH obtained being 1.76%. A relatively high voltage with small concns. of multivalent metals and a diaphragm gave the best yields. The voltage-current curve indicated the absence of a definite decompn. potential over the range 0–5 v. J. W. SHIPLEY

**Effect of service temperature conditions on the electromotive force of unsaturated portable standard cells.** J. H. PARK. *Bur. Standards J. Research* **10**, 89–98(1933).—The temp. coeff. of each limb of an unsatd. Cd (Weston) cell is quite large, but the two are opposite in sign, and the resulting change in e. m. f. is small if both limbs are at the same temp. Temp. inequality causes an error of 0.300 mv. per °C. C. L. WILSON

**Determination of organic matter in accumulator sulfuric acid solutions.** ROLLIN G. MYERS. *Philippine J. Sci.* **49**, 581–5(1932).—Colorimetric methods failed to give consistent results, as did the use of $BaCO_3$ for the removal of the sulfate. Neutral Pb acetate added to an alc. soln. of electrolyte gave a compact ppt. easily sepd. by decantation, and washed in alc. centrifugally. The combined filtrates were evapd. to 30 cc. and the Pb was removed by $H_2S$. After evapn. to dryness, 3 cc. water was added and $Ba(OH)_2$ to remove Fe. The mixt. was filtered into a tared Pt crucible, heated on a

steam bath to const. wt. and then ignited. Org. matter in 1–5-year old electrolytes was approx. 0.08%; in the blank it was 0.03%. H. E. MESSMORE

**A method for the determination of the mass of electrolytic ions.** P. DEBYE. *J. Chem. Physics* **1**, 13–16(1933).—The dynamical reaction due to acceleration of an ion in a solvent ordinarily is negligible compared with the frictional force. To det. the mass of an ion it is necessary to find an effect which is zero when the dynamical reaction is neglected. The use of supersonic waves in electrolytic solns. is proposed for this purpose. If only frictional forces exist between the ions and the solvent, the velocity of the ions and of the surrounding liquid is the same. If, however, the dynamical reactions are taken into account, these are different for ions of different masses. The motion of the cations may then differ from that of the anions and produce p. ds., having the period of the sound waves, between different points in the soln. The measurement of this effect will lead to conclusions as to the masses of ions and the no. of solvent mols. connected with them. A calcn. of the magnitude of this effect is given. With suitable salts the oscillations of potential may amt. to several microvolts. Expts. to detect the effect are in progress. E. R. SMITH

**Measurements on barrier-film rectifiers.** WILFRIED MEYER AND ALEXANDER SCHMIDT. *Z. tech. Physik* **14**, 10–18(1933).—Measurements were made on several kinds of barrier-film rectifiers of the apparent resistance, and this was resolved into series resistance, parallel resistance and capacity. On the basis of these measurements previous theories of the barrier-film rectifier are discussed. ARTHUR FLEISCHER

**Electrode material and contact catalysis as factors in the production of active nitrogen and ammonia in the glow discharge.** ERICH TIEDE AND EMIL HEY. *Ber.* **B66**, 85–94(1933).—The ability of at. N to exist outside the discharge was quantitatively investigated in relation to the recombination effect of different electrodes, and to the wall effect. The $NH_3$ yield from a mixt. of 70% N and 30% H in the glow discharge between different electrodes was measured. The primary processes of $NH_3$ formation and the role of the N atom were thus investigated, obtaining at the same time new exptl. data concerning $NH_3$ catalysis. The ability of electrode metals to adsorb N atoms and thereby accelerate their union to mols. increases in the order Al, W, Ni, Fe, Cu, Pt. The $NH_3$ yield increased in the order W, Al, Ni, Cu, Fe, Pt. The results indicate that the reaction of $NH_3$ catalysis is (*a*) $N_{adsorbed} + H_{adsorbed} + Metal \rightleftharpoons Metal.NH$, (*b*) $Metal.NH + H_2 \rightleftharpoons Metal + NH_3$ (cf. *C. A.* **24**, 2550). ALLEN S. SMITH

**The Cottrell precipitator. I.** KIYOSHI SHIGA. *J. Japan. Ceram. Assoc.* **40**, 779–89(1932).—The theory and practice of the elec pptn. process are illustrated and S.'s new theoretical formulas are explained. S. KONDO

**Flashover tests on 26-kv. wood pole structures.** A. S. BROOKS, R. N. SOUTHGATE AND E. R. WHITEHEAD. *Elec. Eng.* **52**, 89–95(1933).—The results of a series of impulse and dynamic flashover tests on unit pole transmission construction on a large 26-kv. elec. power transmission system are shown The net flashover voltages of wood and porcelain combinations of simple pole tops can be estd. Several breakdown curves are shown. Conclusions are drawn. Creosoting or moisture has no appreciable effect on the impulse sparkover voltages of wood. W. H. BOYNTON

**Further studies and tests on the problems involved in high-precision power-factor measurements of small oil samples.** J. C. BALSBAUGH. *Elec. Eng.* **52**, 103–4(1933).—The abs. power factor of an air condenser is dependent upon the voltage gradient, surface area, and the nature of the surfaces. The abs. power factor of an oxidized brass condenser may be as high as $10^{-4}$. An oil cell has been developed that may be used for measuring the power factor of highly refined oils or synthetic hydrocarbons. The conducting surfaces consist of Ni cylinders which are enclosed in a Pyrex glass tube with sealed-in leads. A metal cylinder is sealed into the glass tube which prevents measurement of any surface leakage or conduction current through the glass. W. H. B.

**Progress report on deterioration of oils and papers under corona discharge.** K. S. WYATT. *Elec. Eng.* **52**, 102–3(1933).—A study was made of the mechanism of the reactions of hydrocarbons in elec. discharge and of the changes in elec. characteristics of oils and papers after subjection to corona discharge under conditions similar to those occurring in cable operations. The impurities in the paper are factors in causing oxidation of thin films on water as evidenced by secondary spread. Cathode bombardment greatly increases the "secondary spread." W. H. BOYNTON

**The life of impregnated paper as related to the impregnating oil.** J. B. WHITEHEAD. *Elec. Eng.* **52**, 105–6(1933).—The general conclusions are: (1) The original or basic chem. structure of the oil has an important bearing on the life of the impregnated paper. (2) The influence of dielec. loss and power factor on the life of impregnated paper is, within wide limits, negligible compared with other factors. (3) The impregnating properties of the oil as detd. by its viscosity and surface tension have an important bearing on the life of the impregnated paper. W. H. BOYNTON

**X-ray studies of the insulating materials in high-tension cables.** G. L. CLARK AND J. N. MRGUDICH. *Elec. Eng.* **52**, 101–2(1933).—By use of a beam of monochromatic x-rays and suitable control standards contg. known percentages of wax, approx. detns. of the amt. of wax in an oil may be rapidly made. A direct relationship apparently exists between the wax content of a stressed cable and the magnitude of the stress. The wax content of a stressed cable is nearly uniform at points more than 1 mm. from the conductor but rises sharply close to it. Heating decreases the wax content within the cable, and the wax content of the previously stressed cable decreases slowly with time during non-use. W. H. BOYNTON

**The piezo- and dielectric properties of Rochelle salt.** ERICH SCHWARTZ. *Elek. Nach. Tech.* **9**, 481–95(1932).—S.'s expts. indicate that consistent results on the piezoelec. effect are possible if readings are independent of the dielec. properties. With Rochelle salt there is no direct proportionality between applied pressure and piezoelec charge. By starting at —20° and gradually raising the temp. to about 30°, the piezoelec. sensitivity increases rapidly, reaching a max. at about —14°; it then drops slowly until about +23°, where a rapid drop occurs; then it dwindles to almost nothing beyond 30°. The dielec. const. is dependent upon field strength (v./cm.) and charging time. Up to about 300 v./cm. the rise in charge density (coulomb/sq. cm.) is rapid, but beyond that it tapers off to an almost zero rate. When mech. pressure is applied in a direction vertical to the *a* axis of the Rochelle crystal, the dielec. const. decreases with increasing pressure. A practical application of the observed phenomena is a new *crystal microphone*. C. G. F.

**Mercury-arc rectifiers for 250-volt supply.** C. A. BUTCHER. *Elec. Eng* **52**, 119–21 (1933).—An outline of the field of applications of the multianode, metal-tank, Hg-cathode rectifier. Emphasis is given to its adaptability to industrial load. The conventional type of rectifier becomes a competitor of the synchronous converter at approx 500-v. Comparison of rectifiers with synchronous converters and motor generator sets is made. Loss and efficiency data are indicated by a comparative curve. W. H. B.

Paint and varnish in the electrical industry (BIRRELL) **26**. Influence of anions on the velocity of solution of Zn in acids (MÜLLER, FÖRSTER) **2**. Electrolytic preparation of aldonic acids (KILIANI) **10**. Electromagnetic devices (Brit. pat 363,697) **9**.

ROTHE, FRITZ: **Über die Entdeckung des Kalkstickstoff-Verfahrens:** Eine lehrreiche Erfindungsgeschichte. Berlin: Maurer & Dimmick G. m. b. H.

RUSS, E. FR.: **Die elektrische Warmbehandlung in der Industrie.** Munich: R Oldenbourg. About 270 pp. About M. 14.

SCHALL, BERTA-MARIE: **Über anodische Oxydation von Silberacetat in Essigsäure und Pyridin.** Thesis, Leipzig, 1930. 48 pp.

**Electric battery.** GEORGES PAUCHARD. Fr. 737,428, May 23, 1932. The battery is composed of a pos. Pb pole in the form of a rod and flat base, a neg. pole of Zn and 2 solns. sepd. by d., one of $CuSO_4$, the other of $ZnSO_4$.

**Electric storage batteries or accumulators.** FREDERICK TEMPLE. Brit. 363,371, Sept. 8, 1930. Divided out of 362,856 (*C. A.* **27**, 1282).

**Accumulators.** LUCIEN GARNOT. Fr. 737,947, Sept. 25, 1931. The electrolyte consists of acidulated distd. water contg. an alkali tartrate and tartaric acid. The efficiency is increased by the addn. of a radioactive metal salt, such as a sulfate or phosphate of U or Th.

**Accumulator plates.** MAX SCHLÖTTER. Fr. 737,785, May 28, 1932. Alloys of Pb with alkali metals or alk. earth metals for accumulator plates are made electrolytically, with molten Pb as cathode, Fe or Ni as anode and NaOH, KOH or an alk. earth hydrate or carbonate as electrolyte.

**Electrical condenser.** SAMUEL RUBEN (to Ruben Condenser Co.). U. S. reissue 18,673, Nov. 29. A reissue of original pat. No. 1,714,319 (*C. A.* **23**, 3414).

**Electrolytic condensers.** N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Fr. 738,137, June 3, 1932. The electrolyte is composed of at least one primary or secondary phosphate in an alc., *e. g.*, a soln. of $KH_2PO_4$ in glycerol. Fr. 738,138. One electrode is composed at least in part of a metal of the first sub-group, of the 4th group, while the other electrode is of an electrolytically conductive material. The electrolyte may be as in Fr. 738,137.

**Electric current rectifier.** SAMUEL RUBEN (to Ruben Rectifier Corp.). U. S. 1,890,470, Dec. 13. A dry-surface contact-type rectifier with substantially uniform unilateral cond. comprises electropos. and electroneg. electrode elements, of Cu alloyed

with a relatively light highly electropos. metal such as Mg or Al and of a Cu compd. of S, resp.

**Coated electric rectifier element.** DONALD G. ACKERLY (to The Westinghouse Brake & Saxby Signal Co., Ltd.). Brit. 367,749, Sept. 11, 1929. Void. A rectifying element comprising a Cu body having a layer of $Cu_2O$ formed directly thereon has a coating of Cu formed on the oxide coating by immersion in a bath of fused inorg. salt. The Cu blank is oxidized by heating to 1000° in an O atm. and is then placed in an electrolytic bath at 500–600°, in contact with Fe or other more electropos. metal, so that it becomes the cathode. $CaCl_2$ should be one of the salts of the bath. In an alternative process the oxidized blank is placed in a bath of molten metal, *e. g.*, Pb, to reduce the outer layer of the $Cu_2O$.

**Mercury-arc rectifiers.** ALBERT W. HULL (to The British Thomson-Houston Co., Ltd.). Brit. 363,377, Aug. 13, 1929.

**Coating with metals.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,813, April 24, 1930. A bath for amalgamating metal surfaces, *e. g.*, prior to electroplating, contains thiourea or a water-sol. deriv. thereof, *e. g.*, Me or Et thiourea. A suitable compn. is thiourea 10 g., $HgCl_2$ 15 g., $H_2O$ 1 l.

**Coating molded articles with metal.** JOSEPH GLOSTER, LTD., and LEONARD J. GLOSTER. Brit. 363,432, Sept. 27, 1930. The article is molded from a mixt. of a synthetic resin or phenol-formaldehyde condensation product (25–50%) and an electrically conductive material, *e. g.*, C (50–75%) in a finely divided state, and a coating of metal is electrodeposited on the finished molding.

**Depositing metals.** THE MOND NICKEL CO., LTD. Fr. 738,450, May 27, 1932. An insol. anode is placed in a vat contg. a diaphragm; the liquid surrounding the anode is ammoniacal and free from metal compds.; the liquid surrounding the cathode is an ammoniacal soln. of one or more compds; capable of giving the desired metal deposit. If a deposit of Pd is desired, the liquid around the cathode contains palladoamine chloride and $NH_3$. The process may also be applied to the extn. of metals from their salts.

**Chromium plating.** ELMER J. WALTZ. U. S. 1,890,633, Dec. 13. An electrolyte for Cr deposition contains chromic acid 18 oz and NaCN 1.5 oz. per gal.

**Silver plating.** ISSAR BUDOWSKI. Fr. 737,661, May 26, 1932. Agents reducing the surface tension, such as Na sulforicinate or derivs. of glutin are added to baths used for Ag plating.

**Apparatus for electrolytic deposition of silver from used photographic solutions.** KODAK-PATHÉ. Fr. 737,749, May 27, 1932.

**Porous electrolytic diaphragm.** WM. H. WOOD. U. S. 1,890,242, Dec. 6. A plastic mastic material such as rubber is mixed with a fibrous porous material such as hair, wool waste or cotton, and the mixt. is rolled repeatedly in the same direction; sheets thus formed are superposed in a pile with the grain of most of the sheets parallel, and the adhering sheets are sliced through the pile transversely of the grain.

**Electrolytic copper.** HIRSCH, KUPFER- UND MESSINGWERKE A.-G. Brit. 363,404, Mar. 6, 1930. More than 1% of Zn is added to the Cu anode, the added Zn being sepd. by electrolysis after the Cu has been electrolyzed. The anode may be made of brass scrap. $NH_4$ persulfate may be used as the oxidation agent for pptg. impurities in recovering the added metal from the electrolyte.

**Treating electrolytic cell slimes from copper deposition.** TANNIE LEWIN. U. S. 1,890,856, Dec. 13. In the electrolytic deposition of Cu from anodes of secondary metals such as brass or bronze in which anodic impurities are disseminated both into the electrolyte soln. and into the cell slime, the cell slime is roasted for oxidation of contained anodic impurities, and the roasted slime is used as an oxide agent for effecting flocculation of anodic impurities colloidally suspended in the electrolyte soln.; live steam and its condensate are introduced into the soln. for accelerating the flocculation, and the flocculated matter is coagulated and settled from the soln.

**Reduction of oxides.** AXEL R. WEJNARTH. Fr. 738,189, June 4, 1932. In the electrothermal reduction of oxides such as PbO, ZnO, CdO, SnO and $SnO_2$, the vapors escaping from the furnace are mixed with reducing agents in the form of a floating dust and heated to reduction temp.

**Palladium.** THE MOND NICKEL CO., LTD. Fr. 737,752, May 27, 1932. Pd is deposited electrolytically, an anode of Pd being used in an aq. soln. of an electrolyte capable of dissolving the anode at a speed about equal to that at which Pd is deposited on the cathode. The electrolyte may contain an alkali metal or alk. earth metal palladonitrite and an alkali metal or alk. earth metal chloride or bromide.

**Gas reactions such as that of oxygen with hydrogen.** ERICH NOACK and OSWIN NITZSCHKE (to I. G. Farbenind. A.-G.). U. S. 1,890,793, Dec. 13. In order to form $H_2O_2$ a mixt. of H and O is passed through a zone of silent elec. discharges to which it is

subjected, while the temp. of the mixt. and resulting reaction products is maintained above their dew points while in this zone. Cf. *C. A.* **27**, 790.

**Acetylene.** Soc. pour l'ind. chim. à Bâle. Brit. 368,164, June 6, 1930. See Fr. 718,088 (*C. A.* **26**, 2662).

**Acetylene.** I. G. Farbenindustrie A.-G. Brit. 363,375, Aug. 5, 1930. In the manuf. of $C_2H_2$ from gaseous or volatilized hydrocarbons or gases, in the elec. arc, the gases are treated in a preheated state, their heat content being derived from a preceding chem. conversion at elevated temp. of part of the same gases, and the gases leaving the arc are cooled down as quickly as possible ("chilled").

**Aliphatic aldehydes.** British Celanese, Ltd., Donald Finlayson and John H. G. Plant. Brit. 364,023, Sept. 25, 1930. Aliphatic aldehydes are obtained by subjecting gaseous satd. hydrocarbons in admixt. with $CO_2$ to the action of a silent brush, arc or glow discharge between electrodes supplied with a. c. of a frequency up to about 1000 cycles. $CH_2O$ and(or) AcH may be thus produced from $CH_4$.

**Purifying a starch-conversion dextrose solution.** Charles Ebert, Wm. B. Newkirk and Meyer Moskowitz (to International Patents Development Co.). U. S. 1,889,779, Dec. 6. The soln. is introduced into and withdrawn from the cathode side of an electrolytic cell having a permeable barrier between its electrodes, and water is introduced into and withdrawn from the cell on the other side of the permeable barrier; and the dextrose soln. withdrawn from the cathode side is filtered to remove coagulated and pptd. impurities. App. is described.

**Electric arc furnace suitable for producing tungsten carbide.** Joseph T. Terry. U. S. 1,889,907, Dec. 6.

**Electric induction crucible furnace.** Franz Eibl (to Ajax Electrothermic Corp.). U. S. 1,890,773, Dec. 13. Structural features.

**Inductance coil for electric induction furnaces.** Edwin F. Northrup (to Electric Furnace Co., Ltd.). Brit. 365,873, Mar. 26, 1930.

**Electric resistance furnace with a fused silica heating chamber, suitable for treating metals with gases.** Clyde R. Johnson (to Amersil Co.). U. S. 1,889,665, Nov. 29.

**Electrodes for electrolytic apparatus.** K. K. Hitati Seisakujo. Brit. 363,289, June 9, 1930. The parts in which the electrode plates are welded to a conducting terminal are placed within gas pockets formed below the level of the electrolytic soln.

**Collecting electrodes for electrical precipitation apparatus.** Metallgesellschaft A.-G. Brit. 363,298, July 24, 1931.

**Anode shield for mercury-arc rectifiers.** Allgemeine Elektricitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 363,258, April 9, 1930.

**Electrically treating gases.** Siemens-Schuckertwerke A.-G. Brit. 363,615, June 12, 1930. A high-resistance material the resistance of which increases with rise of temp., suitable for elec. dust pptn., consists of a non-conducting material through the pores of which metal is distributed to form a fine network. Among various methods cited for forming such materials is one in which Zn dust, ZnO and fine sand are sintered together.

**Electrically treating gases in cooling towers.** L. G. Mouchel & Partners, Ltd., and Georges Prud'Homme. Brit. 363,902, Feb. 24, 1931. An elec. field is used to recover water from the vapor leaving a cooling tower.

**Electric purification of gases.** Soc. anon. d'exploitation des procédés Lurgi. Fr. 737,780, May 28, 1932.

**Electrical purification of gases.** Siemens-Schuckertwerke A.-G. Fr. 738,058, June 2, 1932.

**Apparatus for electrically treating blast-furnace gases.** Siemens-Schuckertwerke A.-G. (to Lodge-Cottrell, Ltd.). Brit. 363,978, Aug. 29, 1930.

**Apparatus for producing ozone.** Vittorio Gambarotta. Brit. 365,579, July 17, 1929. Void. Addn. to 354,702 (*C. A.* **26**, 3704).

**Liquid seals for electrical precipitators.** Metallgesellschaft A.-G. Brit. 363,771, Oct. 29, 1930.

**Electric thermometer for indicating temperatures at a distance.** C. A. Hartung. Brit. 343,526, Aug. 21, 1929. Various elec. features are described.

**Electrically and photoelectrically controlled apparatus for checking fires of films, etc.** Wm. H. DeWitt (one-half to J. Glenn Marks). U. S. 1,890,804, Dec. 13. Elec. and mech. features.

**Electric cables.** John H. Roberts, Ernest A. Bayles, John Bowyer and Charles J. Beaver. Brit. 363,533, Jan. 28, 1931. A high-voltage multicore elec. cable has a layer of ozone-resisting material, consisting of a vulcanizing rubber compn. having a low-rubber content and contg. appreciable quantities of sulfurized bitumens, pitches or oils, disposed on each side of the rubber dielectric and vulcanized thereto, the

cores being completely embedded in the same material the outer part of which is vulcanized to the inner surface of a tough rubber sheath.

**Incandescent electric lamp.** JONATHAN FORCE (to General Elec. Co.). U. S. 1,889,598, Nov. 29. A lamp with a W filament has leading-in conductors united to the ends of the filament, and a quantity of a metal "of the tungsten class" such as W or Ta in the powd. state and substantially free from other ingredients surrounds the junction of the filament and leading-in conductors and serves to react with $H_2O$ vapor present.

## 5—PHOTOGRAPHY

E. P. WIGHTMAN

**Organic photochemistry. I. Spectrochemical and photochemical studies of color sensitizers.** SUEO SAKURAI. *Bull. Inst. Phys.-Chem. Research* (Tokyo) **11**, 681–710(1932); (abstracts) (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) **18**, Nos. 359–65, 85; **19**, No. 380–2, 111. Absorption spectra, sensitization maxima and sensitization limits of 26 kinds of color sensitizers of the lumol series, such as 1,1'-diethyllumol-2,4'-iodide and its Me, MeO, Et and ethylenedioxy derivs., and of the illuminol series, such as 1,1'-diethylilluminol-2,2'-iodide, 1,1'-diethylilluminol-2,4'-iodide, 1,1'-diethylilluminol-4,4'-iodide and their Ph, quinaldyl and quinaldenyl derivs. were examd., and the sensitizations particularly promoted by these sensitizers and some relations between their chem. constitution and sensitization maxima were studied. Throughout both the lumol and illuminol series, the 4,4'-derivs. exert spectrochemically stronger bathochromic effects than the 2,4'-derivs., and the 2,4'-derivs. stronger than the 2,2'-derivs., and photochemically shift the sensitization max. (and likewise absorption max.) and the sensitization limit toward the longer wave lengths. This is attributed to the different chem. constitutions of the color sensitizers, and not to the different mol. wts. or to phosphorescence. Derivs. of the lumol series contg. bathochromes, such as the EtO group, exhibit bathochromic effects; while the ring compd. contg. the ethylenedioxy group behaves differently. Derivs. of the illuminol series with a heterocyclic nucleus introduced do not exert marked effects, compared with their parent dyes; while the introduction of an aromatic nucleus into a methenyl group combined with a heterocyclic nucleus exerts noticeable effects. **II. Photography with organic compounds.**—In a search to find an org. compd. suitable to use as a sensitizer in photography, various salts of the tetrazo compd. of diaminodiphenyl and its naphtholdisulfonic acid deriv. were prepd. in the cryst. state, their properties were examd. and their constitutions discussed. The diazo compd. of diaminodiphenylamine and aminophenylamine are good sensitizers, while benzidinediaminostilbene, J-acid and their derivs. are not good sensitizers. These expts. confirm the facts that the usefulness of any compd. as a sensitizer depends not on the method of synthesis but on the properties of the original bases, and that the stable azo compd. is not always suitable for photographic purposes. **III. Color sensitivity of color sensitizers.**—A new method for the detn. of color sensitivity of color-sensitive photographic plates has been developed, and the color sensitivities of 30 sensitizers of the lumol and illuminol series were detd. by using a neutral wedge and special color filters. K. KONDA

**Introduction of a new system of measurement of sensitivity.** K. JACOBSOHN. *Phot. Ind.* **30**, 909–10(1932).—A discussion. C. E. MEULENDYKE

**Indifference of silver bromide collodion emulsions to desensitizing.** LÜPPO-CRAMER. *Phot. Korr.* **68**, 197–8(1932).—Phenosafranine and pinakryptol green in 0.01 or 0.02% soln. produce little or no diminution of the sensitivity of a AgBr collodion emulsion, although they are powerful desensitizers for gelatin emulsions. The comparative indifference of the collodion emulsion is shown also with 10 other dyes ordinarily considered desensitizing. For yellow filter exposures on erythrosin or isoquinoline red sensitized collodion plates, however, phenosafranine and certain other dyes desensitize nearly as strongly as they do gelatin emulsions. E. R. BULLOCK

**Reducing grain in negatives.** SIGURD MOIR. *Am. Phot.* **26**, 584–7(1932).—While M. recommends for fine-grain negative development a formula which contains 100 g. $Na_2SO_3$ per l. developer, he warns the user to avoid a soln. contg. a superabundance of sulfite. He also claims that plates which have had the moisture removed by heat just before exposing are finer grained than untreated plates. R. A. PURDY

**Fogging of photographic plates by basic dyes.** M. MUDROVČIĆ. *Phot. Korr.* **68**, 203–5(1932).—In expts. on the coagulation of a Carey Lea dextrin Ag sol by basic dyes, M. observes no connection between the effectiveness of the dye in this respect and its photographic fogging action. When, however, the ppt. of dye and Ag is washed by decantation with distilled $H_2O$ 2 or 3 times a day, the supernatant liquid becomes almost

colorless after a time with those dyes that fog, whereas it remains more or less strongly colored in the other cases. E. R. BULLOCK

**Platinum printing.** E. B. LUCAS. *Focus* **19**, 758–61(1932).—Instructions are given for platinum printing following a method L. found satisfactory in the tropics. He sensitizes his own paper. Local treatment with a jet of steam is recommended before the fixation in dil. HCl. C. E. IVES

**Imbibition printing on a mordanting positive.** M. ROBACH. *Brit. J. Phot. Color Suppl.* **26**, 42–3(1932).—Corrections to the procedure described in *C. A.* **26**, 5859. E. P. WIGHTMAN

**Complete growth functions with special reference to the photographic ones.** L. HAMBURGER. *Chem. Weekblad* **30**, 115–40(1932).—The characteristic curve which may show more than one growth cycle, is an example of a complete curve of population growth. Essential for the process of photolytic nucleus formation on the surface of the grain of photographic emulsions is an irreversible "light shock mechanism." The connection between the average numbers of developable centers per grain and exposure and the variation of this connection with grain size are in accordance with the tiny critical nucleus size found by Reinders and the author. The data would be incompatible with a critical nucleus size of say 100 Ag atoms and a nucleus action of sep. Ag atoms would not be acceptable. The essential form of the characteristic curve of the photographic plate, including the stage of reversal, is derived. E. SCHOTTE

Cellulose ester compositions [for photographic films] (Brit. pat. 363,689) **23.** Color-testing apparatus [for filters for color photography] (Brit. pat. 345,868) **1.**

SANTEUL, C. DE: **Les épreuves photographiques à l'encre grasse.** Paris: Dunod & Cie. 108 pp. F. 20.

---

**Color photography.** LEONARD T. TROLAND (to Comstock & Wescott). U. S reissue 18,680, Dec. 6. A reissue of original pat. No. 1,808,584 (*C. A.* **25**, 4190).

**Color photography.** D. A. SPENCER and COLOR PHOTOGRAPHS (BRITISH & FOREIGN), LTD. Brit. 340,605, Oct. 3, 1929. In printing processes of color photography, the intermediate or final support for a colloid layer which may form a relief image by differential hardening includes regenerated cellulose such as Cellophane. For reducing the light-screening effect of the dichromate sensitizer which tends to penetrate into the support if the latter is immersed in the sensitizing bath, the sensitized layer may be treated with reducing agents such as acidified $FeSO_4$ or the sensitizing soln. may contain an addn. of sucrose, Na or K chloride or sulfate or chromic acid may be used instead of dichromate. Removable pigments such as Pb chromate are used when employing the carbon or "carbo" printing processes.

**Color photography.** M. MARTINEZ Brit. 341,454, July 15, 1929. An exposed surface comprising 2 or more layers (each contg., or overcoated with, a different single color dissolved or suspended in the layer) is treated, during or after development and fixing, to remove the color either from the light-affected or -unaffected portions (as by treatment with acidified $H_2O_2$ or by hardening the gelatin of the exposed parts and removing the unhardened parts along with the coloring substance). Various details and examples are given.

**Color photography.** H. BERTLING. Brit. 341,904, Oct. 27, 1928. Optical features of a lighting system for giving correct color values.

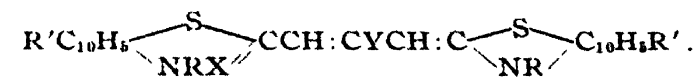
**Color photography.** I. G. FARBENIND. A.-G. Brit. 345,575, June 4, 1929. Pictures in 2 or more colors are produced by printing from component color-record negatives onto layers sensitized with esters or ester salts of leuco dyes. A Hg-vapor lamp is preferable for printing, and as sensitizing materials for 3-color pictures there may be used: Indigosol golden yellow ICK, Indigosol blue O6B, and Indigosol pink IR extra (each in 3% aq. soln.). The component positives may be produced in succession on the same paper or transparent base by resensitizing the base for each component.

**Color photography.** W. CHAPMAN. Brit. 346,010, Jan. 1, 1930. Mech. and optical features.

**Color photography.** P. W. SMITH. Brit. 347,663, Oct. 30, 1929. Optical and mech. features of a mirror system, etc.

**Color photography.** HUMPHREY D. MURRAY and DOUGLAS A. SPENCER. Brit 363,616, June 20, 1930. Images in color are obtained by combining a metallic image with a diazo compd., *e. g.*, diazonium salt of *p*-aminodiaminodimethyl-*p*-phenylenediamine, and coupling the complex formed with an azo coupling agent, *e. g.*, amines, phenylsulfonic acids, etc.

**Color photography.** TRU COLOUR FILM, LTD. Fr. 738,196, June 4, 1932. A pos. image is printed on the outer side of a pos. chloride emulsion from a negative formed by the combination of colored light rays, developed and subjected to a limited toning followed by a controlled fixation. The uncolored portion of the pos. emulsion is treated to bring it into a condition in which it will undergo a final printing, *e. g.*, converted to AgBr by treatment with $(NH_4)_2CO_3$ and a bromide, after which a 2nd pos. image is printed through the support from a neg. image formed by a different combination of light rays. The 2nd image is developed and toned so that the 2 images combine to produce varied color effects. Details of the various baths and times, etc., required are given.



**Color cinematography.** H. T. KALMUS and J. A. BALL (to Technicolor Motion Picture Corp.). Brit. 343,369, April 3, 1929. Films, each bearing a series of color record images of one color, are produced from a lenticular screen film by separately reproducing each color record in a distinct layer of emulsion, which may be treated (as for producing a printing matrix) independently of the records of the other colors. Various optical details, etc., are described.

**Optical system for color photography.** A. PILNY. Brit. 342,036, Nov. 19, 1928.

**Photographic dye impression process.** F. LIERG. Brit. 344,365, Sept. 12, 1929. In producing color prints by imbibition from gelatin reliefs, the dye is temporarily fixed in the relief in an insol. form, as by pptn. of insol. dye acids or dye bases with acid or alkali. Reagents which liberate the dye may be incorporated in the gelatin of the receptive surface and may ppt. the dye transferred to the surface. Various examples and details are given.

**Photographic silver reversal process.** KODAK, LTD., and E. E. JELLEY. Brit. 341,183, Nov. 13, 1929. In a process of the kind in which no re-exposure to light is made after the first development, the plate, film or paper, after treatment in the reversing bath, is treated (simultaneously or successively) with a darkening or fogging agent (such as Na hyposulfite, hydrazine, $H_2O_2$ or methylene blue) forming developable nuclei on the Ag halide grains, and an ordinary developer. Various details and examples are given.

**Photographic emulsions.** I. G. FARBENIND. A.-G. Fr. 738,121, June 3, 1932. Gelatin-Ag halide emulsions are sensitized to red by substituted $\alpha$- and $\beta$-naphthothiocarbocyanines. Compds. of the formulas below are mentioned (R is alkyl, X is halogen or $CH_3OSO_3$ and Y is H, alkyl or aryl, R′ is OMe, OEt, Br or Me)

**Photographic sensitive materials.** E. WOLFF-HEIDE. Brit. 340,278, Sept. 17, 1929. Light-sensitive neg. material for "subtractive work" comprises a single light-sensitive layer which is treated so as to divide it into 3 color-sensitive regions from the bottom surface to the top. An ordinary emulsion layer may be treated with a colloidal soln. of pinaflavol or other green sensitizer for a time to permit the dye to penetrate to the intermediate portion of the layer, followed by drying and treatment of the layer with a colloidal soln. of pinacyanol or other red sensitizer which is allowed to penetrate the surface portion only of the layer, and after again drying the whole layer may be treated with an orange dye which will absorb blue and green rays but will transmit red rays. Various details of the treatments are given.

**Photographic sensitive layers.** MASA GES. ZUR HERSTELLUNG KÜNSTLICHER OBERFLÄCHEN. Brit. 340,246, Oct. 8, 1928. A Ag halogen light-sensitive compn. such as a AgBr emulsion is incorporated (suitably after fine grinding) in a hard drying lacquer or varnish comprising a cellulose ester such as cellulose acetate and the sensitized varnish (which may also include various auxiliary ingredients) may be applied to metal surfaces for reproduction on them of wood-grain finishes. Various details of operation are described.

**Photographic sensitive layers.** I. G. FARBENIND. A.-G. Brit. 341,151, Oct. 28, 1929. A binding material for bleaching-out layers comprises a component (such as alcs. of high b. p., cellulose esters and softening agents suitable for photographic films) which is capable of retaining the dye in soln. and another component (such as cellulose ethers and ether esters) which swells in the fixing agent and in which the dye is insol., *e. g.*, a mixt. of cellulose ethyl benzyl ether and nitrocellulose is sensitized with diethylthiosinamine and a fixing agent of mixed benzine and anisole is used.

**Photographic sensitive layers.** I. G. FARBENIND. A.-G. Brit. 343,212, Dec. 2, 1929. A layer for use in the bleach-out process contains a N-free basic oxonium dye (other than an anthocyanine) such as 3,6-dihydroxy-9-phenylxanthoxonium chloride and its ethers or 3,6-dimethoxy-9-*o*-carbomethoxyphenylxanthoxonium chloride. A layer for the production of multi-color pictures may comprise a mixt. of resorcinol-benzein dimethyl ether bromide, anilinodimethylaminophenonaphthoxyazine chloride and 2,7-

dimethyl-3-dimethylamino-6-methylamino-azazonium phenyl chloride in a mixt. of nitrocellulose and ethylcellulose butyrate.

**Metallic photographic plates.** A. G. SOLOV'EV. Russ. 17,000, July 4, 1929. The plate is covered with one or several layers of cellulose in acetone to which chalk has been added. The layers are dried and one or more layers of barytes are applied. The surface is finally polished and covered with a light-sensitive layer.

**Metallic photographic plates.** A. G. SOLOV'EV. Russ. 25,398, Feb. 12, 1931. Addn. to Russ. 17,000 (preceding abstract). An acetone soln. of celluloid to which $BaSO_4$ is added is placed on the rough surface of an Al plate.

**Anti-halation layers for photographic plates or films.** I. G. FARBENIND. A.-G. Brit. 342,531, Feb. 5, 1930. Fuchsone dyes contg. one or more carboxylic groups are used in anti-halation layers, either dispersed in a binding agent or applied in an alc. soln. Aurine-monocarboxylic acid, aurine-dicarboxylic acid or hydroxy-carboxy-fuchsone may be used, and another dye such as "washing blue" may be added also. Cf. *C. A.* **26**, 2387.

**Photographic diazotype layers.** KALLE & Co., A.-G. Brit. 347,430, March 30, 1929. Materials are used such as (1) the Sn chloride double salt of tetrazodiaminodiphenylthiourea, boric and tartaric acids and thiourea; (2) tetrazodiaminotetramethoxydiphenylurea, tartaric acid and thiourea (development being effected with phloroglucinol and borax); (3) the Zn chloride double salt of 1-amino-2,5-diethoxy-4-benzoylamino benzene, 1-hydroxynaphthalene-7-biguanidine, naphthalenetrisulfonic acid, boric and tartaric acids, thiourea and $(NH_4)_2SO_4$ (developed with $NH_3$ or $Na_2CO_3$), or various similar compns.

**Diazotype reproduction.** N. V. PHILIPS' GLOEILAMPENFABRIEKEN. Fr. 737,377, May 20, 1932. Contrasts or reproductions of images are obtained with a support contg. a diazo compd. which, under exposure to light, produces first in the presence of water a phenol substituted in the $C_6H_6$ ring and capable of being oxidized by the diazo compd itself or by another diazo compd. also present in the support, forming a colored compd. The medium in which the support is found is such that the speed of oxidation is greater than the speed of coupling of the diazo compd. with the phenol, but below, during exposure, that of the transformation of the diazo compd. under the effect of the exposure. The phenol is oxidized by the untransformed diazo compd. to form a colored product which gives the contrasts or the reproduction sought. Several examples are given.

**Fixing photographic layers containing dyes.** I. G. FARBENIND. A.-G. Brit. 341,371, May 11, 1929. Pictures made on layers contg. dyes which bleach out on exposure to light and are sensitized with a deriv. of thiourea such as diethylthiosinamine are fixed by treatment with $SO_2$. Various details of procedure are described.

**Photographic carrier.** REINHOLD KUPFER. Brit. 363,631, Sept. 15, 1930. A carrier for a combined sound and picture film consists of a core of metal of great tensile strength capable of being rolled and having on one part of its surface a layer of (or contg.) Al for the image portion and on another part a layer of (or contg.) Ag for the sound portion.

**Photographic baths.** KODAK-PATHÉ. Fr. 738,164, June 4, 1932. An app. is described for the recovery of Ag from used photographic baths. Cf. *C. A.* **26**, 4762.

**Intensifying photographic silver images.** F. LIERG. Brit. 345,311, Sept. 18, 1929. A Ag image so thin as to be unprintable is converted into a mordant compd. and dyed with a phenosafranine which gives a color gradation from yellow to deep red. The dye may be fixed by a lake-forming substance, and the mordant image may be blackened with $Na_2S$. The process is well suited to the treatment of the front film of a 3-color pack, the intermediate film of which may be treated with a yellow dye such as thioflavine or chrysoidine.

**Photographic films.** L. RADO. Brit. 341,003, Oct. 17, 1928. Light-sensitive layers comprising films of cellulose derivs. (such as hydrates) are attached to a support such as Al foil reënforced by paper or cloth by a permanent fixative compn.

**Sensitive film of the multi-color screen type for producing sound-record cinematograph films in natural colors.** THOMAS T. BAKER (to Spicers, Ltd.). U. S. 1,890,557, Dec. 13. There is applied to a cellulose acetate film, along a narrow strip which is to serve as a sound-record track, a layer of bitumen dissolved in benzene; the surface of the film is coated with a layer of collodion, a multi-color screen is formed on the collodion, the film is treated with benzene to remove the bitumen together with that portion of the collodion layer which overlies the bitumen and the film thus prepd. is finally coated with a photographic emulsion.

**Dyeing motion-picture films.** PHOTOCOLOR CORP. Brit. 347,167, Nov. 20, 1929. One side only of a double-coated film which has been developed is bleached and washed; the opposite side is then wetted and dye is applied to the bleached side. Numerous details of app. and operation are described.

**Apparatus for coloring or varnishing cinematographic films.** SIRIUS KLEUREN-FILM MAATSCHAPPIJ N.-V. Brit. 341,477, Oct. 16, 1929. Mech. features.

**X-ray photography.** SIEMENS-REINIGER-VEIFA GES. FÜR MEDIZINISCHE TECHNIK (to Schering-Kahlbaum A.-G.). Brit. 347,152, Oct. 15, 1928. Two or more radiographs of an object are simultaneously produced by exposing in superposition a plurality of photographic layers between each pair of which are placed 2 intensifying screens laid back to back. Behind the photographic layer which is farthest from the source of rays there may be placed an addnl. intensifying screen with its fluorescent layer facing the photographic layer.

**Apparatus for taking stereoscopic x-ray photographs.** N.-V. PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 342,424, Nov. 24, 1928. Structural and mech. features.

**Photographic bromoil prints.** F. J. SHEPHERD, F. F. RENWICK and ILFORD, LTD. Brit. 341,924, Oct. 23, 1929. Bromoil prints are made on supports sensitized with Ag halide gelatin emulsion to which a hardening agent such as chrome alum or formalin has been added before coating so that the gelatin has a m. p. above 40°, and the developed and bleached print is uniformly inked by a roller or spray device and gradation is developed on it by rolling its surface. Various details and examples of successive steps of procedure are given.

**Glazing photographic negatives.** W. SMITH and J. E. BRAMWELL. Brit. 340,775, Dec. 28, 1929. Developed and fixed negatives with opaque backings are glazed (suitably by squeegeeing onto a ferrotype or glass plate) so that positives made from them by copying with reflected light exhibit greater depth.

**Apparatus for production of photographic sound records of variable form and intensity upon a film.** SVEN A:SON BERGLUND (to N.-V. Kuchenmeisters Internationale Maatschappij voor Sprekende Films). U. S. 1,889,627, Nov. 29. Mech. and optical features.

**Infra-red color filters.** E. S. CLUDERAY and RADIOVISOR PATENT, LTD. Brit. 342,433, Nov. 28, 1929. A thin sheet of ebonite is used supported on or between glass sheets to which it may be secured by bakelite or pitch.

**Color printing plates.** G. ALIFREDI. Brit. 344,148, Jan. 20, 1930. The object is photographed through a greenish yellow colored screen of pure rock crystal onto a panchromatic plate and a negative is prepd. therefrom; a plurality of impressions in accord with the colors in the object are printed from the negative onto lithographic stones sensitized with benzene, Jew's pitch, lavender oil and aniline oil or $CHCl_3$ and color selection is effected by removal of all parts of each impression other than those corresponding to the color to be printed from that impression (the removal being effected by solvents such as turpentine or benzene, separately or in mixt.). Various alternative procedures are described.

**Photogravure printing surfaces.** S. SAWARAGI. Brit. 346,483, Jan. 22, 1930. A Cu plate or cylinder is first coated with a colloidal mixt. obtained by emulsifying beer, Na silicate and white of egg, and, before this material has dried, there is poured onto it the sensitized gelatin while the plate or cylinder is heated and rotated. Gelatin and chrome alum may be substituted for the white of egg.

**Etched metal plates for photomechanical relief printing.** N. LUDVIGSEN. Brit. 345,255, Dec. 19, 1928. A resist screen is applied as by mech. printing to a metal plate before the sensitive coating is applied, and in a modified process this resist screen serves to yield the light parts of the image and after the sensitive coating has been applied a second screen serving for the dark parts and half-tones is applied. For the sensitive layer, a colloid is sensitized with $(NH_4)_2Cr_2O_7$, and the plate is finished, after exposure through a negative, by washing with water, heating and etching. Various details of operation are described.

**Waste films.** RICHARD SPELLING. Fr. 737,404, May 21, 1932. An app. is described for recovering waste photographic films by passing them through baths contg. a solvent for cellulose esters and through water.

# 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**Germanium and gallium from germanite.** RICHARD BERG AND WERNER KEIL. *Z. anorg. allgem. Chem.* **209**, 383–4(1932).—The prepn. of Ge from germanite has already been described (*C. A.* **20**, 2294). The sepn. of Ga by that method is difficult. It is better prepd. by evapg. powd. germanite to dryness with fuming $HNO_3$, taking up the residue in HCl and sepg. the $GeCl_4$ by distn. in a stream of $Cl_2$. After sweeping out the excess $Cl_2$ by air and $SO_2$, the residue is boiled to remove $AsCl_3$. $Fe^{++}$ is oxidized to

$Fe^{+++}$ by perhydrol, HCl is added and the $GaCl_3$ and $FeCl_3$ are extd. by shaking with $Et_2O$. After pptg. $Fe(OH)_3$ by NaOH, $Ga(OH)_3$ is sepd. by adding excess HCl and neutralizing with $NH_4OH$. The purified $Ga(OH)_3$ is dissolved in NaOH soln., and a yield of 0.74% metallic Ga was obtained by electrolyzing with 4 v. for 36 hrs.
J. H. REEDY

**Acetates as a means of separating the yttrium group of rare earth elements from each other.** J. ALLEN HARRIS AND ALAN H. CAMERON. *Trans. Roy. Soc. Can.* III, **26**, 61–2 (1932); cf. *C. A.* **26**, 2668.—Fractional crystns. of rare earth acetates sepd. Er in the head fraction with Nd and Sm concg. in the most sol. fraction. The acetate sepn. is recommended for the rapid sepn. of Er from a mixt. of Yt-group earths. J. W. S.

**Comparison of the efficiencies of bromates and nitrates in the separation of the rare earth elements from one another.** J. ALLEN HARRIS AND DOROTHY E. WYLIE. *Trans. Roy. Soc. Can.* III, **26**, 63–8(1932); cf. preceding abstr.—Comparative crystns. of material obtained from Norwegian gadolinite were obtained for rare earth bromates and nitrates. Bromate sepn. is recommended for the recovery of Er, Nd and Sm in a preliminary sepn. from a Yt-group mixt. while the nitrate sepn. is best for the rapid concn. of Eu, Tb and Gd from a general mixt. J. W. SHIPLEY

**Solid polyiodides of cesium.** H. W. FOOTE, W. M. BRADLEY AND MICHAEL FLEISCHER. *J. Phys. Chem.* **37**, 21–7(1933); cf. *C. A.* **26**, 1534.—Soly. detns. at 6° and 25° in benzene and toluene prove the existence of the binary compds. $CsI_3$ and $CsI_4$. In benzene, a ternary compd., $CsI\text{-}9I\text{-}2C_6H_6$, is also found. The dissocn. pressures of $CsI_3$ and $CsI_4$ are calcd. at both temps. MICHAEL FLEISCHER

**The solid polyiodide of ammonium.** H. W. FOOTE AND W. M. BRADLEY. *J. Phys. Chem.* **37**, 29–31(1933); cf. preceding abstr.—$NH_4I_3$ is the only stable polyiodide found. Its dissocn. pressure is calcd. at 6° and 25°. MICHAEL FLEISCHER

**The chemistry of the alkali amides.** F. W. BERGSTROM AND W. CONARD FERNELIUS. *Chem. Rev.* **12**, 43–179(1933).—An extensive review including (1) the methods of prepn. and storage and (2) inorg. and org. reactions. About 500 references are given
LOUISE KELLEY

**The action of aluminum salts on the alkali tartrates.** YEU-KI-HENG. *Compt rend.* **196**, 259–61(1933).—Optical rotations are given for mixts. of $Al_2(SO_4)_3$, NaOH and Na tartrate (= $Na_2T$) over a wide range of compn., and at concns. between 0.25 and 2 *M* for $Na_2T$. A mutarotation was observed. The reaction is shown by the equations (1) $3T^{--} + Al^{+++} \rightleftharpoons (AlT_3)^{---}$, (2) $(AlT_3)^{---} + Al^{+++} \rightleftharpoons (AlT_3)Al$. The first reaction requires only a few moments; the second ends in about 20 min.
GERALD M. PETTY

**The reaction between lime and silica in the solid phase.** I. WEYER. *Z. anorg. allgem. Chem.* **209**, 409–28(1932).—$SiO_2$ does not react directly with $CaCO_3$, but with the CaO formed by the decompn. of the latter. Below 735°, the primary product is not $\gamma\text{-}Ca_2SiO_4$, but $\beta\text{-}Ca_2SiO_4$, slowly going over into $CaSiO_3$ (wollastonite). From 815° to 835°, $\beta\text{-}CaSiO_3$ is formed directly, along with some $\beta\text{-}Ca_2SiO_4$. At higher temps. (1050–1250°) $\beta\text{-}CaSiO_3$ only is obtained. These results are in agreement with Jander's theory of a concn. gradient in the diffusion of the components (*C. A.* **26**, 2294).
J. H. REEDY

**The reduction of tricalcium phosphate.** W. JANSEN. *Z. anorg. allgem. Chem.* **210**, 113–24(1933).—$Ca_3(PO_4)_2$ alone and in the presence of Fe was reduced with graphite, with CO and with $H_2$. The temps. of reduction were below 1100°, 1300° and 900–1000°, resp., in the absence of Fe. The temp. of initial reduction is lowered by addn. of Fe, being 700–750° with graphite and 600° with $H_2$. No temp. measurement could be obtained with CO on account of cementation of Fe. The velocity of reduction increases with increasing amts. of Fe up to a max. Fe content. H. B. VANVALKENBURGH

**The composition of chloride of lime.** N. TARUGI. *Boll. chim. farm.* **71**, 797–802, 837–47, 877–86, 917–22(1932).—Chloride of lime and metallic Hg react at low temps. to form a product which is probably $Ca(OHgCl)_2$. Since all of the available Cl of chloride of lime disappears in this reaction, it is probable that both Cl atoms are similarly linked in the chloride of lime complex. T. suggests that $Ca(OCl)_2$ is the fundamental component of chloride of lime, but is assocd. with varying amts. of $Ca(OH)_2$, $CaCO_3$, $CaCl_2$ and $H_2O$, depending on the method of prepn. LEWIS W. BUTZ

**Decomposition reactions of oxides of chlorine.** HANS J. SCHUMACHER. *Z. Elektrochem.* **39**, 7–13(1933).—A review with 30 references of the work of various investigators upon the thermal and photochem. decompn. of $Cl_2O$ and $ClO_2$. LOUISE KELLEY

**The carbonyls of lithium, rubidium and calcium [original reads "caesium"].** T. G PEARSON. *Nature* **131**, 166–7(1933).—The carbonyls were prepd. by passing pure dry CO through a soln. of the metal ammoniate in liquid $NH_3$ formed at —60°. LiCO, a white powder which darkens on standing, detonates violently with $H_2O$, forming $Li_2CO_3$, C and $H_2$; RbCO, a white solid, dissolves in $H_2O$; and $Ca(CO)_2$, a cream-colored

powder, partially dissolves in $H_2O$ with the evolution of heat. *In vacuo* LiCO begins to dissoc. at 300°, RbCO at 350° and $Ca(CO)_2$ at 200° to form the corresponding carbonates and oxides and C. JANET E. AUSTIN

**Recovery of iodine from residues.** ISTVÁN NÁRAY-SZABÓ AND ZOLTÁN SZABÓ. *Magyar Chem. Folyóirat* **38**, 95–8(1932).—The residues are treated with 5 cc. satd. $NaNO_2$ soln. and 5 cc. concd. $H_2SO_4$ per l. and the pptd. I is shaken out with 100 cc. $CCl_4$. The I is dissolved with 10% NaOH and the $CCl_4$ again used for extn. The I is freed from the NaOH soln. by acid and purified by sublimation. If KI is wanted, KOH is used for extn. and the satd. soln. treated with $H_2O_2$ to oxidize hypoiodite to iodate and this is converted to iodide. S. S. DE FINÁLY

**The system: phosphorus–selenium.** PERCY L. ROBINSON AND WM. E. SCOTT. *Z. anorg. allgem. Chem.* **210**, 57–66(1933).—Under 50°, Se dissolves in P to form solid solns., but at 130° $P_4Se_3$ is slowly formed. Rise in m. p. after heating at higher temps. is due to change of free white P into red P. This change takes place more readily in the presence of Se. H. STOERTZ

**The volatility of boric acid with water vapor.** S. BEZZI. *Ann. chim. applicata* **22**, 713–25(1932).—Both *o*- and *m*-boric acids may co-exist in soln., but *o*-acid begins to be transformed into the *m*-form at 50°, while the latter is stable up to 100°. In the presence of $H_2O$ vapor, at 100° or over, only the *o*- form is volatile. A. W. CONTIERI

**Formula of hypophosphoric acid.** F. BELL AND S. SUGDEN. *J. Chem. Soc.* **1933**, 48–9.—Since $H_2PO_3$ contains an odd no. of electrons and $H_4P_2O_6$ does not, it follows that if the hypophosphates have the simpler structure they should be paramagnetic. The susceptibilities were detd. at 18–20° with the following results ($X \times 10^6$): $Na_2H_2P_2O_6$ —0.38; $Na_2H_2P_2O_6.6H_2O$ —0.41; $Ag_4P_2O_6$ —0.25; guanidine hypophosphate —0.41. These are thus all diamagnetic and must be derived from an acid of the formula $H_4P_2O_6$. $Ag_4P_2O_6$ and MeI in $Et_2O$ do not give the Me ester; $Ag_4P_2O_6$ and MeI on standing 4 days give the Me ester, d. 1.307; the Et ester, d. 1.173, was prepd. by warming the Ag salt with EtI for 2 hrs. $Ag_4P_2O_6$ does not react with *p*-$IC_6H_4NO_2$ or with 2,4-$(O_2N)_2C_6H_3Br$. C. J. WEST

**Decomposition of hyposulfurous acid in dilute solution at the boiling point.** E. CARRIÈRE AND MLLE. CARLINI. *Compt. rend.* **196**, 111–12(1933).—On boiling a dil. soln. of $H_2S_2O_3$, which contains nothing else but NaCl, decompn. is 80% complete in 15 min. The reaction is quantitatively: $21H_2S_2O_3 = 17SO_2 + 19S + H_2SO_4 + H_2S_5O_6 + 19H_2O$. ALFRED HOFFMAN

**Supposed cases of isomerism in compounds of the nonelectrolyte type $MeX_2A_4$.** WALTER HIEBER AND ERNST LEVY. *Z. Elektrochem.* **39**, 24–6(1933).—Sand's claim (*Ber.* **36**, 1443(1903)) that he had obtained $Co(CNS)_2(C_5H_5N)_4$ in 2 different forms—red and brown—was disproved by Pfeiffer's discovery (*C. A.* **2**, 2518) that the brown color of the β-form was due to traces of I. The discovery of Biltz (*C. A.* **9**, 568) that the tetrapyridine compd. of $CoBr_2$ exists in 2 forms was not substantiated by the work of Hantzsch (*C. A.* **21**, 1234) or by unpublished expts. of Hieber and Mühlbauer. According to Grossmann and Schück (*Z. anorg. Chem.* **50**, 5(1906)), $Ni(CNS)_2en_2$ exists in 2 isomeric forms—a difficultly sol. blue one and an easily sol. red-violet one. H. and L. have repeated the prepn. and have found that the blue compd. is $Ni(CNS)_2en$ (mentioned by G. and S.), while the red-violet one is $Ni(CNS)_2en_2$. The isomerism of $Ni(CNS)_2en_2.H_2O$ described by Werner (*Z. anorg. Chem.* **21**, 231(1899)) could not be confirmed by H. and L. (Werner gave $2H_2O$ for this compd.). Spacu (*C. A.* **9**, 180) stated that the tetrapyridine compd. of $Fe(CNS)_2$ should exist in a yellow and in a dark red-violet form. According to Rosenheim, Roehrich and Trewendt (*C. A.* **26**, 5025) the violet compd. is not an isomer of the yellow, but is a bimol. compd. which contains both $Fe^{II}$ and $Fe^{III}$. H. and L. question the existence of isomerism here and also the explanations given by Rosenheim and by Spacu for the red color of the EtOH and $CHCl_3$ solns. of the yellow form. LOUISE KELLEY

**Physicochemical studies of complex formation involving weak acids. VI. Alkaline solution of thorium tartrate.** H. T. S. BRITTON AND WM. E. BATTRICK. *J. Chem. Soc.* **1933**, 5–9; cf. *C. A.* **26**, 4549.—Titration of $ThCl_4$ with $Na_2C_4H_4O_6(Na_2T)$ proceeds at first according to $ThCl_4 + 1.23Na_2T + 1.54H_2O = 1.54HCl + 2.46NaCl + Th(OH)_{1.54}T_{1.23}$. Further addn. of $Na_2T$ only approx. represents neutralization of HCl to completion, as when 2 moles of $Na_2T$ have been used 0.42 mole of HCl is present to give $ThCl_4 + 2Na_2T + 1.54H_2O = 0.42HCl + 0.56H_2T + 3.58NaCl + Th(OH)_{1.54}T_{1.23} + 0.21Na_2T$. The $Na_2T$ is probably assocd. with basic ThT as an inert complex. Titration of $Na_2T$ with NaOH immediately gives $Th(OH)_3T_{0.5}$ at $p_H$ 10.5, but on aging of the solns. more basic complexes such as $Th(OH)_{3.48}T_{0.26}$ are formed. FOSTER DEE SNELL

**The constitution of complex salts of metallic halides and amines, and the dependence of their stability upon the anions.** WALTER HIEBER AND ERNST LEVY. *Z. Elektrochem.* **39**, 26–34(1933).—Tetrammines of halides of metals in the subgroups of the

Periodic Table usually contain the halogen in the inner sphere, in direct union with the central atom. In almost all substitution compds. and in very many addn. compds. the stability increases in the order Cl ⟶ Br ⟶ I; a complete reversal of this order is limited to some ammoniates. The factors detg. the stability gradation of complexes are divided into 2 effects—one produces the "normal" behavior and always plays a role in complex formation; the other acts in the sense of an "inverse" behavior and only if halogen polarization is concerned in complex formation. The inverse behavior of the hexammoniates of the Au halides can be fitted into the common scheme and explained by the aid of Klemm's energy quotients. For the analysis of the stability gradation another factor must be considered—a contingent change of the lattice type either in transition from Cl to I compds. or in complex formation. The lattice type is detd. by space and polarization magnitudes. LOUISE KELLEY

**Spectroscopic detection of the formation of complex salts of dimethylglyoxime in alcoholic solution.** KENJIRO KIMURA AND HIDEO SUEDA. *J. Chem. Soc. Japan* **54**, 1–8(1933).—The formation of complex salt between metals and dimethylglyoxime in EtOH soln. was detected from the position of max. of the light absorption. Complex salt formation was observed for $Ni^{++}$, $Co^{++}$, $Fe^{++}$, $Fe^{+++}$ and $Cu^{++}$, but not for $Mg^{++}$, $Ca^{++}$, $Mn^{++}$, $Zn^{++}$, $Sr^{++}$, $Cd^{++}$ and $Hg^{++}$. The complex salts of Ni, Co, Cu and $Fe^{++}$ were composed of 1 mol. of metallic salt and 2 mols. of dimethylglyoxime. The mol. ratio was 1 to 3 only for $Fe^{+++}$. It has been found that 19.38 g. of dimethylglyoxime is dissolved in 1 l. of EtOH at 25°. T. KATSURAI

**A supposed anomaly among the plato-tetrammines.** H. D. K. DREW AND G. H. WYATT. *J. Chem. Soc.* **1932**, 2975–6.—Investigations were made to det. if 2 β-forms of the plato-tetrammine $[Pt(NH_3)_2dm_2]Cl_2$ (dm = dimethylamine) of Jorgensen (*Z. anorg. Chem.* **48**, 374(1906)) exist, the compds. β-$Ptdm_2Cl_2$ and β-$[Pt(NH_3)_2dm_2]Cl_2$ being prepd. The investigations lead to the conclusion that only one form of the β-tetrammine exists, and depending on the exptl. conditions (temp., acidity, etc.) the hydrated or the anhyd. plato-salt is obtained from this. β-$Ptdm_2Cl_2$ was prepd. from aq. $NHMe_2$ and $K_2PtCl_4$ at room temps. (for 6 hrs.), and forms yellow plates or needles when recrystd. from $H_2O$ (yield 75%). β-$[Pt(NH_3)_2dm_2]Cl_2$ (colorless square prisms or hexagonal needles) was obtained in nearly quant. yield by dissolving β-$Pt(NH_3)_2Cl_2$ in $NHMe_2$ aq. at room temps. (10–14 days), drying over $P_2O_5$ and recrystg. from aq. EtOH. J. BALOZIAN

**Amino compounds of the platinic chloroammines.** BERTRAM E. DIXON. *J. Chem Soc.* **1932**, 2948–55.—The reactions between alkalies and the simple platinic ammines of the dichlorotetrammine, chloropentammine and hexammine series were studied and it was found that the primary ammino reaction was general for the simple platinic chloroammines. The dichlorotetramminoplatinic nitrate (I) used was prepd. by the action of $HNO_3$ on tetramminoplatinous chloride (prepd. by Ramberg's method from $K_2PtCl_4$). *Aminodichlorotriamminoplatinic nitrate* ($[Pt(NH_3)_3(NH_2)Cl_2]NO_3$), was obtained as a brilliant yellow ppt. on immersing in ice and stirring a mixt. contg. an excess of cold 30% NaOH aq. added to concd. I soln. The ppt. was washed with EtOH until free from NaOH, then with $Et_2O$ and dried in a desiccator *Dichlorotetramminoplatinic hydroxydihydrophosphate*, ($[Pt(NH_3)_4Cl_2](OH)H_2PO_4.2H_2O$), was obtained as a bulky white ppt. on stirring a soln. of I (1 equiv.) to which was added cold $Na_2HPO_4$ aq. (3 equivs.). The ppt. was washed with ice-cold $H_2O$ and dried in a desiccator. *Chloro(hydrophosphato)tetramminoplatinic hydroxide*, ($[Pt(NH_3)_4Cl(HPO_4)]OH$), was obtained as a granular, faintly buff-colored ppt. on pouring hot $Na_2HPO_4$ aq. (2 equivs.) into a boiling soln. of I, the mixt. boiled and stirred for 4 min. The ppt. was well washed with $H_2O$ and dried in a desiccator. On heating this hydroxide to 130°, 1 mol. of $H_2O$ is driven off giving the compd. *chloro(hydrophosphato)aminotriamminoplatinum* ($[Pt(NH_3)_3(NH_2)Cl(HPO_4)]$). *Bis(hydroxotriaminodiamminoplatinic)silver hydroxide*, ($[Ag_3\{(NH_2)_3Pt(NH_3)_2(OH)\}_2](OH)_3$), was obtained in alk. soln. when an excess of moist $Ag_2O$ was shaken vigorously with a soln. of chloropentamminoplatinic chloride (II) for 1–2 hrs. in a corked flask until a small filtered portion gave a ppt. on addn. of HCl, but only a trace on addn. of $HNO_3$. When the main soln. was filtered it gave on evapn. a white pasty mass from which $NH_3$ was slowly evolved on standing. *Bis(chlorodiaminotriamminoplatinic)silver chloride*, ($[Ag_3\{(NH_3)_3Pt(NH_3)_3Cl\}_2]Cl_5$), was obtained as pale yellow isotropic adherent crystals on shaking $Ag_2O$ (2 equivs.) with a soln. of II for about 1 hr., and allowing to stand overnight. *(Hydrosotriaminodiamminoplatinic)-silver chloride* ($[Ag_2\{(NH_2)_3Pt(NH_3)_2(OH)\}]Cl_3$) was obtained as a deposit of bright yellow crystals on shaking a II soln. with $Ag_2O$ (4 equivs.) for about 3 hrs. (until a filtered portion of the soln. gave a ppt. of AgCl on acidification with $HNO_3$ and a soln. contg. pos Ag ions, but no neg. Cl ions), filtering, and allowing the filtrate to stand 24 hrs. The hexamminoplatinic chloride ($[Pt(NH_3)_6]Cl_3$) (III) used in prepg. the following compd. was made by Chugaev's method (*C. A.* **18**, 3151) and was sepd. from the contaminat-

ing hydroxopentaminoplatinic chloride by fractional soln. in dil. AcOH. ***Hexammino-platinic hydroxyhydrophosphate,*** ($[Pt(NH_3)_6]_2(OH)_2(HPO_4)_3.2H_2O$), was pptd. from an $NH_3$ aq. soln. of III by addn. of excess aq. $(NH_4)_2HPO_4$, filtered, the ppt. dissolved in HCl, repptd. and dried at 105°. J. BALOZIAN

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**Volumetric gas experiments with large amounts of material.** W. FRANCK. *Z. physik. chem. Unterricht* **45**, 265–6(1932).—Zn previously prepd. by heating and drying in a desiccator is weighed into a hard-glass test tube. This is then connected to a 2 l. bottle. The entire assembly including a siphon overflow is filled with water. The test tube is then heated. The water displaced gives the amt. of H liberated and the gain in wt. of the test tube when dried gives the amt. of O involved. Where large amts. were used satisfactory results were obtained in demonstration expts. to show the ratio of H to O in $H_2O$. A. LLOYD TAYLOR

**Microvolumetric methods.** A. ROMWALTER. *Mitt. berg. hüttenmänn. Abt. ungar. Hochschule Berg. Forstw. Sopron* **4**, 67–76(1932).—A microvolumetric method for detg. small amts. of gases is described. The app. and method may be used for any reactions in which gases are produced. The data of exptl. analyses agreed well with theoretical values. S. S. DE FINÁLY

**Qualitative analysis by electrolysis and spectrography.** A. SCHLEICHER. *Z. Elektrochem.* **39**, 2–7(1933).—By electrolytic deposition from solns. of definite acidity, the common cations can be divided into 4 groups: (1) Hg, Ag, Pb, Bi, Cu, As, Sb and Sn; (2) Ni, Co, Cd, Zn and Mo; (3) Cr, Fe and Al which remain in the electrolyte as pptd. hydroxides; (4) alk. earths, Mg and alkalies which remain dissolved in the electrolyte. By means of spectrographs it is easy to detect the presence of 0.01 mg. of Hg, Ag, Ni, Co, Fe, Zn and Mn or 0.1 mg. of Cu, Pb, Bi, As, Sb, Zn, Sn, Mo and Cd after an electrolytic sepn. has been made. The tests can be obtained for Hg, Ag, Ni, Co, Fe, Zn or Mn when 0.01 mg. is present in 100 cc. of soln. and for the other cations when 0.1 mg. is present in 100 cc. Details for carrying out the expts. are given and some typical spectrographs of 17 elements shown. W. T. H.

**Spectral analysis.** G. HEIDHAUSEN. *Mitt. Forschungsanstalt. Gutehoffnungshütte-Konzerns* **2**, 62–78(1932).—The advantages of spectral analysis in testing chem. materials are explained at length and a very simple app. is described which can be used for all practical purposes. M. HARTENHEIM

**Modification of the Dumas technic for substances difficult to burn.** JAMES F. COUCH. *J. Am. Chem. Soc.* **55**, 852–3(1933).—The weighed substance is mixed with a large excess of CuO and packed into a Cu tube, which is then inserted into another metal combustion tube. Details and results of analyses are given. C. J. WEST

**Chemical analysis applied to works of art.** PLACIDO GERACI. *Mouseion* **19**, 47–64 (1932); *Tech. Studies Field Fine Arts* **1**, 163–4.—A review. A. PAPINEAU-COUTURE

**Method for determining the titer of sodium thiosulfate solution against Mohr's salt.** A. V. Filosofov. *J. Gen. Chem.* (U. S. S. R.) **2**, 553–4(1932).—Directions are given for standardizing $KMnO_4$ in the Mohr's salt and then for treating a measured vol. of $KMnO_4$ with KI and acid and titrating the liberated I. Chas. Blanc

**Silver iodide-starch paste indicator in a modification of the Haen-Low copper determination method.** F. Sierra. *Anales soc. españ. fís. quím.* **31**, 26–33(1933).—Allow the $Cu(NO_3)_2$ soln. from a buret to drop slowly into a soln. freshly prepd. as follows: To 20–30 cc. of 0.2 *N* KI, add 10 drops of 0.1 *N* $AgNO_3$ and 5 cc. of starch paste. The end point is a change from yellow to blue. This indicator acts like benzidine acetate. Results obtained equal in accuracy those obtained by the classical methods. E. M. Symmes

**The use of 2,4-dinitrophenylhydrazine in the determination of carbonyl compounds.** C. Torres and S. Brosa. *Anales soc. españ. fís. quím.* **31**, 34–6(1933).—The 2,4-dinitrophenylhydrazone of hexetone (2,4-dinitrophenylhydrazone of 6-*m*-menthene-5-one) was obtained in the form of red crystals, sol. in alc., m. 104°. The hexetone content of Bayer ampoules (2 cc. of 10% soln.) was detd. Dissolve the ampoule in 15 cc. of 96° alc., and add to the reagent, which comprises 0.36 g. of 2,4-dinitrophenylhydrazine, m. 194°, in 25 cc. of $H_2O$ and 2.5 cc. of concd. $H_2SO_4$. The pptn. of the hydrazone is quant. in 48 hrs. E. M. Symmes

**Gasometric method of determining chromium.** M. Couture. *Ann. chim. applicata* **22**, 680–2(1932).—$NaBO_3$ is decompd. by chromates with evolution of O, and the Cr content is calcd. from the vol. of gas evolved. A. W. Contieri

**Iron from iron carbonyl as standard in volumetric analysis.** W. Wesly. *Z. anal Chem.* **91**, 341–4(1933).—Exptl. data show that Fe from Fe carbonyl is as good as electrolytic Fe for standardizing $KMnO_4$ or $SnCl_2$ solns. W. T. H.

**Effect of heat treatment of the metal on the determination of silicon in aluminum and the loss of volatile silicon compounds in the mixed acid method of solution of the metal.** L. H. Callendar. *Analyst* **58**, 81–8(1933); cf. *C. A.* **26**, 5029.—The results of numerous expts. show that when the metal is dissolved in 10% NaOH, the soln. boiled to convert Si completely into $SiO_2$ and then poured into $H_2SO_4$, the results in the Si detn are uniform irrespective of the heat treatment which the metal has undergone. When, however, the metal is dissolved in a mixt. of $H_2SO_4$, $HNO_3$ and HCl there appears to be a loss of Si and the extent of this loss varies with the heat treatment. Treatment of the sample with concd. $HNO_3$ plus 60% $H_2SO_4$ gives good results. W. T. H.

**Determination of sodium and potassium in the presence of each other.** László Szebellédy and Károly Schick. *Magyar Gyógyszerésztud. Társaság Értesitöje* **9**, 40–51(1933).—Detailed directions are given for detg. Na and K as iodides. S. S. de F.

**Determination of strontium as oxalate.** Kh. N. Pochinok. *J. Applied Chem* (U. S. S. R.) **5**, 1078–87(1932).—The best method, of those studied, for detg. Sr as oxalate consisted in adding 50 ml. of 0 1 *N* $(NH_4)_2C_2O_4$ soln. to about 25 ml. of approx. 0.1 *N* $SrCl_2$, dilg. to 100 ml., filtering and titrating the excess $C_2O_4^{--}$ in an aliquot part of the filtrate To sep. Ca from Sr, it is recommended to add 50 ml. of 2% $H_2C_2O_4$ soln. to 25–30 ml. of approx. 0.1 *N* Ca and Sr chlorides and ammonia till alk. to methyl orange Filter and wash the ppt with a satd. $SrC_2O_4$ soln. Transfer the ppt. to the beaker where the pptn. was carried out. Wash the filter with 5 ml. of 2.5 *N* HCl and then with water (total washings approx. 70 ml.). Add 5 ml. of 7 *N* $H_2SO_4$ and dissolve the $CaSO_4$ by heating on a boiling water bath while stirring. After 20 min. filter the hot soln. and wash the $SrSO_4$ ppt. 5–6 times with 0.5% $H_2SO_4$. Heat the filtrate on a water bath and neutralize to methyl orange with $NH_3$ and filter off the $CaC_2O_4$ ppt. V. Kalichevsky

**Note on the colorimetric method for determining titanium.** Robert Schwarz *Z. anorg. allgem. Chem.* **210**, 303(1933).—The yellow color obtained in the colorimetric detn. by means of $H_2O_2$ is certainly not due, as has been often assumed, to the formation of pertitanic acid, $H_4TiO_5$, which is yellow and insol. in water but is probably caused by the formation of an ion like $[TiO_2(SO_4)_2]^{--}$. W. T. H.

**Determination of carbon and hydrogen by the centigram method.** Karlhugo Küspert. *Chem. Fabrik* **1933**, 63–4.—Various methods are discussed. K.'s app is described and its accuracy shown by analyses of 8 compds. J. H. Moore

**A simple method for the determination of minimum quantities of bromine in a large excess of chlorine.** Fritz Hartner. *Z. physiol. Chem.* **214**, 179–83(1933).—The method for detg. 10–1000 γ Br in the presence of 100 mg. or more Cl consists essentially in the selective oxidation of bromide in acid soln. by $KMnO_4$ in the presence of $MnSO_4$. The soln. is satd. with $Na_2SO_4$ to decrease the soly. of the liberated Br, and the latter sucked into a receiver contg. KI and starch soln., the final traces of Br being expelled from the reaction flask by $CO_2$ generated by alternate addns. of $NaHCO_3$ and $H_2SO_4$. The liberated I in the receiver is titrated with 0.001–0.0005 *N* $Na_2S_2O_3$. App. is described and special precautions are enumerated. A. W. Dox

**Determination of phosphorus in basic iron.** B. JONES. *Analyst* **58**, 90–1(1933).—In some samples of basic Fe, the P content runs very high, in which case it is advisable to use only 0.5 g. of sample and det. the approx. P content by the alkalimetric titration of the phosphomolybdate ppt. Then carry out a careful analysis as described by Etheridge (*C. A.* **25**, 4487), weighing as $PbMoO_4$, which J. regards as the most reliable of all methods. W. T. H.

**Notes on the determination of oxygen in steel by the hydrogen reduction method.** ERICH CZERMAK AND OTHMAR V. KEIL-EICHENTHURN. *Arch. Eisenhüttenw.* **6**, 145–7 (1932).—It has been assumed that the $H_2$ reduction gives accurate values for the O content of mild steels low in Si when not over 0.2% C is present, but it is now shown that erroneous results are likely to be obtained even when less C is present. When the ratio MnO/FeO in the steel increases the reducing power of the $H_2$ increases. W. T. H.

**Rapid determination of sulfur in steel and iron alloys.** L. M. VIKSVO. *J. Applied Chem.* (U. S. S. R.) **5**, 1107–18(1932).—The method of Holthaus (*C. A.* **19**, 2002) is preferable to that of Schulte (*Stahl u. Eisen* **16**, 867(1896)) as it is more rapid and employs simpler app. V. KALICHEVSKY

**New method for detecting free sulfur in viscose silk and the detection of cyanide ions in aqueous solutions.** A. CASTIGLIONI. *Z. anal. Chem.* **91**, 346–9(1933).—To a little of the substance add 5 cc. of acetone and a few decigrams of KCN. Heat to boiling, cool, pour off the acetone, make acid with $HNO_3$ and add a drop of $Fe(NO_3)_3$ soln. If free S is present in the original material, red $Fe(CNS)_3$ is formed. The same reaction will serve for detecting $CN^-$ in aq. solns. To 4–5 cc. of soln. add a drop of acetone which is satd with S and heat to boiling. Cool, make acid and test with $Fe(NO_3)_3$. W. T. H.

**Determination of labile sulfur in gelatin.** N. V. KIRILENKO. *J. Applied Chem.* (U. S. S. R.) **5**, 1119–26(1932).—The method of Sheppard and Hudson (*C. A.* **25**, 1272) gives an accuracy of ±0.001% on the wt. of sample which corresponds to an error of ±14%. The proposed colorimetric standard is unstable and should be replaced by methylene blue. V. KALICHEVSKY

**Determination of calcium oxide in magnesia, magnesium salts or solutions.** P. ACKERMANN. *Chem.-Ztg.* **57**, 39(1933).—By shaking 10 g. of $MgCl_2$ with 80–100 cc. of 96% alc. and a little 2 *N* $Na_2SO_4$ soln., all the $MgCl_2$ is dissolved and the Ca is left behind as $CaSO_4$. From solns. rich in Mg a similar procedure can be followed after evapn. to dryness W. T. HALL

**Determination of CaO, $3CaO.SiO_2$, $2CaO.SiO_2$, $3CaO.2SiO_2$, $CaO.SiO_2$ and $SiO_2$ when existing together.** WILHELM JANDER AND ERNA HOFFMANN. *Angew. Chem.* **46**, 76–80(1933).—Free CaO is detd. by formation of Ca glycerate, which, after sepn. from the undecompd. silicates, is titrated with HCl. If no $3CaO.2SiO_2$ is present, then $3CaO.SiO_2$, $2CaO.SiO_2$ and $CaO.SiO_2$ together can be detd. in aq. soln. by titration with HCl to neutrality, when the tri- and disilicates are decompd. quantitatively and any $CaO.SiO_2$ remains unchanged. If $3CaO.2SiO_2$ is present the other silicates must be detd. in the presence of *o*-nitrophenol, and the Ca *o*-nitrophenolate titrated with an alc. HCl soln. The compd. $3CaO.2SiO_2$ is detd. by addn. of HCl to a suspension, but since the decompn. is not quant., this introduces some difficulties. An error of about 3% is introduced in the analysis of the four silicates, but free CaO and $SiO_2$ are detd. much more accurately, as is shown by test results which are appended. K. KAMMERMEYER

**Oxide analysis by iodine extraction in steel-making problems.** J. J. EGAN, W. CRAFTS AND A. B. KINZEL. *Am. Inst. Mining Met. Engrs Tech. Pub.* **498**, 10 pp. (1933).—Directions are given for making $FeI_2$ reagent. When a sample of steel is treated properly with this reagent, the metallic Fe dissolves, leaving behind FeO, MnO, $SiO_2$, etc. The analysis of the residue, therefore, serves to det. the O content and the way the O is combined in the sample. With plain C steels, the results obtained agree with those obtained by the Al method; with special alloy steels contg. stable carbides the results are less reliable. The importance of such analyses in steel making is pointed out. W. T. H.

**Detection and recording of small quantities of carbon monoxide, especially in purified contact [process] hydrogen.** O. PFUNDT. *Chem. Fabrik* **1933**, 69–71.—The procedure is a combination of the $I_2O_5$ method and the cond. method of Gordon and Lehmann (*C. A.* **22**, 2294). The app. is described with 3 cuts, and calibrating and operating directions are given. J. H. MOORE

**Volumetric and potentiometric determination of tri- and tetra-thionate by means of silver nitrate.** FUSAO ISHIKAWA AND TOYOSAKU MUROOKA. *Sci. Repts. Tôhoku Imp. Univ., First Ser.* **21**, 527–36(1932).—If either $S_3O_6^{--}$ or $S_4O_6^{--}$ is treated with $AgNO_3$, a yellow ppt. of $Ag_2S_3O_6$ or of $Ag_2S_4O_6$ is first formed which on heating in the presence of water is changed to $Ag_2S$ and $2H_2SO_4$ plus 1 atom of free S with the tetrathionate. After the pptn. of $Ag_2S$ is complete, the $H_2SO_4$ can be titrated with standard acid or the excess

$Ag^+$ with KCNS. By working at 70° in a buffered soln. it is also possible to titrate $AgNO_3$ potentiometrically with trithionate soln. With tetrathionate, good results can be obtained by adding $AgNO_3$ to the unbuffered soln. at 70°. Analytical data and titration curves are given. W. T. H.

**Sources of error in silicate analyses.** WERNER MYLIUS. *Glashütte* **62**, 782–6 (1932).—Recent silicate analyses are critically examd. General errors in silicate analyses and special detns. and errors are discussed. There is needed a more exact method for detg. silicates to 0.01% without difficulty. M. V. KONDOIDY

**New ways for separating the alkaline earth and alkali ions.** J. KUNZ. *Helv. Chim. Acta* **16**, 3–6(1933).—A procedure is given for applying successively tests for Ba with $(NH_4)_2CrO_4$, Sr with $Na_2SO_4$, Ca with $(NH_4)_2C_2O_4$ and Mg with $(NH_4)_2HAsO_4$ in a soln. free from $NH_4$ salts other than those added in these tests. For detecting K in the filtrate, after the above treatments, it is recommended to use Mg cobaltinitrite, a new reagent which can be prepd. by passing $N_2O_3$ into a suspension of MgO and water and mixing the resulting $Mg(NO_2)_2$ with $Co(NO_2)_3$. W. T. H.

**Determination of cations by means of anthranilic acid. I. Simple method for determining zinc and cadmium and separating these cations from the alkaline earths.** H. FUNK AND M. DITT. *Z. anal. Chem.* **91**, 332–40(1933).—In neutral solns., a 3% soln. of Na salt of anthranilic acid is a very sensitive precipitant for either Zn or Cd. As little as 0.005 mg. of Zn or Cd gives a good test. The ppt. can be washed with the reagent dild. 15–20 times and finally with alc. to remove the last traces of reagent. After short drying at 105°, the Zn ppt. contains 19.4% Zn and the Cd ppt. contains 29.03% Cd. The pptn. takes place in the presence of alkalies or alk. earths without interference. The ppts. can also be analyzed volumetrically, by adding a slight excess of KBr-$KBrO_3$ soln. and titrating the excess with $Na_2S_2O_3$ after adding KI. By means of indigocarmine and styphnic acid, it is possible to tell when enough KBr-$KBrO_3$ has been added. W. T. H.

**Ferric phosphate method for analysis of the cations of the I, II and III analytical groups in the presence of the anion $[PO_4]^{---}$.** A. P. KRESHKOV. *J. Gen. Chem.* (U. S. S. R.) **2**, 593–6(1932).—In the method recommended, the oxidized filtrate from the $H_2S$ pptn. is treated with $(NH_4)_2HPO_4$ and a large excess of $NH_4OH$, whereby Fe, Al, Cr, Mn, Ca, Sr, Ba and Mg are pptd. as phosphates. The filtrate is then treated with $(NH_4)_2S$ and the usual tests are made. The ppt. is dissolved in dil. HCl and a basic acetate sepn. made, otherwise the procedure is normal. CHAS. BLANC

**A new method of precipitation and separation of the cations of the third and fourth groups in qualitative analysis.** CARLO PALMIERI. *Officina* **5**, 136–41(1932).—After removing excess $H_2S$ from the filtrate from Group II, oxidize the soln. and treat with $(NH_4)_2HPO_4$ and $NH_4OH$, thus pptg. Li, Ba, Sr, Mg and Ca with the Fe, Al, Cr, Mn, Zn, Ni and Cr. Exam. the filtrate for K and Na as usual. Dissolve the ppt. in HCl and remove sulfates of Ba, Sr and Ca by treatment with $H_2SO_4$ and alc. In other ways the procedure is normal. G. A. BRAVO

**Volumetric determination of chlorine ions in presence of sodium fluosilicate.** S. K. CHIRKOV. *J. Applied Chem.* (U. S. S. R.) **5**, 1103–6(1932).—To the NaCl and $Na_2SiF_6$ soln. add NaOH until phenolphthalein gives a stable coloration. Titrate the resulting soln. with 0.1 *N* $AgNO_3$, using $K_2CrO_4$ as indicator. V. KALICHEVSKY

**Determination of hydrogen fluoride in air.** YU. D. GOLDENBERG. *J. Applied Chem.* (U. S. S. R.) **5**, 1088–96(1932).—Steiger's method is the most satisfactory (absorption in $Ti(SO_4)_2$ in $H_2SO_4$). Max. flow of air is 120 l./hr. Air is washed with water and not with alkalies. Phosphates are sepd. with $AgNO_3$. The defect of the method is the detn. of $SiF_4$ as HF. V. KALICHEVSKY

**Conductometric analysis. I. Acids and acid mixtures. II. Tan liquors and leather extracts.** EDWIN C. RIGHELLATO AND CECIL W. DAVIES. *Trans. Faraday Soc.* **29**, 429–37, 437–41(1933).—The theory of conductometric titrations is explained and typical titration curves are shown. A simple app is described which is easily constructed and is suitable. Conductometric titrations are advantageously used for titrating the acidity of leather exts. W. T. H.

**Determination of nitrous acid.** EMÖD V. MIGRAY. *Chem.-Ztg.* **57**, 48(1933).—To the nitrite soln. contg. 0.04–0.2 g. $N_2O_3$, add 20–50 cc. of 0.1 *N* $KBrO_3$ soln. and 5 cc. of HCl. Stopper the bottle and shake. After 2 min. add 2 g. KI and titrate the liberated $I_2$ with $Na_2S_2O_3$ as a measure of the excess bromate. W. T. H.

**Detection of small quantities of nitrous acid with indigosols.** EMÖD V. MIGRAY. *Chem.-Ztg.* **57**, 94(1933).—To 100 cc. of soln. add 5 drops of 10% indigosol 04 B soln. and 5 cc. of 7 *N* $H_2SO_4$. If 1 mg. of $N_2O_3$ is present per l. a dark blue color will develop. A color appears slowly with even less $N_2O_3$ and with more $N_2O_3$ a blue ppt. is formed. W. T. H.

**Volumetric analysis of fluosilicic acid.** V. YA. ANOSOV AND S. K. CHIRKOV. *J.*

*Applied Chem.* (U. S. S. R.) **5**, 1097–102(1932).—Of the 4 methods described by Treadwell and Hall that of Penfield is the simplest, most convenient, and gives sufficiently accurate results provided EtOH is added after the KCl soln. The method of Sahlbom can be also recommended, but titration is preferably carried out at room temp. The method of Schucht is less satisfactory as it is impossible to predict the amt. of $CaCl_2$ to be used. The method of Treadwell is unsatisfactory. V. KALICHEVSKY

**Coöperation between medical examiners and chemists in forensic determination of fatal poisoning. Phosphorus poisoning.** HERM. MERKEL. *Deut. Z. ges. gericht. Med.* **19**, 384–90(1932). FRANCES KRASNOW

**Alkalimetric microdetermination of chlorine and bromine in organic substances.** M. K. ZACHERL AND H. G. KRAINICK. *Mikrochemie* **11**, 61–73(1932).—Treat 4–6 mg. of the substance with $K_2Cr_2O_7$, $Ag_2Cr_2O_7$ and concd. $H_2SO_4$ at 115–25° and expel all liberated Cl and Br by means of an $O_2$ stream into a measured vol. of NaOH and $H_2O_2$. Each mol. of halogen causes the neutralization of 2 mols. of NaOH so that the halogen content can be calcd. from the NaOH neutralized as detd. by titrating the excess. W. T. H.

**Reactions of organic sulfur compounds. Preliminary note.** L. BERMEJO AND J. JIMÉNEZ HERRERA. *Anales soc. españ fís. quím.* **31**, 48–9(1933).—Alkyl sulfides with $Na_2Fe(CN)_5NO$ give a color almost like that produced with metallic sulfides. From $Me_2S$ to $Am_2S$ the reaction is pos.; with $Ph_2S$ and $Bz_2S$ there is no reaction. Homologs of $Bz_2S$ are being prepd. to det. the influence of the Ph radical. E. M. SYMMES

**Alleged specific test for acetone.** R. J. W. LE FÈVRE AND J. PEARSON. *J. Soc Chem. Ind.* **51**, 433–4T(1932).—Raw's test for acetone (*C. A.* **26**, 5276) is not sp. for acetone but gives pos. results with Et pyruvate, acetophenone and various substitution products of the latter. It appears to be peculiar to Me ketones contg. a reactive $CH_3$ group Improved directions for making the test are given W. T. H.

**Sugars by gravimetric methods. I.** YU. YAVNEL. *Farm. Zhur.* **8-9**, 251–2 (1932).—$Cu_2O$ obtained by reduction is ignited on the ashless filter paper, and from the wt. of CuO the sugar content is detd. L. NASAREVICH

**New method for the determination of benzyl groups in benzylcellulose.** L. MEUNIER AND M. GONFARD. *Rev. gén. plastiques* **8**, 591(1932).—The method, which is an adaptation of Zeissl's method for the detn. of OEt and OMe by means of concd. HI, is essentially as follows: to 0.3–0.4 g. sample (purified by alc. and dried to const. wt. at 80°) in a 100-cc. distg. flask add 20 cc. HI (d. 1.7) and a few pieces of pumice stone, connect the flask to a nearly horizontal bulb-condenser cooled with ice water, pass a current of dry $CO_2$ through the flask, heat with const. agitation to prevent local overheating, continue passing $CO_2$ for a few min. after the reaction is complete; fill a close-grained filter paper with crushed ice, disconnect the condenser and gradually raise it vertically over the funnel, wash the condenser with ice water to a total filtrate of 100 cc., dissolve the contents of the funnel in 95% alc., add 1 g. $AgNO_3$ (dissolved in 5 cc. $H_2O$), 100 cc. $H_2O$ and 40 cc. of 10% $HNO_3$, boil 2 min., filter, wash, dry and weigh the AgI; add 2.7 mg. as a correction for the BzI dissolved in the 100 cc. of ice water. A. PAPINEAU-COUTURE

**Determination of furfural produced from hardwoods.** HAROLD A. IDDLES AND PAUL J. ROBBINS. *Ind. Eng. Chem., Anal. Ed.* **5**, 55–7(1932).—With pure furfural solns. detns. by the usual phloroglucinol and the thiobarbituric acid methods agreed well with results obtained by the volumetric $KBrO_3$-KBr method of Powell and Whittaker (*C. A.* **18**, 1387). This volumetric method when applied to the detn. of furfural from hardwoods gave consistent results, 0.2–0.86% higher than those obtained by the phloroglucinol method. LOUIS E. WISE

**Color tests for salicylic acid and its derivatives.** A. ZAGORSKIKH. *Khim. Farm. Prom.* **10**, 377(1932).—One g. of $NH_4$ molybdate in 100 cc. of concd. $H_2SO_4$ gives a blue color changing to violet with aspirin, and violet changing to olive-green with salol and salicylic acid. L. NASAREVICH

**Microanalytical determination of picrolonic acid with the aid of acridine.** HERBERT SCHIEDEWITZ. *Z. physiol. Chem.* **214**, 177–8(1933).—The proposed method consists in detg. the picrolonic acid content of the salt by dissolving in dil. HCl, adding a 0.3% soln. of acridine in HCl and weighing the voluminous cryst. ppt. of *acridine picrolonate* after filtering, washing and drying 1.5 hrs. at 120–30°. A. W. DOX

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

**The sphalerite of Sajohaza and Rozsnyo, Hungary.** ROBERT REICHERT. *Centr. Mineral. Geol.* **1932A**, 426–32.—Crystallographic. An analysis is given. M. F

**Structural and morphological relationships of ores of the type $ABC_2$. I. The structures of wolfsbergite and emplectite and their relation to stibnite.** WILHELM HOFMANN. *Z. Krist.* **84**, 177–203(1933).—The orthorhombic cell of wolfsbergite ($CuSbS_2$) contains 4 mols. with $a = 6.01$, $b = 3.78$ and $c = 14.46$ A. U.; space group $V_h^{16}$. At. positions and parameters are given. Cu is surrounded tetrahedrally by 2 + 2S (Cu — S = 2.30 A. U.); Sb is surrounded by an irregular tetrahedron of S (Sb — S = 2.44 A. U., av.); 3 of these S atoms form an almost equilateral triangle with S — S = 3.74 A. U. Emplectite ($CuBiS_2$) is isomorphous, with $a = 6.12$, $b = 3.89$ and $c = 14.51$ A. U. Analogies with stibnite are discussed. L. S. RAMSDELL

**Mineragraphic study on the opaque minerals in the lavas from Mt. Elgon, British East Africa.** OLOF H. ÖDMAN. *Geol. Foren. Forh.* **54**, 285–304(1932)(in English). The opaque mineral in the lavas is mostly magnetite, accompanied by 18 others, including perovskite, valleriite, pyrrhotite, chalcocite, covellite, bornite and chalcopyrite. Several unknown minerals were present. The order of crystn. and the probable origin of the inclusions are discussed. WILHELM SEGERBLOM

**Rhodochrosite from the Emilia Appennines.** L. GIROLAMI. *Ann. chim. applicata* **22**, 686–91(1932).—The mineral, varying in color from greenish gray to yellow gray, as Fe or Mn predominates, is microcryst. with sp. gr. 3.6–3.7. An av. sample gave: $CaCO_3$ 6, $FeCO_3$ 20.5, $MnCO_3$ 41, $Al_2(SiO_3)_3$ 7, Fe and $Mn(OH)_2$ 24%. It is thus an Fe-rich rhodochrosite. A. W. CONTIERI

**The structure of spherocobaltite.** M. BACCAREDDA. *Atti accad. Lincei* **16**, 248–52 (1932).—Spherocobaltite, found in Liguria, is rhombohedral with $\alpha$ 103°22′, and side 5.72 A. U. The d., if the unit cell is assumed to contain $2CoCO_3$ mols., was calcd. as 4.10, observed, 4.0. The mineral contains 1.21% NiO; this is remarkable as $NiCO_3$ has not been previously prepd. or observed in nature. A. W. CONTIERI

**Crystal chemistry of the silicates.** FELIX MACHATSCHKI. *Geol. Fören. Förh.* 54, 447–70(1932).—Descriptive. WILHELM SEGERBLOM

**The role of aluminum in the chemical structure of feldspars.** J. MARTINET. *Rev gén. sci.* **43**, 702–5(1932).—A diagram proposed to show the constitution of anorthite is similar to one suggested for quartz, but every alternate Si has been replaced by Al, because the mineral should be considered as an aluminosilicate, and not as a double silicate. But if only every 4th Si is replaced by Al, the charge of the network is only half as large and the meshes will contain univalent ions (*e. g.*, Na, K) instead of bivalent Ca ions. The structure of orthoclase and albite will therefore be strictly comparable to that of anorthite. These diagrams agree with Vernadskii's ideas regarding aluminosilicates and with the electronic theory of valence, and have the advantage of furnishing a satisfactory explanation of known properties of feldspars. A. PAPINEAU-COUTURE

**Metamorphosed pyrophysalite.** IVAR D. WALLERIUS. *Geol. Fören. Förh.* **54**, 279–80(1932).—A pyrophysalite has been found at Gundlebo with a purple exterior zone composed essentially of $SiO_2$ and $Al_2O_3$ with a trace of Mn, but without the F content of the original topaz. WILHELM SEGERBLOM

**Thuringite and chamosite.** H. JUNG. *Chem. Erde* **7**, 594–608(1932); cf. *C. A.* **25**, 1461.—X-ray studies show that the structure of thuringite differs from that of chamosite. The products obtained by heating the minerals to 420° or 1000° differ from the original minerals and from each other. From new analyses, the compn. of thuringite is $76.4H_8(Mg,Fe)_4(Al,Fe)_4Si_2O_{18} + 23.6H_8(Mg,Fe)_6Si_4O_{18}$, and that of chamosite $64.3H_8(Mg,Fe)_4(Al,Fe)_4Si_2O_{18} + 35.7H_8(Mg,Fe)_4Si_5O_{18}$. MICHAEL FLEISCHER

**Chemical investigations of Japanese minerals containing rarer elements. XX. Allanite found in Yamaguti, Nagano.** KENJIRO KIMURA AND IÉTAKÉ OKADA. *J. Chem Soc. Japan* **54**, 9–11(1933).—By goniometric as well as chem. studies a slightly radioactive mineral from Yamaguti, Nagano was found to be allanite rich in rare earths. **XXI. Columbite found in Yamaguti, Nagano.** KENJIRO KIMURA AND SAKAE SHINODA. *Ibid* 11–13.—In the same way another slightly radioactive mineral was shown to be columbite. T. KATSURAI

**The vanadinite of Hérival [Vosges].** L. LONGCHAMBON AND H. LONGCHAMBON. *Compt. rend.* **195**, 1397–8(1932).—A remarkable example of the isomorphism of minerals of the apatite type is found in a recently analyzed mineral contg. P, As, V, Pb, Ca, Cl and F from the Combeauté Valley. M. MCMAHON

**A new type of iron aluminum phosphate deposit [Maranhao, north Brazil].** FRIEDRICH BRANDT. *Chem. Erde* **7**, 383–425(1932).—A microscopical and chem. investigation of a deposit of *phosphatized laterite* is described. As revealed by 4 borings, the profile comprises an iron cap, a zone of loose spherolite, Fe and Al phosphate tubes, a layer of amorphous Al phosphate, and clay with diabase beneath. *Harborite*, $6Al_2O_3{\cdot}4P_2O_5{\cdot}17H_2O$, a new mineral occurring in octahedral form, with hardness 5–5.5, sp. gr. 2.781, optically —, birefringence low, $1.602<n<1.618$, is found in the cap and 2nd layers. From an investigation of the origin of the $P_2O_5$, involving a study of its adsorption by limonite, bauxite and freshly pptd. Fe and Al hydroxides, B. concludes that the $P_2O_5$ has been brought in by infiltration from deeper-lying strata. W. L. HILL

**A new hexahedrite from Cerros del Buen Huerto, Chile.** F. HEIDE, E. HERSCHKOWITSCH AND E. PREUSS. *Chem. Erde* **7**, 483–502(1932).—This meteoric iron is a normal hexahedrite with troilite, schreibersite, daubréelite and graphite. X-ray data are given for kamacite, troilite, rhabdite and daubréelite. W. L. HILL

**The ore-bearing marble at Auerbach [Germany].** RUDOLF KÜHNE. *Chem. Erde* **7**, 503–39(1932).—A complete paragenetic scheme is outlined. Hydrothermal action of waters with varying As and S contents caused the zonal deposition of various sulfides, arsenides, thioarsenites and thioantimonites of Cu, Pb, Fe, Ni, Co, Bi and Ag, with small amts. of native metal. Assocd. with these are magnetite, pyrrhotite, graphite and molybdenite formed by pneumatolytic action, and secondary oxidation products such as erythrite, malachite, covellite and oxides of Fe and Mn. A detailed description is given of the mode of occurrence of safflorite, niccolite, rammelsbergite and 3 types of smaltite. MICHAEL FLEISCHER

**Kaolin.** ROBERT SCHWARZ AND GEORG TRAGESER. *Chem. Erde* **7**, 566–85(1932); cf. *C. A.* **25**, 4987.—The dehydration of kaolin was studied by a combined dilatometric and tensimetric method. The dehydration curves for natural and synthetic kaolins were similar. There is a considerable lag between the loss of $H_2O$ and the change in crystal structure. This is explained by assuming the course of dehydration to be: kaolin ⟶ "anhydrokaolin," an unstable cryst. compd. ⟶ amorphous metakaolin. The heat of dissocn. of kaolin into metakaolin and $H_2O$ is calcd. to be —33.5 kg. cal./mol. at 490°, and the heat of formation of kaolin from the elements is +18 kg. cal./mol. MICHAEL FLEISCHER

**New data on the great salt deposit on the island Chelekenui secured by geological prospecting.** K. P. KALITZKII. *Neftyanoe Khozyaïstvo* **20**, 341–54(1931). A. A. B.

**Preliminary results of geological prospecting in the Barzas districts.** V. A. ORESTOV. *Khim. Tverdogo Topliva* **2**, No. 11–12, 121–7(1931).—Data concerning 6 new coal layers, which are very similar in their chem. characteristics, are given. A. A. B.

**Endogenic basic inclusions in acid igneous rocks. I. The basic inclusions in the tonalite of Adamello.** C. GOTTFRIED. *Chem. Erde* **7**, 586–93(1932).—The basic inclusions are poorer than the normal tonalite in orthoclase and quartz, richer in amphibole and biotite. Possible explanations of their origin are discussed in the light of petrographical and analytical data. MICHAEL FLEISCHER

**Weathering and decomposition phenomena in the South Hanoverian basalts.** E. BLANCK, W. DÖRFELDT AND F. LAVES. *Chem. Erde* **7**, 540–52(1932).—Analyses show

that recent weathering leads to a final product different from the red product from decompd. basalt. This is probably due to changing climatic conditions. M. F.

**The weathering of granite from Schenkenberg in the Odenwald.** E. BLANCK *Chem. Erde* **7**, 553–65(1932).—Analyses of the gross compn. and the HCl exts. show that the course of the decompn. is different when the granite is in contact with humus. MICHAEL FLEISCHER

**The formation of red earth.** E. BLANCK, E. v. OLDERSHAUSEN AND G. MAURMANN. *Chem. Erde* **7**, 620–40(1932); cf. *C. A.* **22**, 4423; **25**, 3280. MICHAEL FLEISCHER

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD RIMBACH

**Gold, silver, copper, lead and zinc in New Mexico and Texas in 1931.** C. W. HENDERSON. Bur. Mines, *Mineral Resources of the U. S.* **1931**, Pt. I, 297–316(preprint No. 17, published January 20, 1933). E. H

**Zinc in 1931.** E. W. PEHRSON. Bur. Mines, *Mineral Resources of the U. S.* **1931**, Pt. I, 265–96 (preprint No. 16, published January 16, 1933). E. H.

**Secondary metals in 1931.** J. P. DUNLOP. Bur. Mines, *Mineral Resources of the U. S.* **1931**, Pt. I, 317–30 (preprint No. 18, published January 30, 1933). E. H.

**Principles of flotation. II. An experimental study of the influence of cyanide, alkalies and copper sulfate on the effect of potassium ethyl xanthate at mineral surfaces.** IAN W. WARK AND ALWYN B. COX. *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. **495**, 24 pp.(1933); cf. *C. A.* **26**, 1881–2.—The solns. used previously differed widely from those of modern flotation circuits; in this and later work the principal flotation reagents will be introduced. An attempt has been made to det. the joint influence of alky. and cyanide concn. on the establishment of air-mineral contact, and the use of $CuSO_4$ as an activating agent. The amt. of cyanide required to depress the Cu and Fe minerals at any given $p_H$ value increases in the following order: pyrite, chalcopyrite, bornite, covellite, chalcite; this effect seems to be dependent only on the cyanide-ion concn. There is a critical $p_H$ value for each mineral above which, even in the absence of cyanide, the response to the standardized soln. of K Et xanthate used in the investigation (25 mg. per l.) is prevented. Galena is not affected by cyanide; it is activated by $CuSO_4$ in solns. in which the $p_H$ value is higher than the critical value. It is considered possible that the formation of the complex cupricyanide ion, $Cu(CN)_3^{--}$, may explain why, in the less alk. solns., normal activation does not result. Certain frothers do not have a significant influence on the cyanide and alk. effects, nor do they influence contact angles. Numerous bibliographical footnotes are included. A. W. FURBANK

**Platinum in nickel sulfide ores.** STEINAR FOSLIE AND MIMI J. HØST. *Norg. Geol Undersøkelse* No. **137**, 71 pp.(1932)(résumé in German).—Ores occurring in the Ofoten and Grong fields, recently surveyed geologically, were analyzed for metal content by the microanalytical method (Lunde, *C. A.* **21**, 2636; L. and Johnson, *C. A.* **22**, 3869). The only Ni deposit showed an appreciable Pt content. Available data on the Pt content and Pt recovery from other Norwegian and foreign Ni ores are reviewed. Only the South African ores are well known. The important Canadian ores have not been described well. E. M. SYMMES

**Methods for the determination of the viscosity of slags.** K. A. Pohle. *Mitt. Forschungsinst. Ver. Stahlwerke A. G. Dortmund* **3**, 59–60(1932).—The reactions between slag and metal are important in many metallurgical processes. As the velocity of a process often depends on the viscosity of the slag and the latter again on the temp., the various methods for the detn. of coeffs. were compared and certain rules developed for comparable measurements. A torsion method was developed which was very useful and exact for lab. purposes; a little vessel contg. the slag was rotated and the velocity with which an immersed rod is taken along is measured. 42 references. **The height of the blast furnace.** E. Cotel. *Mitt. berg. hüttenmänn. Abt. ungar. Hochschule Berg. Forstw. Sopron* **3**, 23–30(1931).—A rounded long quadrangle is proposed as horizontal profile of blast furnaces with a const. height and breadth of 2.5 m. S. S. de Finály

**Use of data on heats of reduction and the thermochemistry of the blast furnace.** Dániel Diószeghy. *Bányász. Kohász Lapok* **65**, 334–7(1932).—The production of the higher oxide of Fe gives no advantage from the thermochem. point of view. The required heat energy is increased by higher oxidation. Calcns. of Svehla (*C. A.* **26**, 5280) are based upon incorrect data. S. S. de Finály

**Heats of reduction.** Gyula Svehla *Bányász. Kohász. Lapok* **65**, 337–8(1932); cf. preceding abstr.—Lower-oxide Fe ores cannot be reduced as easily as roasted ores. The slight variation of basic data does not change the final conclusions. Not only the reduction of different oxides but also the degree of indirect reduction should be observed. S. S. de Finály

**Cupola linings.** J. G. A. Skerl. *Bull. Brit. Cast Iron Research Assoc.* **3**, 170–6 (1933).—Linings of bricks and of rammed materials were investigated; bricks or cut rocks are more prevalent in practice. Fire bricks are more resistant than silica bricks to spalling or splitting by sudden changes of heat and also to the action of slags. The alumina content must be high in order to make the brick heat-resistant. The higher the alumina content and the more nearly the silica content approaches 100%, the more satisfactory is the material from the heat-resisting standpoint; the alumina content should be less than 7% or higher than 25%, as the curve of refractoriness shows a steep min. of less than 1000° at about 10% $Al_2O_3$. The influence of FeO on both fire bricks and silica materials under reducing conditions is very great; fire bricks are generally more resistant. Tables and curves of fusion points of FeO with aluminas and silicas are given. Good working conditions in a cupola are obtained when the refractoriness of the lining is as high as possible to resist the heat generated by the blast on hot coke, the slag is fairly high in lime, and the lining contains as little bonding material as possible. If the slag is highly ferruginous a highly aluminous brick is to be preferred. M. H.

**The absolute dimension of a metal surface.** Otto Erbacher. *Naturwissenschaften* **20**, 944–5(1932).—The total surface of metals can be detd. by coating with a monat. layer of a radioactive metal; the total active surface of a noble metal is detd. by preliminary adsorption of H and subsequent coating. For Ni, Ag and Au by the 1st process the total surface in sq. cm. per sq. cm. of measured surface found is 1.72 for the polished metal and 2.53 and 2.49, resp., for the fine- and coarse-sand-papered surfaces. For Pt by the 2nd method the active surface is 0.065–0.44 sq. cm. for the polished metal, 2.17 and 2.08 for the sand-papered surfaces, 16.9 for a platinized surface. B. J. C. v. d. H.

**Single crystals of the intermediate compound antimony-tin.** H. S. van Klooster and M. O. Debacher. *Metals & Alloys* **4**, 23–4(1933).—Single crystals of the compd. Sb-Sn about 5 cm. long were obtained by the method of Obreimow and Schubnikow, the interval of cooling from 480° to 300° being 15 hrs. Downs Schaaf

**The formation of localized slip layers in metals.** C. W. MacGregor. *Metals & Alloys* **4**, 19–22(1933).—There were investigated (1) the effect of previous cold-work

on the clearness of flow layers in Al and (2) the magnitude of unit shear strain along a flow layer of mild steel. DOWNS SCHAAF

**Creep characteristics of metals at elevated temperatures.** A. E. WHITE AND C. L. CLARK. *Trans. Am. Soc. Steel Treating* **21**, 1–16(1933).—See *C. A.* **26**, 5892. W. A. MUDGE

**The specific heat of Monel metal between —183° and 25°.** W. F. HAMPTON AND J. H. MENNIE. *Can. J. Research* **7**, 677–9(1932).—The heat capacity of Monel metal over the range —183° to 25° was measured in an adiabatic calorimeter. By differentiation of the equation representing the heat-capacity curve, an equation for the sp. heat over this range is obtained, and values calcd. at various temps. are tabulated. The sp. heat at 20° is 0.0997. The equation is $C = 0.09948 + 0.00003368t - 0.0000012501t^2$. J. W. SHIPLEY

**The accuracy of the Brinell test when used for plant control.** MAX MOSER. *Stahl u. Eisen* **53**, 16–8(1933).—With a 10-mm. ball and 3000-kg. load, tests carried out in different plants gave results of an accuracy of ±5%. This range is extended when steel with a hardness of 600 or more is tested, especially when balls smaller than 10 mm. are used. M. recommends use of the Brinell test only for soft and medium-hard steel. To test steel with a hardness of 600 or more the use of a cone or four-cornered pyramid is suggested instead of the ball. By this the accuracy of the measurements is increased and greater uniformity obtained among the readings of the various observers. J. A. S.

**Frictional oxidation.** MAX FINK AND ULRICH HOFMANN. *Arch. Eisenhüttenw.* **6**, 161–4(1932).—Rolling of electrolytic Fe and Cu, and of pure Ni produces a thin surface film of oxides of these metals. Rolling in an atm. of $N_2$ causes less wear and less friction. Formation of oxides is explained by assuming that rolling of metallic surfaces over one another brings about local deformations in the surface layer with the appearance of weak spots in the lattices. These spots are extremely active chemically and oxidize readily in contact with air. This oxidation may occur to a considerable depth and thus cause scaling and loosening of the outer layer. Frictional oxidation is also an important factor in the formation of fissures in rolled material. H. S. v. KLOOSTER

**Heat capacity of some metals, alloys and slag formers at temperatures up to 1200°.** H. ESSER, R. AVERDIECK AND W. GRASS. *Arch. Eisenhüttenw.* **6**, 289–92(1933).—The sp. heats of Cu, Pt, 3 German silver alloys, alumina, quartz, artificial and natural magnetite, MnO and fayallite were detd. from 0 to 1250°. Twenty-seven references are given. M. HARTENHEIM

**Surface effects on assay beads caused by metals of the platinum group.** J. L. BYERS. *Bull. Michigan Coll. Min. & Tech.* **6**, 1–17(1933).—See *C. A.* **26**, 2152. M. HARTENHEIM

**Mineralization, electrolytic treatment and radiographic examination of copper and bronze objects from Nuzi.** RUTHERFORD J. GETTENS. *Tech. Studies Field Fine Arts* **1**, 119–42(1933).—The mineralization of nails found at Nuzi, Iraq, which had been buried about 3500 years under 130 cm. of stiff damp clay, was studied by cross-sectioning the nails along various axes so that all the interior zones would be exposed. Four major zones were observed in the spike portion of the nails: (1) a central core having all the properties of native metallic Cu; (2) an inner, nearly colorless zone, translucent where pure, consisting chiefly of CuCl and corresponding to the rare mineral nantokite; the minor components of this layer are distributed in well defined layers as follows: (a) nearest the center a black opaque layer appearing to be a form of cerargyrite (AgCl), (b) a zone of nantokite which is nearly colorless and free from minor constituents, (c) a 2nd black opaque layer of cerargyrite apparently identical with (a) but much thinner, (d) a reddish brown translucent layer having the characteristics of an Fe compd., consisting probably of a hydrated ferric oxide of the limonite ($2Fe_2O_3.3H_2O$) type, (e) a colorless translucent layer apparently of pure nantokite which serves as the matrix and chief component of the whole zone; (3) a deep red opaque zone of cuprite ($Cu_2O$); (4) a thick outer zone of green oxychloride of Cu corresponding to atacamite, ($CuCl_2.3Cu(OH)_2$). From the study of the corrosion products surrounding the Cu core,

it is evident that reactions have taken place which are similar to those observed under artificial conditions by Bengough *et al.* (*C. A.* **14**, 1957), Lean and Whatmough (*J. Chem. Soc.* **73**, 150(1898)) and Mellor (*Inorg. and Theoretical Chemistry* **1923**, 157–68; cf *C. A.* **17**, 2225). This is apparently the first time that the actual presence of CuCl as an intermediate product of corrosion has been reported. The probable causes of the presence of the minor components of zone (2) are discussed. From the experience gained in the electrolytic treatment of the Cu nails and also of bronze objects, it is concluded that the method will not bring back original outlines where mineralization has resulted in the almost complete transformation of the objects to the basic Cu chloride; this product lacks uniformity and compactness and is usually penetrated with earthy material. When the chief mineral product is cuprite, electrolysis is successful so far as the recovery of form is concerned; but if the object has been completely transformed to cuprite, even after electrolytic treatment it will be extremely brittle. Only when it has a metallic core surrounded by a layer of cuprite may one hope to restore the object so that it will have both form and rigidity. A study of radiographs of several Cu nails and a subsequent sectioning and electrolytic treatment showed that diagnosis of the internal structure of badly mineralized Cu and bronze objects (especially small ones) is much aided by the use of x-rays. A. PAPINEAU-COUTURE

**Coloring of copper and iron in salt melts.** H. KRAUSE. *Mitt. Forschungsinst. Probieramt Edelmet.* **6**, 74–81(1932), 114–22(1933).—On Cu, Fe and their alloys in melts of pure salts or mixts. of salts clean, deep colors are obtained not so much by the length of immersion time in the melt but rather by a certain degree of overheating the melt above the melting point, even up to red heat. The most used salts are $NaNO_2$, $NaNO_3$, $Na_2CrO_4$, $Na_2Cr_2O_7$, $NaClO_4$, $NaBO_3$, $KNO_3$, $KNO_2$, $K_2CrO_4$, $K_2Cr_2O_7$ and $KMnO_4$. NaOH and $Na_2O_2$ also may be used. The colors obtained, mixts. of salts, compn. and time of immersion are described in detail in 25 tables. M. HARTENHEIM

**Coloring of copper and brass.** M. GROSSIEAUX. *Cuivre et laiton* **6**, 35–7(1933).—Several recipes for cleaning and pickling brass with $H_2SO_4$, or $H_2SO_4$ with chromic acid, or $HNO_3$, or a mixt. of $H_2SO_4$ and $HNO_3$ are given. Cu can be colored green ("patina") by an ordinary salt soln. of 25 g. per l. $H_2O$ which is repeatedly applied to the surface until the desired color is obtained; the same effect can be brought about by a soln. of 1 lb. $NH_4Cl$ in about 20 l. $H_2O$. With a soln. of 5 l. $H_2O$ (70°), 4–8 g. K sulfide and 10 drops $NH_3$ (26%), the metal assumes successively the tints brown, bronze-red, blue-black, black; the treatment is stopped when the desired tone is obtained. Blue or black on brass, according to the duration of immersion, is obtained in a soln. of 5 l. $H_2O$ (80°), 250 g. $Na_2S_2O_3$, 30–60 g. Pb acetate. Brass is also blackened by 68 parts of $NH_3$ (0.91 sp. gr.) and 10 parts basic Cu carbonate, in which soln. the metal is vigorously moved about. Details of treatment are given. M. HARTENHEIM

**Cast iron and the diagram of Maurer.** G. D'ARDIGNY. *Rev. fonderie moderne* **26**, 471–3(1932).—The relation between C and Si in a cast iron and its representation in the diagram by Maurer, as well as the application of the diagram for detg. the required percentage for a given wall thickness is explained. M. HARTENHEIM

**Effect of alloys in cast iron.** R. C. GOOD. *Foundry* **21**, 24–5, 54(1933). E. H.

**Investigation at elevated temperatures of some types of steel manufactured by the Izhorskii mill.** S. I. VOLFSON. *Neftyanoe Khozyaĭstvo* **22**, 335–41; **23**, 97–104(1932).—The steels tested (*A*, *B*, *C* and *D*) contained, resp.: C 0.32, 0.31, 0.34, 0.35; S 0.047, 0.064, 0.060, 0.058; P 0.02, 0.07, 0.083, 0.025; Mn 1.39, 1.1, 1.35, 0.83; Cr 0.9, 0.67, —, —; Ni 5.15, 5.21, 0.2, —; Si 0.34, 0.45, 0.34, 0.12%. The short-time tensile strength decreased for all samples except *D* within the temp. range 100–200°, then increased up to 300°, and at 600° amounted to $^1/_6$–$^1/_4$ of that at room temp. The proportional limit decreased for all steels with increase in temp. The impact resistance did not show any change between 20° and 400°; above this a rapid drop took place, and at 600° and higher curves for impact resistance were parallel to those of short-time tensile strength. The elongation of steels *A* and *B* increased only slightly up to 300–400°. The deformation diagrams show a lowering up to 200°, followed by an increase with a max. at 300° and a steep decrease above 400°. The influence of the temperature on the Brinell hardness of the metal was slightly lowered at 100–200°, increased to a max. at 300° and decreased rapidly above 400°. This drop was considerably higher for *A* than for *C* and *D*. The influence of the temperature on the impact test showed a max. at 100–200° and a min. at 500°. The extreme brittleness of *C* may be explained as due to the high content in S. Creep tests showed that the continuous strength at 400° lies considerably above the 0.2% limit, while at 500° it is below the 0.1% limit. Attention is drawn to the brittleness at 450° to 550°, the operating temps. of *cracking coils*. A. A. BOEHTLINGK

**The effect of the magnetic field on the aging phenomena in hardened steel.** ALBRECHT KUSSMANN AND HANS J. WIESTER. *Stahl. u. Eisen* **52**, 944–6(1932).—Rotation of the magnetic field has no effect on the Rockwell and pendulum hardness of C steel

with 0.7–0.9% C either at room temp. or during annealing at 100°. This is contradictory to the results of Herbert (*C. A.* **23**, 5457). J. A. SZILARD

**Hot-hardness of high-speed steels and related alloys.** OSCAR E. HARDER AND H. A. GROVE. *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. **497**, 39 pp.(1933).—The Brinell hardness figures of a large no. of high-speed steels and related alloys were detd. by using the mutual-indentation method as developed by Cowdrey. DOWNS SCHAAF

**Making visible the primary structure of steel by addition of radioactive thorium.** B. G. TAMMANN AND G. BANDEL. *Arch. Eisenhüttenw.* **6**, 293–6(1933).—Addn. of ThB up to a max. of $1 \times 10^{-6}$% made visible, in electrolytic iron and different steels, the primary structure and submicroscopic slag inclusions by placing the samples on photographic plates. These radiograms show the edges of the crystallites, where the radiating ThB accumulates, dark and the center light. As ThB has only a short life, the radiogram must be taken within 24 hrs. after the melt is made. M HARTENHEIM

**Scaling of steel at heat-treating temperatures.** CLAIR UPTHEGROVE AND D. W. MURPHY. *Trans. Am. Soc. Steel Treating* **21**, 73–90(1933).—Relative scaling effects of SAE 1020 steel in atms. of air, CO, $CO_2$ and $H_2O$ at 1000° to 2000°F. were studied. Scaling does not increase regularly with increase in temp. in the simple atm., air, $O_2$ and $CO_2$. A max. and min. are observed for $CO_2$ at 1400° and 1520°F., and for air at 1800° and 2000°F Retardation in rate of scaling in $O_2$ is observed at 1800°F. Little scale is produced below 1700°F. by combustion atms. contg. 4% or more of CO. W. A. MUDGE

**Non-corroding and acid-resisting steel.** REIDAR LUND. *Teknisk Ukeblad* **79**, 20–2(1932).—An illustrated review dealing chiefly with the properties and use of Cr and Ni-Cr steels. C. A. ROBAK

**Properties of low-carbon, medium-chromium steels of the air-hardening type.** E. C. WRIGHT AND P. F. MUMMA. *Am. Inst. Mining Met. Engrs. Tech. Pub.* No. **496**, 11 pp.(1933).—The phys. properties of a series of 12 steels of varying C and Cr contents are described. Steels contg. over 3% Cr and over 0.10% C develop high strength combined with great toughness after simple heat-treatment not involving quenching in liquid media. The steels contg. from 3 to 7% Cr are martensitic after air-hardening and show a ferritic matrix with spheroidized carbides after furnace cooling. Corrosion tests are included. DOWNS SCHAAF

**Copper steel in the construction of boilers.** F. NEHL. *Cuivre et laiton* **5**, 473–6 (1932).—Several Cu steels (for the most part com. German Cu steels) with 0.12–0.85% Cu were tested up to 600°, and the results are given in diagrams. The tensile strength, elastic limit, and especially the ratio tensile strength to elastic limit are, over the whole temp. range, superior to those of ordinary C steel. M. HARTENHEIM

**Copper-molybdenum steel.** ANON. *Cuivre et laiton* **5**, 479–81(1932).—This steel presents a particularly high resistance to corrosion; its compn. is C 0.04–0.05, Cu 0.25 0.35 and Mo (about) 0.05–0.07, Mn 0.45, S 0.013, P 0.014, Si 0.01%. Mo forms a solid soln. with the ferrite which cannot be detected in micrographs, and gives to the steel a very fine and homogeneous grain structure This steel is little segregated and shows macrographically a remarkable purity. It can easily and effectively be welded with the elec. arc as well as with gas. The addn. of Mo to Cu steel increases the corrosion resistance, gives greater ductility and greater reduction of area and increases the impact resistance; it also increases the resistance to oxidation at elevated temps. and increases the ratio of tensile strength to elastic limit. Test results are given in detail. M. H.

**Heat-resistant chromium-aluminum steels.** ERICH SCHEIL AND ERNST H. SCHULZ *Arch. Eisenhüttenw.* **6**, 155–60(1932).—Low-carbon steels (C 0.03–0.26%, Si 0.02–0.45%, Mn 0.25–0.58%) contg. varying percentages of Al (0.5–14.2%) or Cr (0.93–18.00%) or both were studied with regard to their heat resistance at temps. up to 1200°, their acid resistance and their elec. resistance at different temps. The steels investigated when heated for several hrs. at different temps. show striking differences both in the appearance of the surface scale and in the x-ray spectrograms obtained. The best heat-resistant steels showed a white Al oxide scale. The next best steels are those with a Cr oxide scale which for high Cr-content are, likewise, heat resistant. The least resistant against scaling are those steels that show black hammer scale. At temps. not exceeding 900° a fair degree of resistance to scaling is attained with percentages as low as 3% Al and 4% Cr, but at temps. above 1000° a high percentage of Al is necessary to get a high degree of heat resistance. Resistance to acid attack, however, decreases as the Al content increases. Both Al and Cr increase the elec. resistance of the steels, their effect being greater at low temps. High Cr lowers the temp. coeff. of elec. resistance. The excellent antiscaling properties combined with high elec. resistance suggest the use of Al-Cr steels for resistor wire in elec. furnaces. H. S. v. KLOOSTER

**Aluminum-antimony alloys.** J. VESZELKA. *Mitt. berg- hüttenmänn. Abt. ungar. Hochschule Berg- Forstw. Sopron* **3**, 193–201(1931).—The constitutional diagram of Al-

Sb alloys is detd. The ground mass in the alloys contg. more than 18.4% Al and the secondary crystn. of the same alloys remains uncertain. Al-Sb changes in moist air to a black powder, since its Al content is oxidized to $Al_2(OH)_6$. S. S. DE FINÁLY

**Aluminum-silicon alloys.** BRONIEWSKI AND SMIALOWSKI. *Rev. mét.* **29**, 542–52, 601–4(1932).—The properties of the Al-Si system were studied on alloys made of 99.7% Al and 97.3% Si. Specimens were chill-cast, annealed for 50 hrs. in a vacuum at 520° and cooled to room temp. in 50 hrs. The eutectic contained 11.5 at. % Si and was found at 575°. The limit of solid soly. of Al in Si is 4 at. % at the solidus and 3 at. % at room temp. Alloys with about 94% Si have a sp. resistance of 0.07 ohm/sq. cm. and a practically zero temp. coeff. They are brittle but can be used for resistors. A thermoelec. couple formed of 96 and 97% Si alloys has the e. m. f. $E \times 10^6 = 656t + 0.98t^2$. To check the advantages claimed for Ti addns. $TiCl_4$ was bubbled through the metal at 800°. The metal tested as cast did not show any improvements, while the metal treated with a mixt. of NaCl and NaF was much improved. JOHN D. GAT

**Non-rusting and heat-resisting 34% chromium alloy cast irons.** E. HOUDREMONT AND R. WASMUHT. *Metals & Alloys* **4**, 13–17(1933).—See *C. A.* **26**, 4292. DOWNS SCHAAF

**Development and trend in ferrous alloys for high-temperature service.** F. N. SPELLER. *Proc. Am. Petroleum Inst.* Sect. III, 13th Ann. Meeting, 102–13(1932). E. H.

**Hardenable lead alloys.** B. GARRE AND F. VOLLMERT. *Z. anorg. allgem. Chem.* **210**, 77–80(1933).—The hardening influence of addns. of Ag, Sn and Cd on Pb was investigated. In all cases a more or less appreciable hardening effect was noticeable quenched samples showing a greater hardness than slowly cooled samples. An etching method using 120 cc. concd HCl, 100 cc. $H_2O$, 90 g. crystd. Cu chloride was particularly suitable for Pb alloys. M. HARTENHEIM

**Sodium-lead alloys—structure of the compound known as $Na_4Pb$.** CHARLES W. STILLWELL AND WALTER K. ROBINSON. *J. Am. Chem. Soc.* **55**, 127–9(1933).—Diffraction data for $Na_4Pb$ indicate that it is analogous with the γ-phase of Cu, Ag and Au alloys, and that its formula is really $Na_{31}Pb_8$. L. WALDBAUER

**Alloys of lithium; thermal and x-ray analysis of the system: lithium–tin.** A. BARONI. *Atti accad. Lincei* **16**, 153–8(1932).—The system Li–Sn was studied by the method of Pastorello (*C. A.* **25**, 270, 2959, 3227). The equil. diagram shows the existence of 3 compds., $Li_4Sn$, m. 684°, $Li_2Sn_2$, m. 483°, and $LiSn_4$, and of 3 eutectics m. 458°, 320° and 214°, contg. 35, 58 and 94% (atomic) of Sn, resp. X-ray analysis, however, shows only the first 2 compds. The Debye photograms, made by using an Fe anticathode, are very complex, so that the consts. could not be calcd. The compd. $LiSn_4$ could not be identified by the spectrograph, as it decomposes during the cooling. A. W. CONTIERI

**Further studies on chromium-nickel-iron and related alloys.** VSEVOLOD N. KRIVOBOK, E. L. BEARDMAN, H. J. HAND, T. O. A. HOLM, A. REGGIORI AND R. S. ROSE. *Trans. Am. Soc. Steel Treating* **21**, 22–60(1933).—See *C. A.* **26**, 67. W. A MUDGE

**The thermal and electric conductivities of a number of magnesium alloys and their behavior under the Wiedemann-Franz law.** RIMPEI KIKUCHI. *Science Repts. Tôhoku Imp. Univ.*, First Ser., **21**, 585–93(1932).—See *C. A.* **26**, 5532. J. D. S.

**Palladium-nickel alloys.** A. T. GRIGOR'EV. *Ann. inst. platine* No. **9**, 13–22 (1932).—In Pd-Ni alloys the max. hardness (156.0 Brinell) corresponds to the alloy of 60.64 at. % Pd. Alloys contg up to 50% Pd have a finer cryst. structure after tempering than those rich in Pd. The temp. coeff. of elec. resistance decreases at the beginning with increase of Pd and after reaching a min. gradually rises to a max. of 0.00576 for 70.80 at. % Pd, then drops sharply and gradually proceeds to that of pure Pd. The abrupt break corresponds to the magnetic transition point. The study confirms findings of previous investigators in regard to formation of a continuous series of solid solns. W. P. ERICKS

**Platinum-cobalt alloys.** V. A. NEMILOV. *Ann. inst. platine* No. **9**, 23–30(1932).—The fusion temp. of Pt-Co alloys reaches a min. at about 25 at. % Pt (approx. 1468°) and increases thereafter to the m. p. of Pt. The addn. of Co to Pt causes an increase of hardness reaching the first max. in an alloy contg. 12 at. % Pt. Upon further increase in Pt content, the hardness of the alloy decreases and at 20–25 at. % Pt approx. equals the hardness of pure Co. It then increases again, reaching a second max. at 50 at. % Pt, and decreases thereafter gradually to the hardness of pure Pt. Photomicrographs revealed that the alloys do not alter their structure when tempered at 500°. Tempering at 1200° changed the structure of low-Pt alloys but did not affect the polyhedral structure of the high-Pt alloys. There is a gradual increase in elec. resistance with addn. of Co to Pt and a simultaneous decrease of temp. coeff. At all high temps. (above 1128°) the system Pt–Co represents a continuous series of solid solns. During the cooling of

alloys rich in Co at the magnetic transition temp. of Co (1115–1128°) the alteration of one solid soln. into another takes place. Alloys rich in Pt represent a series of solid solns. at all temps. W. P. ERICKS

**The ternary system: iron–nickel–tungsten.** KAZIMIR WINKLER AND RUDOLF VOGEL. *Arch. Eisenhüttenw.* 6, No. 4, 165–72(1932).—The ternary system Fe–Ni–W was investigated by means of thermal analysis, magnetic measurements and particularly by metallographic observation of the solid alloys, annealed and quenched from different temps. The results are expressed in a space model, various cross-sectional temp.-concn. diagrams and numerous photomicrographs. Four satn. surfaces are indicated from which separate, on cooling: (1) ternary α-solid solns., (2) ternary γ-solid soln., (3) crystals of $Fe_2W_2$ and (4) ternary solid solns. rich in W. Two 4-phase equilibria were found: (1) melt + α-solid solution $\rightleftharpoons$ γ-solid soln. + $Fe_2W_2$ and (2) melt + $Fe_2W_2$ $\rightleftharpoons$ γ-solid soln. + solid soln. rich in W. H. S. v. KLOOSTER

**Multiple systems with iron. V. Röntgenographic supplements for the systems: chromium–carbon and iron–silicon–phosphorus.** F. SAUERWALD, W. TESKE AND G. LEMPERT. *Z. anorg. allgem. Chem.* 210, 21–5(1933).—Certain discrepancies in the Cr-C diagram in the range from 0 to 9% C were investigated more thoroughly by x-rays. The coexistence of a stable system besides a metastable system was confirmed. The stable eutectic was found at 4.24% C, the metastable at 4.51% C. The x-ray investigation of the Fe-Si-P alloys showed the existence of the crystals $Fe_2P$, $Fe_3P$, $Fe_M$, $Fe_2Si_2$ and FeSi. The results are discussed at length with regard to the transformations taking place. Six references are given. M. HARTENHEIM

**Rapid detection of rates of corrosion with simplified apparatus.** CLOYD M. CHAPMAN. *Water Works & Sewerage* 79, 282–4(1932); *U. S. Pub. Health Eng. Abstracts* 12, W, 139(Nov. 19, 1932); cf. *C. A.* 26, 340.—Prepn. of the surface of corrosion test specimens of metals and alloys by pre-test polishing to a sufficient degree to permit microscopic detection of the character and progress of the corrosive attack offers a means for making rapid detns. of the relative suitability of the material to resist corrosion. The test is very delicate, as indicated by the fact that exposure for only a few hrs may be sufficient to indicate a difference in the extent of corrosion produced by minor differences in the quantities of corrosive elements present. C. R. FELLERS

**Experiments on the corrosion of metals in mayonnaise plants. Results of tests made in plants under actual operating conditions.** F. L. LAQUE. *Spice Mill* 55, 1414–16, 1421(1932).—The corrosion tests indicate that Inco Chrome Nickel (81% Ni, 13% Cr, 6% Fe) and 18–8 chromium-nickel-iron alloy are the most appropriate for general use in mayonnaise plants. F. L. DUNLAP

**The corrosion and protection of condenser tubes.** M. VARINOIS. *Caoutchouc & gutta-percha* 30, 16272–4(1933).—A discussion of the different kinds of corrosion. C. C. DAVIS

**Effect of oxygen pressure on the corrosion of steel.** A. R. LEE. *Trans. Faraday Soc.* 28, 825–6(1932).—Reply to objections by Evans and Borgmann (cf. *C. A.* 27, 486) LEOPOLD PESSEL

**The importance of chemical reactions in the corrosion of metals.** SCHIKORR *Oberflächentech.* 9, 219–20(1932). M. HARTENHEIM

**Cement and concrete as protection against corrosion.** RICHARD GRÜN. *Oberflächentech.* 9, 222(1932).—Iron embedded in cement (mortar, concrete) is not subject to rusting, as the hardened cement contains small amts. of $Ca(OH)_2$, which prevents corrosion. The various applications are described. M. HARTENHEIM

**Protection against corrosion by coatings of phosphates and coatings with a base of rubber.** SACHS. *Oberflächentech.* 9, 222–3(1932).—In protecting against rust by means of phosphates, an intermediate layer, between the metal and the varnish coating, is produced, which is joined chemically to the base and makes the varnish adhere better The methods of producing this phosphate layer by $H_2SO_4$, Zn and Mn compds. and Parker salts are described. Coatings with a rubber base are the most resistant to org substances and acids; they are applied chiefly in the form of solid plates, and not yet in liquid form as a paint. The processes of making hard rubber and other coatings are discussed. M. HARTENHEIM

**The weldability of copper steel.** ANON. *Cuivre et laiton* 5, 465–71(1932).—A number of tests on steels contg. 0.17–1.96% Cu are reproduced in tables and diagrams. The welded pieces were compared in mech. properties with the nonwelded sheets of the same compn. In general the tests show that the mech. properties of steels with 0.3–0.4% Cu, which gives them very good corrosion resistance, are not modified in any appreciable way. M. HARTENHEIM

**Electric arc welding.** N. GRANT DALTON. *Trans. S. African Inst. Elec. Engrs.* 23, 310–26(1932).—Resistance, butt, spot, seam and arc welding are discussed. W. H. BOYNTON

**Ores.** VICTOR J. J. DEFAYS. Fr. 737,840, May 30, 1932. Fritted ores to be reduced are mixed with ore dust contg. particles of C The ore dust and C may be mixed with a binder and incorporated with the fritted ore as an emulsion.

**Edge runner mills for ores, etc.** THOMAS W. KEET. Brit. 365,725, Dec. 2, 1930.

**Ball or tube mills for producing metal foil, *e. g.*, "bronze colors."** HARTSTOFF-METALL A.-G. Brit. 363,604, May 13, 1931.

**Extracting metals from slags, etc.** MENO LISSAUER, HENRY LISSAUER and BRUNO GRIESMANN (trading as M. Lissauer et Cie.). Brit. 366,168, Dec. 27, 1929. Nonferrous metals such as Cu and also more volatile metals, *e. g.*, Pb, Sn, Sb, etc., are recovered wholly or partly in reguline form from molten slags, to which may also be added substances contg. metal oxides, poor ore, etc., by passing a reducing gas, preheated if desired, through the melt while maintaining a neutral or reducing atm. over it by adjustment of the nature of the combustion gases and the amt. of reducing gas employed. As the bath becomes poorer in metal an oxidizing atm. may be maintained over it to volatilize the residual metals as oxides, and the volatilization may be accelerated by the addn. of S or S-contg. substances to drive off S compds. which may be burned to oxides or sulfates. Examples describe the treatment of melts in a cylindrical oil-fired furnace

with illuminating gas, H and water gas, recovering reguli contg. Sn, 46, Cu 12, Pb 19.8 and Sb 12.4%, and metal contg. Cu 41.2, Sn 18.5 and Sb 37%.

**Tin recovery from scruff, dross, etc.** HARRY P. BASSETT. U. S. 1,890,359, Dec. 6. Material such as scruff, dross or the like contg. Fe as an impurity is heated at approx. the m. p. of Sn in contact with a high-flash-point petroleum oil such as "600 W" oil and an org. reducing agent such as rosin and Ca sulfide, and the molten Sn is sepd. from the mass and recovered.

**Recovering tin, zinc, etc.** BERZELIUS METALLHÜTTEN GES. M. B. H. Brit. 367,611, Apr. 2, 1930. In recovering Sn from materials low in gang, *e. g.*, ores, oxides, etc., contg. or free from Zn, the material is mixed with $Na_2CO_3$ or borax and C and heated in a muffle, elec. or other furnace so that no molten slag forms, the Zn distg. off and the Sn and other metals being recovered in metallic form in the residues.

**Extraction of precious metals by amalgamation.** JOHN R. WILLIAMS. Brit. 365,903, Apr. 21, 1931. In passing pulp contg. the metals over a surface coated with an amalgam of a metal high in the electropos. series, *e. g.*, Zn, Mg or Cd, $NaHSO_3$ is added to the pulp as an activator for the amalgam.

**Extracting gold from solutions.** HERSCHEL C. PARKER. U. S. 1,889,489, Nov. 29. A Au-bearing soln. is passed through a container in the presence of granular ferrous sulfide and agitated for a sufficient time to permit the ferrous sulfide to ext. an appreciable proportion of Au from the soln., and the Au-enriched material is sepd. App is described.

**Smelting iron ores.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,908, Aug. 10, 1929 Void. Pulverulent Fe oxide ore is mixed with a hydraulic binding agent, *e. g.*, cement, and water and then granulated by a screw drum. The granules are dried at about 100° before introduction into the blast furnace.

**Iron ores, etc.** FRIED. KRUPP GRUSONWERK A.-G. Fr. 738,096, June 3, 1932. Ores, residues from roasted pyrites, slags, etc., are heated in the presence of reducing agents to temps. at which spongy Fe is formed, the spongy material is passed through a metallurgical furnace in a layer where it is agitated and heated to 900–1400° and oxidizing gases are blown in to scorify the impurities in the Fe.

**Refining lead.** AMERICAN SMELTING & REFINING CO. Brit. 364,049, Sept. 24, 1930. Zn is removed from Pb which has been desilverized by Parke's process by heating to 650–750°F. and continuously circulating portions of the molten Pb through a chlorinating chamber until the $ZnCl_2$ slag floating on the metal becomes contaminated with $PbCl_2$.

**Apparatus for solidifying slags, etc., in an extremely porous state.** CARL H SCHOL. Fr. 737,771, May 28, 1932.

**Gaseous atmospheres for metallurgical furnaces.** F. P. WILSON (to British Thomson-Houston Co., Ltd.). Brit. 380,428, Mar. 6, 1930.

**Furnace for smelting ores.** ALEXANDER G. MCGREGOR. Brit. 367,346, Nov 11, 1930. The furnace is particularly applicable to the smelting of Cu sulfide and the direct production of steel from Fe oxide ores.

**Metal-heating furnaces.** VEREINIGTE STAHLWERKE, A.-G. Brit. 380,844, July 17, 1930. Oxidation of the charge in such furnaces is minimized by supplying $H_2$ to the products after combustion is complete.

**Metal-heating furnace heated by non-inductive return bend resistor.** WM. B COOLEY (to Hevi-Duty Electric Co.). Brit. 366,542, Sept. 3, 1929. Four means are provided for subjecting the charge to magnetic flux.

**Open-hearth furnaces.** INTERNATIONAL CHROMIUM PROCESS CORPORATION. Brit. 380,502, Feb. 24, 1931. An open-hearth furnace is fired by a plurality of downwardly directed burners arranged in staggered relationship.

**Open-hearth metallurgical furnace of the reversing type.** NIKLAS F. EGLER U. S. 1,890,805, Dec. 13. Structural features of a furnace suitable for treating steel.

**Cupola furnace operation.** STUART P. MILLER (to Barrett Co.). U. S. 1,889,757, Dec. 6. Stack gases are withdrawn from a cupola furnace charged with metal and fuel, O is mixed with the stack gases and the fuel is burned by passing the mixed oxygenated gases in contact with the fuel. App. is described.

**Control means for hot-blast stoves.** FREYN ENGINEERING CO. Brit. 363,709, Sept. 19, 1930.

**Tuyères for blast furnaces.** E. E. BROSIUS. Brit. 381,634, July 25, 1931. Mech. construction.

**Machine for stopping the tap holes of blast furnaces.** DANGO & DIENENTHAL. Fr 737,409, May 21, 1932.

**Cooling blast-furnace flue dust.** E. E. BROSIUS. Brit. 382,003, June 30, 1931.

**Rotary furnaces.** M. G. FREISE (to Berzelius Metallhütten-Ges.). Brit. 380,493, June 24, 1930. Furnace for use in recovery of metals, *e. g.*, Sn, Pb, Sb, Bi.

**Metallurgical converter furnaces.** J. LEEMANS and SOC. GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Brit. 380,297, Nov. 23, 1931.

**Converters.** J. LEEMANS and SOC. GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Brit. 380,297, Nov. 23, 1931. The connection of a metallurgical converter to a chimney by a flue of inverted U-shape is described.

**Shaft furnaces.** MARTIN KÜNKELE. Fr. 737,728, May 27, 1932. Means for altering the position, extent and form of the oxidation spaces in front of the tuyères is described.

**Furnace for reheating blooms.** MASCHINENBAU-A.-G. VORMALS EHRHARDT & SCHMER. Fr. 738,296, June 8, 1932.

**Melting-pots.** FELTEN & GUILLEAUME CARLSWERK A.-G. Brit. 366,797, May 21, 1930. The discharge pipe of a melting pot for easily fusible metal is supplied with neutral or reducing gas, which if combustible may be kept ignited by a small flame.

**Apparatus for melting metals such as lead, solder or aluminum.** NORMAN B. JONES (to General Elec. Co.). U. S. 1,889,604, Nov. 29 Outlet passages for conducting molten metal from a melting chamber are arranged to be heated, as by an elec. resistance heater, so that the heating is controlled by the action of escaping metal. Various structural details are described.

**Melting and refining metals.** ALEXANDER GRANT MCGREGOR. Brit. 367,384, Nov. 11, 1930. Cu and other metals are melted and refined by directing a heating flame in the melting zone of a furnace directly upon the head of the mass of metal which is being advanced at a predetd. rate through a preliminary heating zone, the metal being melted away at the same rate as its rate of advance and the gases from the flame being used to heat the heating zone. The molten metal is directed into an oxidizing furnace where it may be poled and cast through an outlet. App. is described.

**Apparatus for removing occluded gas from molten metal.** HERAEUS-VACUUMSCHMELZE A.-G. and WILHELM ROHN. Brit. 367,246, May 5, 1930.

**Casting-machines.** H. GONSCHEWSKI. Brit. 380,576, Sept. 15, 1930. A water-cooled mold of a centrifugal machine for casting metal pipe is made of Ag, Cu, Al or other metals of high cond. and external smoothness.

**Casting-machines.** P. P. STARLING, W. D. PUGH, ASSOCIATED ELECTRICAL INDUSTRIES, LTD., and ENGLISH STEEL CORPORATION, LTD Brit. 383,686, Sept. 18, 1931. Mech details are described for control of flow of low-melting metal to be run in between an ingot and a mold wall Cf Brit. 360,980 (*C. A.* **27**, 941).

**Metallurgical casting machines.** G. PEMETZRIEDER. Brit. 380,905, Aug. 10, 1931.

**Apparatus for casting metals.** WILHELM KRÄMER and AUGUST KAMPF (trading as Kramer & Co.). Brit. 363,542, Feb 21, 1930.

**Apparatus for casting compound blocks.** OSCAR MELAUN Ger. 567,138, June 28, 1931. Addn. to 564,073 (*C. A.* **27**, 940).

**Casting metal boxes.** JOHN A. CRABTREE. Brit. 363,492, Dec. 3, 1930.

**Mixing machine of edge-roller type for foundry sand.** PNEULEC, LTD., and PERCY PRITCHARD. Brit. 368,002, Jan. 21, 1931.

**Discharging molten materials.** G. PEMETZRIEDER. Brit. 380,905, Aug. 10, 1931. Molten brass is fed to a mold by dipping a refractory supply pipe into metal in a container rotating about an axis, so that its open end faces the advancing metal.

**Presses for the extrusion of metals.** W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., ERNEST E. JUDGE and FRANCIS H. FRY. Brit. 363,421, Sept. 24, 1930.

**Ingot molds.** B. MATUSCHKA. Brit. 380,515, June 19, 1931. A bottle-shaped mold for casting ingots is used in making railway wheels, etc.

**Ingot mold and stripper device.** EMIL GATHMANN. U. S. 1,890,777, Dec. 13. Structural and mech. features.

**Cooling centrifugally cast hollow metal blooms.** WILHELM KOEHN. U. S. 1,889,671, Nov. 29. App. is described by which cooling material such as a gas- or liquid-cooled cylinder may be introduced into the space within the bloom but out of contact with the material of the bloom

**Metals from carbonyls.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,781, Dec. 5, 1930. Metals are obtained from metal carbonyls by decompg. them by contact with moving heated surfaces the temp. of which is 30–80° above that at which they begin to decompose under the prevailing pressure in the decompn. vessel and continuously removing the metals from the heated surfaces.

**Metals from carbonyls.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,996, Jan. 17, 1931. See Fr. 717,568 (*C. A.* **26**, 2690).

**Metals and alloys.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,059, Aug. 22, 1930. In the manuf. of sintered metallic masses by heating without melting pulverulent initial materials addns. are made of not over 1% of such metals, including Si or compds. thereof, as form slags and do not form volatile compds. with the impurities and are not

volatilized. Excess impurities are removed by a purification previous to or simultaneous with the sintering, *e. g.*, by treatment with a reducing gas while heating. O is readily removed by addn. of Mn, Al, Si, V or compds. such as clay, CaO, $CaF_2$, etc. Among examples Fe powder from Fe carbonyl is treated with an alloy contg. 3 parts Al to 1 Fe, $MnCO_3$ or $Al(NO_3)_3$, and a powder contg. 33 parts cement Cu and 67 Ni is treated with $MnCO_3$ at 1000°.

**Composite metal valves.** ARCHIE T. COLWELL (to Thompson Products, Inc.) U. S. 1,889,916, Dec. 6. A "metal-cooled" valve is formed by forging a metal blank contg. an insert of a metal (such as Cu or Al) of relatively high rate of heat cond. to provide a partially finished valve having a core of the insert metal extending through the head; a portion of the core is removed, and the recess thus formed is filled with molten metal of the same compn. as that of the blank, and the valve is finished by reforging the blank.

**Porous metal articles such as bearings, brake linings, etc., from powdered metals.** CHARLES F. SHERWOOD. Brit. 365,068, Nov. 13, 1929. See U. S. 1,873,223 (*C. A.* **26**, 5900).

**Cleaning metals.** VICTOR CHEMICAL WORKS. Brit. 365,425, April 9, 1931. The removal of vitreous enamel from enamelled metal ware is effected by treating the articles with hot caustic alkali of 20–70% concn.

**Cleaning metals.** WALTER WEIGERT. Brit. 365,719, Dec. 24, 1929. See Fr 706,332 (*C. A.* **26**, 258).

**Treating silver surfaces.** ARTHUR O. WATKINS. Brit. 367,991, Jan. 14, 1931. Ag, alloys contg. mainly Ag, Ag plate, etc., are rendered tarnish-resisting by treatment with an aq. soln. of hydrohalogen acid and(or) of water-sol. halide, with the exception of HI and iodides. HCl, $NH_4Br$, $NH_4Cl$, $ZnCl_2$ and $CaCl_2$ may be used.

**Aluminum from silicates.** RAFAEL G. DEL RIO. Brit. 365,199, Oct. 21, 1930. Al is extd. from silicates or clay by heating with NaCl, $K_4Fe(CN)_6$ and HCl, or their chem. equivs., in a reducing atm App. is described.

**Metallizing articles of condensation products of casein and albumin.** MAX OWESCHINGEN. U. S. 1,890,645, Dec. 13. After the surface of the article is freed from fatty substances, it is immersed in a 3–4% aq. soln. of hydroquinone, then dried and placed in a soln. of a reducible metal salt such as a Ag salt to ppt. the metal.

**Coating metallic surfaces.** WALTER GÖTZL. Brit. 364,226, Oct. 25, 1929. In forming on the surface of a metal sheet, etc., a protective or insulating coating consisting of a metal compd., *e. g.*, a coating of oxide on Al, defects due to irregular coating of the edges are avoided by rounding or retroverting the edges prior to production of the coating, which may be formed chemically or electrolytically. In 365,023, divided out of 364,226, a rounded embracing edging is secured to the sheet, etc., prior to production of the coating.

**Coating metals with rhenium.** PATENT-TREUHAND GES. FÜR ELEKTRISCHE GLÜHLAMPEN (to The General Electric Co., Ltd.). Brit. 364,502, June 4, 1931. See Ger 537,936 (*C. A.* **26**, 1200).

**Coating with metals.** ELECTRO METALLURGICAL CO. Brit. 367,198, Mar. 6, 1931 A coating of Al is applied to metal to be drawn and stamped to act as a lubricant It may be applied as an Al paint, comprising 1 part by vol. of Al powder to 3 parts of a volatile liquid, *e. g.*, Am acetate, contg. some nitrocellulose or other cellulose ester or ether, or gums and drying oils to form a film.

**Coating with chromium.** GOODWIN H. HOWE (to The British Thomson-Houston Co., Ltd.). Brit. 363,954, May 29, 1930. A protective coating of Cr is formed on a foundation metal, *e. g.*, Fe, by heating the metal in the presence of, but out of contact with, Cr, the metals being contained in a porous receptacle which is packed in an inert medium contg. a small amt. of a substance that dissociates on heating to form an acid capable of uniting with the Cr, *e. g.*, $NH_4Cl$.

**Coating metal with rubber.** JOSEPH ROCKOFF. Brit. 365,755, July 28, 1930 Rubber is attached to a metal surface by roughing the surface with a sandblast, spraying with an easily fusible molten metal, *e. g.*, brass, from an air spray, applying rubber without the use of cement, etc., and vulcanizing by heat

**Protecting metal surfaces.** FINCKH G. M. B. H. Fr. 737,433, May 23, 1932 Surfaces of metals such as Ag, Cu, Ni, Zn or Sn are protected against tarnishing by plunging the articles in a soln. contg. an oxidizing agent such as chromic acid, $HNO_3$, $HNO_2$, $H_2S_2O_8$ and sol. salts of these acids.

**Protective coatings on iron and other metal structures.** HANS R. S. DE LA ROCHE U. S. 1,889,644, Nov. 29. The material is coated with a rustproofing coating such as red lead or asphalt, and this coating is then covered with a coating of Sorrel cement contg a Ca compd. such as $CaCl_2$ in which the Ca is free to unite with F, and the exterior of the cement coating is treated with a F compd. reactive with the Ca compd. to form $CaF_2$.

**Apparatus for galvanizing iron or steel articles such as wire or strip.** JOSEPH L. HERMAN (to Keystone Steel & Wire Co.). U. S. 1,890,463, Dec. 13. Various structural and mech. details are described.

**Rustproofing iron or steel.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,569, July 15, 1929. Void. A stock soln. for use in rustproofing Fe or steel is formed by dissolving $MnCO_3$ is dil. $H_3PO_4$ at ordinary or slightly raised temp. to satn. The stock soln. is dild. to form a rustproofing bath. Cf. *C. A.* **27**, 265.

**Apparatus for pickling metal articles.** THE PHOSPHOR BRONZE CO. and ZACHARIAS PAYNE. Brit. 363,928, April 1, 1931.

**Treating cupriferous materials.** MENO LISSAUER, HENRY LISSAUER and BRUNO GRIESMANN (trading as M. Lissauer et Cie.). Brit. 366,628, Dec. 19, 1929. Volatile metals such as Zn, Sn, Sb, Pb, As or Bi are sepd. and recovered in oxidic form from metallic materials contg. Cu with or without Ni by introducing reducing gases, *e. g.*, H, CO, producer gas, etc., into a molten bath of the metal while maintaining an oxidizing atm. above the charge in the furnace by suitably regulating the combustion of the burner heating the bath. App is described.

**Treating metallic surfaces to produce a modified surface.** ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Electric Co, Inc.). Brit 365,422, Apr. 7, 1930. An insulating layer is formed on metal by immersing it in a molten fluoride bath, the metal being withdrawn and allowed to cool in a non-oxidizing atm. Thus Cu wire may be treated with molten KF and allowed to cool in $CO_2$.

**Hardening steel, etc.** POMOSIN-WERKE G. M. B. H. Brit. 367,630, May 2, 1930. A hardening bath for steels and steel alloys comprises a soln. of pectin materials or like plant colloids, obtained chiefly from the cell walls of plants.

**Treating steel and steel alloys.** ANDRÉ P. MAHOUX and GEORGES MAHOUX (to Soc. d'exploitation des procédés Mahoux). Brit. 363,376, Nov. 18, 1929. See Fr. 700,049 (*C. A.* **25**, 3304).

**Cementation; coating metals.** ANDRÉ P. MAHOUX and GEORGES MAHOUX (to Société d'exploitation des procédés Mahoux). Brit. 365,033, Feb. 27, 1930. Addn. to 363,376 (preceding abstr.). See Fr. 38,999 (*C. A.* **26**, 1565).

**Cementation.** ANDRÉ P. MAHOUX and GEORGES MAHOUX (to Société d'exploitation des procédés Mahoux). Brit 365,034, June 14, 1930. Addn. to 363,376 (2nd preceding abstr.). The process of the parent patent is used to ext. wholly or partly from the steel, etc, under treatment 1 or more of its constituents by suitably choosing the medium surrounding the steel, etc., during treatment. Thus iron may be decarburized by surrounding it with soft Fe filings or a current of air

**Cementation; tempering.** GEORGE L. KELLEY (to Budd International Corp.). Brit. 367,673, June 9, 1930. Steel metal-working dies are cast roughly to the finished shape, subjected to heat-treatment, machined and then nitrided. A suitable steel includes C 0.2–0.8, Mn 0.2–0.3, Si 0.1–0.3, Al 1–2, Cr 1–3, Mo 0.2% and small quantities of P and S.

**Carbonizing metal.** BRITISH DRIVER-HARRIS CO., LTD. Brit. 366,236, Jan. 2, 1930. In the manuf. of carbonized Ni anode plates for radio tubes the Ni surface is roughened by a sand blast and then carbonized, so that a thin, dull black, firmly adhering layer is produced The roughened metal may be oxidized before carbonization, which is preferably carried out in an atm. of butane.

**Process and apparatus for carbonizing metal surfaces.** HOWARD MCK. ELSEY (to Westinghouse Electric & Mfg. Co.). Brit. 367,325, Aug. 14, 1929. Void. Addn.to 305,465 (*C. A.* **23**, 4666) A modification of the process of Brit. 305,465 consists in reducing the oxidized metal surface previous to carbonizing. Cf. *C. A.* **27**, 487.

**Nitriding iron and steel alloys.** FRIED. KRUPP A.-G. Brit. 366,838, June 2, 1930. The procedure is carried out in the usual manner in the presence of halogen, particularly Cl, compds In an example a steel, contg. C 0.3%, Si 0.2, Mn 0.3, Cr 1.5 and Al 1.2, is sprinkled with $CaCl_2$ and nitrogenized at 500° for 48 hrs. $NH_4Cl$ and bleaching powder may also be used. The alloys contain Al, Cr, Mo, V and(or) Ti, and further elements, *e. g.*, Si, Mn, Ni and W may be incorporated.

**Brazing.** F. P. WILSON (to British Thomson-Houston Co., Ltd.). Brit. 480,428, Mar. 6, 1930. The atm. in a brazing furnace is composed of $H_2$, CO and a small amt. of $N_2$ or $CO_2$ and $CH_4$, $C_2H_6$, $C_3H_8$ or $C_4H_{10}$.

**Annealing.** HIRSCH, KUPFER- UND MESSINGWERKE A.-G. Brit. 363,323, June 10, 1929 Void. In treating metal bodies, *e. g.*, cartridge cases, which require local annealing the parts requiring local annealing are subject to the action of an alternating electromagnetic field, *e. g.*, by introducing them into the interior of an induction coil. App. is described.

**Heat treatment for annealing sheet metal.** PAUL A. MEEHAN (to Swindell-Dressler Corp.). U. S. 1,890,065, Dec. 6. Sheet metal of substantial width is passed, as a

continuous strip, vertically downward through a low-temp. preheating zone in which heat is transferred to the metal by convection, a high-temp. heating zone in which heat is transferred to the metal partly by convection and partly by radiation and in which a reducing atm. is maintained, and a cooling zone through which a cooling fluid is passed in a direction opposite to the travel of the metal strip, and the combustion conditions in the heating zone are regulated to prevent the circulation of gases between the heating and cooling zones. App. is described

**Annealing; alloys.** HERAEUS-VACUUMSCHMELZE A.-G. Brit. 363,306, Dec. 16, 1929. The creep limit or strength of Fe, Ni, Cr, Fe-Ni-Cr alloys contg. over 50% Ni and 12–30% Cr, and Fe-Cr alloys contg. 20–40% Cr, for use as machine elements or furnace parts at temps. above the crystn. temp., is increased by preheating or preannealing at temps. between 1100° and the m. p. of the metal or alloy and cooling at such a rate as to avoid internal stresses.

**Annealing; alloys.** WILLOUGHBY S. SMITH, HENRY J. GARNETT and WALTER F. RANDALL. Brit. 366,523, Oct. 31, 1930. The magnetic permeability of a ferromagnetic material or alloy is increased by a predetd. amt. of cold working, *e. g.*, rolling, prior to the final heat treatment, so as to reduce it to the finished size without producing an overworked or underworked condition. Addns. of small quantities of other elements, *e. g.*, Si, may be made to render the cryst. formation more readily attainable, examples of such alloys being Fe 16.8, 16.65; Cr 1.6, 1.36; Mn 0.7, 0.4; Cu 5, 4.9; and Si 0.02, 0.18%

**Annealing nickel-tin alloys.** VEREINIGTE STAHLWERKE A.-G. Brit. 367,571, July 4, 1930. Ni-Sn alloys contg. 5–25% Sn are improved by rapidly cooling from above 900° and then annealing at 400–800°. In an example an alloy contg. 15% Sn is quenched from 1100° and annealed 1 hr. at 700°.

**Pure iron.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,635, Nov. 27, 1930. Addn. to 269,345 (*C. A.* **22**, 1320) and 318,499 (*C. A.* **24**, 2101). In the process for the production of pure Fe by 269,345 as improved upon by 318,499 the Fe contg. excess O over C is prepd. from an Fe obtained by decompn. of Fe carbonyl and which has been partly or wholly converted into oxide by oxidizing gases, *e. g.*, air, O, $CO_2$ or steam, at room or elevated temp. Cf. *C. A.* **26**, 4788.

**Wrought iron.** FREDRIK H. WILLE (to A. M. BYERS CO.). U. S. 1,890,660, Dec. 13. Ferrous material is poured into a slag bath, and the relative positions of the pouring stream and bath are altered so that the pouring stream traces a path on the surface of the slag bath which is deviated from time to time during the pouring operation

**Wrought iron.** JAMES ASTON and ADDISON H. BEALE (to A. M Byers Co.) U. S 1,890,637, Dec. 13. Molten ferrous metal is fed through a molten slag bath in a receptacle in the lower portion of which a ball is formed having at least one horizontal dimension greater than its vertical dimension. App. is described.

**Desulfurized pig iron.** HUGO STEINEBACH. Brit. 367,602, Mar. 23, 1931. In producing desulfurized pig iron, iron ore is subjected to a cold-blast process in a blast furnace without employing desulfurizing agents, and the molten Fe, which must contain at least 1% Mn, is tapped off into a sep. container to cool, the Mn combining with the S to form Mn sulfide. The Fe is then cast into pigs.

**Apparatus for making spongy iron.** GUTEHOFFNUNGSHÜTTE OBERHAUSEN A.-G Brit. 364,699, Oct 14, 1929.

**Steel.** SCHOELLER-BLECKMANN STAHLWERKE A.-G. Brit. 363,649, Dec. 21, 1929 Same as Austrian 129,596 (*C. A.* **26**, 5541).

**Steel.** EDUARD HERZOG. Fr. 737,729, May 27, 1932. Uncalmed cast steel is protected against radiation by a cover having an internal face which is a bad conductor of heat. A supplementary slag is formed on the ingot.

**Corrosion-resisting steel.** VEREINIGTE STAHLWERKE A.-G. Brit. 365,538, Oct 22, 1929. The steels contain more than 0.15% Cu and over 0.05% P, the upper limits being about 2 and 1%, respectively. In addn. over 0.1 and up to 1% Si may be present Other constituents are kept low, the limits of C and Mn being 0.05 and 0.1%, resp.

**Steel having a high yield point and a good notch toughness.** ADOLF KLINKENBERG (to Vereinigte Stahlwerke A.-G.). U. S. 1,889,482, Nov. 29. A steel which is suitable for use in large structures contains C 0.1–0.3, S not over 0.05, P 0.1–0.4 and Cu 0.1–1.0%, the remainder being substantially all Fe.

**Removing nitrogenous impurities from steel.** WALTER O. AMSLER (to Paul R Caruthers, trustee). U. S. 1,890,485, Dec. 13. To each 100 lb. of the metal batch there is added a refining mixt formed of bauxite 12 oz., feldspar 1 lb. and lime 1 lb.

**Alloys.** SIEMENS & HALSKE A.-G. Brit. 363,861, Jan. 21, 1930. Be and another alk. earth metal, preferably Mg, are added to Fe or Cu or their alloys, excepting Cu-Ni alloys, in such amt. that the total content of alk. earth metal is 0.2–15%.

**Alloys.** GEO. F. TAYLOR (to The British Thomson-Houston Co., Ltd.). Brit 364,718, Oct. 23, 1929. In a method for making alloys of the kind comprising W or like

carbide and an Fe-group metal, the powd. carbide and metal are mixed, compacted and sintered as described in Brit. 213,524 (*C. A.* **18**, 2325) or 288,521 (*C. A.* **23**, 593). The sintered product is then crushed to grain size and powd to such fineness that it floats in alc. about 5 min. and is then again pressed and sintered either simultaneously or successively.

**Alloys for detonating caps.** WILHELM ESCHBACH and WALTER FRIEDERICH. Brit. 363,671, Oct. 3, 1929. Void. See Fr. 696,663 (*C. A.* **25**, 2853).

**"Pre-alloys" for addition to metals such as in making "rustproof" steel.** JOSEF NOVAK and ROMAN KESSELRING. U. S. 1,890,548, Dec. 13. A "pre-alloy" is used contg. Cr 20–30, W 5–6, Ni 6–10, Cu 10–15 and carbidic C 2.5–3%, together with Fe and only traces of P, S, Si and Mn. The material has a ledeburitic structure.

**Acid-resistant alloys containing iron, silicon and titanium.** EMANUEL VALENTA (to Limited Company formerly Skoda Works). U. S. 1,890,595, Dec. 13. Alloys which are suitable for casting contain Fe together with Si 7–20 and Ti 0.01–10%.

**Coloring alloys.** SOCIÉTÉ LA THERMONITE. Brit. 364,623, Sept. 5, 1929. Alloys contg. Zn 95–97, Al 1–2 and Cu 2–3% are colored by treatment in a bath contg. a Cu salt and an oxidizing agent, a deposit of Cu oxide being produced. For a black color a mixt of $CuSO_4$ and picric acid is used. For other colors a bath is made by mixing Cu tartrate and NaOH, and the alloy is treated therein until the proper color is obtained.

**Metal alloys.** KINZOKUZAIRYO KENKYUJO. Brit. 364,696, Dec. 23, 1929. See Fr. 707,693 (*C. A.* **26**, 689).

**Tool alloys.** BRITISH & DOMINIONS FERALLOY, LTD., and JAMES W. BAMPFYLDE. Brit. 364,300, Dec. 11, 1930. Alloys particularly for cutting tools consist of Fe with 10–18% Al and 2–8% B, with or without up to 2% of W and Mo.

**Tool alloys.** FRIED. KRUPP AKT.-GES Brit. 365,895, June 16, 1930. A hard alloy particularly for tools consists of a mixt. of Ti carbide and Ti nitride sintered or fused together, preferably in equal quantities. Up to 25% of Fe, Co, Ni, etc., may be added. Pure Ti nitride is prepd. by heating the com. compd. in N at 2000° in a tubular C furnace and pure Ti carbide by heating a mixt. of titanic acid and C in a current of H at 2000°.

**Aluminum and aluminum alloys.** WALTER ROSENHAIN and JOHN D. GROGAN. Brit. 366,545, Sept. 8, 1930. Al and its alloys are improved, *e. g.*, the grain size reduced, by introducing into the molten metal one or more of the chlorides of Si, C, Ti or Al. App. is described.

**Aluminum alloy resistant to sea water.** I. G. FARBENINDUSTRIE A.-G Brit. 364,507, Aug. 21, 1930. See Fr. 718,045 (*C. A.* **26**, 2693).

**Aluminum alloys.** HERBERT T. DAVIES. Brit. 364,642, July 8, 1930. Sn is incorporated in Al, or in Al alloyed with small quantities of Mn, Pb, etc., by displacement from Sn oxide by reaction with Mg in the form of an alloy, *e. g*, with Cu or Zn. Cf *C. A.* **26**, 5061.

**Aluminum alloys.** SOCIÉTÉ DES BREVETS B. DE MONTBY. Brit. 366,088, Oct. 29, 1929. Bi is incorporated in Al by using Sb as a vehicle, a ternary alloy being produced consisting of a homogeneous solid soln.

**Aluminum alloys.** SOCIÉTÉ DES BREVETS B. DE MONTBY. Brit. 366,483, Oct. 29, 1929. Pb is incorporated in Al by means of Mg so as to produce a ternary alloy contg. about 2% Pb in the form of a homogeneous solid soln.

**Aluminum alloy.** ARTHUR E. E. JONES and ALBERT H. HOBBINS. Brit. 366,720, Feb. 5, 1931. The alloy contains Si about 15, Cu 0.75, Sn 0.5 and Cr 0.25%. A small quantity of Na may be added to the molten alloy, and $ZnCl_2$ may be used as a cleansing flux.

**Aluminum alloys.** HAROLD N. SHAW (to Globar Corp.). Brit. 367,403, Aug. 19, 1929. An alloy consisting of Al with Ni 25–42 or Fe 25–40%, that softens below its m. p., is employed as an elec. contact surface for a bar heater.

**Aluminum alloys.** METALLGESELLSCHAFT A.-G. Brit. 367,831, Dec. 4, 1929. See Fr. 706,721 (*C. A.* **26**, 75).

**Aluminum alloys.** KARL SCHMIDT G. M. B. H. Fr. 737,434, May 23, 1932. Alloys resistant to corrosion, *e. g.*, to the action of sea water, contain Mg 10% and Al the rest. The alloys may also contain Cd up to 5, Sb and(or) Bi up to 5, Cr up to 3, Co up to 5% and enough Si to form $Mg_2Si$.

**Aluminum-silicon alloys.** THERON D. STAY (to Aluminium, Ltd.). Brit. 366,654, Jan. 30, 1930. See Can. 315,201 (*C. A.* **26**, 1570).

**Beryllium alloys.** SIEMENS & HALSKE A.-G. Brit. 363,837, Dec. 23, 1930. Alloys of Be with heavy base metals, *e. g.*, Fe, Cu, Ni, are prepd. by liberating Be from an easily fusible slag contg. at least one alk. earth metal oxide and Be oxide, with or without the addn. of one or more alkali metal oxides, by means of a reducing agent such as C, Si or Al, or one or more carbides in the presence of one or more fused heavy metals.

**Iron alloys.** FREDERICK M. BECKET (to Electro Metallurgical Co.). Brit. 366,060, Apr. 18, 1930. Stain-resisting Fe alloys contain Cr 16–22, Mn 5–15, Cu up to 3 and C not more than 0.3%.

**Iron alloys.** FREDERICK M. BECKET (to Electro Metallurgical Co.). Brit. 366,511, Apr. 29, 1930. A corrosion-resistant Fe alloy contains Cr 16 to preferably not more than 22, Mn 6 to preferably not more than 16, Co 1.5–14 and C preferably not more than 0.3%.

**Iron alloys.** I. G. FARBENINDUSTRIE A.-G. Brit. 366,762, Mar 9, 1931. App. for carrying out reactions at elevated temp. in presence of H is made of or lined with an alloy contg. Ti, Fe and Al, and optionally also Cr, W, Mo, V, Si, Ni, Co, Cu, Mn, Sn, Zn, Pb, Ag and(or) Be. Specified alloys are Fe 92.5, 91%; Al 6, 5; Ti 1.5, 1; and Cr -, 3.

**Iron alloys.** SOC. DES ACIÉRIES DE LONGWY. Fr. 737,575, Sept. 18, 1931. An Fe alloy resistant to corrosion and the action of S compds. contains C 0.04–0.12, Cr 0.1–0.25, Cu 0.06–0.15 and Mo 0.06–0.15%. S 0.005–0.02, P 0.01–0.03 and V 0.1% may also be present.

**Iron-chromium alloys.** HAROLD DONALDSON NEWELL (to The Babcock & Wilcox Tube Co.). Brit. 368,154, May 29, 1930. See Fr. 726,867 (*C. A.* **26**, 5061).

**Iron-nickel alloys.** SIEMENS & HALSKE A.-G. Brit. 367,452, Nov. 23, 1929. Alloys, particularly for powder cores, contain Fe, Ni and also elements, particularly about 0.1 to 5% of Pb, Tl, Bi or Ag, which in a liquid state do not mix completely with Fe or the alloy. Thus 1% of Pb may be added to an alloy contg. Ni 78.5%, Fe 18.5 and Co 3. The alloys may also contain other addns., *e. g.*, Si, Al, Sb, O or S.

**Lead alloys.** REGINALD S. DEAN (to Western Elec. Co.). U. S. 1,890,013, Dec. 6. For prepg. alloys which are suitable for extrusion, Ca (suitably in the proportion of about 0.1%) is alloyed with Pb to form a solid soln., the alloy is cooled to produce a supersatd. solid soln., and is aged to cause the dispersion of the minute particles contg. the Ca substantially uniformly throughout the Pb. U. S. 1,890,014 relates to the production of extruded articles such as cable sheathing from an alloy contg. Pb together with less than 1% Ca and quenching the hot extruded article to reduce the alloy to supersatd. solid soln., followed by an "immobilizing" treatment such as aging at a temp below 150°. The Ca may comprise 0.02–0.1% of the Pb alloy.

**Cobalt molybdenum alloys.** VEREINIGTE STAHLWERKE A.-G. Brit. 368,058, July 4, 1930. See Fr. 713,130 (*C. A.* **26**, 1570).

**Molybdenum-cobalt-copper alloys.** KOEBEL-WAGNER DIAMOND CORP. Brit 367,871, Sept. 26, 1930. A setting for a diamond comprises an alloy of Mo, Co and Cu, with or without a little Fe, *e. g.*, Mo 26%, Co 46, Cu 27.75 and Fe 0.25.

**Molybdenum alloys.** I. G. FARBENINDUSTRIE A.-G. Brit. 367,481, Dec. 3, 1930 Alloys contg. Mo and(or) W are prepd. by thermal decompn. of the metal carbonyls formed by the action of CO under pressure on materials contg. said metals which have been reduced in the presence of Cu or its compds. The Cu-contg. addns. may be ores or waste products and may contain also Fe or other heavy metals, or their compds., which themselves form carbonyls.

**Steel alloy.** THEODOR CZEPL. Brit. 365,106, Feb. 6, 1930. Void. See Fr. 697,801 (*C. A.* **25**, 2965).

**Steel alloys.** VEREINIGTE STAHLWERKE A.-G. Brit. 366,193, Nov. 30, 1929. A steel contains C 0.33%, Si 0.02, Mn 0.39, P 0.037, S 0.051, Cu 0.25 and Al 0.18.

**Steel alloys.** FRIED. KRUPP A.-G. Brit. 366,326, Dec. 11, 1930. A non-magnetic steel alloy contains Mn 16–25, C 0.1–0.4 and up to 1.5% Si, with or without up to 5% of other elements such as Ti, Cr, V and Mo. It may have a wholly or mainly austenitic structure produced by heat treatment such as quenching from 1000° or by hot shaping Cf. *C. A.* **27**, 1318.

**Steel alloys.** STOODY CO. Brit. 367,347, Nov. 12, 1930. An alloy suitable for cutlery, tools, welding rods, etc., contains C 1–4%, Cr 25–35, Ni 5–15, Si 3.5–8, the remainder being principally Fe.

**Steel alloys.** HERMANN J. SCHIFFLER. Brit. 367,377, Aug. 13, 1929. Articles, particularly seamless tubes, are made from a ferritic-pearlitic C steel, substantially free from Ni, contg. Cr at least 5, Si 0.8–2.5, Al 0.5–0.9, Mn not more than 1, and having a joint Cr, Si and Al content of less than about 10%. Up to 1% of Mo, V and Ti and up to 0.9% W may also be present.

**Electromagnetic devices.** ALLGEMEINE ELEKTRICITÄTS-GESELLSCHAFT. Brit 363,697, Aug. 28, 1929. Sheet metal, wire or ribbon cores consist of a ferro-magnetic material, *e. g.*, Fe-Ni alloy to which Mn, Si and Cu have been added in small amts., which is first drawn out with repeated annealings and is then subjected to cold stretching, so that with an initial permeability of $\mu = 25$ and over, it has an instability of less than 5% after any desired degree of d. c. loading has been applied.

**Altering physical or molecular structure by mechanical treatment.** ALLGEMEINE

ELEKTRICITÄTS-GESELLSCHAFT. Brit. 383,328, Aug. 19, 1930. Addition to 363,697 (preceding abstr.). The core material in the parent specification is a Ni-Fe alloy of equal parts which is cold stretched after the final heating so as to reduce its cross section by not more than 50%, and preferably 25%.

**Alumino-thermic processes.** T. GOLDSCHMIDT A.-G. Brit. 367,361, Nov. 16, 1929. See Ger. 551,997 (*C. A.* **26**, 4791).

**Machine for mixing, emulsifying, homogenizing, comminuting, etc.** WILLIAM R. SERGEANT and BURT, BOULTON & HAYWOOD, LTD. Brit. 367,368, Oct. 16, 1930.

**Apparatus and process for producing welded wire fabric.** PILKINGTON BROTHERS, LTD., and JOSEPH GASKELL. Brit. 363,314, Sept. 15, 1930.

**Welding apparatus.** JAMES L. ADAMS, JR. (to The Youngstown Sheet and Tube Co.). Brit. 363,575, June 18, 1930.

**Apparatus for soldering leading-in wires to the caps of electric incandescent lamps.** PATENT-TREUHAND GESELLSCHAFT FÜR ELEKTRISCHE GLÜHLAMPEN (to General Electric Co., Ltd.)., Brit. 365,820, Feb. 18, 1930.

# 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

**Catalytic vapor-phase oxidation of tetraalkylmethanes.** W. LAWRENCE FAITH, SHERLOCK SWAN, JR., AND D. B. KEYES. *Ind. Eng. Chem* **25**, 224(1933).—The oxidation of 3,3-dimethylpentane and 3,3-diethylpentane over Cu, $V_2O_5$ and $CeO_2$ yields only $H_2O$, C oxides, unsatd. hydrocarbons and traces of lower aldehydes. H. A. BEATTY

**Preparation of 3-ethyloctadecane.** S. LANDE AND V. SLIVA. *Collection Czechoslov. Chem. Communications* **4**, 538–42(1932); cf. *C. A.* **26**, 77.—The method of prepg. this branched-chain hydrocarbon is analogous to that previously reported. 3-Ethyl-3-octadecanol (I) was obtained in 99% yield from Et palmitate and EtMgBr and identified by prepn. of its urethan. Dehydration of I to *ethyloctadecene* (II) by means of vacuum distn. reached only 33% but by heating equal parts of I and anhyd. $ZnCl_2$ at 115–25° 97% was dehydrated. The remaining alc. was sepd. by distn. in the presence of 1 g. Na to 40 g. of crude product. II is a colorless liquid $b_{10}$ 199–202°; I no. 90.56, $n_D^{15.4}$ 1.45585, $d_{20}$ 0.8040, gives an addn. compd. with $Hg(OAc)_2$ in MeOH. The position of the ethylenic linkage was established at 2 through isolation of Et pentadecyl ketone after oxidation with cold satd. $KMnO_4$, and prepn. of its oxime. 110 g. of II mixed with reduced Ni was treated for 15 min. with $H_2$ at 145° and an initial pressure of 120 atm. The filtered product was distd. at 12 mm. Pure *3-ethyloctadecane* (III) is a colorless, odorless liquid m. —3°, $b_{12}$ 202°, b. 341°, $n_D^{19.6}$ 1.4476, $d_{20}$ 0.7951, heat of combustion 11.352 cal. Abs. viscosity values from 0° to 99° are given for II and III. ANNE E. WHITE

**Changes in molecular structure during chemical reactions. II. The rearrangement of butyl bromide.** WALTER HÜCKEL AND PAUL ACKERMANN. *J. prakt. Chem.* **136**, 15–29(1933); cf. *C. A.* **24**, 2113.—iso-BuOH, purified through the acid phthalate (m. 65°), $b_{737}$ 106.6°, $d_4^{19.6}$ 0.8021, $n_{He}^{19.6}$ 1.39631, $\eta_{20}$ 3.840, $\eta_{39.8}$ 3.140, $\eta_{59.75}$ 2.595; phenylurethan, m. 86°; acetate, $b_{739}$ 115–5.8°, $d_4^{25.5}$ 0.8667, $n_{He}^{25.5}$ 1.38843, $\eta_{20}$ 0.683. sec-BuOH $b_{740}$ 98.5°, $d_4^{25.4}$ 0.8025, $n_{He}^{25.4}$ 1.39587, $\eta_{20}$ 3.536, $\eta_{39.8}$ 2.644, $\eta_{59.75}$ 2.094; phenylurethan, m. 64.5°; acetate, $b_{738}$ 110.5–10.8°, $d_4^{25.8}$ 0.86580, $n_{He}^{25.9}$ 1.38708, $\eta_{20}$ 0.655. The eutectic of the phenylurethans of the 2 alcs. m. 60° and contains 25% of the iso-BuOH deriv. The sapon. consts. of the 2 acetates at 0.05 and 20° are reported. iso-BuOH with C (graphite) at 400° gives almost entirely iso-$C_4H_8$; $Al(OH)_3$-C at 400° gives iso-$C_4H_8$ with some 2-butene; *sec*-BuOH with either catalyst gives almost entirely *trans*-2-butene. iso-$C_4H_8$ gives a nitrosochloride, m. 98°, and a *nitrolpiperidide*, m. 137–8°. Vapor-pressure data are given for $C_4H_{10}$ and iso-$C_4H_{10}$ and for various reaction products of the bromides with AcOAg in AcOH. C. J. WEST

**Action of chlorine on acetylene, and preparation of tetrachloroethane and trichloroethylene.** N. A. VALYASHKO AND K. G. KOSENKO. *Ukrain. Khem. Zhur.* **7**, No. 1, Sci. pt 12–35(1932).—A comprehensive review of the literature and patents on the subject is given. Patented methods for industrial production of $C_2H_2Cl_4$ and $C_2HCl_3$ were tried out in the lab., of which the following produced the best results: A yield of 78–81% of $C_2H_2Cl_4$ was obtained by the method of Griesheim Elektron (Ger. pat. 204,883) as modified by the Eng. pat. 132,757 with solid Fe as catalyst, and 88% by the Elektrochemische Ind. (Ger. pat. 154,657) with liquefied $SbCl_5$. A yield of 48% of $C_2HCl_3$ resulted by decompn. of $C_2H_2Cl_4$ with $NH_3$ under atm. pressure (Ger. pat. 351,463; Vincens, *C. A.* 23, 384), and 87.5% with aq. $Ca(OH)_2$ (Consortium, Ger. pat. 171,900). C. B.

**Acetylene series. V. Isomerization of acetylene-γ-glycols by the action of formic**

**acid.** V. N. KRESTINSKII AND L. I. BAZHENOVA-KOZLOVSKA. *Ber.* **66B**, 97–100(1933); cf. *C. A.* **24**, 5284.—Continuing the study of the transformations of acetylenic γ-glycols, K. and B.-K. find that $[Me_2C(OH)C:C]_2$ is converted by boiling concd. $HCO_2H$ into 2 isomers: the diketone *2,5-dimethyl-3,4-hexanedione* (*biisobutyryl*) (I), and the HO ketone *2,5-dimethyl-2-hexen-5-ol-4-one* (*α-hydroxy-α,α-dimethyl-α'-isopropylidenacetone*) (II). II is probably mixed with its tautomer *3,4-epoxy-2,5-dimethyl-2-hexen-5-ol* [(*α-hydroxyisopropyl*)*isopropylidenethylene oxide*]. The transformation is complete but is accompanied with considerable resinification; no intermediate products, which might have shed light on the mechanism of the reaction, were isolated. Variations in concn. of the $HCO_2H$ from 85 to 100% hardly affect the yields, which are around 11 g. I and 18 g. II from 100 g. of the glycol. I, light yellow, $b_{760}$ 146°, $b_{12}$ 48°, $d_4^{20}$ 0.92322, $n_D^{20}$ 1.42057, mol. wt. in benzene 134.5; *monoxime*, m. 125–6°; *dioxime*, m. 158–60°. Na-Hg in moist ether reduces I to isobutyroin. II, $b_{760}$ 186°, $b_{12}$ 78°, $d_4^{20}$ 0.94681, $n_D^{20}$ 1.46192, mol. wt. in benzene 139.1, evolves H with Na, forming an eosin-red product, instantly decolorizes Br and $KMnO_4$, reduces $NH_3$-$AgNO_3$, contains 1 HO group (Chugaev-Zerevitinov). Its spectrochem. behavior points to the presence of a C:O group, although it apparently does not react with $NH_2OH$, $PhNHNH_2$, $p$-$O_2NC_6H_4NHNH_2$ or $H_2NCO$-$NHNH_2$. With H and Pt sponge it readily forms *2,5-dimethylhexan-2-ol-3-one*, $b_{12}$ 68–70°, $d_4^{20}$ 0.90741, $n_D^{20}$ 1.42437; *semicarbazone*, m. 144–5°. With $KMnO_4$ II gives acetone, $Me_2C(OH)CO_2H$, m. 77–9° (*Zn* (*$2H_2O$*) and *Ca salts*), and *β-hydroxydimethylpyruvic acid* (*2-methylbutan-2-ol-3-on-4-oic acid*), liquid (*Zn* and *Ca* (*$2H_2O$*) *salts*). The mechanism of the transformation of the glycol by $HCO_2H$ is explained on the basis of the observations made with $PBr_3$ (*C. A.* **24**, 5284). C. A. R.

**Formation of organo-metalloidal compounds by microörganisms. I. Trimethylarsine and dimethylethylarsine.** FREDERICK CHALLENGER, CONSTANCE HIGGINBOTTOM AND LOUIS ELLIS. *J. Chem. Soc.* **1933**, 95–101.—Gosio-gas (Gosio, *Ber.* **30**, 1024 (1897)) is shown to be $Me_3As$. This is produced by the 4 strains of *Penicillium brevicaule* on media contg. $As_2O_3$ and by 1 strain on media contg. Na methanearsonate or Na cacodylate; with acidified $HgCl_2$ this gives *trimethylarsine dimercurichloride*, m. 264–5°; with hot $H_2O$ it loses $Me_3As$; repeated treatment with $Me_2CO$ gives the *monomercurichloride*, m. 224–6°. Direct absorption of $Me_3As$ in $HNO_3$ gives *hydroxytrimethylarsonium nitrate*, m. 128–9°; *picrate*, m. 218–9°. Absorption of $Me_3As$ in alc. $PhCH_2Cl$ and addn. of Na picrate give *benzyltrimethylarsonium picrate*, m. 173–4°. *Hydroxytrimethylarsonium chloride mercurichloride* m. 135–6°. Na ethanearsonate and *P brevicaule, Sacc.* give $Me_2EtAs$, whose *dimercurichloride* m. 240–1° (decompn.); $HNO_3$ and Na picrate give *hydroxydimethylethylarsonium picrate*, m. 161–2.5°. $PhCH_2Cl$ gives *benzyldimethylethylarsonium picrate*, m. 113–4°; *chloride*, m. 167–8°. The mold on As-free bread gave no garlic odor and no ppt. with $HgCl_2$. *Hydroxytriethylarsonium picrate*, golden, m. 121–2°. All of the above compds. were also synthesized from arsines and compared with the products from the molds. C. J. WEST

**Organic compounds of gold.** C. S. GIBSON. *Nature* **131**, 130(1933); cf *C. A.* **26**, 694.—Hydrobromoauric acid and pentamethylenemagnesium bromide yield spirobis-(pentamethylene)gold bromide (I). The Au in I is 4-covalent and can function as a cation. I gives ethylenediaminospirobis(pentamethylene)gold bromide (II). The Au in II is 6-covalent. Since the groups attached to the Au in II must have an octahedral configuration this compd. should be capable of being resolved into optically active isomers. RACHEL BROWN

**Applications of thallium compounds in organic chemistry. IX. Changes observed on replacing dialkylthallium by trimethylplatinum in chelate rings.** R. C. MENZIES AND E. R. WILTSHIRE. *J. Chem. Soc.* **1933**, 21–22; cf. *C. A.* **27**, 490. The chelate derivs. of $PtMe_3$ with acetylacetone, decompg. without melting at 200°, *dipropionylmethane* (I), decompg. 190°, *benzoylacetone*, decompg. 187°, and *Et acetoacetate* (II), m. 200° (decompn.), are cryst. and sol. in org. solvents; the corresponding $TlMe_3$ derivs. m 214°, 121°, 128° and 128°, resp. They resemble the corresponding dialkylthallium compds. in being volatile but differ from the lower members in being insol. in $H_2O$. The assocn. of I and II in freezing $C_6H_6$ varies from 1.914 to 2.057 and from 2.18 to 2.30; the corresponding $TlMe_3$ derivs. vary from 1.03 to 1.20 and from 1.64 to 1.81. It is evident that the forces holding the mols. together are much greater in the Pt compds than in the Tl compds. The unimol. formulas for the $PtMe_3$ compds. in question indicate for the metal an effective atomic no. of 84 and also a covalency of 5. The stable double mol. wts. may be described as due to coördination between the Pt of 1 mol. and O in its neighbor, increasing the effective at. no. to 86 and the coördination no. of the metal to 6. C. J. WEST

**Production of formaldehyde by the catalytic oxidation or dehydrogenation of methanol. I.** G. NATTA. *Giorn. chim. ind. applicata* **14**, 545–51(1932).—A thermodynamic study of the reactions involved in the production of $CH_2O$ from MeOH. It is

shown that an oxidation of MeOH with $O_2$ to $CH_2O$ cannot be expected, as the reaction will continue to form CO or $CO_2$. However, the reaction (I) $MeOH + CO_2 \longrightarrow CH_2O + CO + H_2O$ promises much, as the presence of $CO_2$ will tend to prevent the reaction (II) $CH_2O + O_2 = CO_2 + H_2O$. II. *Ibid* 551–4.—$CH_2O$ may be formed from MeOH with yields up to 90%, providing a catalyst is chosen which will accelerate the dehydrogenation reaction, but not the oxidation reaction. However, when $CO_2$ is present, together with 10–20% $O_2$, yields up to 94–95% are possible, the $CO_2$ present retarding reaction (II), while favoring (I), and the $O_2$ compensates for the heat required in the endothermic reaction of dehydrogenation, with the exothermic reaction of oxidation.
A. W. CONTIERI

**The catalytic partial oxidation of ethyl alcohol in the vapor phase: The use of a liquid salt bath for temperature control.** DONALD B. KEYES AND WM. L. FAITH. Univ. Ill. Eng. Expt. Sta., *Bull.* **252**, 12 pp.(1932).—Control of the temp. of the catalyst in the vapor-phase partial oxidation of EtOH was effected in earlier work (*C. A.* **26**, 420) by the use of a furnace around the catalyst tube; the current study was undertaken to det. the effect of the use of a bath of molten $NaNO_3$ and $KNO_3$ with the app. as before. With high alc.-air ratios, *i. e.*, those conducive to high yields of intermediate products, results with the new setting were similar to those first obtained except that with Cu turnings in a Cu tube the acid yields were higher. With concns. of 0.4 g. EtOH per l. of air results with a Pyrex tube in the salt bath were intermediate between those obtained with a plain Pyrex tube in air and a Cu tube sealed to glass leads. When a high single-pass conversion to AcH is desired the order of merit of the app. is therefore (1) Pyrex tube in air, (2) Pyrex tube in salt bath, (3) Cu-glass seal chamber. For high acid conversion the latter in a salt bath is best.
H. L. OLIN

**Phytochemical reduction of 1-hydroxy-2-ketoheptane [heptan-1-ol-2-one].** P. A. LEVENE AND A. WALTI. *J. Biol. Chem.* **98**, 735–8(1932); cf. *C. A.* **26**, 1901.—The method described for the phytochem. reduction of α-HO ketones must be modified in the higher homologs because of their lower soly. in $H_2O$. *dl-1-Chloro-2-heptanol* (I), $b_{13}$ 93°, is formed by the action of $CH_2ClCHO$ on $C_5H_{11}MgBr$. When I is oxidized with $Na_2Cr_2O_7$, *1-chloro-2-heptanone* (II), $b_{13}$ 80°, is obtained, and this is converted into *heptan-1-ol-2-one* (III), $b_{20}$ 95°, by heating it with MeOH and $HCO_2K$. *d-Heptane-1,2-diol* (IV), $b_{1.6}$ 93–4°, $[\alpha]_D^{25}$ 2.9°, results from the phytochem. reduction of III in an actively fermenting mixt. of sugar and bakers' yeast; *diphenylurethan* of IV, m. 111–12°, $[\alpha]_D^{25}$ 12.14° in abs. alc. HBr converts IV into *d-1-bromo-2-heptanol*, $b_{1.5}$ 75°, $[\alpha]_D^{22}$ 2.0° without solvent.
A. P. LOTHROP

**Steric hindrance. VII. Esterification and saponification from the standpoint of the electronic theory of union.** JULIUS V. BRAUN AND FRIEDRICH FISCHER. *Ber.* **66B**, 101–4(1933); cf. *C. A.* **27**, 74.—In all probability esterification of acids and alk. sapon. of esters consists in a primary addn. of the neg. OH or OR to the pos. C of the C:O group, and therefore all factors which hinder this addn. will hinder esterification and sapon.; among such factors, in addn. to those of a spatial nature, are such as weaken the pos. character of the C atom in question. Hydrocarbon residues, beginning with Me, have an electron-repelling effect, so that in $Me_3CCO_2H$, *e. g.*, in addn. to the spatial hindering influence of the 3 Me groups, there is an electrochem. influence exerted in the same direction, whereas in the much more readily esterified $CCl_3CO_2H$ only the spatial factor comes into play. The presence of a large no. of hydrocarbon residues at a somewhat greater distance from the $CO_2H$ group should therefore also make itself felt in esterification and sapon. Compds. of the type $(R_2CH)_2CHCO_2H$ and $(R_3C)_2CHCO_2H$, in which the 4 or 6 R residues can hardly have any spatial influence, should, as a result of the electron-repelling influence of these residues, be analogous, not to the rather readily esterifiable $Me_2CHCO_2H$, but to the less easily esterified $Me_3CCO_2H$. Measurements on $(Me_2CH)_2CHCO_2H$ (I) and *dicyclopentylacetic acid* (II) confirmed this view. I, $b_{12}$ 108–10°, prepd. by Marshall by a rather tedious method (*C. A.* **25**, 1219), is obtained much more quickly, in almost 90% yield, from $(Me_2CH)_2C(CN)CO_2H$ heated 12 hrs. at 160–70° with 5 parts concd. HCl; there is formed only a very small amt. of $(Me_2CH)_2CHCONH_2$, m. 149°, which, however, is the chief product if the heating is conducted at 130°. I is recovered almost unchanged when treated 2 hrs. in 10 mols. EtOH on the water bath with HCl gas; likewise, the *Et ester*, $b_{12}$ 65°, obtained in 90% yield from the Ag salt heated 1 hr. in benzene with EtI, is not appreciably sapond. by 2 mols. boiling aq. alc. KOH in 2 hrs. and only 10% in 10 hrs.; sapon. with aq. alc. $H_2SO_4$ is even slower. *Di-Et dicyclopentylmalonate*, from the pentenyl compd. with Ni and H in decalin, $b_{0.4}$ 141–4°; when it is boiled 40 hrs. with 4 mols. aq. alc. KOH and then dild. with water, about 1/3 is repptd. unchanged and acidification of the soln. gives an oil having very nearly the compn. of the *mono-Et ester* but which loses $CO_2$ on distn., yielding the *Et ester*, $b_{15}$ 140–2°, of II, hydrolyzed by heating 12 hrs. at 150–60° with concd. HCl (at 130° the reaction is very far from being complete) to the free II, m. 59–60°. II is as

resistant to esterification as I; the ester is only 5% hydrolyzed by 2 mols. boiling aq. alc. KOH in 6 hrs., 10% in 10 hrs., not detectably by 2 *N* aq. alc. $H_2SO_4$ at 100° in 6 hrs. C. A. R.

**Amplification of the double-bond rule of Otto Schmidt.** RYOHEI ODA AND SEIJI NOMAMOTO. *J. Soc. Chem. Ind., Japan* **35**, Suppl. binding 543–6(1932).—Schmidt's rule states that in unsatd. hydrocarbons, bonds next to double bonds are strengthened, but those following are weakened. This rule applies also to alcs., acids and ethers. It explains the large difference in ionization consts. between such acids as formic and acetic, and malonic and succinic. GREGG M. EVANS

**Unsaturated acids and their derivatives. IX. Configuration of the tetrabromostearic acid which melts at 60°.** TSUTOMU MARUYAMA AND BUNSUKE SUZUKI. *Proc. Imp. Acad.* (Tokyo) **8**, 486–9(1932); cf. *C. A.* **26**, 1897.—γ-Tetrabromostearic acid (I), m. 60°, on debromination with Zn and $H_2SO_4$ gives γ-linoleic acid (octadeca-6,9-dien-18-oic acid), which gives principally I on bromination, with a small proportion of the other isomers. I (10 g.) with 8.8 g. KOH in 265 cc. EtOH at 28° for 1.5 hrs. loses 2 atoms Br and the resulting di-Br acid gives azelaic (II) and valeric (III) acids on oxidation; the product is therefore $Me(CH_2)_3CH:CHCHBrCH_2CH:CBr(CH_2)_7CO_2H$ or $Me(CH_2)_3CH:CHCHBrCH_2CBr:CH(CH_2)_7CO_2H$; at 80° 3 atoms of Br are lost and the resulting mono-Br acid gives $(CO_2H)_2$, II and III on oxidation; this is therefore $Me(CH_2)_3CH:CH:CH:CHCH:CBr(CH_2)_7CO_2H$ or $Me(CH_2)_3CH:CHCH:CHBr:CH(CH_2)_7CO_2H$. Heating I with EtOH-KOH at 150° for 10 hrs. gives octadeca-6,8-dien-10-in-18-oic acid. It is obvious that in I 2 Br atoms of the C atoms 6 and 7 take *cis*-positions, while those of C atoms 9 and 10 are in the *trans*-position to each other. C. J. WEST

**Mechanism of oxidation processes. XXXII. Enzymic oxidation of acetic acid by yeast.** HEINRICH WIELAND AND ROBERT SONDERHOFF. *Ann.* **499**, 213–28(1932); cf. *C. A.* **26**, 4302.—Impoverished yeast (*C. A.* **26**, 1957) and $O_2$ oxidize AcOH (as AcONa or $(AcO)_2Ba$) after 24 hrs., giving a soln. contg. succinic acid (5% of AcOH consumed) and citric acid (10% of the AcOH consumed); details are given of their isolation and estn. The oxidation of AcOH is more dependent on the substrate concn. than in the oxidation of EtOH; the reaction velocity with *M*/128 soln. is about 75% of that with *M*/4 soln. The reaction undergoes self-acceleration because of the intermediate products being oxidized faster than the AcOH itself. The ratio of $CO_2$ produced to $O_2$ consumed is approx. 1, while the mol. ratio $O_2$ to AcOH is 1.64–1.81. Glycolic and oxalic acids are not probable intermediates, since these are scarcely affected by yeast and $O_2$. Fumaric acid is oxidized by yeast and $O_2$ at about the same rate as succinic acid, the rate being much slower than with AcOH. AcOH, succinic and malic acids are not dehydrogenated by yeast and methylene blue. The citric acid may be formed by an aldol-like condensation of AcOH and $HO_2CCOCH_2CO_2H$; support for this is found in the fact that succinic acid gives no citric acid with yeast. Oxidation of citric acid also proceeds slowly with yeast and $O_2$; the initial evolution of $CO_2$ is very slow but later increases rapidly. C. J. WEST

**Catalytic hydrogenation of olefinic compounds.** E. H. FARMER AND R. A. P. GALLEY. *Nature* **131**, 60(1933); cf. *C. A.* **26**, 2417.—F. and G. report that the figures they previously recorded to show the course of catalytic hydrogenation in a series of butadiene acids should not be regarded as characteristic of the resp. acids since the condition of the catalyst also materially affects the proportions of the products. When an "aged" catalyst is used, the course of hydrogenation of sorbic acid is very different from that previously observed. Conclusions drawn by Lebedev and his collaborators (*C. A.* **19**, 1401; **22**, 2362, 4460) have been verified by analyses of partial reduction products so far as numerous binary mixts. of $\Delta^{\alpha}$-, $\Delta^{\beta}$- and $\Delta^{\gamma}$-hexenoic acids, $\Delta^{\gamma}$-pentenoic acid, allyl alc., and sorbic acid are concerned. In the hydrogenation of sorbic acid, all of the conjugated acid disappears before the 3 isomeric ethylenic acids are attacked. A. WIEBEN DEXTER

**Monothioethylene glycol. IV. Aryl β-hydroxy- and β-chloroethyl sulfides.** GEO. BADDELEY AND G. MACDONALD BENNETT. *J. Chem. Soc.* **1933**, 46–8; cf. *C. A.* **21**, 3191.—Each aryl β-hydroxyethyl sulfide was prepd. by adding $HOCH_2CH_2Cl$ to a soln. of the thiol in a slight excess of KOH at 60–70° and heating for a short time on the water bath; conversion into the chloro sulfide was effected by $SOCl_2$ in $C_5H_5N$ and $CCl_4$, but with compds. halogenated in the nucleus fusion with $PCl_5$ was necessary; oxidation to the sulfoxides was carried out with $H_2O_2$ in AcOH, to the sulfones by $KMnO_4$ and $MgSO_4$. *Mesityl β-hydroxyethyl sulfide*, m. 25°; *Cl deriv.*, m. 44°; *sulfoxide*, m. 76°; *sulfone*, m. 60.5°. *p-Chlorophenyl β-hydroxyethyl sulfide*, light brown oil; *Cl deriv.*, m. 34°; *sulfone*, m. 96°. *p-Bromophenyl β-hydroxyethyl sulfide*, dark brown oil; *Cl deriv.*, m. 39°; *sulfone*, m. 109°. *p-Iodophenyl β-chloroethyl sulfide*, m. 54°. $2,4\text{-}Cl_2C_6H_3SH$, m. 20°, is oxidized by $K_3Fe(CN)_6$ to *2,4,2',4'-tetrachlorodiphenyl disulfide*, m. 82.5°; *2,4-dichlorothiophenol benzoate*, pale brown, m. 97°; *2,4-dichlorophenyl β-chloroethyl sulfide*

$b_{16}$ 218°; *sulfoxide*, m. 96.5°. *2,5-Dichlorophenyl β-hydroxyethyl sulfide*, m. 32°; *Cl deriv.*, $b_{15}$ 176°; *sulfoxide*, m. 68°. *2,4,6-Trichlorothiophenol*, m. 60° (*benzoate*, m. 170°); *2,4,6,2',4',6'-hexachlorodiphenyl disulfide*, m. 165°; *2,4,6-trichlorophenyl β-hydroxyethyl sulfide*, m. 41°; *Cl deriv.*, m. 71°. *β-Anisyl β-hydroxyethyl sulfide*, m. 41°; *Cl deriv.*, pale yellow, $b_1$ 110°. *α-Naphthyl β-chloroethyl sulfide*, pale brown oil, decomps. on distn. *α-Naphthyl β-hydroxyethyl sulfone*, m. 122°; *Cl deriv.*, m. 74°. *β-Naphthyl β-hydroxyethyl sulfide*, m. 64°; *Cl deriv.*, m. 53°; excess $PCl_5$ gives a *?-chloro-β-naphthyl deriv.*, m. 52°. *β-Naphthyl β-hydroxyethyl sulfone*, m. 108°; *Cl deriv.*, m. 100°. *p-Nitrophenyl-β chloroethyl sulfone*, m. 128°. *Phenyl γ-chloropropyl sulfone*, m. 26°.

**Pentane-1,2,5-triol and $\Delta^1$-5-pentenol.** R. PAUL. *Ann. chim.* 18, 303–94(1932).—The various derivs. of pentane-1,2,5-triol required for a study of the comparative ease of formation of furanic or pyranic cyclic compds. have been prepd. by the hydrogenation of dialkoxypentanones and the addn. of halogens or HOCl to $\Delta^1$-5-pentenol. The dialkoxypentanones, $ROCH_2CO(CH_2)_3OR'$, useful for obtaining $ROCH_2CH(OH)(CH_2)_3OR'$ compds. but too laboriously prepd. to be a readily available source for the dibromohydrins, were prepd. by the action of the Me, Et and iso-Am alkoxynitriles on $XMg(CH_2)_3OR'$ compds. $CH_2(CH_2OH)_2$ was converted into $Cl(CH_2)_3OH$ (*Org. Syntheses* 8, 112) which on methylation with $Me_2SO_4$ gave 65% of $Cl(CH_2)_3OMe$, (I), b. 109–12°. $Br(CH_2)_3OMe$, b. 132–3°, was also prepd. in 50% yields from the glycol by sodation with $NH_2Na$, methylation to the monomethylin, b. 153°, and treatment with $PBr_3$. I was converted into $ClMg(CH_2)_3OMe$ by addn. with stirring to Mg covered with $Et_2O$ in the presence of a trace of $AlCl_3$. Addn. of $MeOCH_2CN$ to the reaction mixt., treatment with dil. acid and extn. with $Et_2O$ yielded, on fractional distn., *1,5-dimethoxypentan-2-one* (II), $C_7H_{14}O_3$, $b_{14}$ 89°, $d_{15}^{15}$ 1.001, $n_D^{15}$ 1.4264, M. R. 37.31 (calcd. 37.82); *semicarbazone*, $C_8H_{17}N_3O_3$, m. 88.5°; *oxime*, $C_7H_{15}NO_3$, $b_{15}$ 139–41°, $d_{15}^{18}$ 1.0428, $n_D^{18}$ 1.4574, M. R. 42.08 (calcd. 42.01). Similarly were prepd.: *1-ethoxy-5-methoxypentan-2-one*, $C_8H_{16}O_3$, $b_{18}$ 95–6°, $d_{15}^{18}$ 0.9691, $n_D^{18}$ 1.4283, M. R. 42.50 (calcd. 42.44) (*semicarbazone*, $C_9H_{19}N_3O_3$, m. 59–60°; *oxime*, $C_8H_{17}NO_3$, $b_9$ 140–1°, $d_{15}^{18}$ 1.013, $n_D^{18}$ 1.4564, M. R. 46.99 (calcd. 46.54)); *1 isoamoxy-5-methoxypentan-2-one* (III), $C_{11}H_{22}O_3$, $b_{17}$ 131–2°, $d_{15}^{18.5}$ 0.930, $n_D^{18.5}$ 1.4314, M. R. 56.27 (calcd. 56.29); and *1-isoamoxy-5-ethoxypentan-2-one*, $C_{12}H_{24}O_3$, $b_{14}$ 134°, $d_{15}^{15}$ 0.920, $n_D^{15}$ 1.4330, M. R. 61.10 (calcd. 60.91). These ketones change slowly on standing, the change probably being due to aldolization owing to the presence of traces of N compds. The small quantity of Me, Et and iso-Am alcs. found in each reaction mixt. is a reaction product and is not formed by the decompn. of the ketone. In no case was it possible to detect the presence of the dimer of the nitrile, $ROCH_2C(:NH)CH(OR)CN$ or its hydrolysis product $ROCH_2COCH(OR)CN$. $EtOCH_2CN$ gave no reaction on treatment with Na. This lack of mobility of the H atoms in the nitriles explains their normal reaction with the organomagnesium compds. On the contrary, the influence of the radical R on the reactivity of the CO group is very limited; the degree of oxime formation and the speed of hydrogenation of these ketones are independent of the mol. wt. of the radical R. The ketones can be alkylated by the method of Haller in spite of the 1,4-position of the CO and OR groups, *e. g.*, on treatment with $NaNH_2$ and EtI, III gave *1-isoamoxy-3-ethyl-5-methoxypentan-5-one*, $C_{13}H_{26}O_3$, $b_{13}$ 135–9°, $d_{15}^{18}$ 0.919, $n_D^{19}$ 1.4384, M. R. 65.71 (calcd. 65.53). The condensation of $NaHC(CO_2Et)_2$ with $CH_2:CHCH_2Br$ gave Et allylmalonate, $b_{16}$ 108–10°, which was converted into K allylmalonate by heating in a Cu vessel for 6 hrs. with concd. KOH. Treatment with dry HCl and extn. with $Et_2O$ gave allylmalonic acid, which was decompd. by heating over a free flame at 160–200° to give $CH_2:CHCH_2CH_2CO_2H$. The esterification of a cold benzene soln. of this acid by agitation for 24 hrs. with a mixt. of $H_2SO_4$ and EtOH yielded $CH_2:CHCH_2CH_2CO_2Et$ (IV), b. 144–6°. The reduction of IV with Na and EtOH gave 55% of $\Delta^1$-*5-pentenol* (V), $C_5H_{10}O$, $b_{760}$ 138.5–9.5° (cor.), $d_{15}^{15}$ 0.848, $n_D^{15}$ 1.4305, M. R. 26.21 (calcd. 26.34), and a small quantity of *diallylethanol* (VI), $C_8H_{14}O$, $d_{15}^{17}$ 0.869, $n_D^{17}$ 1.4556, M. R. 39.40 (calcd. 39.72) (*pyruvate*, $C_{11}H_{16}O_3$, $b_{13}$ 115–7°, $d_{15}^{19}$ 0.982, $n_D^{19}$ 1.4514, M. R. 53.79 (calcd. 53.72); *semicarbazone*, $C_{12}H_{19}N_3O_3$, m. 99–100°). VI is formed by the reduction of the Et diallylacetate accompanying IV and from which it is sepd. with difficulty. Various pentenyl derivs. were prepd. to facilitate the comparative study of the ethylenic alcs. $CH_2:CH(CH_2)_nCH_2OH$, and others were made as sources of derivs. of pentane-1,2,5-triol: *pentenyl phenylurethan*, $C_{12}H_{15}O_2N$, $b_{16}$ 184–5°, $d_{15}^{15}$ 1.068, $n_D^{15}$ 1.5340, M. R. 59.69 (calcd. 59.72); *pentenyl allophanate*, $C_7H_{12}N_2O_3$, m. 147–8°, prepd. by passing a current of HCNO through V (*C. A.* 13, 1839); *pentenyl chloride*, $C_5H_9Cl$, $b_{747}$ 105°, $d_{15}^{18}$ 0.916, $n_D^{18}$ 1.4305, M. R. 29.50 (calcd. 29.45), formed by the action of $SOCl_2$ on a cold mixt. of V and $PhNMe_2$ (*C. A.* 5, 1742); *pentenyl bromide*, $C_5H_9Br$, $b_{748}$ 126–7°, $d_{15}^{15}$ 1.272, $n_D^{15}$ 1.4654, M. R. 32.40 (calcd. 32.59), made by treatment of V with $PBr_3$ in pyridine (*C. A.* 20, 3155); *pentenyl acetate*, $C_7H_{12}O_2$, b. 150–1°, $d_{15}^{18}$ 0.907, $n_D^{18}$ 1.4176, M. R. 35.54 (calcd. 35.71); and, by the action of $Me_2SO_4$

on the Na deriv. of V, *Δ'-5-methoxypentene* (VII), $C_6H_{12}O$, $b_{764}$ 96–8°, $d_{15}^{17}$ 0.787, $n_D^{17}$ 1.4032, M. R. 31.02 (calcd. 31.08). The action of KOH on $CH_2BrCHBr(CH_2)_3OH$ gave *Δ¹-2-bromo-5-pentenol* (VIII), $C_5H_9OBr$, $b_{15}$ 97°, $d_{15}^{17}$ 1.434, $n_D^{17}$ 1.50026, M. R. 33.86 (calcd. 34.11) (*phenylurethan*, $C_{12}H_{14}BrNO_2$; *allophanate*, $C_7H_{11}BrN_2O_3$, m. 136–9°). To establish its constitution VIII was treated with $PBr_3$ in the presence of pyridine and converted into *Δ¹-2,5-dibromopentene*, $C_5H_8Br_2$, $b_{15}$ 83–6°, $d_{15}^{16.5}$ 1.742, $n_D^{16.5}$ 1.5257, M. R. 40.13 (calcd. 40.35), which is readily brominated to *1,4,4,5-tetrabromopentane*, $C_5H_8Br_4$, $b_{14}$ 163.4°, $d_{15}^{18}$ 2.346, $n_D^{18}$ 1.59664, M. R. 56.32 (calcd. 56.35) (for the 1,2,3,4- and 1,2,2,3-isomers, cf. *C. A.* **23**, 2149; **22**, 3626). The action of KOAc and $Ac_2O$ on $CH_2BrCHBr(CH_2)_3OH$ (IX) gave the *acetate* of VIII, $C_7H_{11}BrO_2$, $b_{18}$ 103–5°, $d_{15}^{20}$ 1.312, $n_D^{20}$ 1.4658, M. R. 43.66 (calcd. 43.47). The bromination of this acetate yielded *4,4,5-tribromopentanol acetate*, $C_7H_{11}Br_3O_2$, $b_{17}$ 179–80°, $d_{15}^{20}$ 1.927, $n_D^{20}$ 1.53823, M. R. 59.58 (calcd. 59.47). By the action of dry HBr at 100–110°, VIII was converted into *1,4-dibromopentane*, $C_5H_{10}Br_2$, $b_{12}$ 82°, $d_{15}^{15}$ 1.687, $n_D^{15}$ 1.51048, M. R. 40.81 (calcd. 40.82). Tables are given of the b. p., d., and *n* values of the alcs., acetates and bromides of the satd., ethylenic and alkylallylic isomers of $CH_2:CH(CH_2)_nOH$ (where $n$ = 1, 2 and 3). From a consideration of the action of HBr on these alcs. it is concluded that in the case of the pentenol each of the functional groups retains its individuality and reacts normally as though isolated from the action of the other group. By catalytic hydrogenation, with the aid of $PtO_2$, of the dialkoxypentanones were prepd.: *1,5-dimethoxypentan-2-ol*, $C_7H_{16}O_3$, $b_{18}$ 94–5°, $d_{15}^{14}$ 0.976, $n_D^{14}$ 1.43336, M. R. 39.43 (calcd. 39.34) (*p-nitrobenzoate*, m. 194–5°); *1-ethoxy-5-methoxypentan-2-ol*, $C_8H_{18}O_3$, $b_{13}$ 99°, $d_4^{17}$ 0.955, $n_D^{17}$ M. R. 43.80 (calcd. 43.95); and *1-isoamoxy-5-methoxypentan-2-ol*, $C_{11}H_{24}O_3$, $b_{10}$ 126–7°, $d_4^{15}$ 0.9229, $n_D^{15}$ 1.43637, M. R. 57.83 (calcd. 57.81). By the action of HBr on these alcs. the alkoxy groups were eliminated and all gave *1,5-dibromopentan-2-ol*, $C_5H_{10}Br_2O$, $b_{11}$ 126–8°, $d_4^{18}$ 1.817, $n_D^{18}$ 1.53513, M. R. 42.15 (calcd. 42.34), which on heating is cyclized into *tetrahydrofurfuryl bromide*, $b_{18}$ 67°. The addn. of $Br_2$ to V formed *4,5-dibromopentanol* (IX), which could not be distd. without decompn. The crude dibromohydrin, when treated with $Ac_2O$ at 125°, gave the corresponding *acetate*, $AcO(CH_2)_3CHBrCH_2Br$, $b_{23}$ 156–7°, $d_{15}^{18.5}$ 1.635, $n_D^{18.5}$ 1.50393, M. R. 52.16 (calcd. 51.71), also formed by the bromination of pentenyl acetate in AcOH at 0°. Treatment of IX with $PBr_5$ yielded *1,2,5-tribromopentane*, $C_5H_9Br_3$, $b_{23}$ 146°, $d_{15}^{22}$ 2.075, $n_D^{22}$ 1.56197, M. R. 48.30 (calcd. 48.58), converted by AcOK into the *triacetate* of *pentane-1,2,5-triol*, $C_{11}H_{18}O_6$, $b_9$ 159°, $d_{15}^{15}$ 1.123, $n_D^{15}$ 1.4402, M. R. 57.74 (calcd. 57.96), and $CH_2:CHBr(CH_2)_3CO_2Me$. The sapon. of the triacetate with $Ba(OH)_2.8H_2O$ gave *pentane-1,2,5-triol* (X), $C_5H_{12}O_3$, $b_{12}$ 190–1°, $d_{15}^{20}$ 1 136, $n_D^{20}$ 1.47299, M. R. 29.63 (calcd. 29.86) (*triphenylurethan*, $C_{26}H_{27}N_3O_6$, m. 92°). HOCl, prepd. from $H_2NCONHCl$ (*C. A.* **16**, 2113), was added to VII, producing a small quantity of *1-methoxy-4,5-dichloropentane*, $b_{13}$ 81°, $d_{15}^{16}$ 1.134, $n_D^{16}$ 1.45822, M. R. 41.16 (calcd. 41.28), and a main fraction consisting of *1-chloro-5-methoxypentan-2-ol* (XI), $C_6H_{13}ClO_2$, $b_{13}$ 102–3°, $d_{15}^{19}$ 1.103, $n_D^{19}$ 1.45842, M. R. 37.75 (calcd. 37.94), formed by an addn in accordance with the rule of Markovnikov. XI is transformed by heating with powd. KOH in $Et_2O$ into *1,2-epoxy-5-methoxypentane*, $C_6H_{12}O_2$, b 156°, $d_{15}^{15}$ 0.946, $n_D^{15}$ 1.42085, M. R. 31.08 (calcd. 30.99), from which XI is regenerated by treatment with cold concd. HCl. Reaction velocity measurements show that though the addn. of HOCl to VII leads to an almost pure XI, the addn. of HCl to the epoxy deriv. gives a mixt. of the 2 possible chlorohydrins comprising 9% of $CH_2(OH)CHCl(CH_2)_3OMe$ and 91% of $ClCH_2CH(OH)(CH_2)_3OMe$. Addn. of HOCl to V gave a mixt. of $ClCH_2CH(OH)(CH_2)_3OH$ and $CH_2(OH)CHCl(CH_2)_3OH$ which on treatment with dry HBr gave a chlorobromohydrin decompd. on heating into HBr and a trace of tetrahydrofurfuryl chloride, which was also isolated in small quantities by treating the mixt. with 15% $H_2SO_4$. It was concluded that the mixt. consisted mainly of the *α*-monochlorohydrin, *4-hydroxy-5-chloropentanol* (XII), $C_5H_{11}ClO_2$, $b_{10}$ 138–40°, $d_{15}^{15}$ 1.188, $n_D^{15}$ 1.48013, M. R. 33.13 (calcd. 33.20). Analogies of pentanetriol and its homologs, glycerol and butane-1,2,4-triol, are demonstrated by data provided in a table of b. ps., *d* and *n* of the triols, tribromides, triacetates and *α*-dibromohydrins. The crude *β*-dibromohydrin (IX) when heated with powd. KOH gave 33% of VIII and *α-bromomethyltetrahydrofuran* (XIII), $C_5H_9BrO$, $b_{18}$ 67°, $d_{15}^{18}$ 1.483, $n_D^{18}$ 1.4895, M. R. 32.14 (calcd. 32.49), identified by transformation by heating with dry AcOAg for 10 hrs. at 160–170° into the *acetate*, $b_{22}$ 93–4°, $d_{15}^{22}$ 1.064, $n_D^{22}$ 1.43637, M. R. 35.41 (calcd. 35.62), which on boiling for 2 hrs. with concd. KOH yielded tetrahydrofurfuryl alcohol (XIV), $C_5H_{10}O_2$, b. 176–8°, $d_{15}^{18}$ 1.054, $n_D^{18.5}$ 1.45252, M. R. 26.14 (calcd. 26.26), identical with the alc. prepd. by Wienhaus (*C. A.* **15**, 844) by the catalytic hydrogenation of furfural, and forming a phenylurethan, m. 60–1°, pyruvate, m. 184–5° (semicarbazone, m. 184–6°). XIII reduces $NH_3$-$AgNO_3$, as also does the corresponding alc. The ring system is opened by HBr to give 1,5-dibromopentan-2-ol and a small quantity of the 4,5-dibromopentan-1-ol, but no bromo diacetate can be isolated after treatment with $Ac_2O$ at 150° in the presence of $ZnCl_2$. The action of powd. dry

KOH in $Et_2O$ on **XII** formed **XIV**, probably by the intermediate formation of the epoxypentanol, consequent opening of the ring and a final closure catalyzed by the KOH present. In the series of pentane-1,2,5-triol derivs. the furan ring is preferentially formed on ring closure. The chain may be closed between C atoms 1 and 2 but no case has been observed of closure between the C atoms 1 and 5 with consequent formation of the pyran ring. C. R. ADDINALL

**Dielectric constants of fatty oils.** T. G. KOVALEV AND V. V. ILLARIONOV. *J. prakt. Chem.* **135**, 327–34(1932).—Detailed data are given of the changes which certain fatty oils undergo on standing 3 months in the sunlight, with and without the presence of moisture. The following data show the change in $\epsilon$ (order, fresh oil, action of air and light, action of light and moisture): castor oil, 4.673, 5.437, 5.891; sesame oil, 3.076, 4.259, 3.346; peach oil, 3.014, 4.047, 3.470; sun-flower oil, 3.099, 4.627, 3.359; olive oil, 3.029, 3.990, 3.470; almond oil, 3.056, 4.314, 3.560; mustard oil, 3.034, 5.075, 3.305; linseed oil, 3.103, 4.617, 3.760; linseed-oil varnish, 3.405, 4.416, 4.142 (after 1 mo.); hemp-seed-oil varnish. 3.605, 4.351, 3.908 (after 1 month). C. J. WEST

**The oxidation of acid alcohols and sugars by periodic acid.** PAUL FLEURY AND JACQUES LANGE. *Compt. rend.* **195**, 1395–7(1932); cf. *C. A.* **22**, 1332.—$HIO_4$ oxidizes $CH_2OH[CH(OH)]_nCH_2OH$ and glucose to HCHO and $HCO_2H$; tartaric acid to $OHC\text{-}CO_2H$; gluconic and saccharic acids to $OHCCO_2H$, $HCO_2H$ and HCHO; $CO(CH_2OH)_2$ to HCHO and $CH_2(OH)CO_2H$; levulose to HCHO, $HCO_2H$ and $CH_2(OH)CO_2H$. It has no action on $[CH_2(OH)]_4C$, simple alcs. or glycolic, malic or citric acids. The reaction appears to be sp. for $\alpha$-glycols. It may be possible to use it to det. constitution. JANET E. AUSTIN

**The identity of volemitol with $\beta$-*d*-mannoheptitol [and with $\alpha$-sedoheptitol].** V. ETTEL. *Collection Czechoslov. Chem Communications* **4**, 504–12(1932); cf. following abstr.—Although LaForge and Hudson had assigned a different configuration to volemitol (I), E. recognized the close agreement of its properties with those reported for $\beta$-*d*-mannoheptitol (II), and prepd. and studied acyl derivs. of each. Mixing I and II did not lower the m. p. II was prepd. and treated with BzH in 50% $H_2SO_4$ and the product that crystd. from alc. was fractionated by means of toluene. The *tribenzoate* (III), of $\beta$-*d*-mannoheptitol most sol. in toluene, m. 210°, $[\alpha]_D^{20}$ —1.3° ($CHCl_3$), —42.8° (pyridine), is identical with the tribenzoate of I reported by E. (*C. A.* **23**, 4192). The fraction less sol. in toluene has not been satisfactorily purified; it m. 190–95°, is more strongly *l*-rotatory than III and resembles the 2nd Bz deriv. of I. The identity of II and $\alpha$-sedoheptitol (IV) had been established by LaForge and Hudson but the known Ac derivs. were not the same for I and IV. Fractional crystn. from benzene of the acetylation product, prepd. from I by the method of LaForge, yielded 2 fractions of which the less sol. one is the triacetate previously identified and reported by E. The *triacetylvolemitol* (V), very sol. in benzene, m. 201°, $[\alpha]_D^{20}$ —51.9° ($CHCl_3$), agrees very well with the tri-Ac deriv. of IV reported by LaForge and confirms the identity of these 2 alcs. ANNE E. WHITE

**The configuration of sedoheptose.** V. ETTEL. *Collection Czechoslov. Chem. Communications* **4**, 513–20(1932); cf. preceding abstr.; also LaForge, *C. A.* **14**, 944, 3647.—Reduction of sedoheptose gives $\alpha$-sedoheptitol, which is identical with $\beta$-*d*-mannoheptitol (I), and $\beta$-sedoheptitol. This relation to I leaves only the allocation of the ketonic group to complete the configuration of sedoheptose. This group might be at the 2nd, 3rd, 5th or 6th C atom theoretically but compds. prepd. and characterized by LaForge eliminate positions 2 and 3 in this case. The configuration favored by LaForge having a carbonyl at the 5th C would give as the other reduction product optically active alloheptitol, different from any known heptitol. A compd. with a carbonyl at the 6th position would reduce to I and $\beta$-*l*-guloheptitol and would have the configuration of an altroketoheptose. The properties of $\beta$-sedoheptitol and its benzoate agree with the properties reported by LaForge for $\beta$-*d*-guloheptitol, both being optically inactive. E. concludes that $\beta$-sedoheptitol is the antipode of the known $\beta$-*d*-guloheptitol and that the configuration offered by LaForge is excluded. A table shows the relations of sedoheptose to other heptoses and heptitols. ANNE E. WHITE

**Reactivity of the mercapto group. II.** NILS HELLSTRÖM. *Z. physik. Chem.* **A163**, 33–52(1932); cf. *C. A.* **26**, 965.—The reaction of thioglycolic acid with the haloacetic acids and their amides was studied in neutral and acid soln. A few errors in the preceding paper are corrected. G. M. MURPHY

**Temperatures of sublimation of twelve amino acids.** JANET W. BROWN. *Trans. Roy. Soc. Can.* Sect. III, **26**, 173–8(1932).—The temp. at which appreciable amts. of a cryst. sublimate were obtained in 10 min. by the method of Eder, and the m. p., resp., of the amino acids are: *l*-proline 130–35°, 220°; isoleucine 168–70°, 280°; *l*-leucine 145–8°, 293–5°; glutamic acid 170–5°, 197–8°; isovaline 150–1°, 315°; tryptophan 185–90°, 289°; *l*-phenylalanine 150–5°, 283°; hydroxyproline 185–90°, 270°; *d*-alanine 160–5°,

297°; *l*-serine 186–90°, 228°; glycine 160–75°, 225–30°; *l*-tyrosine 250–6°, 314–8°. *d*-Arginine, m. 238°, *d*-aspartic acid, m. 251°, and histidine, m. 277°, do not sublime. Plates of the crystals obtained accompany the paper. J. W. SHIPLEY

**β-Aminovaleric acid.** H. D. DAKIN. *J. Biol. Chem.* **99**, 531–5(1933).—EtCH:$CHCO_2H$ was heated 24 hrs. at 125–35° with aq. $NH_4OH$ satd. at 5°. After removal of the $H_2O$ the product was esterified, sepd. as the HCl salt from $NH_4Cl$, and the free *Et ester* (I) of *β-aminovaleric acid* (II) distd. I $b_{12}$ 82–4°, and when refluxed 4 hrs. with 10 parts $H_2O$ gave II, very sol. in $H_2O$, needles from alc. with dry $Et_2O$, decompg. 160–5°, m. clear 185°; *Cu salt*, readily sol. blue needles with 1 $H_2O$; phosphotungstate, white cryst. ppt.; *reineckate*, garnet-red crystals, darkens 156° and m. 171–5°. With cyanate II gave *β-uraminovaleric acid*, m. 147–8°, very sol. in $H_2O$, slowly extd. by $Et_2O$, converted by boiling with HCl to the less sol. *4-ethylhydrouracil*, m. 191–2°; *1-phenyl-4-ethylhydrouracil* m. 192°. BEN H. NICOLET

**Electrolytic preparation of aldonic acids.** H. KILIANI. *Ber.* **66B**, 117–20(1933).—I. The Isbell and Frush method (*C. A.* **25**, 4850) seemed promising in the study of glucosides contg. different sugar residues, for as a rule the sugars interfere with each other's crystn. while the corresponding aldonic acids show appreciable differences as regards their salts. The simplest way seemed to be to hydrolyze the glucoside with HCl, sep. the aglucone, neutralize the HCl exactly with $CaCO_3$, electrolyze the soln., conc. to a small vol., add alc. and fractionate the ppt. In a preliminary expt. with glucose no Ca gluconate could be obtained, even when the soln. was seeded, but when HBr was used instead of HCl for the hydrolysis the method worked very satisfactorily. Digitonin gave Ca *d*-galactonate; the mother liquors from this with $CdCO_3$ yielded Cd bromoxylonate, and finally from the mother liquors of the latter was obtained Ca *d*-gluconate. II. Just as for the reaction *d*-galactose ⟶ galactonic acid (*C. A.* **26**, 5912), more precise directions for the prepn. of *d*-mannonic acid are given. III. Especially has the older method of prepg. *d*-galactonic acid directly from lactose (*C. A.* **20**, 2985) been improved by application of the electrolytic process. C. A. R.

**Oxidation of glyoxal bisulfite to glyoxylic acid by molecular oxygen. Oxidation of glyoxal by bromine to glyoxylic and to oxalic acid.** CARL NEUBERG AND MARIA KOBEL. *Biochem. Z.* **256**, 475–84(1932).—Methylglyoxal bisulfite is quantitatively oxidized by atm. O to pyruvic acid whereby no dehydration of a lactate is responsible. The oxidation of glyoxal, which differs from AcCHO in being a dialdehyde instead of a ketoaldehyde, shows that the atm. O can attack only 1 of the CO groups so that only glyoxylic but no oxalic acid results. The reaction is not complete as in the AcCHO compd., the yield being only 80%. S. MORGULIS

**A new unsaturated derivative of glucuronic acid.** JOHN PRYDE AND R. TECWYN WILLIAMS. *Nature* **131**, 57(1933).—By methylating glucurone with $Ag_2O$ and MeI, P. and W. secured an unsatd. compd., $C_9H_{12}O_6$, m. 88°, $[\alpha]_{5461}$ 110.8° in water. Name and formula suggested: *trimethylglucuralone*,

MeOC:C(OMe).CH(OH).CH(OMe).CH($CO_2$H).O.

A. W. DEXTER

**Products of methylation of *d*-galacturonic acid.** K. SMOLEŃSKI AND M. CICHOCKI *Collection Czechoslov. Chem. Communications* **4**, 500–3(1932); cf. Smoleński, *C. A.* **21**, 3603; **22**, 4109; also Ehrlich, *C. A.* **24**, 65.—The sp. rotatory power of the hydrate of *d*-galacturonic acid in water changes from 77.93° to 52.24° after 3.5 hrs. That part exists in the lactone form might be inferred from an acid no. which is lower than theoretical whereas the reducing power is the same as for galactose. Cryst. galacturonic acid hydrate (I) was methylated according to Fischer's method and a 30% yield of rhombic crystals of methyl methyl-*d*-galacturonate (II) obtained, m. 137–8°, sol. in $H_2O$, MeOH and EtOH, almost insol. in acetone, reduces Fehling soln. only after hydrolysis, C 43.14%, H 6.42%, acid no. 447, MeO calcd. to MeOH 28.05%, $[\alpha]_D^{20}$ 124.9°. II was sapond. with $Ba(OH)_2$ and the Ba salt treated to free *methyl-d-galacturonic acid* (III), sol. in $H_2O$ and EtOH, almost insol. in acetone, reduces only after hydrolysis, 0.5% aq. soln. has $p_H$ of 1.8–2.0, m. 115–6°, C 40.21%, H 5.81%, MeOH 14.95%, $[\alpha]_D^{20}$ 138.5°. The filtrate left after removal of II was dried and analyzed considerably later. The data showed the thick sirup to be a methyl methyl-*d*-galacturonate. It differed from II only in $[\alpha]_D^{20}$ —36.92°. S. and C. designate II as the *Me α-methyl-d-galacturonate* and the isomer obtained as a sirup as the *Me β-methyl-d-galacturonate* (IV). They also interpret the mutarotation of I as a typical shift from the α-form to an equil. mixt. of α- and β-forms. From IV were prepd. *β-methyl-d-galacturonic acid*, $[\alpha]_D^{20}$ —32.3°, and its Ba salt, $[\alpha]_D^{20}$ —38.6°. ANNE E. WHITE

**Synthesis of alcamino acids by the cyanohydrin method.** A. I. KIPRIYANOV AND G. I. KIPRIYANOV. *J. Gen. Chem.* (U. S. S. R.) **2**, 585–9(1932).—The proposed term *"alcamino acid"* is constructed from alcamine (amino alc.) and amino acid to distinguish this type of aminohydroxy acids from that of serine. In the synthesis of alcamino acids

by the interaction of α-hydroxides and amino acid esters is usually obtained a mixt. of monohydroxyalkyl- and dihydroxyalkylamino acids, the sepn. of which is very difficult, and in the lower amino acids, such as glycocoll and alanine, is impossible (*C. A.* **21**, 2467; **22**, 3134; **26**, 108). Zelinskii and Stadnikov (*J. Russ. Phys.-Chem. Soc.* **38**, 722; **40**, 790) produced amino acids from CO compds. with KCN and $NH_3$, while by using amines in place of $NH_3$ can be obtained amino acids substituted in the $NH_2$ group. It was found that by using amino alcs. instead of $NH_3$ with CO compds. and KCN are easily obtained good yields of alcaminonitriles which on sapon. give alcamino acids. Thus the HCl salt of ethanolamine (I), condensed at room temp. with $CH_2O$, $Me_2CO$, BzH and cyclohexanone (II), produced with liberation of heat 70% of alcamino acids synthesized for the 1st time. I condensed with II gave *hydroxyethylaminocyclohexanenitrile*, $C_6H_{10}(CN)NH(CH_2)_2OH$ (III), which on sapon. produced *hydroxyethylamino-1-cyclohexanecarboxylic acid*, $C_6H_{10}(CO_2H)NH(CH_2)_2OH$ (IV). In other cases the nitriles were not sepd. but directly sapond. to the acids. BzH gave with I *phenylhydroxyethylaminoacetic acid*, $C_6H_5CH(CO_2H)NH(CH_2)_2OH$ (V), $Me_2CO$, *dimethylhydroxyethylaminoacetic acid*, $Me_2C(CO_2H)NH(CH_2)_2OH$ (VI), and $CH_2O$, *hydroxyethylaminoacetic acid*, $CH_2(CO_2H)NH(CH_2)_2OH$ (VII). I, b. 170–2°, was prepd. by Knorr's method (Ger. pat. 97,102) and converted to the HCl salt with concd. HCl to neutral reaction to litmus, and used in soln. (48 g. in 100 cc.). V was prepd. when a mixt. of 3.3 g. KCN in 15 cc. $H_2O$, 5.4 g. BzH, 10.5 cc. I.HCl and 15 cc. MeOH was digested 1.5 days, the MeOH distd. off, the oil extd. with $Et_2O$, the $Et_2O$ expelled, the oil dissolved in dil. HCl, any insol. matter extd. with $Et_2O$, then concd. by evapg., sapond. with concd. HCl, after 2 hrs. standing dild. with $H_2O$, concd. on the water bath, sepd. from $NH_4Cl$ by treating with alc. and $Et_2O$; there was obtained 8.4 g. (71.8%) of V; HCl salt m. 178–91° in a sealed capillary tube (decompn.), sol. in $H_2O$ and alc. About 65% of the free acid of V was sepd. by treating a concd. soln. of the salt with concd. $NH_3$ to neutral reaction, and the rest by the $Ag(OH)_2$ and $H_2S$ method. V m. 217–8° in a sealed capillary tube, is poorly sol. in cold $H_2O$ and alc., insol. in $Et_2O$. A yield of 7.25 g. (33.8%) of III, m. 78–80°, was prepd. when a mixt. of 26 cc. soln. of I, 8.6 g. KCN, 12 g. II, b. 153–7°, and 50 cc. $Et_2O$ was digested 1 day, the ether layer sepd., the aq. layer extd. with $Et_2O$, the combined ether exts. dried with $K_2CO_3$, the $Et_2O$ expelled; white crystals from $Et_2O$, easily sol. in alc., sparingly sol. in $H_2O$. The HCl salt of III, m. 95–8°, was prepd. by passing dry HCl into III in $Et_2O$. The aq. layer of the reaction and the mother liquor from the sepn. of III were combined and hydrolyzed with HCl, the reaction mass was evapd. to dryness, the mineral salts were sepd. by recrystg. from alc., IV was sepd. from its HCl salt with $NH_3$, and the mother liquor subjected to similar operations produced in all 10 g. (41.9%) IV, (41.9%), or 75.7% of III and IV combined. IV, m. 252–4° in a sealed capillary tube, is sol. in $H_2O$, poorly sol. in alc., and insol. in $Et_2O$. VI was obtained in 6 g. yield (40%) by digesting 1 day a mixt. of 9.75 g. HCl salt of I, 6.5 g. KCN, 5.8 g. $Me_2CO$ and 25 cc. $H_2O$, hydrolyzing with an equal vol. of concd. HCl on the water bath for 2 hrs. and sepg. the mineral salts as above. The sepn. of a cryst. HCl salt of VI being impossible, the free acid was obtained by the $Ag(OH)_2$ method. VI, m. 243–5° in a sealed capillary tube, is sol. in $H_2O$, little sol. in alc. and insol. in $Et_2O$. VII, m. 174–5°, was obtained in 5.7 g. yield (62.3%) when a soln. of 5 g. KCN was added dropwise in 3 hrs. with stirring and cooling to a mixt. of 5.7 g. HCl salt of I and 5.8 g. 40% $CH_2O$, and allowed to stand 1.5 hr. at room temp., an equal vol. of concd. HCl was added, let stand 12 hrs., digested 1.5 hrs. in a water bath, sepd. from KCl and $NH_4Cl$ and worked up with $Ag(OH)_2$ as above; white crystals were obtained easily sol. in $H_2O$, slightly sol. in alc. and insol. in $Et_2O$. CHAS. BLANC

**Synthesis of tartaric acid.** A. C. C. NEWMAN AND H. L. RILEY. *J. Chem. Soc.* **1933**, 45–6.—$[CH(OH)CO_2H]_2$, m. 206°, is obtained in 30% yield from crude glyoxal bisbisulphite (55 g. in 220 cc. $H_2O$) on treating with the theoretical wt. of KCN in the min. of $H_2O$, adding an equal vol. of concd. HCl, satg. with HCl and refluxing for 12 hrs. C. J. WEST

**Alkylated complex cyanides. I. The isomerism of the alkylated ferrocyanides. II. Hexaethylated ferrocyanides.** ERNALD G. J. HARTLEY (crystallographic data by H. M. POWELL). *J. Chem. Soc.* **1933**, 101–5.—The results of H. (*C. A.* **4**, 2293; **6**, 2371; **7**, 3123) and Hölzl (*C. A.* **22**, 224) are mainly in agreement but there is one important discrepancy; Hölzl's β-tetramethylferrocyanide is not identical with that of H. and it is not now possible to explain this discrepancy in exptl. results. The remainder of the 1st part deals with the structure of the original α- and β-tetramethylferrocyanides. *β-Tetramethyldiethylferrocyanogen mercurichloride*, pale yellow, anorthic, $a:b:c = 1.3137:1:1.0464$, $\alpha$ 95° 48′, $\beta$ 117° 35′, $\gamma$ 88° 8′; the *mercuriiodide*, bright yellow, anorthic, did not give crystals suitable for measurement. *Hexamethylferrocyanogen mercuriiodide*, pale yellow, anorthic, $a:b:c = 1.2675:1:1.1897$, $\alpha$ 104° 55′, $\beta$ 107° 28′, $\gamma$ 98° 24′. Other optical data are given. $Ag_4Fe(CN)_6$ and EtI, allowed to stand at room temp. for

6 weeks, gave a product corresponding to addn. of 5 mols. EtI to 1 mol. $Ag_4Fe(CN)_6$; the *hexa-Et compd.* was isolated as the *acid sulfate;* the nitrate was too sol. in $H_2O$ or EtOH to be purified. C. J. WEST

**An extension and a limitation of the thiocyanate method for the preparation of 2-thiohydantoins.** BEN H. NICOLET. *J. Biol. Chem.* **99**, 429–33(1933).—Under the usual conditions, $MeCH(NHBz)CH(NHBz)CO_2H$ readily gave *1-benzoyl-2-thio-5-benzoylaminomethylhydantoin*, S-yellow powder, m. 211–2° (decompn.); soln. in alkali and repptn. gave *2-thio-5-benzoylaminomethylhydantoin*, m. 255° (decompn.). From $MeC(NHAc)_2CO_2H$, *1-acetyl-2-thio-5-methyl-5-acetylaminohydantoin*, m. 230° (rapid heating), and *2-thio-5-methyl-5-acetylaminohydantoin*, m. 248° (decompn.), were similarly obtained in good yield. But no thiohydantoin could be obtained from $MeC(NHBz)_2CO_2H$, which also gives an exceptionally stable azlactone; it is suggested that certain highly substituted azlactones are too stable to allow the reaction to proceed further. BEN H. NICOLET

**Lignin and some of its derivatives. II.** L. LEMMEL. *Anales soc. espaň. fis. quím.* **31**, 50–2(1933); cf. *C. A.* **27**, 1328.—A red 1,3,5-dihydroxytoluenelignin was isolated; it gives a well-defined Ac deriv. m. 250–70° (decompn.). E. M. SYMMES

**Constitution of stachyose.** MOTOI ONUKI. *Proc. Imp. Acad.* (Tokyo) **8**, 496–9 (1932).—See *C. A.* **26**, 4308. C. J. WEST

**Action of strong sulfuric acid on cyclohexene.** S. S. NAMETKIN AND L. N. ABAKUMOVSKAYA. *J. Gen. Chem.* (U. S. S. R.) **2**, 608–13(1932).—Cyclohexene (I), b. 83–4°, treated with 96% $H_2SO_4$ at 2–5° produced 37% of an oil which, redistd. *in vacuo*, gave 3 fractions: (a) a satd. compd. $C_{12}H_{22}$, $b_{739}$ 216–9°, a dimer of I having 2 extra H atoms; (b) a satd. compd. $C_{18}H_{32}$, $b_{1.5-2}$ 145–7°, a trimer of I with 2 extra H, and (c) an unsatd. compd. $C_{24}H_{40}$, $b_{1.5-2}$ 200–3°, a tetramer of I. The expts. on identification of the compds. by dehydrogenation were inconclusive. The work is being continued. CHAS. BLANC

**Naphthenic acids, their preparation and utilization.** D. O. GOLDBERG. *Onti-Aznefteizdat Baku* **1932**, No. 20, 66 pp.—A popular introduction on the org. chemistry of naphthenic acids is given. The structural formulas of naphthenic acids are discussed, as well as their distribution in various crudes and distillates, the detn. methods, mol. wts., chem. properties, behavior in contact with metals, ability to promote emulsification, solubilities and soaps. Various methods of extg. naphthenic acids from petroleum products are discussed and pieces of equipment described. The prepn. of naphthenic acid soap and acid oil and various methods tried in Russia as well as the equipment used is described. Control of manuf., anal. methods, etc., are given. A. A. BOEHTLINGK

**Method of studying nitration.** JOHN A. HETHERINGTON AND IRVINE MASSON. *J Chem. Soc.* **1933**, 105–14.—Systematic nitrations of $PhNO_2$ to $C_6H_4(NO_2)_2$, with full analyses, were made with a wide range of mixts. of $H_2SO_4$, $HNO_3$ and $H_2O$. Special application of triangular plotting is made to the results. The reaction is found to come to a standstill before all the $PhNO_2$ and $HNO_3$ are exhausted, unless there is enough $H_2SO_4$ present to form $H_2SO_4.H_2O$ with the $H_2O$ initially present *plus* that chemically formed. The same appeared to hold in nitrations with $MeC_6H_4NO_2$. While $H_2O$ is the chief inhibitor of the nitration of $PhNO_2$, dissolved $PhNO_2$ itself acts in the same direction. The conditions under which 2 layers are formed in the nitration are defined exptly. and plotted Distribution measurements and others prove that the seat of reaction in a 2-phase nitration is the acid layer, not the org. layer, despite the considerable concns. of strong acids dissolved in it. The promoting action of $H_2SO_4$, the inhibiting action of $H_2O$ and of $PhNO_2$ are traced to the reversible hydration of the 2 acids concerned and to competition between $PhNO_2$ and $H_2O$ for union with $H_2SO_4$. The suggestion is renewed that the real org. agent in *m*-nitration is the complex cation $PhNO_2OH^+$ rather than mol. $PhNO_2$; and the results as a whole point to the following equilibria as essential to this nitration: $H_2SO_4 + (H_3O)'(NO_3)' \rightleftharpoons (H_3O)'(HSO_4)' + HNO_3$; $H_2SO_4 + PhNO_2 \rightleftharpoons (PhNO_2H)'(HSO_4)'$; $HNO_3 + PhNO_2 \rightleftharpoons (PhNO_2H)'(NO_3)'$; $(PhNO_2H)' + H_2O \rightleftharpoons PhNO_2 + (H_3O)'$; the ensuing bimol. irreversible nitration itself will then take the course: $(PhNO_2H)' + HNO_3 \longrightarrow C_6H_4(NO_2)_2 + (H_3O)'$. Results are given for 31 expts. C. J. WEST

**Mechanism of nitration of benzene.** B. V. TRONOV AND L. V. LADUIGINA. *Ukrain. Khem. Zhur.* **7**, No. 1, Sci. pt. 55–63(1932); cf. T., *Proceedings Tomsk Tech. Inst.* 45, No. 3(1924); *J. Russ. Phys.-Chem. Soc.* **61**, 2388(1929); T., *et al.*, *C. A.* **24**, 1077; 25, 3973.—The reaction of nitration in aromatic series is considered as a catalytic process: 1 mol. of $HNO_3$ acts as a catalyst whose H migrates to a C of the $C_6H_6$ ring, loosening the bond between C and H, the latter is split off and the formed complex combines with a new mol. of $HNO_3$ to a nitro compd. Thus 1 mol. of $HNO_3$ reacts with the H and the other with the double bond. The energetic nitration of $C_6H_6$ with $EtNO_3$ in the presence

of $AlCl_3$ (Gierschbach and Kessler, *Z. phys. Chem.* **2**, 676; K., *Ibid* **2**, 69(1888)) shows that the 2 mols. of $HNO_3$ can be substituted by other reagents: 1 mol. of $HNO_3$ by a compd. capable of forming a complex with $C_6H_6$, and the other mol. of $HNO_3$ by an ester of $HNO_3$. The catalytic character of nitration indicates its similarity with all types of Friedel-Crafts synthesis. CHAS. BLANC

**Influence of poles and polar linkings on the course pursued by elimination reactions. X. Formation and decomposition of dibenzyldiallylammonium hydroxide.** L. HEY AND C. K. INGOLD. *J. Chem. Soc.* **1933**, 66–7; cf. *C. A.* **24**, 4004.—The action of allyl iodide or bromide on $(PhCH_2)_2NH$ gives the HI or HBr salt of $(PhCH_2)_2NH$ and not the expected allyl deriv. $PhCH_2NH_2$ behaves similarly. $PhCH_2Br$ and benzylallylamine also do not give the expected dibenzyl deriv. Diallylamine and $PhCH_2Br$ in $MeNO_2$ give *benzyldiallylamine*, $b_{20}$ 121–4° (*picrate*, m. 114°); further action of $PhCH_2Br$ in $MeNO_2$ gives *dibenzyldiallylammonium bromide; picrate*, m. 143°. Thermal decompn. of the hydroxide gives $(PhCH_2)_2NH$; the allyl group was preferentially eliminated, though it appeared in part as acrylaldehyde; no $PhCH_2OH$ could be detected. **XI. Decomposition of quaternary ammonium hydroxides containing the *tert*-butylcarbinyl group.** C. K. INGOLD AND C. S. PATEL. *Ibid* 67–8.—*tert-Butylcarbinyldimethylamine* (I), b. 96–7°, was prepd. from *tert*-butylcarbinylamine (whose *picrate* m. 205°) and $(HCHO)_x$; *HCl salt*, m. 182°; *HBr salt*, m. 170°; *HI salt*, m. 135°; *picrate*, m. 193°; MeI gives *tert-butylcarbinyltrimethylammonium iodide*, m. 240° (decompn.); $PhCH_2Br$ gives *benzyl-tert-butylcarbinyldimethylammonium bromide*, m. 200° (decompn.). $Me_3CCH_2NMe_3OH$, on distn., gives 93% of I and MeOH; the benzyl deriv. also gave I (90%) and $PhCH_2OH$ but no MeOH or *tert*-BuOH. These results indicate the order $PhCH_2>HCH_2>Me_3CCH_2$. **XII. Decomposition of quaternary ammonium alkoxides.** *Ibid* 68–9.—Trimethylethylammonium and trimethylisobutylammonium methoxides and ethoxides decomp. to give, on the 1 hand, $C_2H_4$ or iso-$C_4H_8$ and, on the other, a Me or Et ether, together with the complementary amine in each case. The principal products of the decompn. of $PhCH_2NMe_3OEt$ are $Me_3N$ and $PhCH_2OEt$. **XIII. Decompositions of some quaternary ammonium salts containing the methyl, benzyl and benzohydryl groups.** E. D. HUGHES AND C. K. INGOLD. *Ibid* 69–75.—$PhCH_2NMe_3OH$, on decompn., gives 65% of $PhCH_2OH$ + $Me_3N$ and 35% of MeOH and $PhCH_2NMe_2$; the BzH and $(PhCH_2)_2O$ formed are regarded as derived from $PhCH_2OH$. *Benzohydryltrimethylammonium bromide* m. 145° (decompn.); the *tribromide*, yellow, m. 138°; the *picrate* m. 152° (decompn.); the iodide m. 170–5° (decompn.). Decompn. of the hydroxide commenced at or below the b. p. of the soln. and is completed at 165° in a current of N. The decompn. followed 3 lines: 18% benzohydrol + $Me_3N$; 51% MeOH + benzohydryldimethylamine (*picrate*, m. 196°); while the remainder (31%) was a rearrangement, giving $Ph_2CMeNMe_2$ (*picrate*, m. 151°). *α,α-Diphenylethyltrimethylammonium iodide*, m. 205° (decompn.); the decompn. gives varying % of the alcs., depending on the concn. of the hydroxide; thus a concn. of 2.95 *N* gives 52% $PhCH_2OH$ and 48% MeOH; 0.56 *N* gives 91% $PhCH_2OH$ and 9% MeOH. *Benzohydryldimethylethylammonium picrate* m. 141°. $MeCPh_2NMe_3OH$, on decompn., gives a dimer of $CH_2:CPh_2$, m. 203°, and $Me_3N$. *Benzohydrylbenzyldimethylammonium bromide* m. about 125° (decompn.), crystals with 2 mols. $H_2O$; *picrate*, m. 149° (decompn.); decompn. of the hydroxide proceeds along 3 lines: $C_{13}H_{11}OH$ + $C_7H_7NMe_2$; $C_7H_7OH$ + $C_{13}H_{11}NMe_2$; MeOH + $C_{13}H_{11}N(C_7H_7)Me$; the extent to which decompn. follows the route leading to benzohydrol depends fundamentally on the concn., this reaction predominating in dil. soln. At an initial concn. of 0.5 *N*, the yield is 80%; at 1.8 *N*, 50%; by prior concn. of the soln. to a sirup and addn. of solid KOH before decompn. the proportion was depressed to under 10%. The migration reaction leads to *α,α,β-triphenylethyldimethylamine*, m. 128°; *HCl salt*, m. 280°; *picrate*, m. 218° (decompn.); MeI gives *α,α,β-triphenylethyltrimethylammonium iodide*, m. 238°; *picrate*, m. 214°; decompn. of the hydroxide gives MeOH and the original tert. base and also $Me_3N$ and $Ph_2C:CHPh$, whose *Br deriv.* m. 115°. $Ph_2CHBr$ and $(PhCH_2)_2NH$ gives a mixt. of $(PhCH_2)_2NH.HBr$ and *benzohydryldibenzylamine*, m. 129° (*HCl salt*, m. 180–2°; *picrate*, m. 145° (decompn.)). $Ph_2CHBr$ and $(PhCH_2)_2NMe$ give *dibenzylmethylammonium bromide*, m. 157°; *picrate*, m. 107°. $Ph_2CHBr$ and $Ph_2CHNMe_2$ in MeCN give *benzohydryldimethylammonium bromide*, crystals with 1 mol. $H_2O$, m. 206°. **XIV. Action of tertiary amines on triphenylmethyl halides.** E. D. HUGHES. *Ibid* 75–7.—$Me_3N$ and $Ph_3CCl$ in MeCN-$CHCl_3$ give the *compd.* $2Ph_3COH.Me_3N.HCl$, m. 190–5° (decompn.); washing with cold $H_2O$ gives $Ph_3COH$; it is also decompd. by EtOH and $C_6H_6$. The same compd. was obtained from $Ph_3COH$ and $Me_3N.HCl$ in $CHCl_3$-$MeNO_2$. $Et_3N$ and $Ph_3CCl$ in $CHCl_3$ give $Et_3N.HCl$ and $Ph_3COH$. $Me_3N$ and $Ph_3CBr$ give $Me_3N.HBr$ and $Ph_3COH$. $C_5H_5N$ and $Ph_3CCl$ in AcOEt or in $MeNO_2$-$CHCl_3$ give the *compd.* $Ph_3COH.C_5H_5N.HCl$, m. 170–5°; this also results from crystg. $Ph_3COH$ and $C_5H_5N.HCl$ from $CHCl_3$. $Ph_3CBr$ gives a similar complex. $Ph_3CNMe_2$ and MeI in

MeCN give $Me_4NI$, I and $Ph_3COH$; in EtOH $Ph_3COEt$ is formed, showing that $Ph_3C$ is an intermediate. C. J. WEST

**Condensation of chloral with tolyl- and nitrophenyl-ureas.** F. D. CHATTAWAY, G. M. T. KERR AND C. G. LAWRENCE. *J. Chem. Soc.* **1933**, 30–2.—$Cl_3CCHO$ and *o*-$MeC_6H_4NHCONH_2$ give *N-o-tolyl-N'-β,β,β-trichloro-α-hydroxyethylurea* (I), $Cl_3CCH(OH)NHCONHC_6H_4Me$-*o*, m. 146° (decompn.); *p-tolyl isomer*, m. 181° (decompn.); the 2 *di-Ac derivs.* m. 114° (decompn.) and 120° (decompn.), resp. I in *N* NaOH with $Ac_2O$ at 0–5° gives *bis(β,β,β-trichloro-α-N'-o-tolylcarbamidoethyl) ether* (II), m. 198° (decompn.); *p-tolyl isomer*, m. 167° (decompn.); the 2 *di-Ac derivs.* m. 166° (decompn.) and 167° (decompn.), resp. II and EtONa in EtOH or I in EtOH-KOH and $Ac_2O$ gives the *EtO deriv.* of I, m. 136° (decompn.); *MeO deriv.*, m. 157° (decompn.); the corresponding derivs. of the *p*-tolyl isomer m. 136° (decompn.) and 149° (decompn.), resp. *N-p-Nitrophenyl-N'-β,β,β-trichloro-α-hydroxyethylurea* (III), pale yellow, m. 196° (decompn.); *m-nitro isomer* (IV), very pale yellow, m. 173° (decompn.); the 2 *di-Ac derivs.*, very pale yellow, m. 128° (decompn.) and 126° (decompn.), resp. *Bis(β,β,β-trichloro-α-N'-p-nitrophenylcarbamidoethyl) ether*, pale yellow, m. 203°; *m-nitro isomer*, pale yellow, m. 217° (decompn.); *di-Ac derivs.*, m. 151° (decompn.) and 170° (decompn.), resp. The *MeO deriv.* of III, yellow, m. 192° (decompn.); of IV, m. 170° (decompn.); the *EtO deriv.* of III, pale yellow, m. 161° (decompn.); of IV, m. 146° (decompn.). C. J. WEST

**Iron oxalate as a reducing agent in the preparation of azobenzenes.** I. GAZOPOULOU. *Praktika (Akad. Athenon.)* **6**, 495–7(1931).—$FeC_2O_4$ was successfully used in the reduction of several azoxybenzenes to the corresponding azo compds. according to the reaction $3Ph_2N_2O + 2FeC_2O_4 = 3PhN{:}NPh + Fe_2O_3 + 4CO_2$. Thus were prepd. 3,3'-diamino-4,4'-dimethyl-, 4,4'-dimethoxy- and 4,4'-diethoxyazobenzene. Steps in each prepn. are outlined. Results are compared with those obtained with reduced Fe. LUCIEN Y. DYRENFORTH

**Constitution of azo indicators. II. The higher homologs of helianthin and of methyl red.** K. H. SLOTTA AND W. FRANKE. *Ber.* **66B**, 104–8(1933); cf. *C. A.* **25**, 2993.—Although (di)butylhelianthin was readily synthesized by Reilly and Hickinbottom (*C. A.* **12**, 682) the statement is still made in modern textbooks (*e. g.*, Gattermann-Wieland, *Praxis d. organ. Chemikers*, 22, Aufl., Berlin, 1930, p. 294) that in the coupling of diazonium salts of dialkylamines such as $PhNBu_2$ 1 of the alkyl residues may be split off. S. and F. have effected almost quantitatively the coupling of previously isolated diazobenzenesulfonic acid, in water suspension, with $PhNPr_2$ and $PhNBu_2$ and found no indications of the simultaneous formation of the monoalkylhelianthins Strangely enough, $PhNAm_2$ did not couple, while *dihexylhelianthin* was readily obtained, although in only 55% yield. In the coupling with diazotized anthranilic acid, also, there is no splitting off of an alkyl residue. The following indicators were prepd. (indicator exponents and color-change ranges, resp., in parentheses). *Helianthins.*—Me (3.76, 3.1–4.4); Et, 4.34 (3.1–4.6); Pr, previously described as hydrated, is pptd. anhyd. from MeOH by ether or acetone and m. 225°, decomposes 238° (3.95, 3.2–4.3); Bu, decomps. 198° (4.01, 3.4–4.7); *hexyl*, decomposes 259° (3.71, 2.3–4.1). *Reds:* Me, m. 181° (5.06, 4.4–6.3); Et, m. 148° (5.42, 4.7–6.5); Pr, m. 173° (5.48, 4.8–6.5), was obtained from $Me_2CO$-MeOH in leaflets with black-green luster while all the other representatives of this group generally formed dull red-lilac needles; *Bu* (70% yield), m. 117° (—, 4.7–6.7); *hexyl*, red oil. *Diamylaniline* (15% from $PhNH_2$ and 2 mols. AmBr heated 6 hrs. at 105° with KOH), yellow, b. 280–4°. *Dihexylaniline* (55% from $PhNH_2$ heated 5 hrs. with 2 mols. of 87% KOH and 2.1 mols. $C_6H_{13}Br$), $b_{765}$ 300–1°, $b_{16}$ 172–3°. **III. Alkylation of naphthol orange.** K. H. SLOTTA, W. FRANKE AND G. HABERLAND. *Ibid* 108–12.—In the work on the Me deriv. (I) of naphthol orange (II) which led to the formulation of II as a double zwitterion (*C. A.* **25**, 2993) S and F. were led into an error by the wholly unexpected instability of the monoalkyl derivs. of II. From a spectrochem. examn. of the readily obtained di-Me deriv. (III) and a conductometric study of its sapon., Weissberger and Fasold concluded that III has the structure $MeOC_{10}H_6N{:}NC_6H_4SO_3Me$, and they confirmed the observation that hot HI splits off both Me groups. S., F. and H. have now effected the same cleavage with $SnCl_2$ and HCl, obtaining 1,4-$C_{10}H_6(NH_2)OMe$ and *p*-$H_2NC_6H_4SO_3H$ and thus establishing the above formula for III. When larger amts. of the monoalkyl derivs. were prepd., repeatedly crystd. and sent to W. for spectrochem. examn., he found that they consisted of unalkylated II with varying amts. of water of crystn. S., F. and H. have since been able to again obtain both I and the hexyl deriv. (IV) by the original method, but often, under apparently the same conditions, only the unchanged II was obtained in the alkylation expts., especially when larger amts. were used and the products were repeatedly crystd.; 1 prepn., whose C, H, N and MeO content corresponded to $I.H_2O$ and which in water showed only a slight color change to red, lost MeOH at 135° and changed

into II. That in these (labile) monoalkyl derivs. the alkyl group is not on the N, as had been assumed, was shown by attempts to prep. I by condensing naphthoquinone with $PhNMeNH_2$; only colored solns. resulted and the dyestuff broke down into its components when it was tried to isolate it. That the color change of II is due to its conversion from the hydroxyazo to the naphthoquinone hydrazone form was therefore not proved by the methylation expts.; that does not mean that the theory is wrong, however, but only that the color change is due to setting free of the 2nd instead of the 1st proton. γ-(3-Methoxy-4-hydroxybenzeneazo)pyridine also loses its Me group on heating in dil. HCl soln. To det. what would be the behavior of a MeO group in the *o*-position to the azo group in a compd. closely related to II, β-naphthol orange was chosen, but with $CH_2N_2$ it gave only a mono-Me deriv. which, from its whole behavior, must certainly be the *sulfonic ester;* it seps. from 50% acetone in gleaming red blocks, sol. in aq. acetone with a light yellow color unchanged by acids or alkalies. C. A. R.

**Symmetrical triad prototropic systems. IX. The influence of polynuclear aryl groups upon mobility and equilibrium in the α,γ-diarylmethyleneazomethine system.** CHARLES W. SHOPPEE. *J. Chem. Soc.* **1933**, 37–45; cf. *C. A.* **26**, 2437.—The effect of some polynuclear aryl groups on mobility (and equil.) in the methyleneazomethine prototropic system $ArCH{:}NCH_2Ph$ (I) ⟷ $ArCH_2N{:}CHPh$ (II) is discussed. The effect of the introduction of Ar on the velocity of interconversion of the isomers under standard conditions of temp. and catalysis is as follows: ($k_1 + k_2$ in $hr.^{-1}$) 9-phenanthryl 2.27, α-$C_{10}H_7$ 3.49, β-$C_{10}H_7$ 3.04, *p*-$C_6H_4Ph$ 2.93, *m*-$C_6H_4Ph$ 2.33; with the exception of the 1st group, the mobility sequence is identical with that previously reported. The equil. attained by the system I-II, under the influence of either 0.145 *N* or 1.45 *N* EtOH-EtONa at 82° or 85°, resp., by introduction of the variants Ar are: (*K* and % I given) 9-phenanthryl, 4.41, 18.5; α-$C_{10}H_7$, 2.70, 27; β-$C_{10}H_7$, 0.695, 59; *p*-$C_6H_4Ph$, 0.639, 61; *m*-$C_6H_4Ph$, 0.785, 56. The following new *p-nitrophenylhydrazones* were prepd. by fission of the azomethines: *phenanthrene-9* (III), m 265°; *β-naphthyl* (IV), m. 230°; *biphenyl-4* (V), m. 216.5°; *biphenyl-3* (VI), m. 188°. A new synthesis of phenanthrene-9-carboxylic acid is described; the *acid chloride*, pale yellow, $b_{13}$ 240°, m 102°; *Me ester*, m. 61°; *anilide*, m. 218°. Treatment of the anilide with $PCl_5$ in $C_2H_2Cl_4$, reduction of the iminochloride with $SnCl_2$ in $Et_2O$-HCl at 0° and hydrolysis of the aldimine stannichloride with 2 *N* HCl give *phenanthrene-9-aldehyde*, pale yellow, m. 101°; *semicarbazone*, m. 222–2.5°. *9-Phenanthrylidenebenzylamine* (like I), m. 72–2.5°. *Phenanthrene-9-aldoxime*, m. 155° (the yellow HCl salt m. 126–7°); reduction of the oxime gives *9-phenanthrylmethylamine*, m. 107° (*picrate*, m. 241° (decompn.); *benzoate*, m. 167°; *Ac deriv.*, m. 182.5°). *Benzylidene-9-phenanthrylmethylamine* (like II), m. 103.5°. *β-Naphthylidenebenzylamine*, m. 83.5°. *Phthalo-β-naphthylmethylimide*, m. 150–1°; β-$C_{10}H_7NHMe$, $b_{24}$ 180°, m. 59–60° (*picrate*, m. 230–1° (decompn.); *benzoate*, m. 163°); *benzylidene-β-naphthylmethylamine*, m. 85.5°. *α-Naphthylidenebenzylamine*, pale yellow oil, $b_{0.4}$ 208°. *Phthalo-α-naphthylmethylimide*, m. 175–6°; α-$C_{10}H_7NHMe$, $b_{19}$ 174–5° (*picrate*, m. 227°; *benzoate*, m. 142.5–3°) (original gives these as β-compds.). *Benzylidene-α-naphthylmethylamine*, m 55.5°. *Biphenyl-4-carboxanilide*, m. 220° (from the *acid chloride*, $b_{12}$ 185–6°, m. 107–8°). Biphenyl-4-aldehyde, m. 60°, yields a *semicarbazone*, m. 243° (decompn.). *4-Phenylbenzylidenebenzylamine*, m. 52° and again at 60°. *4-Phenylbenzylamine*, $b_{20}$ 195°, m. 53–4° (*picrate*, m. 218° (decompn.); *benzoate*, m. 151°; *Ac deriv.*, m. 182°). *Benzylidene-4-phenylbenzylamine*, m. 76°. 4-$H_2NC_6H_4Ph$ and $H_2SO_4$, heated 4 hrs. at 170°, give the *4'-sulfonic acid*, m. 270°. *Biphenyl-3-carboxanilide*, m. 184°. *Biphenyl-3-aldehyde*, $b_{21}$ 187–8° (*semicarbazone*, m. 193°; *2,4-dinitrophenylhydrazone*, orange, m. 229°). *3-Phenylbenzylidenebenzylamine*, pale yellow oil, $b_1$ 224°. *Phthalo-m-biphenylmethylimide*, m. 138°; 3-phenylbenzylamine, $b_{18}$ 182°, m. 29° (*picrate*, yellow, m. 220° (decompn.); *Ac deriv.*, m. 115–6°). *Benzylidene-3-phenylbenzylamine*, pale yellow, $b_1$ 220°. M.-p. data are given for mixts. of benzaldehyde *p*-nitrophenylhydrazone and III, IV, V, VI and α-$C_{10}H_7CHO$ *p*-nitrophenylhydrazones. C. J. WEST

**New derivatives of *p*-arsanilic acid. IV. *p*-Arsonoadipanilic acid and related compounds.** GILBERT T. MORGAN AND ERIC WALTON. *J. Chem. Soc.* **1933**, 91–3; cf. *C. A.* **26**, 1911.—Details are given of the prepn. of Me H adipate (60–70 % yield), which gives with $SOCl_2$ *δ-carbomethoxyvaleryl chloride*, $b_{26}$ 141°; with atoxyl in *N* NaOH there results the *Me ester* of *p-arsonoadipanilic acid* (I), $H_2O_3AsC_6H_4NHCO(CH_2)_4CO_2H$; the *Na salt* of the Me ester seps. with 2 mols. $H_2O$, $p_H$ 9; *Et ester* (*Na salt*, $p_H$ 8). I, reduced with $SO_2$ in HCl, gives *p-dichloroarsinoadipanilic acid*, m. 138°, hydrolyzed to the *p*-oxy deriv. The *amide, methylamide, dimethylamide, ethylamide, propylamide* and *anilide* of I and their *Na salts* were also prepd. Adipyl chloride and atoxyl give *adipanilide-p,p'-diarsonic acid* (*di-Na salt*). The min. curative dose varies from 6.25 mg. per 20 g. mouse for the Me ester (Na salt) to 25 for the methylamide. The min. lethal dose varies from 12.5 to 100 mg. C. J. WEST

**Demethylating the phenol ethers.** E. A. TZOFIN AND K. A. CHKHKIVADZE. *Khim. Farm. Prom.* **10**, 376(1932).—A modification of Klemens' method in which the salts of aromatic amines are used together with dry HCl gas at 160–70°. The yields are as high as 94%. L. NASAREVICH

**Physicochemical properties of methol [monomethyl sulfate of *p*-aminophenol].** VIRGILIO LUCAS. *Bol. assoc. brasil. pharm.* **12**, 214(1932).—Methol is a white-yellowish cryst. substance, sol. in water, less sol. in EtOH, insol. in ether, gives a wine-red color with $FeCl_3$ on boiling, reduces Fehling soln. when warmed, and Nessler reagent, ppts. with Pb subacetate, $BaCl_2$ and Br water. The latter may be used for the detn. of methol. E. S. G. BARRON

**Hydration of acetylene alcohols with a primary alcohol group.** E. D. VENUS-DANILOVA AND S. N. DANILOV. *J. Gen. Chem.* (U. S. S. R.) **2**, 645–58(1932).—The synthesis of the primary α-keto alcs. was undertaken to clarify the interrelation of the isomeric phenylacetol, $PhCH_2COCH_2OH$ (I) and phenylglycolaldehyde, $PhCH_2CH(OH)CHO$ (*C. A.* **25**, 1819). All syntheses were carried out by hydration in the presence of $(AcO)_2Hg$. It was assumed that the addn. of $H_2O$ to $PhC:CCH_2OH$ (II) and its homologs would result in formation of α- and β-keto alcs., but no α-keto alcs. were formed. With II was obtained mainly $BzCH:CH_2$ (III) and a little of $BzCH_2CH_2OH$ (IV), and with $PhC:CCH_2OAc$ a mixt. of $BzCH_2CH_2OAc$, III and its polymer. The formation of III is evidently caused by splitting off of $H_2O$ from the intermediate IV. $Me_3CC:CCH_2OH$ (V) reacted analogously, producing $Me_3CCOCH:CH_2$ (VI) and $Me_3CCOCH_2CH_2OH$ (VII), and $Me_3CC:CCH_2OAc$ the corresponding acetates. The vinyl ketones and β-keto alcs. and their acetates in the mixts. were thus identified. The semicarbazone of IV, m. 170°, was obtained together with the semicarbazide semicarbazone of III, m. 206°; semicarbazone of VII m. 223° (decompn.), and that of the acetate m. 127°, while VI gave no semicarbazone. III produced 1,3-diphenylpyrazoline, m. 153.5–4°, and so did IV and its acetate. VII and VI (and its acetate) with $PhNHNH_2$ gave $Me_3CC(:NNHPh)CH_2CH_2NHNHPh$, m. 134°. III, with $NH_2OH$ (1 mol. to 1 mol.) gave $C_{18}H_{19}O_3N$ (VIII), m. 122.5°, which, heated with 25% $H_2SO_4$ or 30% HCl, does not split the $NH_2OH$ radical, but gives salts with 1 mol. of HCl or $H_2SO_4$. III, treated with an excess of $NH_2OH$, or VIII gently heated with $NH_2OH$ in aq. alc., is converted to $C_{18}H_{21}O_3N_3$ (IX), m. 153°, which, treated with mineral acids, gives no salts but splits off 2 $NH_2OH$ radicals with formation of VIII. The proposed structural formulas are for VIII $(PhCOCHMe)_2NOH$ and for IX $[PhC(:NOH)CHMe]_2NOH$. CHAS. BLANC

**The action of various dehydrating agents on primary phenethyl alcohol.** L. PALFRAY, S. SABETAY AND DENISE SONTAG. *Compt. rend.* **195**, 1392–4(1932); cf. *C. A.* **23**, 2427.—By dropping $Ph(CH_2)_2OH$ (I) on an alk. dehydrating agent at 250° styrene is formed. Quant. yields were obtained with melted KOH, good yields with NaOH and BaO. Under the same conditions acid agents form phenethyl ether. $NaHSO_4$ gives 72% $(PhCH_2CH_2)_2O$, $b_{15}$ 180.5°, $n_D^{18.2}$ 1.5488, $d_4^{18}$ 1.014, not fluorescent. $Ac_2O$ yields the acetate. Anhyd. $H_2C_2O_4$ forms the neutral oxalate, m. 51–1.5°, $b_{2-3}$ 221–3°. Other dehydrating agents had slight action. I may be identified by heating 5 g. with 0.1 g anhyd. $H_2C_2O_4$ over a free flame, boiling with 1 cc. $H_2O$ and recryst. from alc. (cf. *C. A.* **23**, 4770). JANET E. AUSTIN

**Synthesis of hydroxyphenyl α-bromoethyl ketones.** C. TORRES AND J. AMARGÓS *Anales soc. españ. fis. quím.* **21**, 37–47(1933).—*o*- and *p*-$HOC_6H_4COEt$ were prepd. simultaneously in yields of 50 and 25%, resp., by allowing EtCOCl to react with the reaction product of molten PhOH and $AlCl_3$. $MeCHBrCOBr$ gave similarly *o*- and *p*-$HOC_6H_4COCHBrMe$, in yields of 35 and 25%, resp. Condensation of pyrocatechol with halopropionic acids in the presence of $POCl_3$ was unsatisfactory. *3,4-(HO)$_2$C$_6$H$_3$COCHBrMe* was obtained in 50% yield by direct halogenation of $3,4-(HO)_2C_6H_3COEt$ in boiling AcOH. The *2,4-dinitrophenylhydrazone* of *o*-hydroxypropiophenone m. 189°, scarlet-red; of *p*-hydroxypropiophenone m. 229°, ruby-red; of *o*-hydroxybromopropiophenone m. 143°, orange-red; of *p*-hydroxybromopropiophenone m. 147°, dark red; of 3,4-dihydroxypropiophenone m. 229°, m. red. The semicarbazone of *o*-hydroxypropiophenone m. 221°, yellow-white. Pure pyrocatechol dipropionate m. 25–6°, columnar crystals. E. M. SYMMES

**The action of the chlorides of the type $XCl_3$ on vanillin and methyl anthranilate.** G. SOLLAZZO. *Officina* **5**, 270–3(1932).—In the reaction between vanillin and Me anthranilate, some resinous compds. are formed which are difficult to obtain in a very pure state. By the action of condensants of the type $XCl_3$ in $Et_2O$, the expected compds of the constitution $RN:CH_2$ were not formed, but the compds. were probably of the constitution $(RNH_2RCHO)XCl_3$. The compd. formed by the action of $AsCl_3$ is a red-yellow powder, sol. in $H_2O$, m. 143° (decompn.). The compd. obtained with $AlCl_3$ is a citron-yellow powder, partially sol. in $H_2O$, m. 178° to a dense liquid. G. A. BRAVO

**Oxidation of aromatic hydrocarbons.** B. A. BUYLLA AND J. M. PERTIERRA.

*Anales soc. espan. fis. quim.* **31**, 59–64(1933).—By oxidation of mixts. of $C_{10}H_8$ vapor and air, catalyzed by V oxides at elevated temp., good yields of phthalic anhydride were obtained. Under the same conditions *o*-xylene also produced $C_6H_4(CO)_2O$. E. M. S.

**Phthalyl fluoride.** ARTHUR T. DANN, ARTHUR N. HAMBLY, RICHARD E. PAUL AND GEO. S. C. SEMMENS. *J. Chem. Soc.* **1933**, 15–21.—$C_6H_4(COCl)_2$ (I) and NaF, heated to 250° in a Pt distg. flask and then gradually, with occasional shaking, to 300° during 48 hrs., give 53% of *phthalyl fluoride* (II), $b_{54}$ 135°, $b_{65}$ 142°, $b_{760}$ 224–36°, m. 42–3°; it is lachrymatory, especially when hot; it is much more slowly converted into $C_6H_4(CO)_2O$ by atm. moisture than is either form of I; the reaction on glass is slow, even when molten II is used. II apparently exists in only 1 form, $C_6H_4(COF)_2$. II is unaffected by prolonged action of heat, with or without $AlF_3$ or $SbF_3$ but is converted by $AlCl_3$ into cyclic I, so that, if $C_6H_6$ is also present, diphenylphthalide is formed (60% yield); II and BzF both react very slowly with boiling anhyd. $HCO_2H$, whereas acyclic I reacts below 25° and cyclic I below 40°, to produce CO and HCl. II in $C_6H_6$ reacts with $NH_4OH$ to give *o*-$NCC_6H_4CO_2H$; $PhNH_2$ gives 90% of phthalyldianilide, m. 253–5°. The constitution of II is established by parachor detns.; the values obtained by using Sugden's consts. are 318.9 and 304.2 for acyclic and cyclic II, resp., whereas the exptl. values are 315.6 and 315.4, $\gamma$ and d. at 50° being 34.63 and 1.3065, resp., *o*-$MeC_6H_4SO_2F$, $\gamma$ 36.05, d. 1.278 at 30.5°, *P* 333.6; *p*-isomer, $\gamma$ 33.04, d. 1.233 at 60°, *P* 338.5°; these results show that the discrepancy between the theoretical and exptl. values for II may be due to a strain effect on the *o*-position. Reaction rates also support the acyclic structure of II. II is initially more reactive toward MeOH than the 2 cyclic chlorides or than BzF but the rates can be considered to be approx. equal; on the other hand, acyclic I reacts about 200 times as rapidly as II with iso-PrOH and, when this alc. is used, BzCl is 500 times as reactive as BzF. It is pointed out that color reactions for isomeric acyl dihalides must be used and interpreted with caution. C. J. WEST

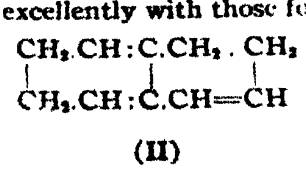
**Isomeric (−)menthyl α-naphthylglycolates.** ALEX. MCKENZIE AND EVELYN R. L. GOW. *J. Chem. Soc.* **1933**, 32–7.—(−)Menthyl *dl*-mandelate has been shown to be partially racemic and to cryst. unchanged under various conditions of temp. above −15° (*J. Chem. Soc.* **85**, 378(1904)). (−)*Menthyl dl-α-naphthylglycolate* (I), m. 38.5–9.5°, $[\alpha]^{21}_{5893}$ −51.6°, $[\alpha]^{21}_{5461}$ −61.4° ($Me_2CO$, *c* 4.096); this value is in good agreement with the value calcd from the figures for the diastereoisomeric esters on the basis of optical superposition and also that obtained by mixing equal amts. of the 2 esters in $Me_2CO$. Crystn. of I from light petroleum at −14°, to which a nucleus of II had been added, gives a ppt. contg. 85% II and repetition gives pure II; evidence of resolution was also obtained when I was distd. under diminished pressure; the fraction $b_3$ 214° had $[\alpha]^{20}_{5893}$ −55.4°, while a 2nd fraction, $b_3$ 214–6°, had −48.9°. (−)*Menthyl* (+)*α-naphthylglycolate* (II), m. 71–2°, is best prepd. from the optically active acid and ester, $[\alpha]^{20}$ 16.2, 18.9, 21.4, 27.6, 34.3, 41, 59.6° for λ 6563, 6162, 5893, 5461, 5106, 4861, 4358 ($Me_2CO$, *c* 3.573); the (−) *isomer* (III) $b_4$ 220°, m. 62–3°, $[\alpha]^{20}$ −96.3, −112, −125, −148.7, −178, −201.6° and — for the same λ. The action of $SOCl_2$ on III gives an oil, $[\alpha]^{21}_{5461}$ −120.5°; on II, $[\alpha]^{20.7}_{5461}$ −23.1°; on I, $[\alpha]^{20.5}_{5461}$ −75.5° (all in $Me_2CO$); the last value is very similar to that for synthetic (−)*menthyl dl-α-naphthylchloroacetate*, $b_4$ 228–30°, $[\alpha]^{20.8}_{5461}$ −75°, prepd. from *α-naphthylchloroacetic acid* (IV), m. 111–2° and 131.5–2.5°. This clearly indicates that the displacement racemization is negligible during the action of $SOCl_2$. III and $PCl_5$ give an oil, $[\alpha]^{20.6}_{5461}$ −78.3°; II, $[\alpha]^{20.8}_{5461}$ −79.2°; I, $[\alpha]^{20.5}_{5461}$ −77.2°; in the case of III the displacement racemization was almost complete; I gives a product with a slight preponderance of III. When IV was heated at 155° with (−)-menthol, the unesterified acid was *d*-rotatory; the acid regenerated from the ester was inactive; with (+)menthol the unesterified acid was *l*-rotatory. Hydrolysis of II and III with EtOH-KOH yields a partially racemized acid but the extent of this racemization was less pronounced than with the corresponding mandelates. The effect of a trace of EtOK on alc. solns. of II and III causes a negligible sapon. but the Me group is to some extent displaced by the Et group; there is no exptl. evidence that asym. catalytic racemization had actually taken place. C. J. WEST

**Depression of the melting point of *r*-isoborneol, *l*-borneol and *d*-camphor oxime by various substances.** T. S. PATTERSON, JANET H. BLACKWOOD AND J. MCWHINNIE STEWART. *J. Chem. Soc.* **1933**, 93–5.—This study was undertaken to find a substitute for camphor as a f.-p. solvent. Hexaacetylmannitol (I) and PhNHAc (II) depress the m. p. of isoborneol (III) in a similar manner and the relationship between mol. concn. and depression is linear, at least up to 10 *M*; the av. const. (*K*) for III is 466, as a mean of all the data, and 462 from the slope of the graph. The depression of the m. p. of *l*-borneol (IV) brought about by I, II, *o*-$ClC_6H_4CO_2H$ (V) and iso-Bu *d*-, *l*- and *dl*-tartrates was detd. The depression of the m. p. of IV is also very considerable and of the same order as in camphor. Up to concns. of about 12% the relationship between concn. and depression is practically linear, although there is considerable variation of individual

observations. The max. depression observed was 25° in a 10.04% soln. of V; the av. const. for IV is 384, taking the mean value of all the data, and 355, from the slope of the graph. Data are given for camphor oxime (VI) with II and V; both depress the m. p. of VI in the same manner but the depressions are not proportional to the concn.; from being very high in dil. solns., they become, rapidly, less and less. Up to a concn. of 0.5 *K* has a value of at least 100, but falls off to a value of about 170 in 10% soln. For mol. wt. detns. in extremely dil solns., VI, which has the further advantage of a comparatively low m. p. (119.6°), might be of distinct value in exceptional cases. With bornyl methylxanthate and II and V there was no appreciable depression in m. p. even in 7 and 10% soln. C. J. West

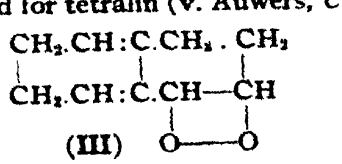
**Constitution of fukugetin and garcinin.** Masuo Murakami. *Proc. Imp. Acad.* (Tokyo) **8**, 500–2(1932).—Fukugetin (I) and garcinin (II) are dyes found in the bark of *Garcinia spicata* and *Xanthocymus ovalifolia* and were isolated in 0.9 and 0.45% yields, resp. Analysis indicates the formula $C_{22}H_{16}O_8.2H_2O$ for each. Each yields a penta-Me deriv., decompg. 141–2°, that from I apparently contg. 1.5 mols. $H_2O$ and that from II 1 mol. $H_2O$. Oxidation of either Me deriv. gives a poor yield of anisic acid; heating with EtOH-KOH gives veratric acid, anisic acid and a phenol, m. 156–9°, having the compn. $C_{18}H_{20}O_7$ with 3 MeO groups. Oxidation of the phenol with $KMnO_4$ gives anisic acid. $Me_2SO_4$ gives a di-Me deriv., m. 161–3°. The phenol is assumed to be 6,2,4,3-MeO(HO)$_2$(MeOCH$_2$CO)C$_6$HCH(OH)C$_6$H$_4$OMe and the Me deriv. (MeO)$_3$-(MeOCH$_2$CO)C$_6$HCH(OH)C$_6$H$_4$OMe. Formulas are also proposed for I and II. C. J. West

**Configurations of the aldoximes from measurements of electric dipole moment.** T. W. J. Taylor and L. E. Sutton. *J. Chem. Soc.* **1933**, 63–5.—The following elec dipole moments ($\mu \times 10^{18}$) have been detd.: α- and β-*O*-methyloxime of *p*-nitrobenzophenone 3.75 and 4.26; β- and α-*O*-methyl-*p*-nitrobenzaldoxime, 3.395 and 3.885. The differences between the 2 sets of measurements are 0.51 and 0.49. It thus appears that the aldoxime and ketoxime derivs. with the smaller moments have a similar configuration and those with the larger moments the opposite configuration. This settles the structures of β- and α-*p*-nitrobenzaldoxime beyond reasonable doubt. The differences in moment which form the basis of this argument, though small, can be measured with ample accuracy because the mols. contain a $NO_2$ group of large moment and thus the total polarization is large. C. J. West



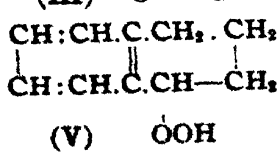
**Phenylstyrylmethylsodium.** Ernst Bergmann and T. Ukai. *Ber.* **66B**, 54–8 (1933).—Whereas almost all possible types of ethers of tertiary arylcarbinols have been tested as to their cleavability by alkali metals in ether, of ethers of disubstituted carbinols it was hitherto known only that diarylcarbinol ethers are cleavable. The present work was undertaken to fill this gap. Phenylstyrylcarbinol, obtained in 38 g. yield from 25 g. PhCH:CHCHO according to Nomura (*C. A.* **20**, 906) gave in MeOH contg conced. $H_2SO_4$ the *Me ether* (I) (85 g. from 100 g. carbinol), $b_{11}$ 180–1°. I reacts instantaneously with Na to form the cherry-red *phenylstyrylmethylsodium* (II). II with $Ph_2CO$ gives *1-hydroxy-1,1,2,4-tetraphenyl-3-butene* (5 g. from 5 g. I), dimorphous crystals (druses and rods), m. 130–1°, dehydrated by boiling AcCl to PhCH:CHCPh:CPh$_2$, m. 148–9°, identical with the product obtained by Staudinger from PhCH:CHCOMe and $Ph_2C$:CO (*C. A.* **4**, 450) and which is oxidized to $Ph_2C$:CPhCHO (III), m. 177–8°. In this connection it was discovered that the substance m. 175–6° obtained by Schlenk and Bergmann by the oxidation of $Ph_2C$:CPhMe and apparently having the compn $C_{26}H_{20}O$ (*C. A.* **24**, 3778) is really III.$C_6H_6$, $C_{27}H_{22}O$; it is always formed when III is slowly crystd. from benzene. With 4 g. fluorenone II gives 6.5 g. *1-hydroxy-1-biphenylene-2,4-diphenyl-3-butene*, m. 145–6°, dehydrated to *1-biphenylene-2,4-diphenyl-1,3-butadiene*, yellow, m. 183–4°, which with $Na_2Cr_2O_7$ in boiling AcOH gives *biphenylenephenyl acrolein*, yellow, m. 164–5°. *1-Hydroxy-1,2,4-triphenyl-3-butene*, from II and BzH, m 109–11°. *1,2,4-Triphenyl-1,3-butadiene*, needles with green shimmer, m. 103–4°, $b_{10}$ 230–9°. *1,2,4-Triphenyl-3-butene*, from II and $PhCH_2Cl$, viscous oil, $b_{40}$ 240–2° (possibly a mixt. of *cis-trans* isomers). The action of $Ph_2CHBr$ on II resulted in disproportionation, the only definite product obtained being $(CHPh_2)_2$. $Ph_2CCl_2$ with II gave *1,3,4,4,5,7-hexaphenyl-1,6-heptadiene*, m. 145°. *1,3,5,7-Tetraphenylhepta-1,6-dien-4-one*, from II and $CO(OEt)_2$, m. 183°; the mother liquors yielded an oil which, from its b. p (170° at 10 mm.) and compn., is probably *1,3-diphenyl-1-propylene*. II in ether shaken with Hg and then decolorized with $CO_2$ gave *phenylstyrylacetic acid*, m. 121°, and *1,3,4,6-tetraphenyl-1,5-hexadiene*, m. 137–8°; no evidence of the presence of the possible diastereomers was obtained. C. A. R.

**New synthesis of cadalene.** E. de Barry Barnett and J. W. Cook. *J. Chem. Soc.* **1933**, 22–4.—The importance of cadalene (4,1,6-iso-Pr$C_{10}H_5Me_2$) (I) as a product of dehydrogenation of a large group of sesquiterpenes led to its synthesis from 1,6-$C_{10}H_6Me_2$ (II) in order to confirm its structure. II (156 g.) and Br in $CS_2$ give 125 g. of the *4-Br*



*deriv.*, $b_{18}$ 171–2° (*picrate*, orange, m. 114°); the Grignard reagent from 100 g. of the Br deriv. and $CO_2$ give 20 g. of *1,6-dimethyl-4-naphthoic acid*, m. 188–9° (*Et ester*, $b_{2-5}$ 166°). The ester and MeMgI form the carbinol, 1,6,4-$Me_2C_{10}H_5CMe_2OH$, not crystd., which heated with picric acid in EtOH, yielded *1,6-dimethyl-4-isopropenylnaphthalene*, (*dehydrocadalene*) (III), $b_{14}$ 154° (*picrate*, orange-red, m. 118–9°). Reduction of III with EtOH and Na and dehydrogenation with Se gives I. The above crude carbinol in AcOH, boiled 2 hrs. with HI, gives the *dimer* of III, $C_{30}H_{32}$, m. 218°; this also results from III in AcOH-HCl. 4-$MeC_{10}H_6CO_2Et$ and MeMgI give *dimethyl(4-methyl-1-naphthyl)carbinol*, m. about 90°; EtOH-HCl gives *1-methyl-4-isopropenylnaphthalene*, whose *picrate*, orange, m. 88°; reduction and dehydrogenation gives apocadalene, $b_{16}$ 148°.

C. J. West



**Autoxidation of hydrocarbons. I. A tetrahydronaphthalene peroxide obtained by autoxidation.** H. Hock and W. Susemihl. *Ber.* **66B**, 61–8(1933).—The water-clear freshly distd. tetralin gradually becomes yellowish on standing, and the behavior toward chem. reagents (concd. $H_2SO_4$, $Fe(CO)_5$, xanthates, etc.) of samples which have thus been exposed to the air points to an autoxidation. By varying the conditions of exposure, H. and S. finally succeeded in obtaining highly oxidized solns. in a very simple way and in isolating a well-crystd. *tetrahydronaphthalene peroxide*, $C_{10}H_{12}O_2$ (I), oxidized by $KMnO_4$ to *o*-$HO_2CC_6H_4CH_2CH_2CO_2H$, reduced by KI in AcOH or $NaHSO_3$ in aq. MeOH to *ac*-tetrahydro-α-naphthol and converted by hot NaOH into α-ketotetrahydronaphthalene. According to prevailing views on the autoxidizability of hydrocarbons, a tetralin contg. a benzene nucleus should not be autoxidizable, and the absorption of O can be explained only by assuming the existence of isomeric tetrahydronaphthalenes in which the double bonds are distributed among both rings (cf. Straus and Lemmel, *C. A.* **15**, 1894). The properties of I show that the $O_2$ mol. has added at a double bond between an α- and a β-C atom. For the distribution of the other 2 double bonds, there are 11 theoretical possibilities; probably tetralin consists of an equil. mixt. of 2 or even more forms, and I is derived from a form contg. 2 crossed double bonds. H. and S. give the preference to the form II which would add $O_2$ to give III, and III, by migration of 2 H atoms and shifting of the double bonds, either directly or perhaps through an intermediate product (IV), would stabilize itself as V. The structure V agrees with the above-mentioned properties of I and the fact that I is recovered unchanged by acidification of its Na salt. I is obtained in 15–17% yield by passing air 50–60 hrs. through com. tetralin at about 75° under a reflux condenser, removing most of the unchanged tetralin at 50–60° under 1–2 mm. and cooling the residue; after 2 recrystns. from petroleum ether it m. 56°, mol. wt. in benzene 164, in camphor 153–64, is stable for a short time at 120–5° when cautiously heated, becomes yellow and loses water at about 130°, and deflagrates when superheated, dissolves completely in 2 *N* NaOH, is easily sol. in org. bases, liquid $NH_3$, Ba and Ca hydroxides, colors Ti sulfate solns. yellow on long standing (instantly if the I has previously been heated with dil. $H_2SO_4$), gives in $CHCl_3$ with $SnCl_4$ a violet, with concd. $H_2SO_4$ a red-violet color, deflagrates vigorously with anhyd. $ZnCl_2$ at 50° or when rubbed with solid $EtOCS_2Na$ at room temp. *Na salt*, almost white to faintly yellowish, doubly refracting needles which deliquesce in the air with extraordinary readiness; its Na content (10.4%) corresponds to the compn. $C_{10}H_{11}OONa.2H_2O$. I shows at 78.8° $d_4$ 1.0988, $n$ 1.53893, 1 54471, 1 55473 for α, He and β, $E\Sigma$ 0.35, 0.43, 0.15% for α, D and β − α. When the $E\Sigma$ values are cor. for temp., they agree excellently with those found for tetralin (v. Auwers, *C. A.* **8**, 119).

C. A. R.

**Podophyllotoxin.** Alexander Robertson and Roy B. Waters. *J. Chem. Soc.* 1933, 83–6.—Dehydration of picropodophyllin, under conditions comparable with those described by Borsche and Niemann (*C. A.* **26**, 3509), gives *α-apopicropodophyllin*, m. 244–5°, $[\alpha]^{21}_{5461}$ —17.5° ($CHCl_3$, *c* 0.4852); this is converted by $Ac_2O$ and AcONa (or $C_5H_5N$) to the *β-isomer*, m. 216°, $[\alpha]^{21}_{5461}$ 117.6° ($CHCl_3$ *c* 0.5104); the β-form can be distinguished by its $H_2SO_4$ reaction; cold concd. $H_2SO_4$ gives a pale orange soln. changing on warming to red, purple and finally violet. Both lactones give *apopicropodophyllic*

*acid* with EtOH-NaOH, m. 174° (decompn.), $[\alpha]^{21}_{5461}$ —279.4° ($CHCl_3$, *c* 0.9624); heating at 185° for 0.5 hr. gives only the α-lactone. Either lactone with HI in AcOH gives podophyllomeronic acid, m. 240°. The constitution ascribed to podophyllomerol (6,7-methylenedioxy-2-methylnaphthalene) (I) has been established by the following synthesis. Reduction of the mixed keto acids resulting from the condensation of veratrole and methylsuccinic anhydride with $AlCl_3$ and ring closure give a mixt. of 1- and 4-keto-6,7-dimethoxy-2-methyl-1,2,3,4-tetrahydronaphthalene, m. 102–10°, reduced by Zn and concd. HCl to 6,7-dimethoxy-7-naphthalene, m. 100°; HI and $Ac_2O$ give the *6,7-di-HO deriv.*, m. 165°, which, with $CH_2I_2$ and $K_2CO_3$ in $Me_2CO$, forms I. The α- and β-lactones described above are considered geometrical isomers. C. J. WEST

**Constitution of podophyllotoxin and picropodophyllin.** ERNST SPÄTH, FRITZ WESSELY AND EDITHA NADLER. *Ber.* **66B**, 125–30(1933).—This is a contribution to the proofs, still lacking, of the positions of the $(MeO)_3C_6H_2$ group and of the free HO group on the hydrogenated nucleus in the formulas assigned to podophyllotoxin (I) and picropodophyllin (II) (*C. A.* **27**, 717; Borsche and Niemann, *C. A.* **27**, 717). Under certain conditions, I and II with $KMnO_4$ give an *acid* $C_{18}H_{16}O_8$ (III), m. 214–6°, which contains 3 MeO groups, is monobasic and yields with $CH_2N_2$ a *Me ester* m. 128–30°. III is reduced to $C_{18}H_{16}O_7$ (IV), m. 218°, and is decarboxylated to $C_{17}H_{16}O_6$ (V), $b_{0.01}$ 180–90°, m 125–7°. IV behaves like a lactone and 2 of the O atoms in III form part of a methylenedioxy group, as indicated by color reactions and definitely established by further expts. That V is *3,4,5-trimethoxy-3',4'-methylenedioxybenzophenone* was proved by condensing 3,4,5-$(MeO)_3C_6H_2COCl$ with the methylene ether (VI) of *o*-$C_6H_4(OH)_2$ by the Friedel-Crafts method, which gave V in small yield (0.05 g. from 2 g. VI). III is therefore 2,4,5-$RCO(CH_2O_2)C_6H_2CO_2H$ (R = 3,4,5-$(MeO)_3C_6H_2$), and IV is $CH_2O_2C_6H_2.CO.O.CHR$.

Borsche and Niemann assigned this structure also, but without strict proof, to the lactone they obtained by oxidation of I and II. These structures of III and IV, in combination with the other degradation reactions, permit of deriving the formulas assigned to I and II only on the assumptions that (a) I and II are both γ-lactones, and (b) the residue R is on the 8-, not the 5-C atom. (a), although probable, has not yet been proved with certainty; (b) has been made probable by the expts. of B. and N. III is probably identical with the acid m. 212–4° (Me ester, m. 126–7°) obtained by B. and N. (*C. A.* **26**, 3509) by mild oxidation of "podophyllic acid" with $KMnO_4$ and to which they assigned the compn. $C_{21}H_{18}O_9$. A reply is made to the comments of B. and N. (*C. A.* **27**, 87). C. A. R.

**Action of lithium on tolan. III.** ERNST BERGMANN AND WERNER SCHREIBER *Ann.* **500**, 118–22(1933); cf. *C. A.* **25**, 4256.—The action of Li on tolan gives 1,2,3-triphenylnaphthalene, 1,2,3,4-dibenzo-9-phenyl-9,10-dihydroanthracene and $C_{28}H_{22}$, m 183°, now shown to be *1-benzylidene-2,3-diphenylhydrindene*, since reduction gives the 1-benzyl deriv., m. 115°. 1,4-Diphenylhydrindone and $PhCH_2MgCl$ give *1-benzyl-1-hydroxy-2,3-diphenylhydrindene*, m. 155°. The Li compd. of 2,3-diphenylindene and BzH give 1-benzal-2,3-diphenylindene. Reduction of 1,2-diphenyl-3-benzylindene with Na and AmOH gives *1,2-diphenyl-3-benzylhydrindene*, m. 143–4°. C J. WEST

**Constitution of rubicene.** ROLAND SCHOLL AND H. KURT MEYER. *Ber.* **65B**, 926–7(1932).—The Schlenk and Karplus fluorene-like condensed *ms*-diphenylanthracene formula for rubicene (I) (*C. A.* **23**, 126) has been confirmed by heating 9,10-diphenyl-9,10-dihydroxy-9,10-dihydroanthracene-1,5-dicarboxylic acid dilactone (*C. A.* **26**, 3502) with Zn dust in $CO_2$; $CO_2$ is split off, H migrates and there is formed a sublimate of I and *ms*-diphenylanthracene (II), sepd. by recrystg. from AcOH and floating off the small red needles of I from the large orange-yellow needles of II. C. A. R.

**Constitution and reactivity. V. Nitration and bromination of aminoanthraquinones.** KARL LAUER. *J. prakt. Chem.* **136**, 1–4(1933); cf. *C. A.* **27**, 1344.—1-Aminoanthraquinone, nitrated by adding 105% $KNO_3$ to the amine in 10 parts monohydrate at 5° during 3 hrs., gives 64.2% 2- and 35.8% of 4-$NO_2$ derivs. Under the same conditions derivs. gave the following yields: methylene 52.4, 47.6; urethan, 28.8, 71.2; Ac, 8.8, 91.2; Bz, 8.5, 91.5; chloroacetyl, 6.9, 93.1; oxamic acid, 3.6, 96.4; toluenesulfonamide, 1.4, 98.6. 2-Aminoanthraquinone gave 84.3% 3- and 15.7% 1-$NO_2$ derivs., the above derivs., in the order named, gave the following yields: 74.4, 25.6; 64.8, 35.2; 10.2, 89.8; 8.8, 91.2; 6.4, 93.6; 3.4, 96.6; 2.8, 97.2. Dropping 105% of the theory of Br into 1-aminoanthraquinone in 10 parts $PhNO_2$ during 3 hrs. and allowing the mixt. to stand 20 hrs. at 30° gave 62.5% 2-Br and 37.5% 4-Br deriv.; derivs. gave the following yields: urethan 28.6, 71.4; Ac 14.6, 85.4; Bz 12.9, 87.1; chloroacetyl 8.6, 91.4; oxamic acid, 3.6, 95.7; toluenesulfonamide 1.6, 98.4. 2-Aminoanthraquinone gave 87.5% 3-Br and 12.5% 1-Br derivs.; derivs. named above gave: 68.4, 31.6; 16.6, 83.4; 15.8, 84.2; 12.6, 87.4; 8.3, 91.7; 3.5, 96.5. The differences in the heat of activation for the $NO_2$ and Br derivs. and $k \times 10^4$ are also given. VI. The replacement of the sulfonic groups

**in chloroanthraquinonesulfonic acids by chlorine.** *Ibid* 5–8.—Data for $k \times 10^3$, $q$ and $\alpha \times 10^{-10}$ are given for the 1,5-, 1,8-, 1,6-, 1,7-, 2,6- and 2,7-chloroanthraquinonesulfonic acids as regards the replacement of the $SO_3H$ group by Cl at 94°, 104° and 114°. C. J. WEST

**Violanthrone-melt in the presence of phenol. I. Separation of the melt products.** TOSHIO MAKI. *J. Soc. Chem. Ind., Japan* **35**, Suppl binding 577–9(1932). **II. Properties of the products.** *Ibid* 579–83.—By fusion with 79% KOH for 30 min. at 220°, and subsequent phys. sepn., 4 products were isolated: (1) an alkali-sol. part, (2) an AcOH-sol. part, (3) violanthrone B (a gray dye) and (4) violanthrone A, or pure dibenzoanthrone. Details of sepn. are given in I, and properties in II. G. M. EVANS

**Biochemistry of filamentous fungi. I. Coloring matters of Monascus purpureus Went.** HIDEJIRO NISHIKAWA. *J. Agr. Chem. Soc., Japan* **8**, 1007–15; *Bull. Agr. Chem. Soc., Japan* **8**, 78–9(1932).—*Monascus purpureus* Went. was cultivated on a soln. contg sucrose 100, peptone 10, $(NH_4)_2HPO_4$ 2, $KNO_3$ 2, $MgSO_4.7H_2O$ 0.5, $As_2O_3$ 0.5, $ZnSO_4.7H_2O$ 0.5, $CaCl_2.6H_2O$ 0.1, tartaric acid 3 g., in 1 l. $H_2O$ at 30° for 10–20 days The mold body was pressed and extd. with cold ether. The ether ext. was dried and evapd. to some extent and kept in a cold place. *Monoascorubrin* (I), $C_{23}H_{24}O_5$, crystd. out as cinnabar-red needles or prisms, m. 136°, is sol. in ether, EtOH, MeOH, $C_6H_6$, $CHCl_3$, acetone and AcOH, and insol. in petr. ether and $H_2O$. I was reduced with Pd-$BaSO_4$ as a catalyst to red-yellow crystals, $C_{23}H_{26}O_5$, m 95–6°, sol. in ether, EtOH and $C_6H_6$, and insol. in petr. ether. I on treatment with Br formed yellow needles, $C_{21}H_{23}O_3Br_3$. I in alc. was converted by $H_2O_2$ into *monascoflavin* (II), $C_{17}H_{22}O_4$, yellow rhombic platelets, m. 145°, sol. in alc., $C_6H_6$, AcOEt, acetone and glacial AcOH, and slightly sol. in ether and petr. ether. II was also obtained from I by oxidation with $KMnO_4$. The dihydro compd. of II, m. 120° (sinters 110°) was obtained by catalytic reduction with Pd-$BaSO_4$. It is sol. in EtOH and $Et_2O$ and insol. in $H_2O$, and has phenolic properties Br deriv. of II, $C_{17}H_{22}O_4Br_2$, yellow silky needles, m. 175–83°; Ac deriv. of II, $C_{17}H_{21}O_4Ac$, an amorphous powder. Five g. of I was fused with 20 g. of KOH at 250–300°. The product after acidification with $H_2SO_4$ and distn. with steam yielded an oil; from the fraction b. 200–20°, an anilide, white needles, m. 92°, was prepd. and identified as caproanilide. I and II have no MeO group. Y. KIHARA

**The economic utilization of the Friedel and Crafts reaction in the synthesis of benzanthrone and its homologs.** M. GALLOTTI AND A. BERETTA. *Ann. chim. applicata* **22**, 691–4(1932).—The synthesis of benzanthrone has been carried out by mixing intimately in a ball mill, phthalic anhydride, $C_6H_6$ and $AlCl_3$, controlling the temp. very carefully. In 20 hrs. at 50–60°, a yield of 93.6% of *o*-$BzC_6H_4CO_2H$ was obtained, while in 12 hrs. at 60–65°, the yield was 96.1%. The above reagents are used in stoichiometric proportions, and the reaction product is used directly for the prepn. of benzanthrone. A. W. CONTIERI

**The active hydrogen atoms of polymeric indoles.** O. SCHMITZ-DUMONT AND K. HAMANN. *Ber.* **66B**, 71–6(1933).—The structures hitherto proposed for polymeric indoles (cf. Oddo, *C. A.* **22**, 78; Chelintzev, *C. A.* **9**, 3055) are based chiefly on the facts that: (1) polymeric indoles break down, on heating, quantitatively into the monomers; (2) with acid chlorides and anhydrides they give only monoacyl derivs.; (3) Chelintzev found only 1 active H atom in triindole by the Chugaev-Zerevitinov method. S.-D. and H., however, find 2 active H atoms in biindole, biskatole and bi(7-methylindole), 3 in triindole, and only 1 in the monomeric forms. That there is no depolymerization by the MeMgI during the detns. is indicated by the fact that the polymers are recovered almost quantitatively from the reaction soln. On the other hand, only 1 of the NH groups in the polymers reacts with PhNCO to form a urea. Expts. to clear up the structures of the polymers are in progress. Using $Am_2O$ and xylene or mixts. of them as solvent, and working under definite conditions in making the active H detns., S.-D. and H. obtained vols. of evolved $CH_4$ which remained const. for hrs. *Phenylurea* of: *biindole*, $C_{28}H_{18}N_2O$, m. 179–80°; *biskatole*, m. 219°; *triindole*, m. 217°. C. A. R.

**Natural and synthetic indican.** ALEXANDER ROBERTSON AND ROY B. WATERS. *J. Chem. Soc.* **1933**, 30.—Synthetic indican (*C. A.* **21**, 3602) is identical with a natural specimen, as shown by comparison of the penta-Ac derivs. C. J. WEST

**Dielectric polarization. V. Benzene solutions of pyrones, thiopyrones and thioketones. Dioxane solutions of ureas and thioureas.** ERIC C. E. HUNTER AND JAMES R. PARTINGTON. *J. Chem. Soc.* **1933**, 87–90; cf. *C. A.* **27**, 1322.—Dipole moments ($\mu \times 10^{18}$) are reported as follows: dimethyl-γ-pyrone 4.05, diphenyl-γ-pyrone 3.82, dimethylthio-γ-pyrone 5.05, thiobenzophenone 3.37, dioxane 0.40, $CO(NHMe)_2$ 4.8, $CO(NHEt)_2$ 4.9, $CO(NHPh)_2$ 4.6, $CS(NHPh)_2$ 4.85. The values of the dipole moments show that the pyrones and thiopyrones do not contain the ether and keto (or thioether and thioketo) groups, as had been concluded previously from the chem. evidence, since, if this were so, the resultant moments would be expected to be the algebraic sums of the

group moments; the measured moments, which are much greater than these calcd. values, point to the presence of polar bonds. The dipole moment of the C—S bond is greater than that of the C—O bond. The mechanism of the formation of oxonium salts is also discussed. C. J. WEST

**Synthetical experiments on the nature of betanin and related nitrogenous anthocyanins. II.** ALICE M. ROBINSON AND ROBERT ROBINSON. *J. Chem. Soc.* **1933**, 25–9; cf. *C. A.* **26**, 4048.—4'-Aminoflavylium salts, contg. 2 or 3 HO groups in the positions (3,5,7) corresponding to those hydroxylated in the anthocyanidins, possess a color, stability to cold mineral acids and behavior with alkali quite similar to the resp. properties of the pigment of the beet; the latter is, however, more unstable to hot mineral acids and appears to be more resistant to the action of $HNO_2$ than any of the synthetic salts *3-Nitro-4-methoxybenzoyl chloride* m. 52°; $CH_2N_2$ gives *ω-diazo-3-nitro-4-methoxyacetophenone*, m 139°, which becomes bright yellow in direct sunlight; warming with AcOH 20–30 min. gives the *ω-Ac deriv.*, yellow, m. 110°; reduction with $Fe_2SO_4$ and $NH_4OH$ gives *3-amino-ω-acetoxy-4-methoxyacetophenone* (I), yellow, m. 119–20°. 2,4,6-HO(MeO)$_2C_6H_2CHO$ and 4-$H_2NC_6H_4COCH_2Ac$ in concd. HCl, satd. with HCl at 0°, and treated with $HClO_4$, form *4'-amino-3-hydroxy-5,7-dimethoxyflavylium perchlorate*, which gives a $KMnO_4$-colored soln. in EtOH and a cherry-red soln. in MeOH; the aq. soln. is red, changed by HCl to orange. 2,4-HO(MeO)$C_6H_3CHO$ and I give *3'-amino-3-hydroxy-7,4'-dimethoxyflavylium perchlorate*, bright red; the MeOH and EtOH solns. are bright red, changing to orange with concd. HCl. 2,4,6-HO(MeO)$_2C_6H_2CHO$ and I give *3'-amino-3-hydroxy-5,7,4'-trimethoxyflavylium perchlorate*, bright red; MeOH gives a bright red soln.; EtOH, a bluish red soln. Absorption curves for the 3 perchlorates are given. *O*-Benzoylphloroglucinaldehyde and 3'-nitro-ω-acetoxy-4-methoxyacetophenone in AcOEt, satd. at 0° with HCl, yield *3'-nitro-3,7-dihydroxy-5-benzoyloxy-4'-methoxyflavylium chloride*, crimson plates; the MeOH and EtOH solns. are orange; hydrolysis gives the *3,5,7-tri-HO deriv.*, dark purplish red. *4'-Nitro-3,5,7-trihydroxyflavylium chloride*, gives brown solns. in MeOH and EtOH. 4-$H_2NC_6H_4COMe$ and β-resorcylaldehyde in concd. HCl, satd with HCl, give *4'-amino-7-hydroxyflavylium chloride* brick-red, forming cherry-red solns. in MeOH and EtOH; the *3,7-di-HO homolog*, dark greenish black, gives blood-red solns. in the simple alcs.; the *3,5,7-tri-HO homolog*, dark purple, gives red-purple solns. in alcs.; its *5-Bz deriv.* was prepd. as an intermediate The absorption curves of the 3 HO derivs. are given. C. J. WEST

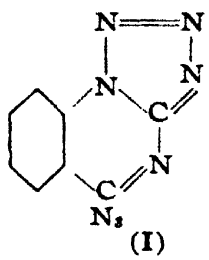
**Hydrogenation of heterocyclic compounds.** G. M. MAKH AND V. N. KHADZHINOV *Ukrain. Khem. Zhur.* 7, No. 1, Sci.-Tech. pt., 32–40(1932).—Berginization of *o*-biphenylene oxide produced 95% of liquid product with $MoS_2$ catalyst in 4 hrs. at 400–10° and 450–70°, and 45% with $MoO_3$ at 450–65°. The liquid is composed of $C_6H_6$, methylcyclopentane, cyclohexane, bicyclic naphthenes and bicyclohexyl. CHAS. BLANC

**Nitration of β-phenylethylpyridine and related compounds. I.** B. D. SHAW AND E. A. WAGSTAFF. *J. Chem Soc.* **1933**, 79–83.—Nitration of 2-β-phenylethylpyridine (I) in $H_2SO_4$ gives 16% *o*-, 3.4% *m*- and 64.5% *p*-$NO_2$ derivs.; 2-stilbazole (II) gives 40.1, 0 and 49%, resp., of the 3 isomers; 2-phenylacetenylpyridine (III) gives 28.7, 0.6 and 62.7%, resp., of the 3 $NO_2$ compds. These values support the principle that the successive intercalation of $CH_2$ groups between a *m*-orienting radical and a $C_6H_5$ nucleus progressively decreases the proportion of *m*-substitution. The *o,p*-ratio of $NO_2$ substitution in II varies considerably (0.75–1.12) with the compn. of the nitration medium (21 expts. reported); increase in the concn., combined with decrease of the quantity, of the $HNO_3$ employed decreases the *o,p*-ratio; varying the temp. appears to have a slight influence; addn. of sol. nitrates or AcOH to the $HNO_3$ increases the *o,p*-ratio but to a smaller extent than an equal wt. of $H_2O$; nitration in $H_2SO_4$ gives *o,p*-ratios (0.85–0.93) equal to those obtained with 87–92% $HNO_3$. The products of nitration of I and III are not susceptible to thermal analysis, but sepn. of the isomers indicates that a similar variation of the *o,p*-ratios exists for III and that the variation for I, if existent, is much smaller I gives a *nitrate*, m. 91°; *o-$NO_2$ deriv.* of I, m. 36° (methiodide, m. 184°); *p-$NO_2$ deriv.*, m. 96° (methiodide, deep yellow, m. 198°). *2-β-o-Aminophenylethylpyridine*, m. 61° (HBr salt, m. 295°), is formed from the nitro-2-stilbazole, HI and red P at 160° for 5 hrs., *m-isomer*, m. 72°; *p-isomer*, m. 57°; the crude Ac deriv. on nitration and hydrolysis forms *2-(β-3'-nitro-4'-aminophenylethyl)pyridine*, deep yellow, m. 150°; the diazo reaction gives the *m-$NO_2$ deriv.* of I, m. 76°. The *nitrate* of II, crystals with 2 mols. $H_2O$, m. 89°; anhyd., it m. 123° (decompn.); the m. ps. are given for mixts. of 2'- and 4'-$NO_2$ derivs. of II. The 3-$NO_2$ deriv. of II and $HNO_3$ yield 15% of *3',4'-dinitro-2-stilbazole*, deep yellow, m. 168°. The *nitrate* of III m. 85°; *2-o-$NO_2$ deriv.* m. 55°; *m-isomer*, pale yellow, m. 93°; *p-isomer* m. 157° (picrate, m. 206° (decompn.)). C. J. WEST

**Reaction between 2-picoline and aromatic aldehydes.** B. D. SHAW AND E. A. WAGSTAFF. *J. Chem. Soc.* **1933**, 77–9.—Stilbazoles can be prepd. from 2-picoline and aromatic aldehydes, by using $Ac_2O$ in place of $ZnCl_2$, in higher yields and in purer form.

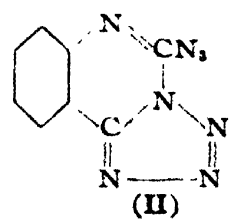
Small quantities of $PhCH:CHCO_2H$ are also formed, except with BzH and *p*-$MeC_6H_4CHO$. The formation of benzylidene diacetates was not detected. The following yields of stilbazoles are reported, the expts. being carried out at the b. p. of the soln. and 1 mol. each of aldehyde and 2-picoline being used: BzH, 0.5 mol. $Ac_2O$, 30 hrs., 87%. *o*-$O_2NC_6H_4CHO$, 1 5 mols. $Ac_2O$, 10 hrs., 80%; 2-nitro-2-stilbazole gives a *nitrate*, m. 148°; picrate, m. 220°. *m*- and *p*-$O_2NC_6H_4CHO$, 1 mol. $Ac_2O$, 10 hrs., 90%. 2,4-$(O_2N)_2C_6H_3CHO$, 2 mols. $Ac_2O$, 1 hr., 65%. *p*-$MeC_6H_4CHO$ with 1 mol. $Ac_2O$ for 10 hrs. gives 80% *4'-methyl-2-stilbazole*, m. 87°. *o*-$O_2NC_6H_4CHO$ in AcOH gives 79% with 1 mol. and 48% with 3 mols.; with 12 mols. no stilbazole was isolated. Heating the aldehyde and 2-picoline with 4 mols. $H_2O$ for 10 hrs. at 140° gives alkines; *3'-nitro-2-stilbazolealkine* m. 98°; *4'-Me deriv.* m. 96°; the reaction is reversible, the % decompn. being: unsubstituted, 60; *o*-, *m*- and *p*-$NO_2$ derivs., about 30%. The alkines were dehydrated by heating with 4 mols. $Ac_2O$ for 0.5–3 hrs. at 100°. C. J. WEST

**The condensation of piperidinoacetonitrile with resorcinol and phloroglucinol.** MASATARO YAMASHITA. *Science Repts. Tôhoku Imp. Univ.*, 1st Ser. 21, 545–8(1932).—$C_5H_{10}NCH_2COC_6H_2(OH)_3.HCl$ was obtained as feather-like needles (decompg. 244–5°) by hydrolyzing the yellow ppt. obtained from 1.2 g. piperidinoacetonitrile (I), 1.3 g. phloroglucinol, 0.5 g. anhyd. $ZnCl_2$ and dry HCl in 20 cc. glacial AcOH. Likewise $C_5H_{10}NCH_2COC_6H_2(OH)_2.HCl$ (colorless needles, decompg. 243–5°) was obtained from 2.2 g. I, 2.2 g. $C_6H_4(OH)_2$, 0.6 g. anhyd. $ZnCl_2$, and dry HCl in 20 cc. glacial AcOH. J. V. VAUGHEN



**The communication of G. Reddelien and Alfred Thurm: "The alleged acetone anil."** K. v. AUWERS *Ber.* **66B**, 59–60(1933); cf. R. and T., *C. A.* **27**, 92.—R. and T. reported that the supposed acetone anil is really a 2,2,4- or 2,4,4-trimethyldihydroquinoline (I) Earlier spectrochem. measurements had shown that in its mol. refraction it resembled the anils of isobutyraldehyde and trimethylacetaldehyde but unexpectedly differed from them in its mol. dispersion (*C. A.* **26**, 2178). New measurements on samples of I, its 1-Me deriv. (tetramethyldihydroquinoline) (II) and its dihydro deriv. (trimethyltetrahydroquinoline) (III) supplied by R. gave the following results for d., $n_\alpha$, $n_{Hg}$, $n_\beta$, $E\Sigma_\alpha$, $E\Sigma_D$, $E(\Sigma_\beta - \Sigma_\alpha)$, resp., at $t°$, the $E\Sigma$ values being calcd. on the basis of the hydroquinoline structure: I, 1.0109, 1.58241, 1.59010, 1.61096, 1.52, 1.65, 77%, at 18.2°; II, 1.0042, 1.58123, 1.58912, 1.61026, 1.37, 1 52, 78%, at 20.2°; III, 0.9531, 1 53055, 1.53592, 1 54947, 1.01, 1.07, 41%, at 65.4° (the $E\Sigma_\alpha$ and $E\Sigma_D$ values, cor. for temp. to 20°, are 0.9 and 0.95). For a series of tetrahydroquinoline derivs. $E\Sigma$ values of 0 85, 0.9, 44%, for $\alpha$, D and $\beta - \alpha$ had been obtained (*C. A.* **19**, 2911); spectrochemically, therefore, III fits in excellently with this group of substances If I and II were 1,4-dihydro compds., they should show exaltations similar to those of III, as the isolated 4th double bond should exert no particular influence. Their appreciably higher exaltations indicate that this double bond is in a conjugation, *i. e.*, that they are 1,2-dihydro compds. C. A. R.

**Cyanine dyes. V. Lepidyl-, quinaldyl- and picolylcarbocyanines.** TERUTARO OGATA. *Proc. Imp Acad* (Tokyo) **8**, 503–6(1932); cf. *C. A.* **27**, 982.—Cryptocyanine (O.A.) 1 (*Bull. Inst. Phys. Chem. Research* **4**, 423(1925)) is 10-*N*-iodoethyllepidyl-1,1'-diethyl-4,4'-carboquinocyanine iodide; the yield from lepidine-EtI and $HC(OEt)_3$ varies greatly with the solvent (AcOH, $EtCO_2H$ 67; $Ac_2O$ 52, $PrCO_2H$ 36, BzOH 23; $HOC_6H_4CO_2H$ 21, PhOH 21, $C_6H_4(CO)_2O$ 17, succinic acid 13, nicotinic acid 10, quinolinic acid 4, $(CO_2H)_2$ 0 (8); no reaction occurred with AmOH, $PhNO_2$, $C_{10}H_8$, $C_{10}H_{12}$, $C_5H_5N$, $C_7H_9N$, $PhNMe_2$, PhNHMe or $PhNH_2$). Quinaldine-EtI, $HC(OEt)_3$ and succinic acid give 4% of *10-N-iodoethyl-1,1'-diethyl-2,2'-carboquinocyanine iodide*, green, m 244.5° (decompn.); 280 cc. dissolve in 1 g. hot alc., giving a blue soln. with a sensitizing max. at 740 $\mu\mu$. $\alpha$-Picoline-MeI, $HC(OEt)_3$ and $(CO_2H)_2$ give 4% of *8-N-iodomethylpicolyl-1,1'-dimethyl-2,2'-carbopyridinocyanine iodide*, green, m. 244°; sensitizing max., 640 $\mu\mu$; the *8-N-iodoethylpicolyl-1,1'-diethyl deriv.*, green, m. 227°. C. J. WEST



**One-sided substitution in piperazine: halogen acid-cleaving substituting agents.** K. H. JACOBI. *Ber.* **B66**, 113–16(1933).—When the soln. is kept at a definite acidity ($p_H$ 2.75), monosubstitution derivs. of piperazine (I) can be obtained with such reagents as AcCl, $Ac_2O$, $ClCO_2R$, BzCl, $MeC_6H_4SO_2Cl$, which by themselves give sym. disubstitution derivs. At a lower $p_H$ only hydrolysis of the substituent occurs, whereas with increasing $p_H$ there is an increasing formation of disubstitution compds., and the resulting mixts. of mono- and di-compds. are very difficultly sepd. The nature of the substituting agents has no influence on the $p_H$ at which monosubstitution occurs, but the differing ease with which they react makes it necessary to vary the conditions in order to obtain good yields. AcCl, which reacts very rapidly, gives good yields only with quick work, whereas *p*-$MeC_6H_4SO_2Cl$ requires a long time. An important feature of these compds. is the ease with which the substituent can be removed with dil. alkali; by first making the mono-Ac or mono-Bz deriv., then substituting the other NH group and re-

moving the Ac or Bz group first introduced, it is possible to prep. monosubstituted derivs. which hitherto could not be obtained. Moore, Boyle and Thorn (*C. A.* **23**, 2183) concluded, on theoretical grounds, that a definite $p_H$ is necessary for the introduction of 1 acyl group into I. With bromophenol blue (range 3.0–4.6, neutral point 4.0) as indicator, they were able to introduce an $RO_2C$ and, less satisfactorily, a Bz group, but J. was unable to duplicate their results at this low H-ion concn. *Benzoylpiperazine-HCl*, m. 274°, was obtained in 51–68% yield from 1 g. I.$6H_2O$ in 10 cc. cold water and 6 drops of aq. 0.01% K *p*-benzenesulfonate-azobenzylaniline (neutral point 2.75) treated with just enough 2 *N* HCl to give a pink color (about 6 cc ), then brought to a yellow color with 1 drop of NaOAc (40 g. cryst. salt in 100 cc. water), dild. with 10 cc. acetone and treated dropwise at 50° with 0.7 g. BzCl; as the soln. becomes pink, it is at once turned yellow again by addn. of the NaOAc soln. The free benzoylpiperazine, m. 75° (64° in the literature), is obtained in 0.2–0.4 g yield by satg. the above reaction mixt. in the cold with $K_2CO_3$ and extg. with ether. *Ac deriv.*, best obtained with *pure* AcCl at 10–20° without the addn. of acetone, m. 52°; *HCl salt* (58–70% yield), m. 181°. Carbethoxy deriv., light yellow, $b_{12}$ 121°; *HCl salt* (30% yield), m. 145°. *p-Toluenesulfonyl deriv.*, obtained in 21–8% yield as the *HCl salt*, sinters 168°, m. 173°. C. A. R.

**Reaction of 2,4-dichloroquinazoline and 2,3-dichloroquinoxaline with sodium azide.** R. Stollé and Fr. Hanusch. *J. prakt. Chem.* **136**, 9–14(1933).—1,2-Tetrazolo-4-chlorophthalazine 1,2-dihydride and $N_2H_4$ in abs. EtOH give 50% of the *4-hydrazino deriv.*, m. 287°; $NaNO_2$ in 25% HCl gives the 4-azido deriv., identical with that obtained from 2,3-dichlorophthalazine 1,2-dihydride and $NaN_3$. 2,4-Dichloroquinazoline and $NaN_3$ in $Me_2CO$ give *tetrazoloazidoquinazoline dihydride* (I or II), m. 145° (decompn.); in EtOH-EtONa it gives the *HO deriv.*, m. 243° (decompn.). 2,3-Dichloroquinoxaline and $NaN_3$ in EtOH give *1,2-tetrazolo-3-azidoquinoxaline 1,2-dihydride*, m. 265°; EtONa gives the *3-HO deriv.*, m. 288° (decompn.). Oxanilideimide chloride and $N_2H_4$ give *oxanilideimide hydrazide*, yellow, m. 156° (decompn.); *$Me_2CO$ condensation product*, $C_{20}H_{24}N_6$, m. 203°; $NaNO_2$ gives 1,1'-diphenyl-5,5'-bistetrazole, m 212°, identical with that obtained from the chloride and $NaN_3$.

**Cinchona alkaloids. XXVIII. Synthesis of the mirror-image isomers of hydroquinine and of hydroquinidine.** Paul Rabe and Albrecht Schultze. *Ber.* **66B**, 120–2(1933); cf. *C. A.* **26**, 4607.—These syntheses were carried out in essentially the same way as the total syntheses of hydroquinine (I) and hydroquinidine (II) (*C. A* **26**, 475). β-(3-Ethyl-4-piperidyl)acrylic acid was catalytically hydrogenated, the resulting mixt. of propionic acid HCl salts esterified and the ester mixt. added to 1 mol. *l*-tartaric acid in hot abs. alc.; the yield was 10–15% of (−)-*homocincholoipon acid l-tartrate*, m around 123–4° (decompn.), $[\alpha]_D^{18}$ −10.4° (MeOH, *c* 2.12), sol. to the extent of about 0.8% in cold EtOH and 0.3% in cold acetone. (−)-*Homocincholoipon Et ester*, $b_{0.2}$ 124°, $d_4^{18}$ 0.9873, $n_D^{18}$ 1.4691, $[\alpha]_D^{18}$ −21.17° (no solvent); *N-Bz deriv.*, $b_{0.2-0.3}$ 197–200°. The ester, condensed with Et quininate and worked up for the toxin, gave (−)-*hydroquininone*, m. 98–9° (cor.), $[\alpha]_D^{20}$ −70.0° (final value, alc., *c* 1.100). This was hydrogenated to (−)-II (purified through the acid *l*-tartrate), m. 171° (cor.), $[\alpha]_D^{18}$ −237.7° (alc., *c* 0.793) and (+)-I, m. 171.5° (cor.), $[\alpha]_D^{18}$ 143.5° (*c* 1.087). *dl*-I, m. 175–6.5° (cor.). C. A. R

**Strychnos alkaloids. LXIX. Further experiments on the cyanogen bromide cleavage of brucine and the first on that of dihydrobrucine.** Hermann Leuchs and Helmut S. Overberg. *Ber.* **66B**, 79–84(1933); cf. *C. A.* **26**, 5099.—Brucine (I) and BrCN in hot benzene give 16% of a quaternary salt $C_{47}H_{56}O_8N_4Br$ (II) and 20% of a neutral product $C_{24}H_{26}O_4N_2Br$ (III) which is presumably a brominated cyanoamide (*C. A.* **26**, 4820). The residue from the acetone mother liquors of III, which comprises the greater part of the I-BrCN reaction products, does not crystallize until it has been boiled with MeOH; it then gives 30% I.HBr (but no "allobrucine"-HBr) and 20% of a neutral *compd.*, $C_{23}H_{29}O_5N_2$ (IV) contg. 3 MeO groups. IV seps. from MeOH in prisms or columns which lose 4–6% in wt. at 60° and 15 mm. and m. around 80°, effervesce about 90° and show $[\alpha]_D^{21}$ −65° to −67.8°/d. (benzene), −88° to −89°/d. (AcOH); from ace-

tone and benzene with ether and water it seps. in prisms m. 98–100°; $AgNO_3$ ppts. a little AgCN. III, however, gives chiefly I.HBr and only very little IV when boiled in MeOH. With $KMnO_4$ in acetone III (5 g.) gives neutral and acid products which for the most part remain resinous; there is obtained only 0.3 g. of a cryst. *acid* $C_{24}H_{36}O_4N_2Br$, needles with 4–5 $H_2O$, $[\alpha]_D^{25}$ 86–7.5°/d. (AcOH), acid to litmus and easily sol. in *N* $KHCO_3$. This acid is probably formed by conversion of the residue —O.$CH_2$.CH:C.$CH_2$Br | (NCN< into —O.$CH_2CO_2H$ | OC.$CH_2$Br | (NC)N<. Attempts to show the presence of an alkyl bromide grouping in III by means of AgOBz in acetone failed; I was quite smoothly regenerated. Boiling pyridine also converted III into I. Unlike I, dihydrobrucine (V) reacts almost in only 1 way with BrCN in benzene, 4 g. yielding 4.4 g. of a cryst. *compd.* $C_{24}H_{28}O_4N_2Br$ (VI), becomes colored at 230°, m. 240–2° (foaming), $[\alpha]_D^{20}$ 58.2°/d. ($CHCl_3$); it appears to be identical with Wieland and Gumlich's product (*C. A.* **26**, 3508), although L. and O. were not able to effect with Zn and AcOH the smooth conversion into V reported by W. and G. With pyridine at 100° it readily forms a quaternary *salt*, $C_{24}H_{28}O_4N_2Br.C_5H_5N$, yellow prisms, becoming discolored at 250°, decompg. around 280°, $[\alpha]_D^{25}$ 39.2°/d. (water), easily sol. in water with neutral reaction. With boiling $PhNMe_2$, however, it gives 40–50% of V-*MeBr*, crystals with 4.8–5.7% $H_2O$, $[\alpha]_D^{20}$ 31.6°/d. (water), and a neutral *compd.* $C_{32}H_{38}O_4N_4$ (VII), sepg. from alc. in prisms which lose 3.5–8.8% in wt. at 95° and 15 mm., m. 168–70°, $[\alpha]_D^{20}$ 41.7°/d. ($CHCl_3$), easily sol. in 2 *N* HCl and repptd. by 2 *N* $KHCO_3$, becoming faintly green or blue in the air. VII is apparently formed by rearrangement of the expected quaternary salt, $PhNMe_2Br.CH_2.R>N(CN)$ ⟶ $BrH.Me_2NC_6H_4.CH_2.R.N.(CN)$, or by replacement of Br by $C_6H_4NMe_2$. PhNHMe yields 50% V.HBr and 20% of a neutral *compd.* $C_{21}H_{26}O_4N_4$ (VIII), prisms losing 3.1% in wt. at 95° and 15 mm., $[\alpha]_D^{20}$ 40.8°/d. ($CHCl_3$), sinters 170°, m. 178–80°; mixed with VII, VIII sinters 160°, m. 168–70°, and, while it appears to be different from VII, identity of the 2 products is not wholly precluded. This work shows, in various ways, that BrCN ruptures the ring of I and V, but the resulting bromoalkylcyanoamides have a great tendency to reform the ring, with loss of BrCN, when the latter is removed, as it is formed, by reagents or by evapn.: $BrCH_2.R:N.CN \rightleftharpoons CH_2.R:N(CN)Br \rightleftharpoons CH_2.R:N + BrCN$. It is hardly probable, however, that there can be any accumulation of the intermediate product and that Wieland's "salt-like" form can be isolated. C. A. R.

**Strophanthins of Strophanthus eminii.** Walter A. Jacobs and Newell M. Bigelow. *J. Biol. Chem.* **99**, 521–9(1933).—From 2900 g. of seeds of *Strophanthus eminii* from Tanganyika, 0.7 g. crude monoside (I), 20 g. mixed genins (II), and 2 g. bioside (III) were obtained. The *aglucone monoside*, $C_{30}H_{46}O_9$, m. 174–80° (decompn.), $[\alpha]_D^{28}$ 22° in 95% alc., is derived from a *Me ether desoxysugar*, $C_7H_{14}O_5$, identical or isomeric with digitalose. Cleavage with 5% HCl in MeOH at 100° gave a *trianhydroaglucone* (IV), m. 154–6°. The *bioside* (III), m. 195–200°, $[\alpha]_D^{25}$ 8° in 95% alc., also yielded a *trianhydroaglucone*, $[\alpha]_D^{25}$ —84.6° in $C_5H_5N$, probably the same as IV, and surely not trianhydroperiplogenin. Fraction II contained about equal amts. of strophanthidin and periplogenin. Hydrogenated in alc. with Pt oxide catalyst, the mixt. gave dihydrostrophanthidol (V), m. 170–3°, $[\alpha]_D^{28}$ 35.0° in 95% alc. (V from other sources has also now been obtained m. 172–5°), and *dihydroperiplogenin*, m. 201–3°; *monobenzoate*, m. 214–6°, $[\alpha]_D^{28}$ 46° in $C_5H_5N$. Ben H. Nicolet

**Structural formulas of the chlorophylls.** James B. Conant and Emma M. Dietz. *Nature* **131**, 131(1933); cf. *C. A.* **26**, 476.—Pheophorbide *a* (I) is sepd. with difficulty from a similar substance which on hydrolysis yields pheopurpurin 7 (II). The purest samples of I do not hydrolyze to give II, but a mono-Me compd. in which the carbomethoxy group is in the side chain attached to the bridge. The lactam formula allows for the existence of 2 similar forms of chlorophyll *a*. Rachel Brown

**Transformation of chlorophyll *b* into chlorophyll *a*.** Arthur Stoll and Erwin Wiedemann. *Naturwissenschaften* **20**, 889(1932); cf. *C. A.* **27**, 727.—Cryst. pheophorbide *b* or pheophytin *b* treated with strong HCl in ether gives cryst. anhydropheophorbide *b* with an absorption spectrum analogous to that of the oxime and rhodin *g*, hence a double bond is present between C atoms 9 and 10. This compd. is reduced by $TiCl_3$ to cryst. pheophorbide *a*, showing a yellow phase and yielding chlorin *e* on decompn. or cryst. protopheoporphyrin on careful treatment with AcOH-HI. Pd + $H_2$ acting on anhydropheophorbide *b* gives hydropheophorbide *a* which yields hydrochlorin *e* on sapon.; from it cryst. protopheoporphyrin *a* can be made. The process chlorophyll *a* to chlorophyll *b* is thereby possible in 5 steps via the pheophorbides. B. J. C. v. D. H.

**Determination of the double bonds in the carotene molecule.** L. Zechmeister, L. v. Cholnoky and V. Vrabély. *Ber.* **66B**, 123–4(1933).—Smith (*C. A.* **26**, 3509)

claims that carotene absorbs only 10 mols. $H_2$ and believes that the value of 11 mols. obtained by the authors (*C. A.* **22**, 2169) was due to the tension of the cyclohexane used as solvent. The hydrogenation has accordingly been repeated in glacial AcOH. Carotene is hardly sol. in AcOH but can be hydrogenated in suspension without any particular difficulty. The Pt sponge is satd. with H under AcOH, the thin carotene-AcOH paste is introduced and rinsed in with AcOH and the hydrogenation effected in the app. with side tube previously described (*C. A.* **22**, 4533). The possible criticism that the H content of the contact substance may be shifted by the presence of the polyene is nullified by the observation that variations in the ratio pigment/catalyst or the use of Pd instead of Pt sponge does not alter the results. Of course, the hydrogenation, being effected in a heterogeneous phase, is slow and it takes 0.5–2 days before the last glittering leaflet disappears. The end point is sharp, however, and exactly 22 atoms H are absorbed, both by paprika ($\beta$) and by beet ($\beta + \alpha$) carotene. While it thus seems to be definitely established that the no. of double bonds in carotene is 11, there are a no. of open questions as to the course of its hydrogenation and the factors which impede it. With menthane or decalin as solvent, it has repeatedly not been possible to push the absorption of H beyond 10 mols. Possibly under certain conditions cyclization processes (more or less reversible) come into play. C. A. R.

**Oxidation of $\beta$-carotene.** P. Karrer, H. v. Euler, H. Hellström and E. Klussmann. *Arkiv Kemi, Mineral. Geol.* **11B**, No. 3, 5 pp.(1932); cf. *C. A.* **26**, 733.—In the adsorption spectrum of carotene oxide the band at 492 $\mu\mu$ of carotene is lost while the others are only displaced. Carotene oxide has the same growth-promoting activity as carotene. Plant exts. are being examd. for carotene oxide content. Rachel Brown

**The relationship of cholestenone to cholesterol. Cholestenone, the ketone of allocholesterol.** Kurt Bonstedt *Z. physiol. Chem.* **214**, 173–6(1933).—Oxidation of allocholesterol in AcOH by $CrO_3$ yields a mixt. of cholestenone and hydroxycholestenone, from which the latter is sepd. by the insoly. of its Na salt in $Et_2O$. Similar treatment of cholesterol gives no trace of cholestenone. Cholestenone is therefore the ketone of allocholesterol and not that of cholesterol. A. W. Dox

**Hexahydro derivatives of the irradiation products of ergosterol.** G. Ahrens, E. Fernholz and W. Stoll. *Ann.* **500**, 109–18(1933).—Catalytic reduction of dihydrolumisteryl acetate and sapon. gives *hexahydrolumisterol*, m. 127°, $[\alpha]_D^{18}$ 9.5° (14.8 mg. in 2 cc. $CHCl_3$); *acetate*, m. 69°, $[\alpha]_D^{18}$ 5° (20.2 mg. in 2 cc. $Me_2CO$); heating with EtOH-EtONa at 200° for 10 hrs. gives *epihexahydrolumisterol*, m. 86–95° (apparently contains $H_2O$ of crystn.), $[\alpha]_D^{18}$ 10.3° (19.4 mg. in 2 cc. $CHCl_3$); *acetate*, m. 64–5°, $[\alpha]_D^{18}$ 20° (17 mg. in 2 cc. $CHCl_3$); the same compd. results by catalytic reduction of epidihydrolumisterol. *Hexahydrovitamin $D_3$* m. 96–7°, $[\alpha]_D^{18}$ —7.4° (21.6 mg. in 2 cc $CHCl_3$); *m-dinitrobenzoate* m. 131°, $[\alpha]_D^{23}$ 5.2° (22.9 mg. in 2 cc. $CHCl_3$), $[\alpha]_D^{18}$ 6.4° (28 mg. in 2 cc. $CHCl_3$); it is not changed by EtONa. Fractionation of the *m*-dinitrobenzoate gives *suprastanol IA*, m. 116°, $[\alpha]_D^{18}$ 12° (10 mg. in 2 cc. $CHCl_3$); (*m-dinitrobenzoate*, m. 187–8°, $[\alpha]_D^{18}$ 30.8° (10.4 mg. in 2 cc. $CHCl_3$); the mother liquor gives *suprastanol IB*, m. 146–7°, $[\alpha]_D^{18}$ 18.4° (10.9 mg. in 2 cc. $CHCl_3$) (*m-nitrobenzoate*, m. 154°, $[\alpha]_D^{18}$ 32.4° (10.5 mg. in 2 cc. $CHCl_3$). Suprasteryl II allophanate, catalytically reduced in $Et_2O$ and AcOH, gives the *tetrahydro deriv.*, decompg. above 234°, $[\alpha]_D^{20}$ —41.8° (13.4 mg. in 2 cc. $CHCl_3$); sapon. gives *tetrahydrosuprasterol* II, m. 99–102°, $[\alpha]_D^{18}$ —50.4° (13.9 mg. in 2 cc. $CHCl_3$); its *m-dinitrobenzoate* m. 110–2°, $[\alpha]_D^{18}$ —23.68° (19 mg. in 2 cc. $CHCl_3$). Further reduction at 65° gives *suprastanol II*, m. 130–1°, $[\alpha]_D$ —18.4°; *dinitrobenzoate*, m. 180–1°, $[\alpha]_D$ —11.1°; it yields 2 allophanates, m. 230–2°, $[\alpha]_D^{18}$ 22° (11.8 mg. in 2 cc. $CHCl_3$), and m. 222–5°, $[\alpha]_D^{21}$ 6.9° (8.7 mg. in 2 cc. $CHCl_3$). C. J. West

**Synthesis of lecithins and cephalins. I. Synthesis of dipalmityl-$\beta$-cephalin and -$\beta$-lecithin.** Iwai Kabashima and Bunsuke Suzuki. *Proc. Imp. Acad.* (Tokyo) **8**, 492–5(1932).—K phthalimide and $C_2H_4Br_2$ give *bromoethylphthalimide*, m. 82°; HBr gives $BrCH_2CH_2NH_2$, analyzed as the *picrate* (I), m. 130–1°, or with 0.5 mol. $H_2O$, m. 99°. The *mono-Ag salt* of dipalmityl-$\beta$-glycerophosphoric acid and I, heated in $C_6H_6$-$Me_2CO$ at 85–90° for 6 hrs., give dipalmityl-$\beta$-cephalin. Similarly, *bromocholine picrate*, m. 223° (decompn.), gives dipalmityl-$\beta$-lecithin, decomps. 190°. Comparison shows the similarity of the synthetic with the natural products. C. J. West

**Synthetic experiments on the constitution of the bile pigment. X. The constitution of bilirubin, syntheses of neo- and isoneoxanthobilirubic acid.** Walter Siedel and Hans Fischer. *Z. physiol. Chem.* **214**, 145–72(1933); cf. *C. A.* **27**, 99.—The neoxanthobilirubic acid recently obtained by resorcinol fusion of synthetic mesobilirubin m. 13° higher than that similarly obtained from the mesobilirubin prepd. from hemin. The 2 acids differed not only in m. p. but also in soly. in MeOH. The Me esters and BzH condensation products likewise showed m.-p. differences. The discrepancy, which was then attributed to a keto-enol tautomerism, is now shown to be due to an isomerism

in which the positions of Me and Et on 1 of the pyrrole rings are reversed. In fact, the analytical prepn. actually consists of a mixt. of 2 isomers which can be sepd. by crystn. of their Me esters from MeOH-EtOH. The isomerism is analogous to that existing between xanthobilirubic and isoxanthobilirubic acids previously described. Mesobilirubin, and hence bilirubin, possess an unsymm. structure. The physiol. formation of bilirubin from hemin occurs by oxidative removal of the α-CH bridge, leaving 2 OH groups on pyrrole rings I and IV. On the basis of known breakdown products of hemin or mesoporphyrin there could be 4 isomeric etioporphyrins and 15 hemins. Each hemin could yield 2, 3 or 4 bilirubins depending on the presence of 2, 1 or no planes of symmetry. In all, 52 isomeric bilirubins, or mesobilirubins, are possible. The 3 mesobilirubins now known are designated XIIIα, IIIα and IXα, the α denoting the ring opening of the porphin system at the α-CH bridge. 2-Formyl-3-ethyl-4-methyl-5-carbethoxypyrrole was sapond. and brominated to *2-formyl-3-ethyl-4-methyl-5-bromopyrrole* (I), m. 115° (*aldazine*, m. 200°, by treatment with $N_2H_4.H_2O$), and *3,3'-diethyl-4,4'-dimethyl-5,5'-dibromopyrromethene*, m. 184° (*Cu salt*, red needles). Condensation of I with opsopyrrolecarboxylic acid in AcOH by HBr gave *3-ethyl-4,3'-dimethyl-4'-propionic acid-5-bromopyrromethene-HBr* (II), no. m. p. to 300° (*free base*, amorphous; *picrate* m. 199°). By heating II to 175° with 10% NaOMe *xanthobilirubic acid*, m. 290°, was obtained. This is a new synthesis by direct introduction of Me into the α-position. Refluxing of II with NaOMe, addn. of $Et_2O$ and 10% $HNO_3$, and extn. with $Et_2O$ gave *neoxanthobilirubic acid Me ether* (III), m. 160°, which was esterified by $CH_2N_2$ to the *Me ester*, m. 70°. Hydrolysis and reduction of III by HI gave *neobilirubic acid* (IV), m. 179°. The *condensation product* of IV with BzH consisted of yellow needles, m. 276°, which gave a m.-p. depression with the analytical prepn. Heating II with NaOMe and $H_2O$ at 150° and treatment with $HNO_3$ yielded *neoxanthobilirubic acid* (V), m. 246°. Resorcinol fusion of sym. mesobilirubin IIIα gave *isoneoxanthobilirubic acid* (VI), m. 242°, which on AcOH-HI reduction yielded *isoneobilirubic acid*, m. 194° (*condensation product* with BzH m. 273°); *Me ester*, m. 204°, was very difficultly sol. in MeOH. *Me neoxanthobilirubate*, m. 174°, prepd. by esterification of V, gave a m.-p. depression with the analytical ester. By crystn. from MeOH-EtOH the anal. mixt. of esters was sepd. into the Me esters of V and VI. Condensation of V with $CH_2O$ by HCl gave *mesobilirubin* XIIIα (VII), m. 310°. The latter was obtained also by refluxing II in AcOH with KOAc, and by heating III with NaOMe at 180°. Condensation of III with $CH_2O$ and HCl gave the *di-Me ether HCl salt of* VII, m. 295° (*free base*, m. 193°, by treatment with pyridine). Both gave the Gmelin reaction. The *di-Me ester di-Me ether of* VII, m. 144°, was obtained by esterification with $CH_2N_2$, and sapond. to VII by boiling in cyclohexane with anhyd. $AlCl_3$.

**Hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,144, Sept. 22, 1930. Liquid hydrocarbons are produced by treating $CH_4$ or gases contg. $CH_4$ at 800–1200° in contact with catalysts consisting of or coated with Cr or graphite. Cf. *C. A.* **27**, 990.

**Hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,655, Sept. 9, 1930.

Solid and liquid hydrocarbons are desulfurized and hydrogenated by heating under pressure with H, or gases contg. or yielding H, in presence of Fe which has been activated with Co and (or) Ni. The Fe is prepd. by impregnating Fe oxide with a soln. of Co or Ni salt or by pptg. a soln. of an Fe salt contg. Ni or Co, the oxides of carbonates being reduced in the subsequent treatment.

**Thermal treatment of hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,344, June 6, 1930. In the conversion by heat treatment of paraffinic or olefinic hydrocarbons that are gaseous at ordinary temp. and pressure into hydrocarbons contg. less H, high-temp. coke formed in the dry distn. of coals is used as catalyst, the coke being heated up from time to time and then used as a heat accumulator supplying the heat required for the conversion. The coke may be partly or wholly freed from mineral constituents by boiling with acids before employment. $CH_4$ may be converted into aromatic hydrocarbons; ethane, propane or butane into olefins, etc.

**Chlorinating hydrocarbons.** JULIUS SÖLL and CURT RUNKEL (to I. G. Farbenind. A.-G.). U. S. 1,889,157, Nov. 29. In forming products such as $CCl_4$, Cl is caused to react with hydrocarbons such as $CH_4$ and the chlorinated hydrocarbon product is sepd. from the gas passing from the reaction chamber and the remaining gas is mixed with fresh reaction gases and the mixt. is reintroduced into the reaction chamber, including HCl formed in the reaction. An arrangement of app. is described. Cf. *C. A.* **27**, 991.

**Oxidation of hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,711, Sept. 19, 1930. The oxidation of solid or liquid hydrocarbons to obtain alcs., aldehydes, ketones and non-aromatic carboxylic acids is preceded by a purification with H at 150–450° under 5–500 atm. to remove S compds., preferably under conditions causing hydrogenation of a substantial proportion of the unsatd. hydrocarbons. Cf. *C. A.* **27**, 991.

**Dehydrogenating hydrocarbons.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,106, Aug. 20, 1930. In the conversion of mixts. of gaseous hydrocarbons into hydrocarbons poorer in H and H at elevated temps. the initial material is treated in stages at successively increased temps. so that the hydrocarbons which do not at first participate in the reaction are converted in the subsequent stage(s), temps. to 1000° being employed in stages in which mainly hydrocarbons with 2 or more C atoms are converted and above 1000° in which mainly $CH_4$ is converted. The thermal treatment is carried out in chambers provided with continuously or periodically heated heat-exchanging filling material, *e. g.*, coke, fire clay, Cr alloys, or with catalysts or with both.

**Desulfurizing hydrocarbons.** THEODOR TRONISECK. Brit. 364,778, Dec. 4, 1930. See Fr. 706,985, (*C. A.* **26**, 478).

**Olefins.** N. V. DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Fr. 737,743, May 27, 1932. Olefins which form tertiary derivs. such as isobutylene are selectively eliminated from mixts. of hydrocarbons which contain them, by bringing the mixt. of hydrocarbons into contact with a substance having a selective absorbent power toward the olefin to be eliminated, *e. g.*, $H_2SO_4$ of 60–70%, sepg. the soln. of olefin, polymerizing the olefin, and sepg. the polymer from the absorbent which is used again.

**Alcohols.** MERCK & CO., INC. Brit. 364,111, Sept. 22, 1930. See Can. 316,552 (*C. A.* **26**, 1705).

**Alcohols.** PAUL P. SHORUIGIN, VACHE I. ISAGULYANTZ, ANNA R. GUSEVA, KLARA S. POLIAKOV and VALENTINA P. OSSIPOVA. Fr. 738,277, June 7, 1932. Organo-Mg compds. are made by heating Mg with org. chloro compds., and the products are converted to alcs., by condensation with compds. such as ethylene oxide, ethylene chlorohydrin, ketones, aldehydes or esters dissolved in neutral solvents such as hydrocarbons, or without solvents. Thus, Mg is heated to 160–170° with PhCl to form $C_6H_5MgCl$ and this is condensed with ethylene oxide to form β-phenylethyl alc.

**Higher alcohols.** OTTO FUCHS and WILHELM QUERFURTH. Brit. 364,134, July 26, 1930. Higher alcs., especially BuOH, are prepd. by passing EtOH vapor with H at atm. pressure over catalysts comprising an alk. earth metal oxide, especially MgO, activated by the presence of small amts. of oxides of Pb, Th, Ag, U, W, Cd, Sn, Cr, Mn, Zn, Fe, Ni, Co and (or) Cu. The reaction is effected below 400°, using ½ to 3 mols. H per mol. of alc.

**Polyhydric alcohols.** HENRY DREYFUS. Fr. 737,612, May 25, 1932. Olefins are oxidized by O in the presence of water. Thus, glycol is prepd. from $C_2H_4$. Catalysts favor the reaction.

**Aromatic esters of amino alcohols.** CHARLES MANNICH. U. S. 1,889,678, Nov. 29. 3-Diethylamino-2-dimethyl-1-propanol *p*-aminobenzoate, which forms a cryst. hydrochloride, m. 195–6°, stable in hot water and having very strong anesthetic properties, is obtained by esterifying 3-diethylamino-2-dimethyl-1-propanol with *p*-nitrobenzoyl chloride, followed by reduction (suitably with Na amalgam in HOAc soln.). Similarly, there may be obtained other esters of alc. bases of the general formula (HO)$CH_2$-

$CRR'CH_2NRR$, where R represents H or an alkyl radical, R' represents an alkyl radical, and aromatic carboxylic acids contg. a benzene nucleus, the new products forming well crystallized hydrochlorides, which are stable in hot water and have very strong anesthetic properties. Numerous details of procedure are given.

**Esters.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 737,663, May 26, 1932. Esters are made in a continuous manner in the liquid phase by circulating a reaction mixt. upward through a distn. heater and downward through an exterior branch or column joined to the heater so as to eliminate the ester and(or) water by boiling, and introducing the reagents with or without other substances into the external current of liquid. A multi-tubular type of heater is described. $EtNO_3$ may be prepd. in this way.

**Acrylic acid esters.** WALTER BAUER (to Röhm & Haas A.-G.). U. S. 1,890,277, Dec. 6. In forming an alkyl ester of acrylic acid such as the ethyl ester, a hydracrylic ester such as the ethyl ester is treated with a dehydrating agent (such as $H_2SO_4$ on silica gel) of catalytic character at a temp. of about 200°. Cf. *C. A.* **26**, 4345.

**Polymerizing vinyl esters and styrene.** WALTER E. LAWSON (to E. I. du Pont de Nemours & Co.). U. S. 1,890,060, Dec. 6. Polymerization of styrene or a vinyl ester such as vinyl chloride, acetate or chloroacetate is effected by dissolving ozone in a solvent such as MeOH, ethylbenzene or ethylene dichloride and then dissolving the material to be polymerized in the ozonized solvent. Cf. *C. A.* **27**, 513.

**Aminodiaryl ethers.** ERNEST F. GRETHER (to Dow Chemical Co.). U. S. 1,890,256, Dec. 6. Products such as 4,4'-diaminodiphenyl ether are formed by reaction of $NH_3$ with a halodiaryl ether such as 4,4'-dibromodiphenyl ether in the presence of a catalyst such as $Cu_2O$ or $Cu_2Cl_2$.

**Cyclic diketones.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,739, Nov. 5, 1930. A 1,5- or 1,4-di(*o*-aminoaryl)naphthalene or substitution product thereof is tetrazotized and the diazo groups subsequently are split off with or without the aid of a catalyst or chemically active light. Among examples 1,5-di(*o*-aminobenzoyl)naphthalene is tetrazotized in HCl soln. and concd. by boiling to give the 3,4,8,9-dibenzo-5,10-pyrenequinone.

**Primary aromatic amines of the benzene series by hydrogenation of their corresponding azo ethers.** RALPH P. PERKINS and PETER S. PETRIE (to Dow Chemical Co.). U. S. 1,890,430, Dec. 6. Hydrogenation reactions such as the production of *p*-phenetidine from *p*-ethoxyazobenzene in the presence of a catalyst such as one contg. Ni and alumina are effected without use of a solvent, at a temp. between the m. p. of the azo ether and about 200° (suitably 120° or higher) under pressure (suitably 450–500 lb. per sq. in.). Various examples with details of procedure are given. Cf. *C. A.* **27**, 306.

**Separating *N*-alkyl and *N*-dialkyl aromatic amines of the benzene series.** EDGAR C. BRITTON and RAY D. HOLMES (to Dow Chemical Co.). U. S. 1,890,246, Dec. 6. Products such as *N*-methyl- and *N*-dimethyl-anilines are sepd. by effecting reaction (suitably at temps. of about 100–200°) between the *N*-alkyl compd. and a dicarboxylic acid such as phthalic acid which has a selective action on it under the prevailing conditions, and then sepg. the unreacted *N*-dialkyl compd. from the reaction mixt. (suitably by distn.).

**Amine derivatives.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,000, July 25, 1930. See Fr. 713,998 (*C. A.* **26**, 1619).

**Acylated aromatic amines; artificial filaments.** HENRY DREYFUS. Brit. 363,986, Aug. 15, 1930. Diacyl derivs. of aromatic diamino bases of the $C_6H_6$ or $C_{10}H_8$ series are obtained in a fine state of subdivision, suitable for incorporation in cellulose ester spinning solns., by acylation of the base in dil. soln., suspension or dispersion at temp. below boiling, preferably 30–80°. The concn. should not exceed 10–15%. Among examples purified benzidine is dissolved in xylene (20–50 parts), acetic anhydride is added with vigorous stirring and the pptd. product is filtered quickly; after washing with xylene and then acetone it is ready for incorporation.

**Acylated aromatic amines; artificial filaments, etc.** HENRY DREYFUS. Brit. 364,040, Aug. 15, 1930. Divided out of 363,986 (cf. preceding abstr.). Diacyl aromatic diamines are obtained pure and in fine state of subdivision suitable for incorporation in cellulose ester spinning solns. by treating a base contg. 2 $C_6H_6$ residues, linked directly as in benzidine or through an atom or group as in diphenyl ether and contg. 2 amino groups, with benzoic anhydride or other aromatic anhydride, the acylation being carried out in dil. soln., suspension or dispersion, preferably below the boiling temp. with or without a wetting agent.

**Aminopropanols.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,535, Oct. 15, 1930. *l*-1-Phenyl-2-amino-1-propanols are prepd. by (1) treating *l*-1-phenyl-2-keto-1-propanol with H and either (a) a precious metal catalyst in presence of $NH_3$ or a primary or secondary amine excepting methylamine, or (b) a catalyst comprising Fe, Co, Ni or Cu in the presence of an $NH_4$ salt or a salt of a primary or secondary amine, or (2) converting *l*-1-phenyl-2-keto-1-propanol into its oxime with $NH_2OH$ and reducing it with a precious

metal catalyst. The product of (2) may be alkylated to yield the corresponding alkylamino compd.

**Aminopropanols.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,540, Oct. 17, 1930. Addn. to 365,535 (preceding abstract). *l*-1-Hydroxyphenyl-2-amino-1-propanols are prepd. from *l*-1-hydroxyphenyl-2-keto-1-propanol by the processes of 365,535.

**Aminopropanols.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,541, Oct. 7, 1930. Addn. to 365,535 (2nd preceding abstr). Racemic 1-phenyl-2-amino-1-propanols are prepd. by treating *l*-1-phenyl-2-keto-1-propanol with H in the presence of $NH_3$ or a primary or secondary amine using Fe, Ni, Co or Cu as a catalyst.

**Arylides of 2,3-hydroxynaphthoic acid.** JOHN M. TINKER and LOUIS SPIEGLER (to E. I. du Pont de Nemours & Co.). U. S. 1,890,201, Dec. 6. For producing a product such as an $\alpha$-naphthalide, 2,3-hydroxynaphthoic acid is reacted with an arylamine such as $\alpha$-naphthylamine which is employed in the form of its hydrochloride. U. S. 1,890,202 relates to purification of such arylides by milling them in the dry state with a water-sol. mildly alk. compd. such as $NaHCO_3$ or NaOAc.

**Phenols.** COAL-OIL EXTRACTION, LTD. Brit. 363,330, June 11, 1929. Void. Acid tar oils or the tar acids extd. therefrom are refined so as to yield white, non-pink, emulsions with water by adding alkali and passing in a gas contg. O. Thus to oil, from which the more volatile portions have been removed for use as fuel, a 0.1% NaOH soln. is added for neutralization and air blown in until oxidation of the pink-color-producing constituents is complete.

**Sulfurized phenols.** CHEMISCHE FABRIK VORM. SANDOZ. Brit. 365,534, Oct. 19, 1929. Metalliferous sulfurized phenols are obtained by treating phenols, their homologs and substitution products other than those contg. N with metals or metallic compds. of the $H_2S$, $(NH_4)_2S$ or $NH_3$ groups (qual. analysis) and S in the presence of carbonates, hydroxides or sulfides of the alkali or alk. earth metal groups. The products are complex compds., sol. in $H_2O$, *possessing mordanting, tanning and reserving properties* and may be used for making lakes. Among examples PhOH is treated with $(NH_4)_2MoO_4$, NaOH and S and $\beta$-naphthol is treated with Sn chloride, NaOH and S.

**Halogenation of anthraquinones.** IMPERIAL CHEMICAL INDUSTRIES, LTD., WM. W. TATUM and ROBERT F. THOMSON. Brit. 364,141, Sept. 2, 1930. $\alpha$-Halogenated anthraquinones are prepd. by halogenating in sun or actinic light anthraquinone, or its halogenated derivs. capable of further $\alpha$-halogenation, in the presence or not of halogen carriers, solvents or diluents. Thus anthraquinone is chlorinated in oleum in presence of I under the action of sunlight and 1,4,5,8-tetrachloroanthraquinone is obtained.

**Purifying an impure phthalide.** ALPHONS O. JAEGER (to Selden Research & Engineering Corp.). U. S. 1,889,961, Dec. 6. An impure phthalide obtained by the reduction of a compd. such as impure phthalic anhydride prepd by the catalytic air-oxidation of naphthalene is subjected to distn. with steam at a temp. below that at which substantial amounts of the phthalide sublime over. Cf. *C. A.* **26**, 2990.

**Dimers of $\gamma$-butylenes.** MARTIN MÜLLER-CUNRADI and FRITZ EGGERT (to I. G. Farbenind. A.-G.). U. S. 1,889,952, Dec. 6. For producing dimers of $\gamma$-butylenes, with only small quantities of trimers or higher polymerization products, a $\gamma$-butylene is treated with $H_2SO_4$ of about 50–60% strength and heated and the polymerization products which sep. during the heating are removed, and the remaining $H_2SO_4$ soln. is cooled and reused for polymerizing a further quantity of $\gamma$-butylene.

**Aniline derivatives.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 738,157, June 4, 1932. 2,2′-Dichloro or 2,2′-dibromo derivs. of 4,4′-dialkoxycarbanilides are prepd. by dichlorination or dibromination of 4,4′-dialkoxycarbanilides, and 2-chloro- or 2-bromo-4-alkoxyanilines are obtained by hydrolysis. Examples are given of the prepn. of *3-chloro-p-phenetidine*, m. 22–3° (acetyl deriv., m. 97°), *3-bromo-p-phenetidine*, $b_{18}$ 160°, and 3-chloro-*p*-anisidine.

**Anthracene derivatives.** I. G. FARBENIND. A.-G. Fr. 738,184, June 4, 1932. A compd. which is probably 1-hydroxyanthracene-2-carboxylic acid (m. 200° with decompn.) is prepd. by heating an alkali metal salt of 1-hydroxyanthracene with $CO_2$ to 210–250° under a pressure of 50–120 atm.

**Naphthalene derivatives.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,544, Sept. 26, 1930. Derivs. of naphthalene-1,4,5,8-tetracarboxylic acid are obtained by condensing equimol. proportions of a salt of said acid or its monoanhydride with an aromatic monoamine or salt thereof, whereby the dicarboxylic acid arylmonoimides or their anhydrides are obtained, or with an aromatic *o*-diamine, or salt thereof, whereby naphthoylene arylimidazole-*peri*-dicarboxylic acids or their anhydrides are obtained, in presence of a suitable solvent or diluent. Among examples the alkali metal salt of the tetracarboxylic acid or its anhydride is prepd. in aq. soln. and condensed with *o*-diaminobenzene, 4-bromo-1,2-diaminobenzene, *p*-chloroaniline, etc. Cf. *C. A.* **27**, 1002.

**Pyridine derivatives.** I. G. FARBENIND. A.-G. Fr. 40,632, July 30, 1931. Addn.

to 705,113 (*C. A.* **25**, 5177). β-Hydroxypyridine or β-hydroxyalkylpyridines are first treated with $HNO_3$ to form the nitrates which are then treated with $H_2SO_4$ to eliminate water. Examples are given of the prepn. of nitro-5-hydroxy-2-methyl- (m. 107–108°), nitro-3-hydroxy-4-methyl- (m. 90–92°) and nitro-3-hydroxy-2-methyl-5-ethylpyridine (m. 163–165°).

**Thiocyano derivatives.** Röhm & Haas Co. Brit. 364,060, Oct. 3, 1929. See Fr. 702,829 (*C. A.* **25**, 4284).

**Alkyl substituted aromatic hydroxyl compounds.** Carl Reichhold, Ottokar A. Boecking, Carl Demgenski and Zahn (executors of Eduard Flügger) (trading as Reichhold, Flügger & Boecking). Brit. 363,341, June 13, 1930. See Fr. 697,711 (*C. A.* **25**, 3013).

**Polyvinyl compounds.** I. G. Farbenindustrie A.-G. Brit. 364,323, Dec. 27, 1929. Hydroxyalkyl-polyvinyl compds. are made by causing an alkylene oxide to act upon a polyvinyl alc. The reaction may be accelerated by a basic catalyst, *e. g.*, an alkali or alk. earth or a tertiary org. base. The products are suitable for prepg. thickening, dressing and sizing agents and for producing plastic masses. Among examples a polyvinyl alc. prepd. by sapong. polymerized vinyl acetate of high viscosity is treated with ethylene oxide.

**Pentaerythritol nitrates.** Josef Meissner. Brit. 364,624, Sept. 28, 1929. See Ger. 539,175 (*C. A.* **26**, 1621).

**Formates of alkaline earth metals.** Rudolf Koepp & Co., Egon Elöd and Max Enderli. Brit. 363,788, Nov. 14, 1930. See Fr. 720,714 (*C. A.* **26**, 4066).

**Acetates and hydrogen from acetylene.** Dow Chemical Co. Brit. 363,948, May 18, 1930. See U. S. 1,866,329 (*C. A.* **26**, 4345).

**Salts of carbamic acid esters.** Theodore H. Rider. Fr. 738,260, June 7, 1932. Salts of γ-dialkylaminopropanediol esters of aromatic carbamic acids are prepd. by adding to an aromatic isocyanate in ether an equiv. mol. amt. of dialkylaminopropanediol, the mixt. being heated and an acid added. The corresponding carbamyl chlorides may be used. The ester produced may be brought into contact with chlorides or isocyanates to form mixed esters. Examples are given of the prepn. of the HCl salt of the monophenylurethan of (1) γ-dibutylaminopropanediol, m. 128–9° (this may be used as a *local anesthetic*), (2) dimethylaminopropanediol, m. 138–40°, (3) diethylaminopropanediol, m. 135°, (4) dipropylaminopropanediol, m. 163–4°, (5) diisobutylaminopropanediol, m. 125–7°, (6) diamylaminopropanediol, m. 101–3°, and (7) piperidylpropanediol, m. 176–7°, and the HCl salt of the diphenylurethan of (1) γ-piperidylpropanediol, m. 197–8°, (2) diethylaminopropanediol, m. 109°, (3) dipropylaminopropanediol, m. 183–8°, (4) diisobutylaminopropanediol, m. 116–18°. Also the neutral tartrate, m. 180–2°, borate, m. 195–6°, and picrate, m. 112–20°, of the diphenylurethan of γ-piperidylpropanediol.

**Salts of chloroethanesulfonic acid.** Otto Ernst and Otto Nicodemus (to I. G. Farbenind. A.-G.). U. S. 1,888,794, Nov. 22. A soln. of ethylene dichloride is caused to react, while refluxing the vapors evolved from the reaction mixt., with a soln. of a sulfurous acid salt of Na, K, Ca or Mg such as $Na_2SO_3$ at a temp. below 90°, the ethylene dichloride being used in excess, and the resulting chloroethanesulfonate is sepd. (suitably by recrystn. from alc.). Cf. *C. A.* **27**, 1006.

**Quaternary ammonium salts.** Imperial Chemical Industries, Ltd. Fr. 738,028, June 1, 1932. New salts which may be used for *cleaning textile fibers* are made by combining a higher alkyl halide (from an aliphatic alc. contg. not less than 6 C atoms) and a tertiary amine, the N of which forms part of a heterocyclic ring. Examples are given of the prepn. of dodecyl-, cetyl- and stearyl-pyridinium bromide and stearyl-α-picolinium bromide.

**Fatty acids.** I. G. Farbenindustrie A.-G. Brit. 364,574, Oct. 6, 1930. See Ger. 566,450 (*C. A.* **27**, 1007).

**Brominated aliphatic acids.** Siegwart Hermann and Pharmaceutische Werke "Norgine" A.-G. Brit. 364,394, May 10, 1930. Unsatd. aliphatic acids of high mol. wt. and of natural origin are transformed to Br-substituted satd. acids by addn. of Br without substitution of H, and part of the Br is then split off as HBr, *e. g.*, as a bromide, and the Br-substituted unsatd. aliphatic acids thus obtained are converted into their alkali or $NH_4$ or alk. earth salts. Instead of the free acids their triglycerides may be brominated whereupon sapon. and the partial removal of Br may be effected simultaneously, *e. g.*, with alc. KOH.

**Glutamic acid.** Fong Yih Sen. U. S. 1,890,590, Dec. 13. Gluten is hydrolyzed with concd. HCl in the presence of $HNO_3$ or $MnO_2$, and the glutamic acid hydrochloride formed is converted into glutamic acid and the latter is recovered.

**Carboxylic acids.** I. G. Farbenindustrie A.-G. Brit. 365,613, Sept. 15, 1930. The oxidation product of difficultly volatile hydrocarbons or an acid fraction thereof is

heated above 100° while avoiding distn. to destroy the hydroxy carboxylic acids by splitting off $H_2O$.

**Monocarboxylic acids such as benzoic acid from dicarboxylic acids and their anhydrides such as phthalic anhydride.** JOHANNES BRODE and ADOLF JOHANNSEN (to I. G. Farbenind. A.-G.). U. S. 1,889,945, Dec. 6. In effecting reactions with initial materials such as phthalic acid or anhydride contaminated with S compds. for the production of products such as benzoic acid in the presence of a catalyst such as ZnO on a carrier, the initial material is preliminarily treated in the vapor state with a material such as pumice grit for absorbing S compds. such as $H_2SO_4$.

**Naphthalene-1,4,5,8-tetracarboxylic acid.** I. G. FARBENINDUSTRIE A.-G. Brit. 363,044, Oct. 17, 1930. The products obtained from acenaphthenes and 1,3-dicarboxylic acid nitriles by the method of Brit. 359,201 (*C. A.* **27**, 427) are subjected to treatment with oxidizing agents, *e. g.*, $HNO_3$, $KMnO_4$, $K_2Cr_2O_7$, to give naphthalene-1,4,5,8-tetracarboxylic acid. Cf. *C. A.* **27**, 1008.

**Anthraquinonesulfonic acids.** ERWIN SCHWENK (to General Aniline Works). U. S. 1,890,866, Dec. 13. In forming a product such as anthraquinone-β-monosulfonic acid, a sulfonic acid of phthalic acid anhydride is condensed with an aromatic hydrocarbon such as $C_6H_6$ and the sulfonic acids of aroylarylcarboxylic acids obtained as condensation products are subjected to a ring-forming treatment.

**Methylated dihydroxydiaminoanthraquinonesulfonic acids.** ERNST GUTZWILLER (to Chemische Fabrik vorm. Sandoz). U. S. 1,889,831, Dec. 6. Dihydroxydiaminoanthraquinonesulfonic acids are heated, in the form of their alkali metal salts, to 50–100° for 10–20 hrs. in the presence of small quantities of an inorg. acid such as $H_2SO_4$ with formaldehyde or agents such as a formaldehyde polymer yielding formaldehyde.

**Aliphatic anhydrides.** HENRY DREYFUS. Fr. 737,610, May 25, 1932. $Ac_2O$ or other anhydrides are made by passing the vapor of AcOH or other aliphatic acid through a molten bath of Pb, Te or other metal or alloy, contg. catalysts favoring the decompn. of the acids. The acids may be preheated by passing them through molten baths not contg. a catalyst. Fr. 737,611. Steam is sepd. from vapors of aliphatic anhydrides by chem. reaction with a substance which is oxidized by the O of the water. Thus $CH_4$, CO or C is caused to react with the steam in the presence of a catalyst.

**Ethyl acetate.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,701, Oct. 15, 1930. EtOAc is produced by reacting upon ethylsulfuric acid with 70–90% of the AcOH equiv. to the contained $C_2H_4$ in presence of 50–80% of $H_2O$ (calcd. on the ethylsulfuric acid) while distg. off a ternary mixt. of ester, alc. and $H_2O$, a fractionating column being preferably used. After sepg. the ester the alc. and $H_2O$ may be added to the next batch.

**Acetaldehyde and acetic acid.** I. G. FARBENINDUSTRIE A.-G. Brit. 364,255, Nov 14, 1930. See Ger. 554,784 (*C. A.* **26**, 5971).

**Urea.** GEORGE BARSKY (to American Cyanamid Co.). U. S. 1,889,944, Dec. 6. An aq. soln. such as $Na_2CO_3$ or $Na_2SO_4$ is treated with Ca cyanamide and the mixt. is heated and a ratio of cyanamide ions to alkali metal ions is maintained in the soln. such that all cyanamide is in ionized form.

**Thiourea.** RALPH V. HEUSER (to American Cyanamid Co.). U. S. 1,889,959, Dec. 6. Reaction is effected between $P_2S_5$ and $NH_3$, a cyanamide is added, and the thiourea formed is recovered, as by crystn

**Apparatus for drying hexachloroethane and similar substances.** ROLLAND D MYERS. U. S. 1,890,654, Dec. 13. Various structural and operative details are described.

**1,4-Dioxane.** CARBIDE & CARBON CHEMICAL CORP. Brit. 363,895, Feb. 20, 1930. See Fr. 711,595 (*C. A.* **26**, 1947).

**6-Bromo-2-hydroxynaphthalene and its substitution products.** JOHANNES WOLLFMANN (to General Aniline Works). U. S. 1,890,711, Dec. 13. See Ger. 549,840 (*C. A.* **26**, 4828).

**Benzanthrone.** E. I. DU PONT DE NEMOURS & Co. Brit. 364,042, June 24, 1930 Anthraquinone is reduced with Fe, Cu or Al and the product substantially simultaneously condensed with glycerol in a $H_2SO_4$ medium at 110–120°. In an example anthraquinone is reduced with Fe dust in $H_2SO_4$, glycerol being added simultaneously and condensation taking place, the momentarily formed intermediate products being hydroxyanthrone and anthraquinol.

**Separating biphenyl, *o*-chlorobiphenyl and *p*-chlorobiphenyl from each other.** EDGAR C. BRITTON and WESLEY C. STOESSER (to Dow Chemical Co.). U. S. 1,890,427, Dec. 6. The mixt. is distd. into a fraction consisting of biphenyl and *o*-chlorobiphenyl in non-eutectic proportions and another fraction consisting of *o*- and *p*-chlorobiphenyl in non-eutectic proportions, and each fraction is then sepd. into its components by cooling.

**Purifying crude anthracene, etc.** ALPHONS O. JAEGER (to The Selden Co.). Brit. 364,628, Oct. 5, 1929. Crude anthracene, acenaphthene, phenanthrene and carbazole

are fractionally sublimed with the vapors, preferably superheated or satd., of liquid chlorinated hydrocarbons, both aromatic and aliphatic such as monochlorobenzene, *o*-dichlorobenzene, chlorinated paraffin hydrocarbons and the chlorinated residue from the Cl purification of crude $C_6H_6$ fractions, all of which exercise a selective solvent action on at least one of the impurities in the crude compd. to be purified. In 364,629 crude anthracene, acenaphthene, phenanthrene and fluorene are purified by fractional sublimation with vapors of a liquid compd. contg. the furan or hydrogenated furan nucleus, *e. g.*, furfural, methylfurfural, etc., and other furan substances exercising a selective solvent action, with or without the addn. of a vapor of a chlorinated hydrocarbon mentioned above. Cf. *C. A.* **27**, 313.

**Purifying crude anthracene, etc.** THE SELDEN CO. Brit. 364,723, Nov. 1, 1929. Crude anthracene, acenaphthene, phenanthrene or carbazole is purified by fractional sublimation with vapors, superheated if desired, of at least one liquid solvent falling within the group including aromatic hydrocarbons, alicylic hydrocarbons, nitro hydrocarbons, phenols, aromatic amines, and their OH derivs., *e. g.*, $C_6H_6$, $C_6H_5NO_2$, cyclohexane, PhOH, $PhNH_2$, etc. Vapors of chlorinated hydrocarbons, *e. g.*, *o*-dichlorobenzene, and furan compds. may also be used in admixt.

**Anthraquinone and its derivatives.** ARTHUR LÜTTRINGHAUS, HEINRICH NERESHEIMER, WILLY EICHHOLZ, GEORG BOEHNER and WILHELM SCHNEIDER (to General Aniline Works). U. S. 1,890,040, Dec. 6. The compds. which can be obtained by condensing a quinone of the formula 2,3-(X)(X)-*p*-$C_6H_2(:O)_2$ (in which the two X positions may be part of an attached benzene nucleus which may be substituted) with from 1 to 2 mol. proportions of a 1,3-butadiene hydrocarbon, can be converted into anthraquinone, or its derivs. by treating the condensation products under non-acid conditions with an agent capable of splitting off H by oxidation, as by treating the condensation products in a molten state or in neutral or alk. dilg. or suspending media, such as water, alcs., hydrocarbons, heterocyclic compds. and substitution products thereof of neutral or alk. reaction, for instance nitrobenzene, trichlorobenzene, naphthalene and substitution products thereof, pyridine, etc. Dilg. or suspending media suitable for the purpose are aq. solns. of caustic alkalies. By the use of catalysts transferring O, such as compds. of Cu, Co, Ni, Fe, etc., for instance their oxides, vanadates, chromates, etc., the process can be often accelerated. Agents splitting off H by oxidation comprise, for example, air, O, $H_2O_2$, $KMnO_4$, perborate, etc. Since the said condensation products when treated in indifferent solvents with $O_3$, form ozonides which split up under destruction of the anthracene ring system, $O_3$ does not fall under the term "agents splitting off H by oxidation." For example, a mixt. of 2,6- and 2,7-dimethylanthraquinone is obtained by boiling the condensation product of 1 mol. proportion of benzoquinone with 2 mol. proportions of isoprene with an alc. or aq. soln. of caustic alkali, while introducing O or air. Condensation products from 1 mol. proportion of benzoquinone and one mol. proportion each of two different 1,3-butadienes can also be employed as the starting materials. In the same manner anthraquinone or a deriv. is obtained from a condensation product from 1 mol. proportion of an α-naphthoquinone and 1 mol. proportion of a 1,3-butadiene. Thus, for example, the condensation product from α-naphthoquinone and 1,3-butadiene, when heated with dil. NaOH soln. in a current of air or O furnishes anthraquinone. Thirty-seven different examples with various details of procedure are given.

**Chlorinating *m*-styrene.** HARRY B. DYKSTRA (to E. I. du Pont de Nemours & Co.). U. S. 1,890,772, Dec. 13. A soln. of *m*-styrene (suitably in $CCl_4$ as a solvent) is treated with Cl under conditions which favor nuclear substitution (suitably in the presence of iron filings, in the dark at low temp.) to obtain a product suitable for use in *spray coating compns.*

**Chlorinated *m*-styrene.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 364,873, Jan. 28, 1930. Polymerized vinylbenzene, known as metastyrene, is treated with Cl in the dark at about 0–25° in presence of a halogen carrier, *e. g.*, Fe, $AlCl_3$, and a chlorinated org. solvent, *e. g.*, $CCl_4$; $H_2O$ may be present. The products contain Cl in the nucleus and are resinous materials useful for plastic and coating compns.

**Polymerized styrenes.** I. G. FARBENINDUSTRIE A.-G. Brit. 365,217, Oct. 27, 1930. Polymerization products from styrene or its homologs are made by polymerizing an aq. emulsion thereof, if desired by means of a peroxide, treating the resulting emulsion with steam or an inert gas, *e. g.*, $CO_2$ or N, while warming if desired, at any pressure below atm. and finally coagulating the product, *e. g.*, with HCl or AcOH or by cooling or anodic electrodeposition. They *may be worked up into artificial masses, lacquers, films, artificial threads* or *pressed shaped articles.*

**Polymerization processes and apparatus.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 365,102, July 5, 1929. Void. Org. substances are polymerized, with or without heat and catalysts, at pressures of 2000 atm. or more. The org. compds. may be used alone or as mixts., solns. or emulsions. Examples describe the treatment of isoprene,

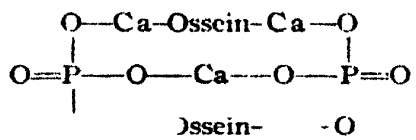
2,3-dimethylbutadiene, styrene and indene, vinyl acetate and bromide, isoprene and petroleum ether, styrene and malonic ester, etc.

# 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

## A—GENERAL

ARTHUR W. DOX



**The changes of diastase in blood and urine after the administration of different types of surgical anesthesia.** TRINO CASTRO. *Arch. ist. biochim. ital.* **4**, 361–74 (1932).—There is an increase of blood and urinary diastase after ether or spinal anesthesia. The increase varies with the duration and quantity of anesthetic. Anesthesia with gas ($C_2H_4$, $N_2O$) produces no change. The increase is due to a toxic action of the anesthetic on the normal metabolism of the pancreas. E. S. G. BARRON

**The presence of phosphatase in microörganisms. I. Hyphomycetes.** C. ARNAUDI AND M. FRANCIOLI. *Boll. soc. intern. microbiol., Sez. ital.* **4**, 264–8(1932)(in French).—Phosphatase is of frequent occurrence in microörganisms and fungi. G. A. BRAVO

**The presence in the liver of an enzyme hydrolyzing glycocholic acid.** F. P. MAZZA AND G. STOLFI. *Chim. ind. agr. biol.* **8**, 408(1932)(abstr.).—The liver of dog, ox and rabbit contains an enzyme, glycocholase (I), which hydrolyzes glycocholic acid to glycine and cholic acid, and a dipeptidase which splits *dl*-leucylglycine. I has optimum activity at $p_H$ 6–7; it was not detected in the spleen, in the duodenal mucosa or in the pancreas I is purified by adsorption on $Al(OH)_3$ from the glycerol exts. of the organs. G. A. B.

**The existence of a lipase in adipose tissues.** G. QUAGLIARELLO AND G. SCOZ. *Chim. ind. agr. biol.* **8**, 408(1932)(abstr.).—In several adipose tissues of the dog, a lipase was detected which hydrolyzes triglycerides, with optimum activity at $p_H$ 8–9; the reaction is activated by Ca salts and ovalbumin, and inhibited by fluorides and quinine salts; its behavior is identical with that of pancreas lipase. G. A. BRAVO

**The nature of the calcium phosphate of bones.** C. ANTONIANI AND F. USUELLI. *Chim. ind. agr. biol.* **8**, 409(1932)(abstr.).—In bones, $H_3PO_4$, Ca and ossein are probably bound thus:

The union with ossein is through its $NH_2$ groups. G. A. BRAVO

**The action of irradiated ergosterol on the mobility of calcium in vitro, in relation to the $p_H$ value.** M. COPP. *Chim. ind. agr. biol.* **8**, 410(1932)(abstr.).—When bones are put in isotonic NaCl soln., in the presence of irradiated ergosterol soln. (1%), the Ca ion does not pass into the soln.; but if the $p_H$ value decreases from 7.2 to 6.4, the inhibiting action ceases. This increase of acidity is probably due to the decompn. products of the org. matter of the bones. G. A. BRAVO

**Separation of the two malt amylases by sorption.** OSKAR HOLMBERGH. *Arkiv Kemi, Mineral. Geol.* **11B**, No. 4, 6 pp.(1932).— The adsorption of malt amylase from alc. soln on starch was max. at 50% alc. concn. A 50% alc. washing of the adsorbate contained β-amylase while a subsequent $H_2O$ washing contained α-amylase. About 50% of the latter was adsorbed. Alc., in 30–45% concn., pptd. relatively large amts. of α-amylase from malt ext. In this connection the inhibiting effect of alc. in starch splitting by malt ext. must be studied. The adsorption increased with H-ion concn. β-Amylase was completely adsorbed at $p_H$ 3.3. RACHEL BROWN

**Iodoacetic acid, glutathione and tissue glyoxalase.** FRANK DICKENS. *Nature* **131**, 130–1(1933).—The action of $ICH_2CO_2H$ (I) in arresting glyoxalase activity is completely reversed by the addn. of reduced glutathione (II). In a dialyzed ext. of glyoxalase activated by II, an equimol. amt. of I inhibits the lactic acid formation Actually I and II react to give one mol. of HI for each mol. of reactant decompd. RACHEL BROWN

**The spontaneous decomposition of egg lecithin.** A. FIORI. *Rass. clin. terap. sci aff ni* **31**, 74–7(1932); cf. *C. A.* **26**, 159.—Egg lecithin in 5% aq. soln. was kept for 1 year (30 hrs. at 70°) in sealed 5 cc. tubes well-filled with liquid. The soln. on evapn. under reduced pressure (35–40°) gave a residue which was successively extd. with alc. and water. The aq. ext. was strongly acid and contained phosphates, choline and glycerol.

After removal of the solvent from the alc. ext., the residue was extd. with $Et_2O$, a small quantity of insol. lysocithin being left. The solvent was removed from the $Et_2O$ soln. and the residue dissolved in alc. to give an acid soln. Free fatty acids were removed by neutralizing with $Ba(OH)_2$ and centrifuging off the insol. Ba soaps. Examn. of the latter indicated the presence of stearate, palmitate and oleate. The acid-free alc. soln. on evapn. gave a reddish orange oil. Analysis (sapon. no., % fatty acids, acid no. of fatty acids) indicated a diglyceride of arachidonic acid. The I no. was only 0.5 the theoretical value, but the expected octabromide was obtained by Wesson's method. This anomaly might be explained by assuming a chem. bond between the 2 arachidonic acid residues in the glyceride which is ruptured during the bromination but not during the less vigorous iodination. Such a view is in agreement with the stability of the glycerol-fatty acid bond in the lecithin contg. 2 mols. of arachidonic acid; this lecithin does not yield a lysocithin on hydrolysis. LEWIS W. BUTZ

**Yeast asparaginase.** WOLFGANG GRASSMANN AND OTTO MAYR. *Z. physiol. Chem.* **214**, 185–210(1933).—Conflicting statements in the literature regarding the occurrence and properties of asparaginase are due to a failure to recognize the extreme instability of this enzyme toward acids. Active prepns. may be obtained by autolyzing the yeast in the presence of a cell poison, preferably PhMe, while maintaining a $p_H$ of 7.5–8.5 by addn. of $NH_4OH$, macerating the centrifuged residue 48 hrs. with dil. $NH_4OH$ at $p_H$ 8.5–8.0 and centrifuging the soln. The enzyme is so extremely sensitive to acid that at $p_H$ 5.0 and 0° 66% of its activity is destroyed in 0.5 hr. This sensitivity to acid, as also to $Me_2CO$ and other precipitants, distinguishes asparaginase from peptidases. Sepn. from dipeptidase is effected by the alk. autolysis, and from polypeptidase by adsorption on kaolin. The simplest procedure for excluding other enzymes is the addn. of certain inhibitory substances, *e. g.*, HCN, $H_2S$ and $Na_4P_2O_7$, to which dipeptidase and aminopolypeptidase are sensitive while asparaginase is unaffected. Asparaginase is highly specific. It hydrolyzes only *l*-β-asparagine and the diamide of aspartic acid. Other asparagine derivs. or amides, including the following, are not attacked: *dl*-asparagyldi-*l*-alanine, *dl*-asparagylmonoglycine, *dl*-α-asparagine, *dl*-leucinamide, glycinamide, β-aminobutyric amide, the 4 *dl*-hydroxyasparagines, the diamides of the 2 *dl*-hydroxyaspartic acids, choloroacetyl-*l*-asparagine, bromopropionyl-*l*-asparagine, glycyl-asparagine, alanyl-*l*-asparagine, *l*-glutamine, succinamide, acetamide, propionamide. The essential grouping of the substrate appears to be $—COCH(NH_2)CH_2CONH_2$. Even under optimum conditions for stability, *viz.* $p_H$ 7–8 and icebox temp., the enzyme loses 30% of its activity in 24 hrs. A. W. DOX

**Vegetable growth substances. IV. A phytohormone of cell extension. Purification of auxin from human urine.** FRITZ KÖGL, A. J. H. SMIT AND HANNI ERXLEBEN. *Z. physiol. Chem.* **214**, 241–61(1933); cf. *C. A.* **26**, 2755.—A hormone which activates cell extension, as distinguished from cell division, in plants has already been demonstrated in the tips of maize and oat coleoptiles, cultures of *Rhizopus*, *Es. coli*, various yeasts and in distillery slops. Unequal distribution of the hormone, through external influences, accounts for the well-known phenomena of phototropism and geotropism. Demonstration of the hormone and detn. of its activity are accomplished by the Went method of measuring the growth deflection of an oat seedling placed in contact with an agar block contg. the active substance in soln. One "avena unit" is the amt. required to produce a curvature of 10° under standard conditions. The active substance, for which the name *auxin* is proposed, is an $Et_2O$-sol. *acid*, m. 196°, which forms an active *lactone* m. 172-3°. Human urine affords a much more prolific source of the active substance than any plant material thus far examd. A long series of extns. yields both auxin and its lactone in pure cryst. form. The av. activity is $5 \times 10^{10}$ "avena units" per g., *i. e.*, 0.00002 γ causes a 10° curvature in an oat seedling. About 1 g. is present in 500 l. of human urine, or in 25,000 l. of *Es. coli* culture. Chem. properties other than the above are not stated. A. W. DOX

**Demonstration of *l*-norleucine as a component of proteins of spinal cord and peripheral nerves.** EMIL ABDERHALDEN AND KURT HEYNS. *Z. physiol. Chem.* **214**, 262–6 (1933).—*l*-Norleucine was again isolated from beef spinal-cord protein and identified by prepn. of its $PhSO_2$ and CHO derivs. It was isolated also from peripheral nerve protein (plexus ischiadicus and brachialis) and identified by the m. p. of its betaine chloroaurate. Phenylalanine and glycine were also found in both proteins. A. W. DOX

**Cold light.** A. X. BOURNAZOU. *Praktika (Akad. Athenon)* **6**, 108–18(1931).—A discussion of the sources and biochemistry of bioluminescence, particularly in marine organisms. LUCIEN Y. DYRENFORTH

**Reactivation of koji invertase.** N. TAKETOMI AND T. HORIKOSHI. *J. Soc. Chem. Ind., Japan* **35**, Suppl. binding 583(1932).—Invertase injured by very dil. acid or alkali recovers on standing in a cool place. Injuries by $HgCl_2$ are overcome with $H_2S$; but heat injuries seem irreparable. GREGG M. EVANS

**Comparison of the enzymic liquefaction and saccharification of starch. II. Pancreatic amylase.** G. Orestano. *Bull. soc. chim. biol.* **14**, 1531–51(1932); cf. *C. A.* **25**, 5903; **26**, 5108. Liquefaction of starch follows the law of monomol. reactions until at least 75% of the substrate is digested. The saccharification curve varies with the proportion of enzyme, but with high concns. of enzyme the reaction is monomol. at the beginning. The speed of liquefaction is directly proportional to the concn. of substrate and varies with the concn. of enzyme, but not in direct proportion to the latter. The speed of saccharification is directly proportional to the concn. of enzyme but inversely proportional to the concn. of substrate. Outside of a limited range of concns. the results are irregular and the above statements do not hold true. Many tables of exptl. data are given. L. E. Gilson

**The nature of koji diastase.** Mitsuji Ito. *J. Faculty Agr., Hokkaido Imp. Univ.* **30**, Pt. 5, 243–386(1932).—The koji used was a culture of *Aspergillus oryzae* on steamed polished rice. The diastase was prepd. by Lintner's method and its action on starch studied over a wide range of conditions. The enzyme is not a protein in the ordinary sense but seems to consist of an active group, a polypeptide, a complex carbohydrate and 5–12% of ash loosely united. Removal of the Mg and the $PO_4$ inactivates it. It is not inactivated by heating to 100°, or even 130° for a short time. It is not colloidal, but diffuses completely through a membrane made from shark air bladder. Attempts were made to duplicate the enzyme artificially. A no. of varied mixts. of monosaccharides, glycogen, dextrin, peptone, amino acids, $MgHPO_4$ and other salts were prepd. and found to have more or less hydrolyzing action on starch under sterile conditions at $p_H$ 4.8–5.0. Many references and 77 pages of tabulated exptl. data are given. L. E. Gilson

**Enzymes, hormones and vitamins.** Angelo Pugliese. *Scientia* **53**, 100–10 (1933).—Discussion. L. E. Gilson

**Biochemistry and the world today.** Ross A. Gortner. *Sigma Xi Quart.* **20**, No. 3, 124–39(1932). E. H.

**Autoxidation.** Carl Neuberg and Maria Kobel. *Naturwissenschaften* **20**, 953–4(1932).—Products of biochem. destruction of *foodstuffs* often show increased autoxidation tendency, *e. g.*, AcCHO from carbohydrates (*C. A.* **26**, 5588). A soln. of 0.133% glyoxal in 0.417 *M* phosphate + 2 mol. sulfite yields 70–80% glyoxylic acid when oxidized by atm. O at $p_H$ 7.3–6.5 for 18–20 hrs. The reaction is faster than for AcCHO; it is retarded in acid soln. Pure aq. solns. of glyoxal-$NaHSO_3$ (initial $p_H$ 6.8) are not attacked in 8 days by O; the glyoxylic acid in phosphate soln. is not further oxidized by 8-day O treatment. Hence dismutation does not play a role and under anaerobic conditions no oxidation of glyoxal takes place, although some of the substance gradually disappears. The sulfite is essential to the reactions in phosphate soln. B. J. C. van der Hoeven

**The synthesis of proteins and their enzymes.** Max Bergmann. *Naturwissenschaften* **20**, 941–3(1932); cf. *C. A.* **27**, 738.—A few points of polypeptide synthesis and enzyme characteristic are reviewed, including the recent work on the "carbobenzoxy" synthesis of peptides (*C. A.* **26**, 5072). The inactivity of dipeptidase toward glycylproline and alanylproline, *l*-asparagyl-*l*-tyrosine and *d*-lysyl-*d*-glutamic acid shows the complexity of the enzyme requirements. The nonequivalence of carboxyl liberation (Willstätter titration) and increase in free amino groups (van Slyke) (the latter is zero) during the enzymic decompn. of the 2 proline dipeptides, furthermore, indicates a special type of peptidic bond. Similar nonequiv. carboxyl and amine liberation is found in the ereptic hydrolysis of gelatin. A recently prepd. glycyldehydrophenylalanine was stable toward normal dipeptidase but was decompd. by a kidney enzyme into glycine, phenylpyruvic acid and $NH_3$. B. J. C. van der Hoeven

**The new oxidation enzyme.** Otto Warburg and Walter Christian. *Naturwissenschaften* **20**, 980–1(1932); cf. *C. A.* **26**, 5976; **27**, 318.—Pptn. of Lebedev juice from bottom yeast with Pb subacetate, filtration and removal of Pb by phosphate gives a soln. of the new oxidation enzyme plus some Keilins cytochrome *c*. The latter substance can be removed by adding 0.5 vol. $Me_2CO$ and allowing it to stand at 0° for 24 hrs. Further purification of the dissolved enzyme is obtained by complete pptn. with $Me_2CO$, soln. in $H_2O$ and addn. of 0.5 vol. $Me_2CO$. On satn. of this soln. with $CO_2$ a yellow-red oil seps., from which the enzyme is pptd. at 0° by MeOH as a yellow powder contg. some colorless protein. The absorption spectrum of the enzyme has 3 bands, of which 465 and 495 mμ are in the long-wave range. The enzyme is bound to protein, sepn. being effected by shaking at 38° in 1:3 $H_2O$-MeOH. The protein-free soln. fluoresces green and is catalytically inactive; the visible absorption spectrum is almost unchanged (15–20 mμ shift toward the blue). The protein-free substance in dil. NaOH illuminated by an incandescent lamp becomes sol. in $CHCl_3$ after acidification, a method for obtaining the material in cryst. form. B. J. C. van der Hoeven

**Lactic acid dehydrogenase of yeast.** AMANDUS HAHN, E. FISCHBACH AND H. NIEMER. *Z. Biol.* **93**, 121–2(1932).—A dehydrogenase prepn. from yeast, free of lactic acid, converted lactic into pyruvic acid. FRANCES KRASNOW

**Radiation and enzyme activity.** MAURICE COPISAROW. *Nature* **130**, 1001–2 (1932).—Metabolic radiation is a normal enzymic activity. This deduction links Warburg's work on abnormal glucolysis by restricted activity of respiratory enzymes with Gesenius's investigation on inhibited radiation in relation to disease. M. E. L.

**Irradiation of nucleic acids and uracil.** FRANCIS F. HEYROTH AND JOHN R. LOOFBOUROW. *Nature* **131**, 92–3(1933).—Thymus and yeast nucleic acids and uracil were irradiated and introduced into polyneuritic rats. Ultra-violet irradiation was ineffective in producing vitamin $B_1$ or $B_2$. MARY E. LEAR

**Oxidase of the crystalline style.** C. BERKELEY. *Nature* **131**, 94(1933).—The oxidase of 3 species of oyster gave a marked reaction to guaiacum. Each species yielded exts. equal in activity to those from *Saxidomus giganteus*. Oxidase is probably of general occurrence in the lamellibranchs. MARY E. LEAR

**Further studies of the phosphatase of body organs. I. The effect of manganese salts on the phosphatase of the kidney, the digestive organs and the digestive juices.** ISOO HORII, MASAMICHI MORII, MASUMI MORIMURA AND SEIHO TOMIKAWA. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto, Ser. C*, No. 3, 7–29(1932); cf. *C. A.* **26**, 2477.—The splitting of Ca fructose-6-monophosphoric acid by phosphatase in general is retarded by the addn. of large or moderate quantities of Mn acetate, chloride and nitrate. Small quantities of these salts exert only a slight effect or no effect on the action of kidney phosphatase. With sucrosephosphoric acid the above Mn salts definitely inhibit the action of the enzyme. The acetate, chloride and sulfate augment, while the nitrate inhibits, the action of the kidney enzyme upon glycidol- and diethyl-phosphoric acid. The sputum of rabbits contains no phosphatase. Exts. of the salivary glands show the presence of strong enzymic activity toward ortho- and pyro-phosphoric esters. For the 1st, the optimum is at $p_H$ 8.6–8.8, and for the 2nd 7.3–7.6. The α-glycerol, fructose-6-mono and sucrose esters are not split by either the ext. of gastric mucosa of the rabbit or a soln. of pepsin at $p_H$ = 8.6. The ext. of the dog pancreas, pancreatic prepn. (Tsuru) and pancreatin (Merck) contain esterophosphatase. Ext. of rabbit pancreas is inactive, as is the pancreatic juice of the dog and the bile of the rabbit. Ext. of the intestinal mucosa of the rabbit as well as its secretion is strongly phospholytic. The work of Forrai on the presence of phosphatase in the human adult (cf. *C. A.* **18**, 3610; **22**, 601, 818) has been substantiated. The organ exts. and organ secretions of the fetus act much like those of the adult human. The phosphatase is localized mostly in the renal cortex. B. S. LEVINE

**The ortho- and pyro-phosphatase of bone and cartilage. III. The effect of arsenic and fluorine salts on bone phosphatase.** TAKATSURA YAMANE. *Arb. dritt Abt. anat. Inst. Kaiser Univ. Kyoto, Ser. C*, No. 3, 35–45(1932); cf. *C. A.* **26**, 2477.—The effect of K arsenate on bone phosphatase varies with the ester on which it is tested. with fructose-6-mono- and glucose-6-mono-phosphoric acid and diethylpyrophosphoric acid the enzyme action is augmented, while with sucrosephosphoric it is inhibited and with diethylphosphoric acid it is unaffected. NaF, on the other hand, augments the action of the enzyme in all instances. B. S. LEVINE

**The phosphatases of human uterine tumors.** MASAMICHI MORII AND YOSHITERU TAKABATAKE. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto, Ser. C*, No. 3, 46–51(1932). *Carcinomatous uterus.* In lymphoglandular metastases of the uterus a very active phosphatase was demonstrated. Bone was completely digested within 15 min. No phosphatase was demonstrated in normal lymph glands. *Myomatous uterus.* No phosphatase was demonstrated. B. S. LEVINE

**Phosphatase in bovine kidneys. I. Method of obtaining and localization of the phosphatase.** MASAMICHI MORII. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto, Ser. C*, No. 3, 52–8(1932).—The cortical tissue is the seat of the enzyme. Methods most suitable for obtaining the enzyme are given. **II.** MASAMICHI MORII. *Arb. dritt Abt. anat. Inst. kaiser. Univ. Kyoto, Ser. C*, No. 3, 68–72(1932).—The hydrolytic power of dried and powd. phosphatase obtained by autolysis of kidney tissue varies with different prepns. Generally its action is strongest toward Ca sucrosephosphate, and then (in order) the Ca salts of fructose-6-mono-, diethylpyro-, and α-glycerophosphoric esters. Purification by dialysis renders the enzyme inert. **III.** *Ibid* 73–8.—Röntgen rays from a Mo anticathode have no effect on the powd. enzyme. The effect of As and F salts has also been studied. B. S. LEVINE

**Kidney phosphatase in experimental nephritis.** SEIHO TOMIKAWA. *Arb. dritt. Abt. anat. Inst. kaiser. Univ. Kyoto, Ser. C*, No. 3, 62–7(1932).—Normal rabbit kidney (as control) hydrolyzes α-glycerophosphoric acid 63.3–70.0, diethylphosphoric acid 1.8–15.9, fructose-6-monophosphoric acid 56.7–82.6, glucose-6-monophosphoric acid 60.1–

73.3, sucrosephosphoric acid 67.8–89.4%. In cantharidin nephritis the kidney ext. hydrolyses the same acids, resp., 15.5–66.9, 0.0–2.6, 7.6–33.8, 10.0–66.3, 11.1–50.9%; in Cr nephritis 0.0–44.6, 0.0–18.1, 0.0–27.3, 0.0–26.6, 0.0–61.6%; in U nephritis 13.1–49.0, 0.0–41.3, 0.0–11.7, —, 0.0–41.3%. Most of the phosphatase is found in the cortex of the kidney. B. S. LEVINE

**Starch-liquefying capacity of amylase and methods for its determination.** T. CHRZASZCZ AND J. JANICKI. *Biochem. Z.* **256**, 252–91(1932); cf. *C. A.* **27**, 1308.—Fifteen different methods, based on the application of 3 distinct principles, have been proposed for detg. the starch-liquefying activity of amylase. Several of these were found to be entirely unreliable. Each method is very extensively discussed. S. M.

**Influence of different glucose concentrations on lactic acid formation and glycogen decomposition.** WALTER HAARMANN AND FRIEDRICH-WILHELM STRATMANN. *Biochem. Z.* **256**, 361–70(1932).—Lactic acid formation from glucose is greatly dependent on the concn. of the added glucose but varies also with different organs. In the case of skeletal muscles, where the optimum lactic acid formation is at the glucose concn. of blood, higher concns. of glucose inhibit the lactic acid production, but in heart muscle, kidney and brain the optimum production is at the higher glucose concns. Other glucides, when added to the tissue, affect the degree of lactic acid formation differently. The lactic acid formation from the glycogen present in skeletal muscles or from added glycogen is increasingly inhibited with increasing concn. of added glucose. S. MORGULIS

**The decomposition of xylose, salabrose and sionon by surviving tissue.** WALTER HAARMANN AND FRIEDRICH-WILHELM STRATMANN. *Biochem. Z.* **256**, 371–5(1932).—Xylose, salabrose (tetraglucosan) and sionon (*d*-sorbitol) do not give rise to lactic acid in surviving tissues under anaerobic conditions. Nevertheless, the 1st 2 sugars do undergo decompn. by the tissue. S. MORGULIS

**Presence of invertase in the gizzard of chickens.** A. BERNARDI AND M. A. SCHWARZ. *Biochem. Z.* **256**, 406–10(1932); cf. *C. A.* **27**, 112.—The amylase found in the glycerol ext. of chicken gizzard is produced in the mucous layer, which lies between the keratoid and the muscle layer. Such limitation of origin could not be demonstrated for the invertase content of the glycerol ext. S. MORGULIS

**New observations on β-glucosidase.** CARL NEUBERG AND EDUARD HOFMANN. *Biochem. Z.* **256**, 450–61(1932); cf. *C. A.* **26**, 5588.—The enzymes prepd. from lactose yeast hydrolyze not only such galactosides as lactose, lactose-ureide and lactobionic acid but also β-glucosides such as amygdalin, β-methylglucoside, salicin, arbutin and cellobiose. Melibiose, which is hydrolyzed by emulsin, is not attacked. Hydrolysis and fermentability do not run parallel. Thus, cellobiose, which is generally regarded as non-fermentable, is well fermented by lactose yeast 102, feebly by *Saccharomyces fragilis* and not at all by *Saccharomyces kefir*. This difference may be due to differences in cell permeability. S. MORGULIS

**The β-glucosidase of lactose yeast.** EDUARD HOFMANN. *Biochem. Z.* **256**, 462–74 (1932).—From aq. exts. of lactose yeast a dry powder can be prepd. which hydrolyzes β-galactosides as well as β-glucosides. The optimum $p_H$ for this dry prepn., with salicin as the substrate, is about 6. In its action upon lactose it is more effective than the best emulsin prepn. and is undoubtedly the most active lactase known. S. MORGULIS

**Dismutation of glyoxal.** CARL NEUBERG AND ERNST SIMON. *Biochem. Z.* **256**, 485–91(1932).—The transformation of α-ketoaldehydes to α-hydroxy acids is an inner Cannizzaro reaction. To test whether glyoxal can also undergo this type of reaction enzymically the juice from pea seedlings, pig liver and kidney as well as acetone-dry prepns. of peas were employed. Liver pulp and fresh top or bottom yeast act similarly. Although AcCHO, BzCHO or $CHOCOCH_2CH_2CO_2H$ are completely oxidized and accounted for under such exptl. conditions, the unsubstituted glyoxal also disappears completely but the recovery of glycolic acid is never more than 62%. The loss is attributed to the involved procedure for detn. of the glycolic acid. The latter is definitely shown to be produced enzymically by the dismutation of glyoxal. S. M.

**Formation and destruction of amino acids.** CHARLOTTE BLASCHE. *Biochem. Z* **257**, 14–21(1933).—A study of the transformation of imino into amino acids by purely chem. means. Böttinger's mixt., as well as iminodipropionic acid, was used. By Knoop's method of hydrogenation of keto acids with Pd catalyst in the presence of nascent imino acid, a 50–60% yield of amino acid was obtained. S. MORGULIS

**Influence of glycerol on egg-white proteins during heating.** S. IWANOWSKY. *Biochem. Z.* **257**, 57–61(1933).—The formation of alkali albuminates by heating egg white in an alk. medium is not prevented by glycerol, which, however, stabilizes the protein soln. toward such pptg. agents as $(NH_4)_2SO_4$. S. MORGULIS

**Complex coazervation. XIV. Autocomplex flocculation of sodium yeast nucleinate sols.** H. G. BUNGENBERG DE JONG AND F. A. MENALDA. *Biochem. Z.* 257, 62–77(1933); cf. *C. A.* **27**, 217.—Sols of Na nucleinate (yeast) at $p_H$ = 7.0 are pptd.

from pure aq. soln. by hexol nitrate, luteo cobalt chloride or chlorides of the alk. earths, but not by NaCl or KCl. The flocculation is a coazervation, and under proper conditions of temp. or in the presence of $NH_4OH$ fluid droplets may be formed. The flocculation is prevented by neutral salts. S. MORGULIS

**Quinones as enzyme models. VIII. The $CO_2/NH_3$ quotient of the oxidative deamination of amino acids.** BRUNO KISCH AND KARL SCHUWIRTH. *Biochem. Z.* **257**, 89–94(1933); cf. *C. A.* **27**, 317.—The $CO_2/NH_3$ ratio in the oxidative deamination of glycine or serine with such catalysts as pyrocatechol, hydroxyhydroquinone, adrenaline or resorcinol is 1:1. Glycyltyrosine and glycylglycine are extensively deaminated by means of hydroxyhydroquinone as catalyst without the production of $CO_2$. Small amts. of glycine which may be formed from glycylglycine or even more from glycine Et ester account for the traces of $CO_2$ produced. Alanine, leucine and isoleucine give only traces of $NH_3$ or $CO_2$. S. MORGULIS

**The effect of lecithin and sodium chloride on the solubility of fatty acids in bile salts.** OTTO FÜRTH AND RUDOLF SCHOLL. *Biochem. Z.* **257**, 151–9(1933).—The soly. of oleic or linoleic acid in bile salts is greatly increased by the addn. of lecithin, *very little* NaCl, KCl or $Na_2SO_4$. *Much* NaCl has the opposite effect of causing a sepn. of the bile salts and the fatty acids. In 100 cc. 5% Na glycocholate it was possible to dissolve completely 4.5 g. oleic acid in the presence of 0.8% lecithin and 0.9% NaCl. These findings indicate that such constituents of the bile must exert a very favorable effect on its solvent action on the higher fatty acids. S. MORGULIS

**Influence of thyroid protein with higher iodine or bromine content on metabolism.** I. ABELIN. *Biochem. Z.* **257**, 213–20(1933).—Thyroid protein whose I or Br content has been greatly increased is less toxic to rats and has less effect on their basal metabolic rate. Possibly this highly iodized or brominized protein yields diiodo- or dibromotyrosine, which is antagonistic to thyroxine. S. MORGULIS

**Effect of certain chemicals on the hydrolytic activity of Ricinus and pancreas lipase.** R. H. CLARK AND R. M. ARCHIBALD. *Trans. Roy. Soc. Can. III* **26**, 87–92(1932); cf. *C. A.* **26**, 2755.—Twenty-five chemicals were tested for activation of the lipase from pork pancreas and castor beans, with cold-drawn castor oil as substrate. Thiourea, $ClCH_2$-$CH_2OH$ and $CH_2O$ inhibited the enzyme. I, Br and HCl were inhibitory but the effect decreased with time. Lactic acid caused almost complete inhibition of enzymes from both sources. Aldehydes at low concns. appeared to activate; at higher concns. they appear to inhibit. The *Ricinus* lipase was more sensitive to the chemicals investigated than was the pancreatic. J. W. SHIPLEY

**Fractionation of Bios II.** W. LASH MILLER, EDNA V. EASTCOTT AND ELGIN M. SPARLING. *Trans. Roy. Soc. Can. III* **26**, 165–9(1932); cf. *C. A.* **19**, 2679; **22**, 3897.—Fifty-lb. lots of malt combings were worked up through an alc., lime, acetone, charcoal series of treatments until a 7.7% residue of solids dried at 110°, or 11% if dried at 35°, was secured, contg. Bios II. Crystn. through acetylation proved futile but purification of a soln. made neutral with CaO (by treatment with acetone) gave a filtrate rich in active material from which fractions contg. Bios IIA and IIB were easily obtained. Expts. with Bios from 9 different sources indicate that it is a mixt. of inositol with as yet unisolated Bios IIA and IIB. The presence of IIA and IIB together with inactive inositol appears to be necessary for obtaining good crops of yeast. J. W. SHIPLEY

**Observations on insulin crystals.** D. A. SCOTT. *Trans. Roy. Soc. Can.* Sect. V, **26**, 275–82(1932).—The insulin crystals were obtained as follows: To each of a series of 15 cc. centrifuge tubes contg. 10 mg. of amorphous insulin, 4 cc. of *N* AcOH, 4 cc. of 50% acetone and varying amts. of 0.9 *N* $NH_4OH$ were added. The tubes were scratched with a glass rod and placed in a refrigerator overnight at 4°. From the soln. which had an acidity of $p_H$ 5.2 peculiar wedge-shaped crystals were obtained, while in that with $p_H$ 6.2, the usual rhombohedral form of insulin crystals was present. The yield of wedge-shaped crystals could be increased by the presence of saponin. The potency of the dried crystals when assayed against the International Insulin Standard was 24.1 and 24.3 units per mg. The wedge-shaped crystals could be converted into the rhombohedral form at $p_H$ 6.2, but not *vice versa*. Seeding certain solns. with the 2 types of crystals did not influence the type of crystal formed. The wedge-shaped crystals are either (1) insulin acetate or, more likely, (2) a dimorphous form of the cryst. insulin induced by impurities in the amorphous insulin or by the $NH_4OAc$ soln. LOUIS J. SOFFER

**The action of methyl iodide on insulin.** A. F. CHARLES AND D. A. SCOTT. *Trans. Roy. Soc. Can.* Sect. V, **26**, 335–9(1932).—Cryst. insulin was 95% inactivated by addn. of MeI and standing 9 hrs. in a water bath at 56°. The inactive product was then 30% reactivated by addn. of 0.1 *N* NaOH and a sojourn of 12 hrs. in an ice bath. When the inactivated insulin protein was pptd. from an ether-alc. soln. and the ppt. washed twice with ether, a large amt. of I remained on the ppt. This could be partially removed by isoelec. pptn. of the protein. Finally, the reactivated product contained I in an amt.

equal to that of the inactivated product. The inactivation was not due to traces of MeCl forming an addn. compd. with the insulin. An inactive I compd. is formed which bears little relationship to the inactivation of the insulin. The latter process is attributed to some other factor, probably an intramol. or tautomeric change in the protein. LOUIS J. SOFFER

**Peroxidases. II. The influence of the concentration of substrate [hydroquinone], hydrogen peroxide, $p_H$ and other factors on the activity of the peroxidase of chow chow [Sechium edule].** BIMAN B. DEY AND MAYAVARAM V. SITHARAMAN. *J. Indian Chem. Soc.* **9**, 499–508(1932); cf. *C. A.* **26**, 487.—An av. chow-chow fruit weighing 250 g. yields 120–40 cc. of a colorless, turbid liquid, which is purified by dialysis at 10° for 4 days; the dialyzed sap, centrifuged and filtered, has a $p_H$ of 4.5–4.6 and shows the same peroxidase activity after 1 month. The peroxidase concn. is very high and for exptl. purposes the sap is dild. with 3 vols. $H_2O$. The reaction period is 15 min. The max. activity is attained when 2 cc. of 1% $H_2O_2$ (0.02 g. in 13 cc. reaction mixt.) is used. The activity seems to remain const. when the concn. of the substrate is between 0.25 and 0.35 at the total const. vol. of 13 cc. The max. activity of chow-chow peroxidase lies between $p_H$ 4.8 and 5.2 in the acid region, whether the crude or dialyzed sap is used. With dil. solns. of the enzyme the reaction is practically nil in the presence of HCl; with the undild. sap, the reaction is completely stopped only by the addn. of 2 *N* HCl until the final soln. has become approx. 0.2 *N* with respect to it. The activity of the enzyme is inhibited completely by KCN of 0.0001 *M* concn., while in solns. of 0.00001 *M* concn. the activity is almost unaffected. $HgCl_2$ does not seem to have so marked an effect in poisoning the peroxidase, considerable activity being shown after the addn. of a soln. of $HgCl_2$ of 0.001 *M* concn. The results are given in tables and curves. C. J. WEST

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

**Hepatolienography by means of thorotrast [Heyden 1073a] and its practical value in internal medicine.** J. L. A. PEUTZ. *Nederland. Tijdschr. Geneeskunde* **76**, III, 4429–37(1932).—Distinct x-ray shadows of spleen and of liver are obtained after intravenous injections of 30–40 cc. of a colloidal soln. of $ThO_2$ (thorotrast, Heyden). This injection proves to be harmless. R. BEUTNER

**A microchemical reagent for the detection of acetone [in the urine].** FRANCESCO LETI. *Chim. ind. agr. biol.* **8**, 419–20(1932)(abstr.).—Place 1 g. of a mixt. of 4 g. Na nitroprusside and 10 g. NaOH (perfectly dry) in a porcelain dish, and add 1–2 drops urine: a red-lilac color is formed which immediately turns brown if acetone is present; if it is not present, the red color turns canary-yellow. The reaction gives pos. results with a concn. of 0.025%. G. A. BRAVO

**The determination of bilirubin in the blood.** S. FAMULARI. *Diagnostica tec. lab. (Napoli) Riv. mensile* **3**, 212–18(1932).—Blood bilirubin occurs partly in combination with protein, and this combined bilirubin cannot be extd. by EtOH. Therefore in colorimetric methods involving preliminary extn. by EtOH only the free bilirubin is detd. By using the method of ring formation of Chabrol, *et al.* (*C. A.* **26**, 2998) the

total bilirubin is detd. From the results obtained by these 2 methods the combined bilirubin can be calcd. LEWIS W. BUTZ

**Photometric method for the determination of urinary sulfur and a study of the colloidal stability of sulfate precipitates.** E. OBERMER AND R. MILTON. *Bull. soc. chim. biol.* **14**, 1447–1509(1932); cf. *C. A.* **26**, 4353, 5595.—A Vernes-Bricq-Yvon photometer is used. An adaptation of the Denis and Reed method of detg. the 3 forms of combined S in urine is described and the factors leading to inaccuracies are discussed. Several methods of stabilizing the colloidal $BaSO_4$ ppt. were tried, and the combined use of peptone and gum Ghatti is finally adopted. L. E. GILSON

**Adaptation of the colorimetric method to the determination of free cholesterol in blood serum.** A. GRIGAUT. *Compt. rend. soc. biol.* **112**, 34–6(1933).—Several methods are criticized and a slight modification of Windaus' method is recommended. L. E. GILSON

**Determination of glucose in blood.** ROBERT RAZAFIMAHERY. *Ann. chim. anal. chim. appl.* **15**, 1–10(1933); cf. *C. A.* **27**, 319.—Further testing of known methods is described and the final conclusions are: (1) The method of Hagedorn and Jansen gives results of the same precision as that of Baudoin and Lewin and can be used with as little as 0.1 cc. of blood $CCl_3.CO_2H$ is recommended in place of $Zn(OH)_2$ as reagent for removing albumin. (2) Results obtained by the method of Ionescu-Matiu and Vitner are a little lower and their procedure is a little longer than that of B.-L. (3) Results obtained by the method of B.-L. are sometimes erroneous because of loss of $I_2$. If 5 tests are made with 7.5 cc. of defecated filtrate, usually 3 values will be concordant. The chem. reactions at the basis of each of these tests are explained and the results obtained in numerous tests given. W. T. H.

**The significance of species agglutination in forensic medicine.** V. N. KRAINSKA-IGNATOVA AND E. L. SOBOLEVA. *Deut. Z. ges. gericht. Med.* **19**, 446–53(1932).—Blood and sperm in stains and cadaver organs may be identified by a simple technic. F. K.

**Determination of alcohol in blood according to Widmark.** JOSEF KOLLER. *Deut. Z. ges. gericht. Med.* **19**, 513–15(1932).—A drawing of the modified app. is given. FRANCES KRASNOW

**Demonstration of minute traces of blood.** P. MEDINGER. *Deut. Z. ges. gericht. Med.* **20**, 74–85(1932).—The reagent (contg. leucomalachite green 1 g., glacial acetic acid 100 cc. and water 150 cc.) is mixed with 1% $H_2O_2$ soln. in proportion of 8:2. A drop of this mixt. should turn the stain (if from blood) green in 10 sec. and dark blue-green in 1 min. Hundreds of tests were successful. FRANCES KRASNOW

**Microscopic demonstration and differentiation of glycogen and galactan.** F. MAY AND F. KORODOWICH. *Z. Biol.* **93**, 233–8(1932).—New methods are necessary. FRANCES KRASNOW

**The urea clearance test in urology.** V. J. HARDING AND R. W. T. URQUHART. *J. Urol.* **29**, 1–13(1933). E. R. MAIN

**A new micro-Kjeldahl method.** S. BALAKHOVSKII AND K. BRUNS. *Biochem. Z.* **256**, 292(1932).—The principle is to distil the $NH_3$ soln. to dryness *in vacuo*. The material is digested as usual with $H_2SO_4$ in a test tube and made up to a definite vol. An app. is described. S. MORGULIS

**A micro method for the direct determination of organic acids in blood serum.** HEINZ BRÜHL. *Biochem. Z.* **256**, 293–307(1932).—Allow a few cc. of blood to clot, remove the serum by centrifugation and subject to ultrafiltration under pressure. The method of ultrafiltration is discussed in detail. In the ultrafiltrate det. the org. acids electrometrically. The org. acids of serum stronger than $H_2CO_3$ are at the neutral point in the form of their salts, and the addn. of HCl decreases their dissocn. or ability to form salts, the value of the latter varying with the H-ion concn. according to the formula $\alpha = k(k + h)$. The added HCl is thus neutralized by the alkali set free and the $p_H$ is detd. by the acid-salt ratio of the buffer mixt. until all the salt of the org. acid is used up when the $p_H$ is detd. by the HCl. The concn. of the buffer acid can be detd. from the max. deviation from the abscissa of the titration curve and its dissocn. const. from the $p_H$ at half dissocn. To 1 cc. of the serum ultrafiltrate about 0.12–0.15 cc. 0.1 *N* HCl is added, to adjust the $p_H$ to 7.5–8.0, and the $CO_2$ is driven off by passing $N_2$ for 30 min., the $p_H$ is measured with a quinhydrone-calomel system and the titration is made by adding 0.05 cc. 0.05 *N* HCl, passing $N_2$ for 15 min. to remove $CO_2$ between each addn. The titration is carried out to a $p_H$ 2.5–2.1. The results are plotted and the titration curve is superimposed by a diagram of a control titration curve so that the neutral points of the two coincide. The org. acid concn. is calcd. from the max. sepn. of these curves. The normal org. acid concn. of serum is 7.75–10.25 millimols. and the mean dissocn.

const. is $p_K = 3.6$, but in uremias, tetanic convulsions or on a ketogenic diet this concn. may rise to a max. value of 29.5 millimols. S. MORGULIS

**Determination of inorganic and phytin phosphoric acid in phytin preparations.** K. LINDENFELD. *Biochem. Z.* **257**, 8–13(1933).—Reagents required are: (1) 10% $HNO_3$; (2) 25% $NH_4NO_3$; (3) sulfate-molybdate soln. (according to Neubauer and Lücker, *C. A.* **6**, 1264) made by pouring a thin stream of a soln. of 150 g. $(NH_4)_2MnO_4$ dissolved in 400 cc. hot $H_2O$, into a soln. of 50 g. $(NH_4)_2SO_4$ in 500 cc. $HNO_3$ (sp. gr. 1.36), stirring well, dilg. to 1 l. and filtering into a dark bottle after 2 days; (4) 2% $NH_4NO_3$ soln. acidified by a few drops of $HNO_3$. Dissolve 0.1–0.3 g. of substance in 3 cc. 10% $HNO_3$, and mix with 20 cc. of soln. 2, 11 cc. $H_2O$ and 6 cc. freshly filtered soln. 3. If the original soln. of the substance is turbid it should be dild. with 5 cc. of soln. 2 and filtered, the remaining 15 cc. of the soln. being used for rinsing. After 3–4 hrs. filter the ppt., wash with soln. 4, then 2–3 times with 95% alc. and 3–4 times with acetone. Dry 30 min. in a vacuum desiccator and weigh. Calc. the amt. of P as free $H_3PO_4$ by multiplying by the factor 0.01525. To det. the phytin $H_3PO_4$ the reagents required are: (1) standard $FeCl_3$ in 0.6% HCl contg. 0.15–0.20% Fe; (2) 6% HCl; (3) 0.3% aq. $NH_4CNS$. Dissolve 0.2–0.3 g. substance in 10 cc. 6% HCl, add 10 cc. $NH_4CNS$ and 80 cc. $H_2O$ and titrate with $FeCl_3$ soln. The titration is completed as soon as the supernatant fluid is rose colored. One mg. Fe corresponds to 1.2 mg. phytin P. S. MORGULIS

**Titrimetric determination of very small quantities of blood phosphatide.** SHIGEHIRO KATSURA, TATSUO HATAKEYAMA AND KICHIRO TAJIMA. *Biochem. Z.* **257**, 22–31 (1933).—To 0.15–0.20 cc. add 60 vols. 95% alc., then 30 vols. of $Et_2O$. Filter and evap. at about 50° *in vacuo*. To the dry residue add 15 cc. petroleum ether (35–45°) and filter the ext. into a 25 cc. flask. Repeat the extn. twice and make up the vol. to the mark at room temp. To dissolve the salts which make the ext. turbid add a drop of $H_2O$ and shake the flask vigorously. Measure 10 cc. of the petr. ether into a stoppered 50-cc. flask for oxidation (*b*). Measure a similar sample into another flask and evap. to 1 cc. To this add 5 cc. of redistd. dry acetone, evap. to 1 cc. again and ppt. the phosphatides by means of 7 cc. acetone satd. with $CaCl_2$ (*a*). Filter the soln. after 1 hr. and evap. to dryness on a water bath. Take up the residue in 0.5 cc. $H_2O$ and 8 cc. petroleum ether and transfer the clear petroleum ether soln. to an oxidation flask. Repeat this twice. Drive off the petroleum ether from both flasks, add 1 cc. of the $Ag_2Cr_2O_7$-$K_2Cr_2O_7$ (4 : 1) mixt. and oxidize 1.5 hrs. at 100°, add 20 cc. $H_2O$ and 1 cc. 40% KI and titrate with 0.04 *N* $Na_2S_2O_3$. The calcn. of the phosphatide content of the blood (when 0.2 cc. was used) is made from the formula $(a - b) \times 0.4 \times 25 \times 100/2.82 \times 0.2 \times 10$, or $(a - b) \times 177$ = mg. %. The method gives results with an error of ± 2–5%. S. MORGULIS

**Further isolation of the growth-promoting thymocrescin.** DORIS ASHER. *Biochem Z.* **257**, 209–12(1933).—Thymocrescin is obtained by extn. with 70% alc. of the initial ppt. produced by 95% alc. The residue, a fine hygroscopic powder, obtained on rapid evapn. of the 70% alc. ext. is the substance used for the further purification of thymocrescin. This powder is dissolved in just enough $H_2O$ and almost satd. with solid $(NH_4)_2SO_4$ and the ppt. is centrifuged off. The pptd. mass is collected, washed with satd. $(NH_4)_2SO_4$ and extd. with 70% alc. The alc. soln. is evapd. in a high vacuum to a powder which can be preserved in closed vessels in the cold. The substance so prepd still shows the characteristics of a peptide but is much more active than the original material, 1 mg. instead of 20 mg. being now sufficient to produce growth stimulation. It is free from protein and lipide and is well tolerated by the animals. S. MORGULIS

**Determination of the dilution of chlorides in humors as a sign of vital submersion in fresh water.** J. LECLERC, M. MULLER AND J. PAYEN. *Ann. méd. légale criminol police sci.* **12**, 528–34(1932).—The av. NaCl content of human humors is approx. 6 g per l. Death by submersion produces an approx. 30% diln. of the humors; immersion in soft water for 20 days of a corpse in which death was due to causes other than submersion also produces an approx. 30% diln. of the humors. The possible value of this detn. in medico-legal work is pointed out, indicating also factors which may interfere with the proper interpretation of the results. A. PAPINEAU-COUTURE

**Preliminary account of analytical methods for individual carbohydrates.** VICTOR J. HARDING, THOMAS F. NICHOLSON, GORDON A. GRANT, GRANT HERN, AND C. E. DOWNS. *Trans. Roy. Soc. Can.* Sect. V, **26**, 33–43(1932).—The authors have attempted to det. the presence of any particular sugar in a soln. by the ability of yeasts and bacteria specifically to remove certain sugars. Standard sugar solns. were prepd. from pure sugars recrystd. 2 or 3 times. The reducing power of the soln. to be analyzed was detd before and after treatment with the yeast or bacterium. The organisms employed were *Proteus vulgaris, Monilia krusei, Saccharomyces marxianus* and *Monilia tropicalis*. The authors found that in the absence of galactose *Proteus vulgaris* becomes specific for glucose. The sepn. of glucose and galactose can be effected by incubation with 0.25 g. of washed Fleischman bakers' yeast at 38° incubated for 8 min. However, sepn. with

this yeast presupposes the absence of fructose and mannose. *Proteus vulgaris* was particularly valuable in the sepn. of glucose from fructose and mannose since both these sugars are easily fermented by other yeasts and bacteria. In testing for fructose or mannose, glucose must be removed by *Proteus vulgaris* and in the absence of mannose, *M. krusei* becomes specific for fructose and *vice versa*. The presence of saccharose was detd. by removing glucose and fructose and then hydrolyzing the saccharose with 0.01 *N* HCl. The HCl was neutralized with 0.01 *N* NaOH and an equimol. amt. of glucose and fructose was found in the soln. This was regarded as evidence of the presence of saccharose in the soln. *S. marxianus* was found to be efficient in the removal of galactose provided that glucose, fructose and mannose were first removed by *M. krusei*. *S. marxianus* is capable of removing saccharose but this introduced no error. *M. tropicalis* was chosen as the reagent for maltose on which it has a very rapid action. If *S. marxianus* is used previous to *M. tropicalis*, the latter becomes specific for maltose. Lactose detn. was least satisfactory. Glucose, fructose, mannose, galactose, saccharose and maltose were first removed, then the remaining soln. was hydrolyzed with an equal vol. of 2 *N* $H_2SO_4$ under pressure for 1 hr. The acid was then neutralized by solid $BaCO_3$ and the soln. filtered and tested for the resultant glucose and galactose. The hydrolysis of lactose proceeded to the extent of only 72% and the amt. present was calcd. from either the glucose or galactose formed. LOUIS J. SOFFER

**A critical comparison of color tests for fructose, pentoses and glucuronates in urine.** F. D. WHITE AND A. C. GREEN. *Trans. Roy. Soc. Can.* Sect. V, **26**, 145–57(1932).—The authors found that the various modifications of Seliwanoff's test for fructose in the urine, such as replacing the resorcinol with other reacting substances as *phloroglucinol, thymol,* or *diphenylamine*, were less sensitive than the original Seliwanoff test. The sensitivity of the original test could be increased if carried out with a dil. HCl soln. whose strength did not exceed 12% and the time of boiling was limited to 30 sec. The specificity of the Seliwanoff test was increased by clarification of the urine as follows: To 1 vol. of urine, 1 vol. of concd. HCl was added and the mixt. heated just to boiling. A dark brown color was produced. The mixt. was then allowed to stand for 2 min., a little norite was added, the mixt. was shaken, heated to boiling again and after standing for 2 min. was filtered. On boiling 8 drops of the filtrate with 5 cc. of the reagent for 30 seconds, the production of a pink color was regarded as a pos. test for fructose. By this method, the presence of fructose in at least 0.3% concn. was detected even in the presence of 3% glucose. The authors describe a new test for pentoses called the "aniline" test which consisted of adding 2 cc. of glacial AcOH and 5 drops of redistd. aniline to 2 cc. of sugar soln. The mixt. was heated to boiling, allowed to stand for 2 min. and the color extd. with 2 cc. of chloroform. Under these conditions 1% solns. of glucose and galactose gave green colors, fructose a pale yellow, glucuronates no color and arabinose a bright red color. This test was capable of detecting pentoses in amts. exceeding 0.03%. Conclusion: Those tests for pentoses and glucuronates employing Bial's reagent and naphthoresorcinol were unsatisfactory since some substance is present in normal urine which is capable of reacting with these reagents. LOUIS J. SOFFER

**The histological applications of triphenylmethane and diphenylnaphthylmethane dyes. I. The physicochemical characters of these dyes.** S. HASHIMOTO. *Japan. Z. Mikrobiol. Path.* **26**, 1075–1100(1932).—H. investigated the elec charge, the diffusibility, the coloring, the lipoid soly., the carbinol reaction and the toxicity of triphenylmethane and diphenylnaphthylmethane dyes. In general, the basic dyes have lipoid soly. while the acid dyes have not. The basic dyes are more toxic than the acid dyes. **II. Vital staining. Dyes which vitally stain protoplasmic granules.** *Ibid* 1101–14. **III. Vital staining. The relation between the physicochemical characters and the vital staining of protoplasmic granules.** *Ibid* 1115–28.—There is a close relation between the vital staining of protoplasmic granules by triphenylmethane and diphenylnaphthylmethane dyes and the elec. charge and the diffusibility of these dyes. I. S. YUN

**The application of triphenylmethane and diphenylnaphthylmethane dyes in morphological studies. IV. Vital staining of the capillary bile ducts of the liver.** S. HASHIMOTO. *Japan. Z. Mikrobiol. Path.* **26**, 1527–33(1932).—V. **Chromazurol S concentrate G. In histological work.** *Ibid* 1631–41. **VI. Mechanism of staining of dead tissues by the polychromatic dye chromazurol S concentrate. 2.** *Ibid* 1642–50.—Investigation of the mechanism of polychromasia assocd. with chromazurol S(G) from the colloid-electrochem. and spectrochem. standpoints showed that this dye is adsorbed electrically and chemically combined with amino acids or with proteins in the staining process. I. S. YUN

**Vital staining with diamine dyes.** KUMAKI FUJITA. *Trans. Japan. Path. Soc.* **21**, 206–8(1931).—More than 120 diamine dyes were investigated. Most dyes effective for vital staining are acid dyes. I. S. YUN

**Relation between the intensity of the staining reaction of cell granules and the composition of the fixing solution.** YUTAKA KON AND KATSUO TAKEDA. *Trans. Japan. Path. Soc.* **21**, 233–5(1931).—Mitochondria, chondriomites and chondriocontes could be easily demonstrated by means of HCl-formol. I. S. YUN

**Relationship between the chemical reaction of fixative solution and the basophilic granules in stained tissue.** KOHKICHI KATOH. *Trans. Japan. Path. Soc.* **21**, 236–7 (1931).—The diffuse staining of basophilic tissues was usually accentuated by fixation in alk. solution. I. S. YUN

## C—BACTERIOLOGY

CHARLES B. MORREY

**A critical study of the methods for determining bactericidal properties of chemical sterilizers.** ROBERT P. MYERS AND ARNOLD H. JOHNSON. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect.* **25**, 21–55(1932).—The ratio of available Cl to total alky. (as $Na_2O$) appears to be of aid in evaluating, by chem. means, the germicidal potency of hypochlorite prepns. Lower corrosiveness and lower bactericidal effectiveness are assocd. with high alky. Data and practical tests are given. PHILIP D. ADAMS

**Review of the methods proposed for isolating Eberth's bacillus from water.** GIULIO BUONOMINI. *Boll. ist. sieroterap. milan.* **11**, 271–83(1932).—The phys., chem., phys.-chem., biol., serological, etc., methods are described, and a bibliography is added. G. A. BRAVO

**Chromogenesis of Brucella in egg media.** MARCO MASTROEMI. *Boll. soc. intern microbiol. Sez. ital.* **4**, 268–72(in French)(1932).—*Brucella melitensis* and *B. abortus* cultivated on egg-contg. culture media show chromogenic properties, without modifications of morphological, cultural, pathol. and biol. characters. The bacterial pigment is probably formed by enzymic action, with degradation of protein, oxidation of tyrosine and successive condensation of products of the melanine type. G. A. BRAVO

**The influence of carbon dioxide on the rate of multiplication of certain bacteria, as judged by viable counts.** R. B. HAINES. *J. Soc. Chem. Ind.* **52**, 13–17T(1933). —"Viable counts have been made to det. the rate of growth of 3 species of bacteria isolated chiefly from meat in nutrient broth satd. with air and air contg. 10% and 20% $CO_2$, resp., at 20°, 4° and 0°. $CO_2$ in these concns. has but little action on *Proteus*, but increases the lag period and lengthens the generation time by about $^1/_2$ of *Pseudomonas* and *Achromobacter* at 20°. On the last 2 the effect is more marked at a lower temp., the generation time being more than doubled at 0° by 10% $CO_2$. The max. no. of organisms reached is the same in the presence and in the absence of $CO_2$, but the time for the attainment of this max. is approx. doubled at 0° by 10% $CO_2$. Ten % $CO_2$ is as effective as 20% in inhibiting the growth of *Achromobacter* at 0°, but it is not so efficient at 4°. The change in $p_H$ caused by the $CO_2$ does not account for the retardation of growth and it is suggested that an explanation may be found in the action of this gas on the dehydrogenating enzymes of the cell." F. L. DUNLAP

**Metabolism of the lactic acid bacteria. I. Nitrogen metabolism.** JOHN G. DAVIS AND ALEXANDER T. R. MATTICK. *J. Dairy Research* **4**, 81–90(1932).—The true lactic acid bacteria did not grow in a medium in which the sole source of N was an amino acid or an $NH_4$ salt. The presence of yeast ext., marmite and peptones did not permit the utilization of this "simple" N. The streptococci exhibited most rapid growth with those peptones contg. the greatest amt. of the higher fractions while the lactobacilli showed a considerably greater rate of fermentation with those peptones contg. the most amino N. Similarly the streptococci thrived the best on peptic casein digest which was about 15 days old, further digestion impoverishing the growth. The lactobacilli, on the other hand, grew better the longer the digestion of the casein. A. H. JOHNSON

**The bacteriological examination of milk. I. Modification of the agar plate count method. II. The use of methylene blue reductase test as a method of determining the keeping quality of milk.** E. R. HISCOX, W. A. HOY, K. L. LOMAX AND A. T. R MATTICK. *J. Dairy Research* **4**, 105–21(1932).—It was shown that neither lactose, dextrose, galactose, casein peptone nor yeast ext. could satisfactorily replace milk as a means of correcting discrepancies observed between plate counts of 1 to 100 cc. and 1 to

1000 cc. diln. of milk on standard agar. A close correlation was found between the appearance of a taint in milk and the reducing time for methylene blue at 15.5°.
A. H. JOHNSON

**Bacillus saprogenes saké Takahashi and the lactic acid bacteria which putrefy saké.** TEIZO TAKAHASHI AND AKIRA SUZUKI. *J. Agr. Chem. Soc. Japan* 8, 1064–8(1932).—*Bac. saprogenes* generally cannot be cultivated on koji ext., except on a few species of koji (*Aspergillus oryzae*) which produce mainly alc. When the juices or exts. of oranges, other fruits and vegetables were added to saké, the growth of *Bac. saprogenes* was remarkably promoted.
Y. KIHARA

**The chemical composition of ashes of bacteria.** A. DÂMBOVICEANU AND C. BARBER. *Arch. roumaines path. exptl. microbiol.* 4, No. 1(1931).—Detns. of P, Na, Ca and K were made on the ashes of *Staphylococcus, Streptococcus, Bacillus anthracis, Vibrio cholerae, Sh. dysenteriae, Eb. typhi* and *Sal. paratyphi* and *Phy. tumefaciens*. P and Na are present in greatest amt. The rough forms are richer in K than the smooth forms. The contents of K, Ca and Mg vary from one species to another.
MARIE MAXIM

**Self disinfection of solid surfaces.** A. THIROUX AND J. RISLER. *Bull. acad. méd.* 106, 39–41(1931).—Active charcoal was impregnated with thymol. *E. coli* and staphylococcus are rapidly destroyed on the surface. Impregnation with $CH_2O$ was not satisfactory.
A. E. MEYER

**The use of calcium chloride and brilliant green in soft agar spreading colony plates for the isolation of motile pathogenic fecal bacteria.** STEVAN Z. IVANIĆ AND V. DIMITJEVIĆ-SPETH. *Zentr. Bakt. Parasitenk., Abt. I* 126, 445–9(1932).
J. T. M.

**The physiology and chemistry of bacterial cell growth.** JULIUS HIRSCH. *Zentr. Bakt. Parasitenk., Abt. I* 127, 116–22(1932).
JOHN T. MYERS

**The influence of silica upon the growth of the tubercle bacillus.** R. M. PRICE. *Can. J. Research* 7, 617–21(1932).—The addn. of small amts. of sol. $SiO_2$ to modified Dorset egg medium enhanced the growth of the human type of the tubercle bacillus in the test tube. This is manifested by a lessening of the latent period and a greater luxuriance of growth.
J. W. SHIPLEY

**Antibacterial power of trypaflavine, isravin, panseptin and mercurochrome.** JUNICHIRO DOHI. *Japan. J. Dermatol. Urol.* 32, 952–6(1932).—The growth of *Staphylococcus albus* and *citreus, Streptococcus pyogenes* and *Es. coli* was completely inhibited by immersing in 1:200 diln. of trypaflavine, isravin, panseptin and mercurochrome for 1 min., in 1:500 for 10 min., in 1:1000 for 30 min. and in 1:2000 for 60 min. Immersion in 1:10,000 diln. for 60 min. did not kill these bacteria. Fluorescein derivs. possessed much more bactericidal power than the acridine derivs.
K. SUGIURA

**Enhanced lethal effects of x-rays on Escherichia coli in the presence of inorganic salts.** WALTER D. CLAUS. *J. Exptl. Med.* 57, 335–47(1933).—When *Es. coli* are irradiated by x-rays in a series of 0.1 *M* salt solns., the synergistic effect does not become appreciable until heavy salts are used. When $Pb(NO_3)_2$ or KBr solns. are used in increasing concns., the synergistic effect is not appreciable until large concns. or absorption coeffs. are reached, whereupon the effect increases sharply. Thus the no. of effective hits per bacterium per min., $\alpha$, is a function of the absorption coeff., $\mu$. The sharp increase in $\alpha$ does not occur at the same concn. or same $\mu$ for $Pb(NO_3)_2$ and for KBr. Thus $\alpha$ is a function of the nature of the salt, or possibly of the penetration of the salt into the cell, some measure of which may be obtained from the initial toxicity of the soln. For a given soln., $\alpha$ increases as the wave length $\lambda$ of the x-rays decreases, although $\mu$ decreases by the same process as the cube of $\lambda$. Thus $\alpha$ is a function of $\lambda$ to some power greater than the cube. Within the range investigated, short wave lengths of x-rays, in conjunction with sensitizers, are the most efficacious in producing lethal effects.

## D—BOTANY

THOMAS G. PHILLIPS

**Effect of reduced oxygen pressure on rice germination.** JENKIN W. JONES. *J. Am. Soc. Agron.* 25, 69–81(1933).—Rice sown on the surface of the soil, 1/2 in. deep and 1 in. deep, then continuously submerged, produced an av. of 78.14, 20.00 and 2.66% of seedlings, resp. When sown 1.5 in. or deeper and continuously submerged no seedlings were obtained unless O was forced into the soil. When continuously submerged a 1/2-in. layer of Stockton clay adobe soil materially reduced the O pressure and a layer 1 in. or

more in depth reduced the O pressure to a point at which normal germination did not occur. Under such conditions there appeared to be insufficient O to initiate growth of the radicle. Germination in pots into which O was forced indicates that a deficiency of O is probably the principal factor causing a lack of normal germination in rice seed sown at various depths and continuously submerged in $H_2O$. Early seeding of rice is preferable to late seeding because more O is dissolved in $H_2O$ at the low temps. in the spring and this insures a larger percentage of seedlings. J. R. ADAMS

**Nitrogen fixation in the genus Lolium.** R. BROWN. *Nature* **131**, 169–70(1933).—From a comparison of the leaf lengths and dry wt. of plants grown 7–8 weeks in sterile silver sand with and without added nitrate N, under bell jars through which a stream of air, a mixt. of 80% $H_2$, 20% $O_2$ and 0.03% $CO_2$, or a mixt. of 40% $H_2$, 40% $N_2$, 20% $O_2$ and 0.03% $CO_2$ was drawn, it seems probable that some of the N requirement is met by atm. $N_2$ though the full effect of exclusion of $N_2$ is masked by the stimulating effect of $H_2$. JANET E. AUSTIN

**The vitamin content of the culture media and the growth of some mycetes.** V. MANCA-PASTORINO. *Boll. ist. sieroterap. milan.* **11**, 425–37(1932).—The juices of fresh lemons, oranges and peas added (1–5%) to Sabourand's medium, and the presence in the culture media of peanut oil or sterogyl (a com. prepn. contg. vitamin D) increase the growth of several dermatophytes: *Trichophyton violaceum, T. roseum, T. pedis, Achorion schönleinii, Sporotricum gougeroti, Actinomyces bovis*, etc. G. A. BRAVO

**The action of anesthetics on the [plant] protoplasm.** ROSA GIAMBRA. *Lavori ist. botan. Palermo* **2**, 64–9(1931).—The cells treated with $H_2O$ contg. 3% $Et_2O$ for 1–2 hrs. showed an increase in osmotic pressure. G. A. BRAVO

**Oxalic acid in Oxalis cernua, Thumb.** G. CATALANO. *Lavori ist. botan. Palermo* **2**, 84–92(1931).—The oxalic acid content was examd. by plunging the sections in $AgNO_3$ soln.: a white ppt. is formed, which then turns brown, and finally black. It was observed that when the acid is present in excess in the plant, the excess is transformed into Ca oxalate. **Oxalic acid and the aging process in the organs of Oxalis cernua.** *Ibid* **3**, 13–41(1932).—The max. of oxalic acid (2% on fresh substance) was found in fully vegetating organs, while in the old organs, in the bulbs and resting seeds, the acid was found in very small quantities. G. A. BRAVO

**Hormone and growth substance.** H. v. EULER, H. HELLSTRÖM, L. PULKKI AND D. BURSTRÖM. *Arkiv Kemi, Mineral. Geol.* **11B**, No. 5, 5 pp.(1932).—The presence in the spectra of exts. of male and female begonia blossoms and alder catkins of adsorption bands similar to those of folliculin lends support to the assumption that the source of the sex hormones is in the plants. RACHEL BROWN

**Carbohydrate and nitrogen metabolism in the celery plant as related to premature seeding.** H. PLATENIUS. Cornell Univ. Agr. Expt. Sta., *Memoir* **140**, 66 pp.(1932).—Chem. examn. of the whole celery plant showed that the accumulation of carbohydrates was decidedly influenced by temp. At 4–10° the percentages of both starch and sugar increased. There were no indications that a lowering of the temp. caused transformation of starch into sugar, even at near-freezing temps. When plants were moved from a lower to a higher temp., transformations of carbohydrates occurred within a very short time to the levels of plants always kept at the higher temp. During the growing season both carbohydrates and N, based on dry wt., decreased slowly. Low temps. caused an increase in protein and a decrease in sol. N. Temp. was without effect on the synthesis of amino acids. Whenever amino N increased or decreased, nitrate N acted inversely. This lends proof to the theory that amino N is formed from nitrate N. An inverse relation also existed between amino and protein N; this indicates that protein is the result of a polymerization of amino acids. Morphological evidence of seed stalk formation was found fully 10 days before any change in chem. compn. was noted. With the development of reproductive organs, a considerable increase in metabolic efficiency took place; the growth curve was higher and carbohydrates were synthesized at a more rapid rate than in the corresponding vegetative plants. In the celery plant the formation of the reproductive organs is not detd. by nutritional factors which involve the entire plant. Low-temp. treatment of celery plants coupled with low carbohydrate content is assocd. with premature seeding. The changes in the plant which bring about this condition are not believed to be enzymic. It is possible that low temp. results in the formation of flower-forming substances of the nature of hormones. Fifty-two references are appended. C. R. FELLERS

**Assimilation of nutrients by Sudan grass.** LAJOS DWORÁK. *Kisérletügyi Közlemények* **35**, 28–44(1932).—Assimilation of K by Sudan grass stops at the flowering period but begins once more during the ripening of seeds. Sudan grass takes more N and less K out of the soil than the cereals. It requires most nutriment during the periods of stem and flower formation. For the formation of dry matter there is required in the beginning much P, then much N and finally much K. S. S. DE FINÁLY

**Phytochemical examination of the leafy tops of Amaranthus quitensis H. B. K.** LUIS FLORIANI. *Rev. centro estud. farm. bioquím.* **22,** 143–7(1932).—The plant is a weed commonly called "yuyo colorado" in Argentina. A botanical description and chem. analysis are given. It contains a new acid saponin provisionally named *quitensis-saponin.* L. E. GILSON

**Vitamin formation in plants.** ARTTURI I. VIRTANEN AND SYNNÖVE v. HAUSEN. *Naturwissenschaften* **20,** 905(1932).—Peas grown under sterile ($p_H$ 6.5, $KNO_3$ as N source), and those grown under natural, conditions produce equal amts. of carotene (around 1.3 mg. per g. dry substance) and vitamin C (27 and 14–19 cc. of 0.001 *M* 2,6-dichlorophenol-indophenol soln. per 10 g. dry substance). The plants synthesize vitamins A and C without coöperation of soil bacteria. The N source is of some influence; somewhat lower values for both vitamins are found if $(NH_4)_2SO_4$ is used; addn. of nitrification bacteria will improve the yield. B. J. C. VAN DER HOEVEN

**Chemical mechanism of photosynthesis.** ARTHUR STOLL. *Naturwissenschaften* **20,** 955–8(1932).—A review on $CO_2$ assimilation and chlorophyll chemistry. The work of Conant and co-workers (*C. A.* **25,** 1256) is discussed. In the recent chlorophyll formulas of S. one extra double bond is present which can be catalytically hydrogenated to give dehydrochlorophyllene *a* or *b* without change in color or spectrum; the H can be readily given up. This H is considered the active element in the function of chlorophyll in photosynthesis, activated $CO_2$ being the acceptor for this H. The original H can be derived from photodecompn. of $H_2O$ by chlorophyll into H + OH, the latter giving $H_2O_2$ and being subsequently decompd. into $H_2O + O_2$ by leaf catalase (Blackman reaction). None of the intermediary products accumulates; hence the assimilatory ratio $O_2/CO_2 = 1$. The assumption of a double photoreaction in assimilation, (1) $CO_2$ activation, (2) $H_2O$ decompn., seems supported by the trend of the fluorescence intensity during assimilation (Kautsky and Hirsch, *C. A.* **26,** 1637), for which an interpretation different from the one of Kautsky (*C. A.* **27,** 1029) is given. B. J. C. VAN DER HOEVEN

**Extractives of Acanthias vulgaris embryos.** FR. KUTSCHER, ERNST MÜLLER AND WILH. SPAHR. *Z. Biol.* **93,** 239–40(1932).—Choline and betaine were isolated but contrary to existing belief no trimethylamine oxide was found. FRANCES KRASNOW

**Role of vine reserve materials in the setting of fruit varieties and in the ripening of grapes.** L. MOREAU AND E. VINET. *Ann. agron.* [N. S.], **2,** 363–74(1932).—At the time of budding and ripening the necessary sugar is obtained largely from the vine structure, principally from the trunk. The root furnishes none. Sugar addns. to varieties not naturally rich in sugar and affected by spring freezing increased the no. of grapes. During grape growth sugars and acid increase only slightly until ripening when there is a sudden rise in sugar content and a slight decrease in acidity. These phenomena continue moderately during maturation. The vital forces initiating this mobilization depend on temp. and humidity. The sugar proportions in the sap of the grape variety studied were glucose 63 and levulose 37% during budding and ripening. F. W. MARSH

**Wood's rays and the physiological selection of rice seed.** R. CHIAPPELLI. *Giorn. risicoltura* **22,** 171–3(1932).—A new system of seed selection is based on the fluorescence of seed under Wood's rays, indicating loss of vitality. ALBERT R. MERZ

**The influence of some colloidal solutions on the development of Aspergillus niger.** G. ROSSI AND A. MARESCOTTI. *Biochim. terap. sper.* **18,** 482–8(1932); cf. *C. A.* **26,** 5123.—Colloidal solns. of S, $As_2S_3$ and of Congo red, when added to Raulins culture medium with 2% agar, inhibit the growth of *Aspergillus niger.* Congo red has the greatest effect, $As_2S_3$ the least. Below a certain limit of concn. the growth is only retarded. A. E. MEYER

**The photochemical reaction in photosynthesis.** ROBERT EMERSON AND WM. ARNOLD. *J. Gen. Physiol.* **16,** 191–205(1932); cf. *C. A.* **26,** 3822.—Measurements of photosynthesis in continuous and flashing light of high intensity showed that the amt. of chlorophyll present per mol. of $CO_2$ reduced per single flash of light was about 2480 mols. The time required for 1 unit in the photosynthetic mechanism to complete the cycle of photochem. and Blackman reactions was about 0.02 sec. at 25°. The rate of the photochem. reaction is described by the equation, $R = AIN$, where $A$ is a velocity const., $I$, the intensity of light and $N$, the no. of units in the photosynthetic mechanism. C. H. RICHARDSON

**Literature on pollen statistics and related topics published in 1930 and 1931.** G. ERDTMAN. *Geol. Fören. Förh.* **54,** 395–418(1932).—A continuation of the list noted in *C. A.* **22,** 102, with 261 titles. WILHELM SEGERBLOM

**The biological study of radiosensitivity.** J. NAKAGAWA. *Japan. J. Obstet. Gynecol.* 15, 304–12(1932).—The sensitivity of the young plant, *Pisum sativum,* to x-rays was increased by administering the chlorides of K, Mg and Ca in certain concn. The degree

of distufbance which the ions of K, Mg and Ca caused in the growth of the plant was in the order K>Mg>Ca, and the effects in increasing the radiosensitivity, Ca>Mg>K. Addn. of the chlorides of Al, Fe, Cu, Zn, Sn, Ba, W, Hg and Pb to culture media brought a marked increase in the radiosensitivity of the plant, and the intensity increased approx. in the order Ba, Sn<Al<Pb, W<Fe<Cu<Zn<Hg. ## E—NUTRITION

PHILIP B. HAWK

**Experimental rickets in rats. V. Toxicity of irradiated ergosterol preparations.** P. GYÖRGY AND G. POPOVICIU. *Jahrb. Kinderheilk.* **82**, 34–74(1931).—By irradiation of ergosterol a highly antirachitic but nontoxic prepn. has not yet been obtained. B. C. A.

**The cause of infections following lack of vitamin A.** PH. ARONS AND MARY P. J. VAN DER RIJST. *Nederland. Tijdschr. Geneeskunde* **76**, IV, 5445–57(1932).—Products of glandular excretion accumulate leading to keratinization of the ducts, thus producing a favorable substrate for the bacteria. R. BEUTNER

**Vitamin deficiency in the antenatal period, its effects on the mother and infant.** J. PRESTON MAXWELL. *J. Obstet. Gynaecol. Brit. Empire* **39**, 764–76(1932).—Vitamin deficiency may prove to be the cause of a no. of the cases of hemorrhagic disease in the newborn. RACHEL BROWN

**The need for standardization of products containing added vitamins.** KATHLEEN CULHANE AND S. W. F. UNDERHILL. *Chemistry and Industry* **1933**, 66–8.—A general discussion. F. L. DUNLAP

**The comparative value of various protein foods for growth.** ÉMILE F. TERROINE AND SIMONE VALLA. *Compt. rend.* **196**, 288–90(1933).—A study of the effect of 18 substances on the growth of young pigs. A mixt. of skimmed milk and starch, together with the necessary minerals and vitamins, constitutes a regimen for growth *par excellence* Among the cereals, barley shows a marked superiority. The complete proteins from wheat (Graham flour) are better than those in flour of shorter extn. Soy-bean flour is among the better protein foods of vegetable origin. Peanut-flour proteins are equal in value to those from whole wheat. F. L. DUNLAP

**A method of animal tests for vitamin A.** SEI-IHI UENO, YASUO OTA, KŌTARO TONE AND SHIGERU YOKOYAMA. *J. Soc. Chem. Ind., Japan* **35**, Suppl. binding 491–2(1932) —Feeding tests for vitamin A were made on carp (*Cyprinus caprio* Linné). The only defect of this method is the falling of the water temp. during the winter season, which leads to a weakening of the fish. F. L. DUNLAP

**The decrease in vitamin A by the heat treatment of milk.** S. SCHMIDT-NIELSEN, ARNE FLOOD AND JØRGINE STENE. *Kgl. Norske Videnskab. Selskab Forh.* **5**, 110–13 (1932).—A comparative test with rats of butter fat, obtained from the same sample of milk, a portion of which was unheated, a portion pasteurized and a portion stassanized. The butter fat from the pasteurized milk (63° for 30 min.) showed greater vitamin A loss than did that from stassanized milk (heating in a closed system to a max. of 73° for 15 sec. and immediate cooling to 2° out of contact with air). F. L. DUNLAP

**Effect of the conditions of storage on the vitamin D potency and on other features of cod-liver oil.** E. J. SHEEHY. *Sci. Proc. Roy. Dublin Soc.* **20**, 463–8(1932).—"A good quality sample of cod-liver oil does not materially alter its vitamin D potency when stored for 16 months—(1) in a completely filled and sealed transparent bottle exposed

to light, (2) a similar bottle kept in a dark cupboard, (3) a completely filled and sealed tin-lined container and (4) a barrel partly filled with oil." F. L. DUNLAP

**Experimental dietetic studies on the utilization of fish meat and fish roe.** A. BICKEL. *Arch. Verdauungskrankh.* **52**, 361–76(1932).—Caviar is rich in protein, lecithin and fat. It increases gastric secretion to a greater extent than ordinary meat, contains a significant amt. of growth vitamin, and its protein is almost completely absorbed in the intestinal canal. Fish (perch-pike) meat is almost pure protein, has a marked stimulating action in gastric secretion, is completely absorbed from the intestinal tract, and, in the raw state at least, contains a large amt. of growth vitamins. HARRY EAGLE

**Magnesium rachitis.** GEORG MEYER ZU HÖRSTE. *Klin. Wochschr.* **11**, 1796 (1932).—A preliminary report. The addn. of $MgCO_3$ to an otherwise satisfactory diet causes a P-deficient rachitis in rabbits and rats, similar to that caused by $CaCO_3$. Histologically and chemically the condition so produced resembles the rachitis of infancy, as well as that caused by P deficiency in rats; moreover, it is cured by the same therapeutic agents effective in the rachitis of children. In considering the etiology of the disease, one must therefore consider the ratio Ca + Mg/P, instead of merely Ca/P. HARRY EAGLE

**The effect of Lugol's solution upon the adrenaline effect in Basedow's disease and beriberi.** W. C. AALSMEER. *Klin. Wochschr.* **11**, 2111–13(1932); cf. *C. A.* **26**, 3837.—In beriberi, as in hyperthyroidism, Lugol's soln. has a therapeutic action, suggesting that the thyroid may be involved in the former. The effect of adrenaline upon the circulation, used as a clinical measure of the degree of hyperthyroidism, soon becomes less pronounced in both conditions upon the administration of I. HARRY EAGLE

**Deterioration of alfalfa hays resulting from rain.** EARL DOUGLASS. Colo. Agr. Expt. Sta., *45th Annual Rept.* **1931–2**, 32–4.—Alfalfa hay cured in diffused light contained an av. of 52 units of vitamin A per g.; that cured in direct sunlight averaged only 27 units. Approx. 56% of the vitamin A was lost from cut alfalfa hay after a 1 in. rain; after a 2 in. rain the loss was 73% in the first cutting. There is a progressive increase in both vitamins A and B (complex) from the bud to the one-half bloom stage of growth. Vitamin B is richest in the first cutting, the third cutting contg. only $^1/_2$ as much as the first. Vitamin B is conserved to a much greater degree in alfalfa cured in diffused sunlight. C. R. FELLERS

**Relation of the vitamin B complex to renal enlargement caused by cystine and protein in the diet of the rat.** BERNARD B. LONGWELL, ROBERT M. HILL AND ROBERT C. LEWIS. *J. Nutrition* **5**, 539–50(1932).—Vitamin B complex prevents abnormal development of the kidney of the rat under the influence of cystine or excess casein. A concn. of 0.6% cystine or an excess of casein caused renal hypertrophy but 0.3% of cystine did not. The hypertrophy could be prevented by the administration of vitamin B complex. Graded doses of whole yeast ext. caused a progressively decreasing response on the part of the kidney to the administration of cystine. Cystine was not nephrotoxic to rats in the sense of causing degenerative lesions of the kidney. Thirty-five references are appended. C. R. FELLERS

**Protein requirements of the albino mouse.** FRANKLIN C. BING, W. LLOYD ADAMS AND RUSSEL O. BOWMAN. *J. Nutrition* **5**, 571–9(1932).—The protein requirements of the mouse are certainly fulfilled by diets contg. 15.6% casein and probably somewhat less would be satisfactory. However, inasmuch as the livers of the mice fed 7.8% casein contained only $^1/_2$ as much glutathione as mice fed 15.6% or more casein, and growth was somewhat stunted, it seems probable that 7.8% was insufficient. The protein requirements of rats and mice are nearly the same. C. R. FELLERS

**Calcium and phosphorus of saliva in relation to dental caries.** REBECCA B. HUBBELL AND RUSSEL W. BUNTING. *J. Nutrition* **5**, 599–605(1932).—In a group of children 7–16 yrs. old there was no relation between Ca and P contents of the saliva and the occurrence of dental caries. When the diet was supplemented by the daily addn. of 1 qt. of milk and 2 oz. of tomato juice, with or without viosterol, there was a slight tendency toward a decrease in the incidence of dental caries. This improvement in tooth condition was not accompanied by any consistent change in the salivary Ca and P. In interpreting salivary analyses, the vol. of saliva secreted in a given time should be considered. C. R. FELLERS

**Utilization of calcium and phosphorus by dairy heifers; high and low calcium roughages.** O. C. CUNNINGHAM, L. H. ADDINGTON AND W. E. WATKINS. N. Mex. Agr. Expt. Sta., *Tech. Bull.* **206**, 3–18(1932).—There was no material difference in the use of P by heifers receiving cane hay or alfalfa hay. Wood gnawing, in this expt., was not an indication of P deficiency. A calf up to 1 yr. of age should have a Ca and P intake of at least 31.7 and 16.3 g., resp., per day, providing at least 50% of the ash of the feed is available. Numerous P and Ca balances are reported. C. R. FELLERS

**Cottonseed meal studies.** C. H. HUNT. Ohio Agr. Expt. Sta., *Bimonthly Bull.*

158, 178–82(1932).—Feeding expts. with rats showed cottonseed meal was deficient in certain amino acids (unnamed) and in minerals. When supplemented with casein, alfalfa, yeast, etc., the meal gave good growth gains. About 20% of the ration is the max. amt. of raw cottonseed meal which when properly supplemented can be fed to rats and still obtain good growth. *Gossypol*, the poisonous principle of cottonseed, is much more toxic to the hog than to the rat (5 to 1). About 75% of the gossypol content of raw cottonseed is destroyed in the prepn. of com. cottonseed meal. Even com. meal retains sufficient toxic principle to produce somewhat abnormal reproduction in the rat. The meal is a good source of vitamin B complex. The administration of $Fe_2O_3$ did not reduce the toxicity of the cottonseed meal. C. R. Fellers

**Vitamin D requirements of dairy calves.** S. I. Bechdel and K. G. Landsburg. Penna. Agr. Expt. Sta., *Bull.* 279(45th Annual Rept.), 9(1932).—Sun-cured alfalfa hay when fed as a supplement to calves at the 2.5 lb. daily level showed no rickets whereas dehydrated alfalfa hay resulted in the development of mild rickets. Rat-feeding tests verified the results obtained with calves. A daily exposure of 30 min. to a C arc lamp cured or prevented rickets in calves when fed a basal rachitic diet. The growing calf was able to utilize the antirachitic factor supplied by activated ergosterol. Rat-feeding as well as calf-feeding trials indicated that oat straw carries considerable vitamin D C. R. Fellers

**Hock disease in poultry.** J. E. Hunter, H. C. Knandel, R. Adams Dutcher and N. B. Guerrant. Penna. Agr. Expt. Sta., *Bull.* 279(45th Annual Rept.), 10(1932).—Two % of bonemeal in a poultry ration caused 50% of the chicks to develop hock-joint disease, while an equiv. amt. of $Ca_3PO_4$ had no effect. When $CaCO_3$ was fed so that the Ca intake was equiv. to 2% of bonemeal, hock disease developed. The feeding of oat hulls, which contain vitamins B and G in appreciable amts., prevented the disease C. R. Fellers

**Lime and phosphoric acid requirements for chicks.** R. M. Sherwood. Tex. Agr. Expt. Sta., *Bull.* 462, 2–14(1932).—The $P_2O_5$ requirement for the 1st 6–8 weeks is higher than for a period of 12 weeks. With the rations used, 0.65–0.87% P and 1.07–2.14% of Ca were required for greatest growth gains. With chicks grown to 12 weeks of age and receiving rations contg. 12–18% of dried buttermilk, the P requirement for satisfactory gain in wt. was 0.48–0.53%. Under these conditions the Ca requirement was 0.93–1.36%. These results agree very well with those of Wilgus (*C. A.* 26, 2221). The mineral requirements recommended for normal gains in live wt. also resulted in satisfactory calcification of the bones. C. R. Fellers

**Calcium and phosphorus requirements of dairy cows. II. Weekly balances through lactation and gestation periods.** H. B. Ellenberger, J. A. Newlander and C. H. Jones. Vt. Agr. Expt. Sta., *Bull.* 342, 2–20(1932); cf. *C. A.* 26, 3009.—In all, 10 trials were completed on the Ca and P balances of 5 cows through complete lactation and gestation periods. Slightly pos. Ca and P balances were found, with 1 exception, in all cows who had ended their second lactation and gestation periods. There was a decided increase in the amt. of Ca stored but a slight decrease in the amt. of P retained when no mineral supplements were given. By considering all trials of each cow together, with and without mineral supplements, there was a substantial storage of both Ca and P in each case. C. R. Fellers

**The metabolism of animal organisms. II.** László Urbanek *Mezögazdasági Kutatások* 5, 355–66(1932).—A relatively small disturbance in the salt metabolism very considerably diminishes the power of resistance of the organism against contagious diseases. Insufficient intake of mineral substances is not compensated by addn. of vitamin D alone to the ration. The quality of fodder plants should be detd. with respect to their effect on mineral metabolism. S. S. de Finály

**Vitamin D.** Viktor Kurelec. *Mezögazdasági Kutatások* 5, 381–5(1932).—A review. S. S. de Finály

**Carotene in the endocrine glands of bovine cattle.** Roger Nettier *Bull. soc. chim. biol.* 14, 1555–9(1932); cf. *C. A.* 26, 5328.—Crystallizable carotene was isolated from the suprarenals, ovaries and testicles. The hypophysis contained a trace and the thymus and thyroid none. L. E. Gilson

**The magnesium-potassium-calcium ratio in the diet of Egyptian peasants.** P. Schrumpf-Pierron. *Compt. rend. soc. biol.* 111, 996–8(1932).—Analyses of the ash of the foods commonly eaten by the fellah class of Egypt are given. The diet is much higher in Mg than the av. European diet. L. E. Gilson

**The origin of vitamin D in the organism.** F. Venulet and F. Gorbel. *Compt. rend. soc. biol.* 111, 1026–8(1932).—Rats were kept on McCollum's diet 3143 until rachitic. The addn. to the diet of ultra-violet-irradiated feces of rachitic rats or non-irradiated feces of normal rats had no effect, but 10% of irradiated feces of normal rats caused recovery. Rachitic rats were killed, hashed and dried. This tissue mixt. when

fed had no antirachitic effect, but if irradiated before feeding it became markedly antirachitic. L. E. GILSON

**Effect of dinitro-α-naphthol on the glycogen of pigeons deprived of vitamin B.** C. HEYMANS AND H. CASIER. *Compt. rend. soc. biol.* **111**, 1078–80(1932); cf. *C. A.* **26**, 5339.—Pigeons were deprived of vitamin B until they had lost 28% in wt., then daily doses of 1–5 mg. 2,4-dinitro-α-naphthol per kg body wt. were injected. No hyperthermia occurred but a rapid decrease in liver glycogen was produced. L. E. G.

**Nutrition in relation to reproduction, with special reference to sterility.** I. LEITCH. *Nutrition Abstracts and Reviews* **2**, 451–8(1933).—A review. E. H.

**Effects of vitamins A and D on antibody production and resistance to infection.** MERIDIAN RUTH GREENE. *Am. J. Hyg.* **17**, 60–101(1933).—The sera of rabbits deficient in vitamins A and D were normal for natural hemolytic antibodies for sheep red corpuscles. Rabbits deficient in vitamin A exhibit a marked lack of response to immunization with sheep or ox red cells. The titer of the serum of each control animal was 10–300 times higher than that of the corresponding vitamin-deficient rabbit injected at the same time. Animals deficient in vitamin D respond normally to sheep red blood cells. Rabbits deficient in vitamins A and D showed no change in the normal agglutinin content of the sera for *B. typhosus*. There appeared to be a slight tendency for rabbits depleted of vitamin A to respond with lower titers than controls to immunization with *B. typhosus*. Acquired agglutinins for *B typhosus* were normal in the rabbits deficient in vitamin D. Rabbits deficient in vitamin D showed no difference in normal and acquired hemagglutinins for sheep red cells when compared with control animals. Rabbits on diets deficient in vitamins A and D showed no change in the serum complement. The temps. of rabbits deficient in vitamin A and D remained normal during the period of depletion. Rabbits deficient in vitamins A and D showed no difference in erythrocyte counts when compared with their resp. controls. Rabbits on a diet deficient in vitamin A reacted with a definite leucocytosis, which appeared with xerophthalmia, in about 75% of the animals. The leucocyte counts of the rabbits deficient in vitamin D were normal. In the xerophthalmia group 53% showed a decided abs. increase in pseudoeosinophils when compared with the control group. A lymphocytosis occurred in the rachitic animals and their controls, but it occurred in a higher percentage of the rabbits deficient in vitamin D and had a tendency to be considerably greater. After the appearance of xerophthalmia there was a change in the nasal flora of the rabbits deficient in vitamin A. The flora of the vitamin A controls and that of the rachitic group did not change. Spontaneous infections with *B. pyocyaneus* occurred in rabbits deficient in vitamin A, but not in animals deficient in vitamin D nor in the controls of either group. Rabbits deficient in both vitamin A and vitamin D are more susceptible to intranasal infection with *Bact lepisepticum* than control animals. Rabbits deficient in vitamin A are more susceptible to intravenous infection with type I pneumococcus than normal controls. Rachitic rabbits showed a higher morbidity and mortality following intranasal inoculation with type I pneumococcus than the control animals. There are 32 references to the literature. J. A. KENNEDY

**Health aspects of fruit beverages.** WALTER H. EDDY. *Am. J. Pub. Health* **23**, 129–37(1933). Results in general give further support to the suggestion that fruit juices may have a supplementing effect in making more utilizable other factors in food mixts. The mechanism by which the effect is accomplished is not demonstrated by expts. to date but several leads have been suggested and are being followed. Tabulated data are given for: (1) dietary studies on 3 boys using a banana diet, (2) milk modified with banana sugar, (3) effect of varying proportions of banana in rat diets on retention of Ca, P and N, (4) the effect of sugars on intestinal flora and H-ion concn., (5) the effect of banana sugar on *B. enteritidis* and (6) the effect of fruit juices on the rate of absorption of Ca salt. J. A. KENNEDY

**Vitamin A. I. The absorption spectra of carotenoids.** KOZO KAWAKAMI. *J. Agr. Chem. Soc. Japan* **8**, 48–54(1932). β-Carotene isolated from *Daucus, Capsicum* or spinach has absorption bands between 3300 and 3400 A. U. and between 2630 and 2950 A. U. Biosterol also has an absorption band between 3300 and 3400 A. U. The absorption bands of xanthophyll and lutein could not be distinguished from those of carotene, while α-crocetin and capsanthin have very different absorption bands. **II. Properties of hydrocarotene and its physiological action.** *Ibid* 55–63.—Carotene was dissolved in a mixt. of hexane and EtOH and reduced with Al amalgam for 3 hrs. A light reddish orange oil was obtained. The reactions and the absorption bands of hydrocarotene resembled those of biosterol, but it did not have the effects of vitamin A in albino rats. **III. Relation between hydrocarotene and biosterol.** *Ibid* 64–71.—An ether soln. of biosterol was treated with Grignard reagent. A ppt. was formed and at the same time $CH_4$ was generated. The ppt. was practically insol. in petroleum ether. The color reaction of biosterol with concd. $H_2SO_4$ was found only in part of the ppt. The genera-

tion of $CH_4$ indicates the existence of a OH group in biosterol. Carotene and hydrocarotene do not react with Grignard reagent, and hence hydrocarotene is not contained in biosterol. Xanthophyll was reduced with Al amalgam at 60–70° to hydroxanthophyll, which reacts with Grignard reagent and resembles biosterol in its chem. properties and absorption spectrum. It does not have the effects of vitamin A in albino rats.
Y. KIHARA

**Nutritive value of various types of phosphoric acids.** KATSUO TAKAHASHI. *J. Agr. Chem. Soc. Japan* **8**, 515–18(1932).—Na salts of orthophosphoric acid (secondary salt), pyrophosphoric acid, metaphosphoric acid, hypophosphorous acid, glycerophosphoric acid and phytic acid, and Ca salts of orthophosphoric acid (secondary salt) and hexosediphosphoric acid were used. The phosphate (1% as free acid) was given to albino rats along with the basal ration contg. muscle protein 17, starch 60, butter 20, salts without P 3% and a small amt. of oryzanin. No growth took place with hypophosphorous acid and without phosphoric acid. In the other cases normal growth was observed.
Y. KIHARA

**Physiological actions of ether-soluble substances of polished rice. [Supplement].** YOSHIKAZU SAHASHI. *J. Agr. Chem. Soc. Japan* **8**, 1093–1103(1932); cf. *C. A.* **27**, 756.—Higher unsatd. fatty acids such as clupanodonic acid and hiragonic acid hindered the growth of rats. Albino rats were fed with polished rice freed from fat 90, muscle protein 10 and McCollum salt 4. No toxicosis could be found. When 1% of pure fatty acids such as oleic, linoleic, linolenic acid was added, growth was rather good. Linolic acid of rice is necessary for normal nutrition. The portion of lower b. p. and the liquid unsaponifiable matter in the ether-sol. substances of the rice were given *per os* Toxic action could not be demonstrated. From unsapd. matter sterols crystd. out The properties of sterol coincide with those of phytosterol. Trace of ergosterol in sterols was indicated by color reactions, etc. Albino rats were separately fed with extd. polished rice and wheat flour for a half year. The difference between their nutritive value could not be observed.
Y. KIHARA

**The nutritive value of pentosan. III. The glycogen accumulation in the body of rats on xylan feeding.** HISAYOSHI IWATA. *J. Agr. Chem. Soc. Japan* **8**, 1175–9; *Bull. Agr. Chem. Soc. Japan.* **8**, 90–3(1932); cf. *C. A.* **25**, 3036.—Xylan was given to starving albino rats; of glycogen an accumulation in the body was found. It is, however, little less than in starch feeding This may be attributed mainly to the difficulty in the digestion of xylan by rats. If the quantity of glycogen is calcd. for the unit of the digestable substance, there is little difference between starch and xylan. **IV. The methods of treatment and the kinds of animal for the digestibility of pentosan.** *Ibid. J Agr Chem. Soc. Japan* **8**, 1252–8; *Bull. Agr. Chem. Soc. Japan* **8**, 93–5(1932) —When the straw of rice, barley, wheat, *Panicum crus-galli* L. var. frumentaceum, Hook or coarse hay of *Muscanthus sinensis* Anders. was soaked in a cold 0.75–1.5% NaOH for 4 hrs., or in 1% $Ca(OH)_2$ for 2 days, or boiled in 1% $Ca(OH)_2$ for 1.5–3 hrs., the digestibility of pentosan was 1 4–2.1 times that of the untreated materials. When rice straw was soaked in 0.25% NaOH for 4 hrs., or in the wood ash soln. for 2 days or boiled in $H_2O$ for 3 hrs, no increase of the digestibility could be found. The rabbit digested 78.9% of xylan, the albino rat 33.1% and the guinea pig 62.9%.

**The present status of the ketogenic diet.** D. SCHUYLER PULFORD. *Ann. Internal Med.* **6**, 795–801(1932).
JOHN T. MYERS

**Changes in the testes of rats kept on a diet deficient in vitamin A.** MYRA M SAMPSON AND V. KORENSCHEVSKY. *J. Path. Bact.* **35**, 875–87(1932); cf. *C. A.* **27**, 755, 1031.
JOHN T. MYERS

**The occurrence of vitamin C in the Eriwan grape.** AKOP JOHANNISSIAN AND HRATSCHJA BUNIATIAN. *Bull. inst. sci. R. S. S. Arménie* **1931**, 213–28(Russian 229–31)(Summary 231–4 in German).—Quant. results in vitamin C assay are obtained from the Bezssenov color test, even though it gives a pos. test with *o*- and *p*-substituted aromatic compds. This method was employed in detg. the vitamin C content of several kinds of grapes, feeding expts. on guinea pigs being used as controls. All the Eriwan grapes examd. contained vitamin C. Orthuzi-Djilari, Muscat, Chardji and Chatscha basch grapes contained more vitamin C than the others examd.
W. G. ROSE

**The importance of potassium for the animal organism.** F. BUROW. *Kunstdünger u. Leim* **30**, 5–7(1933).—A brief review.
C. J. SCHOLLENBERGER

**The effect of the ingestion of a large amount of fat and of a balanced meal on the blood lipides of normal man.** EVELYN B. MAN AND EDWIN F. GILDEA. *J. Biol. Chem.* **99**, 61–9(1932).—The ingestion of 3.5–4 g. fat per kg. body wt. raised the non-phospholipide fatty acids of the serum from the normal value of 5.0–9.4 to values from 8.7 to 22.0 milliequivs. per 100 cc. serum, an av. rise of 62%. The phospholipide fatty acids were increased about 18%. A balanced meal increased the non-phospholipide fatty acids by an av. of 21% but only slightly affected the phospholipides.
K. V. T.

**The antirachitic potency of eggs from hens receiving massive doses of activated ergosterol.** FRANCIS G. MCDONALD AND O. N. MASSENGALE. *J. Biol. Chem.* **99**, 79–83(1932).—Pullets receiving 2 g. cod-liver oil per 100 g. diet produced egg yolks whose oil had a cod-liver oil coeff. of only 0.7. Substitution of 2 g. activated ergosterol contg. 10,000 units per g. for the cod-liver oil gave a yolk oil with a cod-liver coeff. of 130. The transfer of vitamin D from food to eggs is thus as inefficient as the transfer from food to milk by the cow. Egg-yolk oil administered to baby chicks was not as effective a source of vitamin D as cod-liver oil of the same vitamin content. K. V. THIMANN

**The fate of the antirachitic factor in the chicken. II. The effectiveness of the factor administered by mouth and intraperitoneally.** WALTER C. RUSSELL, M. W. TAYLOR AND D. E. WILCOX. *J. Biol. Chem.* **99**, 109–18(1932); cf. Klein and Russell, *C. A.* **26**, 1014 and preceding abstr.—The bone-ash percentage in chicks fed irradiated ergosterol was markedly less than in chicks fed cod-liver oil contg. only one-sixth the amt. of vitamin D. However, the serum Ca and phosphate were the same in the two groups. Whether the vitamin was given by feeding or injection the results were the same, except that when given by injection, the serum phosphate and the total body wts. of the chicks were somewhat lower. K. V. THIMANN

**Changes in phosphoric ester content of the red blood cells and the liver in experimental rickets.** H. D. KAY. *J. Biol. Chem.* **99**, 85–94(1932).—The phosphatase content of the tissues of rachitic rats was not significantly different from the normal The acid-sol. phosphoric esters in the red blood cells, however, fell from 55–71 in the normal to 33–53 mg. per 100 cc. in the rachitic animals. A similar decrease in the acid-sol. phosphoric esters in the liver is partly set off by the fact that these compds. increase in amt. with increase in the size of the animal. The addn. of viosterol or cod-liver oil to the rachitogenic diet increases the values in the red corpuscles toward the normal K. V. THIMANN

**Studies on vitamin G [$B_2$] with special reference to protein intake.** H. C. SHERMAN AND I. A. DERBIGNY. *J. Biol. Chem* **99**, 165–71(1932).—Rats on a diet contg. 12 and 18% protein made considerable gains in wt. although deprived of vitamin G ($B_2$). When the protein constituted only 6% of the diet the gains in wt. were slight or neg. There is thus a definite relation between protein supply and susceptibility to vitamin G deficiency K. V THIMANN

**Vital need of the body for certain unsaturated fatty acids. III. Inability of the rat organism to synthesize the essential unsaturated fatty acids.** HERBERT M EVANS AND SAMUEL LEPKOVSKY. *J. Biol. Chem.* **99**, 231–4(1932); cf *C A*. **26**, 3547.—The Me esters of the body fats of rats on various diets were fed to animals on a fat-free diet. The fat from rats on stock diets or from 21-day-old daughters of these rats, just weaned, contained the unsatd. fatty acids essential for growth, but fats from animals on fat free diets were lacking in these compds K V. THIMANN

**The sparing action of fat on vitamin B. IV. Is it necessary for fat to interact with vitamin B in the alimentary canal to exert its sparing effect?** HERBERT M EVANS AND SAMUEL LEPKOVSKY. *J. Biol. Chem* **99**, 235–6(1932); cf. *C. A.* **26**, 3548.—Fat was just as sparing on the requirement of vitamin B in rats when the latter was administered intraperitoneally as when it was given in the diet. **V. The role of glycerides of oleic acid.** *Ibid* 237–40.—Pure oleic glycerides have about the same vitamin-B-sparing action as natural fats On an inadequate vitamin-B supply, glycerides of corn oleic acid are rather less satisfactory, however. The mixed glycerides of oleic and stearic acids were superior in growth-promoting action to glycerides of either acid separately. K. V. T.

**The use of the chick in vitamin $B_1$ and $B_2$ studies.** O. L. KLINE, J. A. KEENAN, C. A. ELVEHJEM AND E. B. HART. *J. Biol. Chem.* **99**, 295–307(1932).—A mixt. of yellow corn 58, middlings 25, casein 12 and NaCl 1 part contains sufficient vitamins $B_1$ and $B_2$ for the maintenance of chicks; together with 2 parts of cod-liver oil and 2 parts of $CaCO_3$ it makes a complete diet. It can be freed from vitamin $B_1$ by autoclaving at 120° for 5 hrs. (diet A) or from vitamin $B_2$ by heating dry at 95–100° for 44 hrs. (diet H). The severe polyneuritis induced in chicks by diet A is cured by the addn. of a vitamin $B_1$ concentrate, and the pellagra induced by diet H is cured by the addn. of autoclaved yeast. K. V. THIMANN

**A study of the heat stability of the vitamin B factors required by the chick.** C. A. ELVEHJEM, O. L. KLINE, J. A. KEENAN AND E. B. HART. *J. Biol. Chem.* **99**, 309–19 (1932).—The vitamin $B_1$ in yeast and in the mixed diet of the preceding abstr. was largely destroyed by heating moist at 100° for 24 hrs. but not by heating dry. The destruction of vitamin $B_2$ on heating dry at 100° was, after 24 hrs., 0%, after 72 hrs., 50%, and after 144 hrs., 100%. In yeast, which contains about 25 times as much vitamin $B_2$ as the diet, the rate of destruction was about half as great. Neither vitamin $B_2$ nor any other thermolabile growth factor is required for the normal growth of chicks. K. V. THIMANN

**Significance of studies of ketosis and of nitrogen and water balance to obesity diets.**

JENNIE I. ROUNTREE. *J. Am. Dietetic Assoc.* **8**, 307–15(1932).—A review with bibliography. Ketosis tends to increase the N loss of the body. Obese subjects are less susceptible to ketosis. Adequate base in the diet reduces the N loss, and the loss of water from the tissues. AMY LE VESCONTE

**The relation of calcium and phosphorus in the diet to the cause of mottled enamel of human teeth.** RUTH M. LEVERTON AND MARGARET CAMMACK SMITH. *J. Home Econ.* **24**, 1091–7(1932).—Adequate Ca and P intake in childhood will not prevent mottled enamel. Adequate protein, calories and vitamins do not prevent it. AMY LE VESCONTE

**Vitamin A in six varieties of frozen cherries.** MYRA T. POTTER AND MABEL A. DICKSON. *J. Home Econ.* **25**, 47–52(1932).—Cherries are as rich in vitamin A as other fruits. The sour variety and the hybrid studied were more potent than the black, sweet varieties. About 0.375 g. of the latter contains 1 unit of vitamin A. A. LE V.

**The winesap apple as a source of vitamin C.** MYRA T. POTTER. *J. Home Econ.* **25**, 52–6(1932).—Feedings of 10 g. of apple daily protected guinea pigs from scurvy. AMY LE VESCONTE

**A study of the effects of fatty acid on nutrition.** UME TANGE. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **20**, 13–28(1932).—Rats on a basal diet that contained no fat developed disease after 7 or 8 weeks, with loss of hair, dermatitis and hemorrhage. Addn. of linoleic and linolenic acids cured this. Oleic and elaidic acids were less effective. Clupanodonic and stearic acids caused continued loss of wt. and death AMY LE VESCONTE

Oxidation of β-carotene (KARRER, *et al.*) **10.**

## F—PHYSIOLOGY

HOMER W. SMITH

**Neurogenic or humoral transmission of stimuli at the ends of the autonomous nerves.** S. E. DE JONGH. *Nederland. Tijdschr. Geneeskunde* **76**, I, 811–20(1932). A discussion emphasizing the difficulties of the theory of humoral, as well as of that of neurogeneous transmission; de. J. assumes (1) that the identical effects of adrenaline and of sympathetic stimulation, *e. g.*, are due to a (hypothetic) secretion of adrenaline by the sympathetic nerves themselves, and (2) that adrenaline acts on the muscle directly. The different actions on various smooth muscles are explained by a difference in their sensitivities, and by the fact that adrenaline, like many other drugs, depresses at low concns. and stimulates at higher ones. R. BEUTNER

**Heterogony and the chemical ground-plan of animal growth.** C. H. WADDINGTON *Nature* **131**, 134(1933).—In addn. to Needham's relative time scales of the chem development of animals, the stages of morphological development and times of detn of different organs should provide 2 other systems of relative time measurements. RACHEL BROWN

**The behavior of glutathione in the hen egg during incubation.** S. CASTAGNA AND M. TALENTI. *Arch. farmacol. sper.* **55**, 28–34(1933).—Reduced glutathione is not present in mature hen eggs, fertilized or unfertilized. During incubation glutathione is formed, the amt. being directly related to the degree of development of the germ, and therefore varying from egg to egg. In general, only small quantities were formed during the first 10–12 days, after which the glutathione content increased much more rapidly The glutathione was detd. by the method of Tunnicliffe. LEWIS W. BUTZ

**The action of extracts of the appendix on the isolated intestine.** C. R. PELLIZZARI AND ENRICO NARDELLI. *Arch. farmacol. sper.* **55**, 89–99(1933).—Exts. of the normal human appendix added in very small amounts to the isolated intestine of the rabbit stimulated peristalsis. Cecal exts. did not have this effect. LEWIS W. BUTZ

**Cholesterol from the human brain.** C. ANTONIANI AND F. ZANELLI. *Atti accad Lincei* **16**, 150–3(1932).—In order to det. whether cholesterol from the human brain is

identical with that from bile, a quantity was extd. from the adult human brain as well as that of the fully developed fetus, by means of $Me_2CO$, and recrystd. from EtOH-$Et_2O$. That derived from the fetus, m. 150°, has $\alpha_D$ —38.7; mol. wt. detd., 410, calcd. for $C_{27}H_{45}OH$ 386; m. p. of the acetate 117°; of the benzoate 148°, and $\alpha_D$ —17.1; palmitate, m. 76.5°, $\alpha_D$ —24.8. That derived from the adult brain, m. 151°, has $\alpha_D$ —45.5; acetate, m. 119.5°; $[\alpha]_D$ —41.0; salicylate, m. 179°, $[\alpha]_D$ —20.4; formate, m. 95–6°; $[\alpha]_D$ —52.1; palmitate, m. 74° $[\alpha]_D$ —23 4; dihydrocholesterol, m. 145°, $[\alpha]_D$ +19.8. These values all show good agreement with those for biliary cholesterol; the generally slightly higher values obtained for the m. ps. are attributed to the absence of cholesterol esters in the above products, since these are not sol. in $Me_2CO$ used above to ext. the material. A. W. CONTIERI

**Growth and development with special reference to domestic animals. XXIV. Decline in energy metabolism per unit weight with increasing age in farm animals, laboratory animals and humans.** SAMUEL BRODY, *et al.* Univ. Mo. Agr. Expt. Sta., *Research Bull.* **176**, 5–59(1932); cf. *C. A.* **26**, 5629.— Data are presented on resting and basal energy metabolism per unit wt. as a function of age for dairy cattle, beef cattle, sheep, hogs, and horses from birth until about $3^1/_2$ yrs of age; also basal metabolism data for white rats grown under various conditions of food supply. There is a slight but unmistakable decline in metabolism per unit wt. with increasing age during the period of senescence. Gestation increases the metabolism per unit wt.; lactation increases this still further. There are marked seasonal variations in the metabolism per unit wt. in sheep with the peak occurring in spring and the trough in summer. Metabolism is more nearly proportional to area than to live wt., probably because the ratio of area to live wt tends to vary in the same manner as the ratio of the visceral organs to live wt. Thirty-seven references are appended. C. R. FELLERS

**Guanidine content of resting and working muscles.** ALADÁR BEZNÁK. *Magyar Biol. Kutató Intézet Munkái* **4**, 476–8(in German 478–82)(1931) —No significant difference was found in guanidine contents of resting and of working frog muscle. The content ranged between 0.85 and 0.61 mg %. S. S. DE FINÁLY

**The β-hormone, cythin, of the corpus luteum.** S. J. PATEL. *Magyar Biol. Kutató Intézet Munkái* **4**, 483–7(in English 488–94)(1931).—Hormone of the corpeus luteum of cows (cythin) caused pseudopregnancy on ovariectomized animals Cythin can be detected by production of mucification in ovariectomized mice. The hormone dissolves in fat solvents and is not saponifiable S S. DE FINÁLY

**Effect of splenectomy and spleen extract on the blood sugar of the dog.** NOËL FIESSINGER AND ROGER CATTAN. *Compt. rend soc. biol.* **112**, 53–5(1933); cf. *C. A.* **26**, 5629 —After splenectomy there is a chronic hyperglucemia, the effect of insulin is diminished to some extent, and the periods of alimentary hyperglucemia are prolonged. The administration of a spleen ext , free from lipoids, proteins and pigments, at the rate of 1 cc ( = 15 g. fresh spleen) per kg decreases blood sugar 20–30%. It is probable that the spleen secretes a "secondary" hormone, totally different from insulin, which decreases blood sugar **Spleen extract and blood sugar in man.** NOËL FIESSINGER AND S GOTHIE *Ibid* 171–2 — Two cc. of the spleen ext. described above was injected intravenously in normal persons and persons suffering from various diseases. Blood sugar was lowered 6–28% at the end of 30 min. No shock or hyperthermia was produced. L. E. GILSON

**Changes in the polypeptide content of the blood during the hours following total hepatectomy or Eck's fistula operation in dogs.** RENÉ LANÇON. *Compt. rend. soc. biol.* **112**, 57–9(1933). L. E. GILSON

**Action of extract of the posterior lobe of the hypophysis on the ovary of the guinea pig.** R. COLLIN AND J. WATRIN. *Compt. rend. soc. biol.* **112**, 61–3(1933).—Ext. of the posterior lobe of the hypophysis has an opposite effect in comparison to that of the anterior lobe. The ovaries decrease in size and the follicles disappear. L. E. G.

**The chemical nature of the ovarian and the gonadotropic hormones.** H. L. FEVOLD. *J. Chem. Education* **10**, 174–9(1933). E. H.

**The absorption of fats.** F. VERZAR. *Nutrition Abstracts and Reviews* **2**, 441–50 (1933).—A review. E. H.

**Volume change in muscle contraction.** O. MEYERHOF. *Naturwissenschaften* **20**, 977–80(1932).—A lecture, describing expts. on measurement of the change in vol. during muscle contraction; hexane was used as indicating liquid in the expansion capillary connected with the vessel contg the muscle in Ringer soln. The vol. change is related to the chem. processes, particularly to the phosphate decompn. taking place in the muscle. A table of vol. changes of the various biochem. reactions is given. B. J. C. VAN DER HOEVEN

**Physiology of the metabolism of the fatty matter in lactation.** L. A. MAYNARD.

*Lait* **12**, 761–74(1932).—With individual cows the level of the lipoid in the blood varied depending on whether the subject was in lactation or not; it differed at different stages of the lactation period, and was influenced under certain conditions by the nature and quantity of the ration. Before it could be said definitely that there was a relation between fat content in the blood and fat content of the milk it was considered necessary to place the exptl. animals under carefully controlled conditions. A. H. JOHNSON

**Protein metabolism in man and animal.** E. VOIT. *Z. Biol.* **93**, 15–41(1932).—An attempt is made to differentiate protein destruction of the fasting individual, min. physiologic protein decompd. and min. physiol. protein requirement. F. KRASNOW

**Glycogen in bone cartilage.** H. A. HARRIS. *Nature* **130**, 996–7(1932).—Cartilage cells in the neighborhood of the epiphysis store glycogen in proportion to their age. It is suggested that the hypertrophic cells provide both phosphatase and glycogen. The latter hydrolyzes and hexosephosphoric esters form, which lead to the deposition of insol. Ca phosphate in the matrix. The literature on phosphatase, glycogen and phosphoric esters is reviewed. MARY E. LEAR

**Glycogen in cartilage.** H. B. FELL AND R. ROBISON. *Nature* **131**, 62(1933).—Harris (preceding abstr.) calls attention to the presence of glycogen in hypertrophic cartilage cells and correlates this with a secretion of phosphatase by these cells. F. and R. suggest that osteoblasts and highly vascularized bone, which were said to contain no glycogen, also secrete phosphatase. A. W. DEXTER

**In vitro respiration of nerve.** T. H. CHANG, R. W. GERARD AND M. SHAFFER. *Proc. Natl. Acad. Sci.* **19**, 152–3(1933).—Nerves suspended in dog serum show greater abs. O consumption than in Ringer soln. and no rise for 20 hrs. The serum prevents the growth of bacteria by heat labile bacteristatic substances in the protein fraction The initially high values seem to be related to a similar fraction. The gain in wt. is much smaller than in Ringer soln. Serum heated to 80° behaves like Ringer. MARY E. LEAR

**Metabolism of the pancreas.** EUGENE U. STILL. *Proc. Natl. Acad. Sci.* **19**, 155–7 (1933).—Pancreatic juice of dogs was collected under oil. Blood pressure, rate of blood flow and rate of secretion were recorded. The av. respiratory quotient was 0.87; max., 1.01. During secretion, the O consumption rose rapidly and the $CO_2$ content of venous blood from the pancreas fell rapidly. It was indicated that metabolic $CO_2$ is diverted into the juice rather than into the blood with as much as 300% increase. M. E. L.

**The phospholytic action of rabbit urine.** ISOO HORII AND SEIHO TOMIKAWA. *Arb dritt. Abt. anat. Inst. kaiser. Univ. Kyoto, Ser. C*, No. 3, 30–4(1932).—In the normal urine of the rabbit no phospholytic enzyme was found. It was found in pathol. urine, but was weak and differed in strength with each specimen. B. S. LEVINE

**Nerve metabolism.** R. W. GERARD. *Physiol. Rev.* **12**, 469–592(1932).—A general review with extensive bibliography. E. R. LONG

**Blood stability in relation to dilution.** MARIO RIGONI. *Arch. fisiol.* **31**, 1–13 (1932).—Diln. with isotonic solns. causes in blood of high isoagglutinating power (horses pregnant women) retardation of the sedimentation. The reverse happens in blood of little agglutinating power (non-pregnant women, cattle). The difference is explained as due to a difference in the elec. charge of the blood constituents. A. E. MEYER

**The imbibition of muscle tissue.** GIULIO BUCCIARDI *Arch. fisiol.* **31**, 19–124 (1932).—The imbibition of the muscle is maximal at the isoelec. point of the muscle protein. In muscle activity, imbibition and surface tension are decreased as a consequence of the decrease of the alky. It cannot be supposed that the formation of $NH_3$ causes muscle contractions by increase of imbibition and surface tension. A. E. M

**Parathyroid and blood coagulation.** RODOLFO FERRARI. *Arch. fisiol.* **31**, 200–7 (1932).—The time of coagulation of dog blood doubles after parathyroidectomy. Parathyroid ext. restores normal clotting time. Blood elements related to the clotting show changes of concn. in relation to the Ca change. A. E MEYER

**Pancreas and blood coagulation.** R. FERRARI AND F. CORTESE. *Arch. fisiol* 31, 274–85(1932); cf. *C. A.* **26**, 1024.—The external secretions contain a substance influencing blood coagulation. It causes formation of prothrombin after absorption through the intestine. A. E. MEYER

**The composition of fat deposits in relation to the surrounding temperature.** C. ZUMMO. *Arch. fisiol.* **31**, 347–54(1932).—The formation of fat from sugar is confirmed in rats. Animals kept at a temp. of 0° or 30° and fed sugar after a previous starvation show a difference of the I value of the fat deposits of 15–25%. Even after diets rich or low in oleic acid, the influence of the temp. could be observed. A. E. MEYER

**The duplicity of the vasoconstrictor substance in serum.** S. GOLDBERGER. *Arch. fisiol.* **31**, 381–7(1932).—One substance is naturally dissolved in the serum, while the other one arises from the cell debris. A. E. MEYER

**Gastric secretion during and after sun baths.** VITTORIO G. BARONE. *Arch. fisiol.* **31**, 468–80(1932).—Gastric secretion is stimulated by sun baths. Quant. values are given. A. E. MEYER

**The mineral content in the bone of rats under varying experimental conditions.** LUISA POZZI AND EDOARDO PRETO. *Biochim. terap. sper.* **18**, 397–407(1932).—The leg bones of the adult rats contain 55–56% of ash, with variations of about 1% between both sides. Slight reductions were observed after prolonged exposure to cold. Unilateral cutting of the *nervus sciaticus* and *cruralis causes* a decrease of the ash on the same side. Injections of trypan blue increase the ash content on both sides, with intact as well as with severed nerves. Irradiated ergosterol has no effect in subcutaneous application. Oral treatment causes a decrease of the mineral content of the bone of 5 to 6% in adult rats. Parathormone, given subcutaneously for several weeks, causes a decrease. By simultaneous treatment with vitamin D and parathormone an additive effect was obtained, with a max. reduction of 9%. A. E MEYER

**The action of posterior lobe-pituitary extract on gastric secretion. Its application on gastric hyperacidity and gastric ulcer.** P L. DROUET AND J. SIMONIN. *Bull. acad. méd.* **107**, 30–5(1932).—Ext. from the posterior lobe of the pituitary reduced gastric acidity and caused improvement in gastric and duodenal ulcers. A. E. MEYER

**Kidney-function test by feeding creatinine [Brandt-Rehberg test].** J. TILLGREN AND E. HAKANSON. *Acta Chirurgica Scand.* **72**, 493–500(1932).—The Brandt-Rehberg creatinine test for kidney bilateral efficiency has been found to be a good supplement to the ordinary kidney-function tests. S. MORGULIS

**Employment of parathyroid hormone in "infiltrations" of the subcutaneous tissue and in the muscles.** OSCAR HORN. *Acta Med. Scand.* **79**, 219–38(1932).—The parathyroid hormone can be administered without producing a demonstrable change in the blood Ca concn. The hormone has been used in the so-called "subcutaneous infiltrations" (fibrositis, cellulitis) often accompanied by myalgia with very favorable results. S. MORGULIS

**Studies on kidney function according to the Rehberg method. I. Variations of the filtration in normal adults.** H. C. A. LASSEN. *Acta Med. Scand.* **79**, 275–97(1932).—With the Rehberg creatinine procedure the kidney filtration rate in 21 normal young individuals varied between 70 and 297 cc. per min., of which $^2/_3$ showed a variation of 100–200 cc. The filtration is somewhat greater in men than in women Considerable variation was also observed in the same individual during different tests, which was partly due to incomplete emptying of the bladder. In clinical cases it is suggested that the glomerular filtration should be detd. for 3 successive 1-hr. periods; the av. should be used. In a no. of patients the av. glomerular filtration was below 100 cc. per min. Diuresis increases the rate of glomerular filtration, which, however, diminishes when the diuresis is excessive. The creatinine output per min. during diuresis increases parallel to the filtration increase. Filtration below 100 cc. per min. is always assocd. with a relatively high plasma creatinine, whereas with low plasma creatinine the filtration is above 200 cc. per min. S. MORGULIS

**Distribution of sugar in the blood and the permeability of the blood corpuscles to sugar.** LADISLAUS MOSONYI. *Biochem. Z.* **256**, 308–25(1932) —The red cells of both man and dog contain less sugar than the plasma. On giving sugar by mouth to dogs the sugar content of the whole blood increases but that of the corpuscles becomes relatively lower than ordinarily. This condition, however, becomes reversed as time passes so that finally the cells contain more sugar than the plasma. In mild diabetics the distribution of sugar in the blood is practically the same as in the normal. But in depancreatized dogs the corpuscles contain relatively less sugar than in the normal animal, which leads to the conclusion that either the pancreas or insulin is essential in regulating the sugar distribution. On administering sugar to depancreatized dogs the same condition arises as in the normal only the inversion of the relation between cell and plasma sugar concn. does not proceed as far as in the normal animal probably because sugar is not so rapidly removed from plasma by the tissues. Injection of insulin brings about a great diminution in the sugar content of the corpuscles of normal dogs, probably because of the formation of glycogen. In depancreatized dogs injection of insulin brings about a return to the normal distribution of the sugar between cells and plasma. The insulin is supposed to regulate the sugar distribution by altering the permeability of the surface to sugar. S. MORGULIS

**Metabolism of tonic and non-tonic bird muscles.** JOSEF MÜNDELEIN. *Biochem. Z.* **256**, 376–83(1932).—The tonic muscles of the pigeon leg differ from the non-tonic muscles of the breast in the same way as the fetal or denervated muscles differ from normal muscles. The leg muscles show an increased lactic acid formation from glucose and hexosediphosphate, whereas in the breast muscles glucose actually inhibits lactic acid formation while hexosediphosphate gives only a small rise in lactic acid. The

transformation of pyruvic to lactic acid by the breast muscles is completely inhibited by $CH_2BrCO_2H$ but that by the leg muscles is entirely unaffected. S. MORGULIS

**The role of bile acids in the carbohydrate metabolism. XXIV. The glucemia curve under the influence of bile acids and adrenaline with or without spleen extract in splenectomized rabbits.** KEIZO FUZIWARA. *Biochem. Z.* **256**, 384–97(1932); cf. *C. A.* **27**, 1404.—After splenectomy rabbits exhibit a condition of hyperglucemia for a long period, but after about 3 weeks the normal glucemia level is reëstablished. Cholic acid administered to splenectomized rabbits brings down the glucemia level but its hypoglucemic effect is weak. Exptl. alimentary hyperglucemia can be reduced either by cholic acid or by spleen ext., and especially by both, when administered to the splenectomized rabbits. But cholic acid increases the hyperglucemic effect of adrenaline in the splenectomized rabbit, this hyperglucemia being reduced by the administration of spleen ext. S. MORGULIS

**The anticoagulant action of bile in vitro.** H. ELBEL. *Biochem. Z.* **256**, 398–405 (1932).—The anticoagulant action of bile may be attributed to the effect of the bile acids on Ca, and it is thought that the inhibiting effect of the cholates results from a rupture of a lipoid-Ca complex (thrombokinase). S. MORGULIS

**Chemistry of the skin.** A. LOEWY AND G. CRONHEIM. *Biochem. Z.* **256**, 411–31 (1932).—Chem. analyses were made of the skin from rats and guinea pigs both under usual conditions and when the animals were under greatly reduced pressure, kept in the dark, radiated with ultra-violet or treated with vigantol. The water and fat contents of the skin are highly variable even under normal conditions. The non-protein N was not affected by 5 hrs. of ultra-violet radiation nor by exposure to one-half atm. pressure for periods up to 18 days. It is difficult to judge the significance of such analyses in guinea pigs since even normally the non-protein N ranges from 123 to 227 mg. %, but in the rat where the normal variation is 86–114 mg. % an increase of 27% was found under reduced pressure and of 36% under the influence of vigantol. The Cl content of the rat skin was increased by low pressure or vigantol treatment, but decreased in the dark or under ultra-violet radiation. The K was raised by long sojourn under low pressure or vigantol; it was lowered by ultra-violet radiation but unaffected by darkness. The Ca was decreased under low pressure or vigantol treatment. The Na was practically const. Mg was increased by low pressure or radiation. In the guinea pig the Cl of the skin is affected just as in the rat. The K content was hardly determinable but its amt. was increased by radiation or by vigantol. The Ca was not affected by darkness or radiation while the influence of vigantol and low pressure was uncertain. So far as Mg is concerned, the results show great variability except that it decreased markedly in fasting. Under radiation the ratio of cations to halogens in the rat and guinea pig is increased. In guinea pigs the cation content decreases during fasting. S. MORGULIS

**The potentials of the gastric mucosa. I.** E. MISLOWITZER AND S. SILVER. *Biochem. Z.* **256**, 432–43(1932).—The gastric mucosa potential is only slightly affected by acid, alkali or various drugs injected into the blood stream but is greatly influenced by $I^-$, SCN or I applied to the membrane. **II. Gastric mucosa potential and absorption.** E. MISLOWITZER, S. SILVER AND M. ROTHSCHILD. *Ibid* 444–9.—No absorption of sugar was observed even when the animal was perishing from hypoglucemic shock due to insulin overdosage. This failure of the sugar absorption could not be remedied by the aid of ions lowering the potential of the gastric mucosa; hence it is concluded that the cell membrane alone cannot be of primary importance in the matter of absorption. On the contrary KI is absorbed through the gastric mucosa and the addn. of $Li^+$ or $SCN^-$ ions increases the absorption of $I^-$ greatly. S. MORGULIS

**Optical activity of blood filtrates. II. Influence of acidity and relationship between rotation and reducing power.** HANS N. NAUMANN. *Biochem. Z.* **257**, 32–40 (1933); cf. *C. A.* **26**, 5635.—The optical rotation of a Folin-Wu blood filtrate varies with its acidity, reaching a max. at about $p_H$ 0.7, while the reducing power is unaffected. The increasing *d*-rotation is not occasioned by glucose but by non-glucide components, as it persists even after all the glucose is removed by glucolysis, and is entirely absent from Zn or Cd blood filtrates. The effect of the degree of acidity on the *d*-rotation is attributed to a liberation of *d*-active org. acids from their *l*-active salts, and partly to the hydrolysis of the *l*-rotatory polypeptides and glucuronates. The phenomenon of mutarotation also appears in the blood filtrates. The correspondence between the rotation and reduction and the constancy of the residual rotation and residual reduction indicate that in the blood filtrate there exists an ordinary glucose equil. and not a modified glucose. S. MORGULIS

**Electrochemistry of liver and bile.** RUDOLF KELLER. *Biochem. Z.* **257**, 78–85 (1933).—Liver dissocs. the strong neutral salt electrolytes into bases (on the neg. plane) and acids (on the pos. plane). Electrometrically the liver occupies a singular position. The human liver which passes about 8 l. of $H_2O$ through the bile ducts resorbs all but

about 1 l., and this gives support to Pick's theory of the importance of the liver in the water metabolism, from its electrometric behavior. S. MORGULIS

**Biochemistry of spermatozoa and ova.** RUDOLF KELLER. *Biochem. Z.* **257**, 86–8 (1933).—The principal components of sperm and unfertilized ova fall into 2 distinct groups, one migrating to the cathode and the other to the anode, where they accumulate. Electrometric studies show that the unfertilized ovum has a positive surface and a positive nucleolus, while the head of the sperm has a strong neg. charge. S. M.

**Serum bilirubin and erythropoiesis in high altitude.** F. VERZÁR, A. VON ÁRVAY, J. PETER AND H. SCHOLDERER. *Biochem. Z.* **257**, 113–29(1933).—The no. of red blood cells increases within the first day at high altitude, and the serum bilirubin shows a parallel rise in 7 out of 11 persons studied. The initial cell count increase is attributable to a splenic contraction. With the circulatory compensations which take place in the first few days the red cell count and the serum bilirubin diminish again, if the person is at rest. A single strenuous exercise occasioned an extensive destruction of red cells with rising serum bilirubin values, which in turn is followed by a great increase in the no. of red blood cells. It is therefore argued that bilirubin, as one of the products of red blood cell destruction, furnishes the stimulus for blood-cell formation S. MORGULIS

**Influence of spleen on the bilirubin content of the blood serum. Experiments on splenectomy, spleen contraction, anemia and asphyxia.** G. V. LUDÁNY AND F. VERZÁR. *Biochem. Z.* **257**, 130–6(1933).—Splenectomy causes the bilirubin content of the serum to become doubled in the operated rabbits. Intravenous adrenaline injection or bleeding likewise causes a rise in serum bilirubin but not if this is preceded by splenectomy. Asphyxia also brings about an increase in the serum bilirubin. The expts. indicate a relationship between erythropoiesis and the bilirubin content of the serum. S. M.

**Disappearance of intravenously injected bilirubin from the blood stream and the effect of the spleen.** H. SCHOLDERER. *Biochem Z.* **257**, 137–44(1933).—Intravenously injected bilirubin disappears very rapidly, 95% being lost within 15 min., the rest leaving the blood stream more slowly In splenectomized rabbits the rate of disappearance is not materially altered, nor does the kidney have any part in this process. On the contrary, the liver plays the most important role since excluding it from the circulation checks completely the disappearance of the bilirubin introduced into the blood stream. S. MORGULIS

**Resorption of bilirubin from the intestine.** H. SCHOLDERER. *Biochem. Z.* **257**, 145–50(1933).—No evidence of absorption of bilirubin from the intestine could be obtained, even when this was administered together with 2–4% Na cholate or Na taurocholate. This amt. of bile salt makes the excised rat intestine permeable to the bilirubin. It is stated that if any absorption of bilirubin does take place in the rat intestine, it does not exceed 10% of the injected amt. (1–2 mg. in 2 cc.) during 1–2 hrs. S. MORGULIS

**The bile acids of the feces and their relation to the fat absorption in children.** HARALD MINNIBECK. *Biochem. Z.* **257**, 160–70(1933).—In a large no. of cases studied an increased bile acid excretion was found together with an increased loss of fat in the feces. The ratio between bile acids and fat was 1:38.7 to 1:31.6 in some instances, which more or less approximates the ratio in the small intestine, where this ranges from 1:8 to 1:24. However, more generally this ratio exceeded 1:100, an indication of a very large reduction in the bile salt content of the feces as compared to the intestinal contents. Expts. show that this loss of bile acids cannot be due to bacterial action in the large intestine, and the amt. present in the feces must therefore represent merely the unreabsorbed portion of the bile salts from the small intestine. S. MORGULIS

**Cholesterol in the Liebermann-Burchard reaction.** ALFRED BLOCH. *Biochem. Z* **257**, 171–80(1933).—The Liebermann-Burchard $Ac_2O$ reaction of cholesterol has been investigated under different conditions. The green color developed in 15 min. is due to only $^2/_3$ of the cholesterol present, but the colorimetric detn. at that time is justifiable because the same relative amt. reacts. On adding the acid mixt. to the soln. of cholesterol in $CHCl_3$ there is at first a reversible physicochem. alteration, manifested by the temporary appearance of a red color, followed by the green coloration due to the formation of the cholesterol esters. S. MORGULIS

**Elasticity of blood plasma and serum in the capillary viscometer.** GUNNAR BLIX. *Biochem. Z.* **257**, 180–7(1933). S. MORGULIS

**Studies on the in vitro decomposition of adenylpyrophosphate.** ERIK JACOBSEN. *Biochem. Z.* **257**, 221–33(1933).—In an inactivated muscle ext. $NH_3$ and P are formed in equiv. amts. in a neutral or slightly acid medium, but at a $p_H$ 9 there is more $NH_3$ than P formed from adenylpyrophosphate. Deamination of adenylpyrophosphate proceeds 20 times slower than that of adenylic acid. The synthesis of adenylic acid to adenylpyrophosphate is inhibited by NaF, $CH_2ICO_2H$ and KSCN. S. MORGULIS

**Cleavage metabolism of mammalian spermatozoa in relation to their motility.** E. REDENZ. *Biochem. Z.* **257**, 234–41(1933).—The motility of spermatozoa under anaerobic conditions is promoted by energy derived from glucolysis. Under aerobic conditions the addn. of sugar increases the motility. S. MORGULIS

**Effect of alterations in the sex hormone balance on blood coagulation and bleeding.** HERMANN DRUCKREY. *Endokrinologie* **12**, 1–17(1933).—The ovarian (estrus) hormone causes a prolongation of the coagulation time and bleeding in 30 min. when administered to female rats. This is followed by a shortening of the period in 1–3 days depending upon the amt. of prepn. On repeating the expt. only a larger dose can bring about the same effect. The corpus luteum hormone produces a similar action but the initial lengthening is not so great and the subsequent shortening is greater. The anterior pituitary hormone shortens the coagulation time (after a very brief lengthening) to a very marked degree, but this action is not produced when both ovaries or the uterus are removed. Implantation of the uterus in the secretory phase or subcutaneous injection of its secretion shortens the coagulation time after a brief period of delayed coagulation. S. MORGULIS

**Differences in the activity of the anterior hypophyseal sex hormone from the gland and from urine.** M. REISS, R. PICK AND K. A. WINTER. *Endokrinologie* **12**, 18–22 (1933).—The sex hormones obtained from the anterior pituitary of the cow or from urine exert a totally different effect upon cockerels. Whereas the former causes a marked increase in the hormonal activity of the testes, measurable by the increased comb growth and a tremendous increase (tenfold) in the size of the testes, no such effect was obtained with the urinary prepn. S. MORGULIS

**The hormonal function of the prostate.** L. RICCITELLI. *Endokrinologie* **12**, 23–4 (1933).—An extensive investigation of the hormonal activity of the prostate, although it does not perhaps satisfy every requirement for establishing its endocrine nature, nevertheless shows more or less definite effects of the exts. on growth, metabolism, blood pressure, etc., to warrant the belief that it is an organ of internal secretion. S. MORGULIS

**Physiology of plant and animal membranes.** E. WERTHEIMER. *Kolloid-Z.* **61**, 181–98(1932).—A review. C. RIEGEL

**Suprarenal cortex. I. Cortical suprarenal insufficiency and the action of the cortical hormone upon the normal and suprarenalectomized dog.** GEORGE A. HARROP AND ALBERT WEINSTEIN. *J. Exptl. Med.* **57**, 305–33(1933).—Addison's disease resembles suprarenal insufficiency in dogs after withdrawal of ext., in the extreme muscular weakness, anorexia, vomiting and diarrhea, lowered general bodily activity assocd. with lowered body temp., lowered general metabolism, increased blood concn. and characteristic increase in blood non-protein and urea N. Serum K and inorg. phosphate characteristically increase and total serum base falls All of these are dependent directly or indirectly on the lack of the cortical hormone. The proper dosage of cortical ext. in the dog appears to maintain normal nutrition and wt. and to preserve life indefinitely There is no lowering of the blood sugar, no increased pigmentation and no change in the basal respiratory metabolism; there is an increased sensitivity to insulin and to thryoid ext. C. J. WEST

**Effects of various organ preparations on the growth of tissue in vitro. I. The effects of endocrine organ preparations on the growth in vitro of fibroblasts of chicken embryo.** M. OMMYOJI. *Japan. Z. Mikrobiol. Path.* **26**, 999–1014(1932).—The effects of prepns. of the thyroid, parathyroid, ovary, hypophysis, anterior lobe and posterior lobes of the hypophysis, testes and prostate were studied. In general, they accelerate growth in dil. solns. and inhibit growth in concd. solns. The accelerating action was most marked with the thyroid and parathyroid prepns. I. S. YUN

**The influences of various organ preparations on tissue growth in vitro. II. The effects of organ preparations on the growth of fibroblasts of the chicken embryo in vitro.** M. OMMYOJI. *Japan. Z. Mikrobiol. Path.* **26**, 1183–94(1932).—O. investigated the effects of lung ext., corpus luteum ext., spleen ext., kidney parenchyma ext., pancreas ext. and liver parenchyma ext. on the growth of fibroblasts of the chicken embryo *in vitro*. These organ exts., except lung ext., in general inhibit markedly the growth of chicken embryo fibroblasts in concd. solns., but in dil. solns. they accelerate the growth, especially the exts. of lung, spleen and pancreas. Liver ext. inhibits the growth of chicken embryo fibroblasts most markedly and it has no accelerating power whatever Cf. preceding abstr. I. S. YUN

**Variations in the growth-accelerating power of chicken embryo juice on cultivated tissues in vitro.** J. SHIMIZU. *Japan. Z. Mikrobiol. Path.* **26**, 1174–82(1932).—Chicken embryo juice loses its tissue-growth-accelerating power after 24 days in the ice-chest, after 10 days at room temp., and after 48 hrs. at 37°. I. S. YUN

**Perinuclear granules and reticulum. III. The chemical nature of the granules.** GUICHI YAGI. *Trans. Japan. Path. Soc.* **21**, 248–51(1931).—The chem. substance in the

perinuclear granules and reticulum of white and red blood cells is not related to glycogen, fat or fibrin, but is a basic nucleoprotein. I. S. YUN

**The reticulo-endothelial system. II. Secretion of specific substances by the reticulo-endothelial system.** GENSAKU OBO. *Trans. Japan. Path. Soc.* **21**, 324–28 (1931).—A sp. substance stimulating the reticulo-endothelial system was proved present even a short time after the injection of India ink into rabbits. This substance was most effective after 24 hrs.; it accelerated the phagocytosis of foreign bodies by the reticulo-endothelial system and caused monocytosis. It also accelerated the detoxication of morphine. Chemically the substance is nonprotein, is sol. in ether and also in $CHCl_3$, but is not a true lipoid. I. S. YUN

## G—PATHOLOGY

H. GIDEON WELLS

**Proofs that some substances like hystamine are formed in the lung isolated from a guinea pig during anaphylactic shock.** A. SPINELLI. *Boll. soc. intern. microbiol. Sez. ital.* **4**, 257–61(1932)(in French).—The biol. behavior of these substances is described. G. A. BRAVO

**Colloid instability of leprous sera: [examination of the] chemical, precipitant and floculant reactions. I. Reactions of Matéfy, Daranyi, Baum-Schumann, Klausner and Bruck. II. Miostagminic precipitant reaction, formaldehyde-gel reaction, Botelho's, Brossa-Bozzolo-Lombardi's, Roffo's neutral red and Lange's reactions.** AGOSTINO AMBROGIO. *Pathologica* **24**, 721–9, 804–10(1932).—The reactions are described, and a bibliography is given. Comparative expts. made on leprous and control sera with these reactions show: (1) that none of the chem. reactions gives a practical contribution to the diagnosis of leprosy, but Matéfy's, Daranyi's and analogous reactions often give pos. results with leprous sera, and may support the evidence of clinical and bacteriol. investigations; (2) that the biol. tests possess slight sensibility and specificity and are very irregular in behavior. G. A. BRAVO

**The lipemic level in acute infectious diseases.** S. MARINO. *Arch. farmacol. sper.* 55, 1–27(1933).—The various lipoid fractions were detd. in the blood of patients with a no. of acute infections at different stages of the disease. Only in typhoid fever were the changes const. and considerable. During the febrile period the free cholesterol, cholesteryl esters and phosphatides were below normal. During convalescence there was hyperlipemia with regard to each of these fractions. The changes in lipemic level produced by the invading organisms are attributed to a deranged function of those endocrine glands controlling lipoid metabolism. The results support the theory that these lipoid fractions are concerned in the defense mechanism of the body against toxins. Since the changes in the content of cholesteryl esters were greatest, these probably play the most important part. LEWIS W. BUTZ

**Observations on the various forms of crystallization of choline in the Florence and the Kraut reactions.** MARIA FRANCIOLI. *Diagnostica tec. lab. (Napoli) Riv. mensile* **3**, 219–24(1932).—A description is given of the different forms of choline periodide which are produced under various conditions. Twenty-four photomicrographs illustrate the text. LEWIS W. BUTZ

**The diameter, volume and osmotic resistance of erythrocytes. Methods of de-**

**termination and the physico-pathological significance in blood diseases.** R. Scotti Douglas. *Diagnostica tec. lab.* (*Napoli*) *Riv. mensile* **3**, 277–361(1932).—A review with a large bibliography. Lewis W. Butz

**Cholesterolemia and alexinemia in diphtheria and scarlatina.** Egle Inglessi. *Pediatria* **40**, 1045–60(1932).—The cholesterolemic and alexinemic curves run parallel in scarlatina and serum sickness. Such a relation was observed in only 57.75% of the diphtheria cases studied. In post-diphtheritic paralysis the hypocholesterolemia is not always const., whereas the amt. of complement is constantly diminished. L. W. B.

**A fixation reaction with active serum.** A. Levit. *Compt. rend. soc. biol.* **112**, 16–17 (1933).—Tsü's reaction (*C. A.* **25**, 5467) is as reliable as the Bordet-Wassermann and requires less time. L. E. Gilson

**Comparison of Mutermilch's reaction and the classical Bordet-Wassermann reaction.** Serban Bratiano, Victor Davidesco and Eugène Bano. *Compt. rend. soc. biol.* **112**, 97–8(1933).—Both reactions are equally specific and that of Mutermilch is more sensitive. L. E. Gilson

**The blood-corpuscle glutathione in hyperthyroidism.** G. Litarczek, H. Aubert and B. Nestoresco. *Compt. rend. soc. biol.* **112**, 82–3(1933); cf. *C. A.* **27**, 332.—In cases of hyperthyroidism with a basal metabolism of +25 to +56 the total glutathione of the blood was found to be practically normal and the reduced glutathione slightly decreased. L. E. Gilson

**Some data on the respiratory exchanges of cases of hyperthyroidism. Discussion of the pathogenic state.** G. Litarczek, H. Aubert and J. Cosmulesco. *Compt. rend. soc. biol.* **112**, 84–5(1933). L. E. Gilson

**Action of tar on diphtheria toxin and antidiphtheritic serum.** Georges Magheru, Alice Magheru and G. Mihailescu. *Compt. rend. soc. biol.* **112**, 86–8(1933). L. E. Gilson

**Action of tar on the cholera vibrio.** Georges Magheru, Alice Magheru and G. Mihailescu. *Compt. rend. soc. biol.* **112**, 88–9(1933). L E Gilson

**Physicochemical conditions for the melanin-flocculation reaction of Henry.** R. Gille. *Compt. rend. soc. biol.* **112**, 334–6(1933).—Discussion. L. E. Gilson

**Demonstration of precipitating hare-antiserum.** O Mezger, M. Volkmann and H. Jesser. *Deut. Z. ges. gericht. Med.* **20**, 115–21(1932).—A hare-antiserum of considerable titer is seldom obtained when rabbits are used as the immunizing animals Very good sera resulted from the injection of chickens with hare-blood Protein from man, horse, hog, roe, cow, goat and soy bean were tested. In most cases antisera for man, horse and hog were obtained. Frances Krasnow

**Studies in anaphylaxis in the rabbit. I. A study of the factors concerned in the establishment of maximal hypersensitiveness in rabbits to egg white and horse serum.** Ella F. Grove. *J. Immunol.* **23**, 101–23(1932).—Active sensitization of rabbits does not depend entirely on the degree of antibody production; animals with high power of antibody production may be wholly insensitive and *vice versa*. **II. A study of the effect of histamine, barium chloride and adrenaline on unstriped muscle of the guinea pig and rabbit.** *Ibid* 125–38.—Histamine, adrenaline and $BaCl_2$ may produce a characteristically different effect (contraction, relaxation of normal tone, no change) upon the same unstriated muscular tissue (bronchial) in the same animal. The action of a substance upon isolated unstriped muscular tissue in a bath is not always reflected in the physiol. action of the substance upon the same tissue in the living animal. **III. The sensitization of rabbits with fowl corpuscles.** *Ibid* 139–45. **IV. The Simonds explanation of the different pathologies of acute anaphylactic shock in different animal species. V. The role of unstriped muscle in acute anaphylaxis in the rabbit.** *Ibid* 147–52.—The expts. described emphasize the role of unstriped muscle in anaphylactic shock and confirm the view that the difference in pathology of acute anaphylaxis in the guinea pig and rabbit is due to structural differences in the shock organs. E. R. L.

**Are antiviruses specific?** A. Besredka. *J. Immunol.* **23**, 349–60(1932).—Antiviruses are endowed with a specificity as strict as that of the bacteria from which they come. E. R. Long

**Serological studies on iodinated sera. I. Precipitins and precipitinogens.** John Jacobs. *J. Immunol.* **23**, 361–74(1932).—When I is added to animal sera in the absence of acid or alkali, substances are formed that ppt. with antisera prepd. from iodinated sera. This change takes place in the presence of aq. solns. as dil. as *N*/32. Diiodotyrosine, but not KI, inhibits pptn. specifically in systems of iodinated sera. (Cf. Wormall, *C. A.* **24**, 1422). **II. Anaphylaxis.** *Ibid* 375–84.—Guinea pigs were sensitized by Lugol-guinea pig serum prepns. and by Lugol-horse serum prepns., so that they reacted in a large percentage of cases with acute anaphylactic shock to iodinated serum. Diiodotyrosine, but not ionic I, inhibited anaphylaxis in sensitized animals.
E. R. Long

**Variability of tubercle bacilli. VII. Antigenic activity of "S" and "R" cultures as measured by complement fixation.** CHRISTINE E. RICE AND G. B. REED. *J. Immunol.* **23**, 385–404(1932); cf. *C. A.* **26**, 3276.—The S type of various strains of acid-fast bacteria, including tubercle bacilli, contains antigenic substances not present in the R type, dissocn. apparently being accompanied by considerable loss in antigenic complexity. In S antiserum 3 types of antibody could be identified, an S-specific, a species and a group antibody. In R antiserum only the species and group antibodies could be detected. E. R. LONG

**Active immunization of white mice by a non-polysaccharide and probably non-protein derivative of the pneumococcus.** LLOYD D FELTON *J. Immunol.* **23**, 405–21 (1932).—White mice can be immunized with a fraction of pneumococci that is sol. in Cu acetate in the presence of satd. NaCl soln. and that can be extd. with EtOH from the dried Cu-free filtrate. This antigen gives a neg. Molisch test, and appears free from protein. No pptn. occurs with antipneumococcus horse serum. E. R. LONG

**A hypothetical mechanism of antibody production.** STUART MUDD. *J. Immunol.* **23**, 423–7(1932).—Antibodies are probably synthesized from less complex units, *e. g.*, peptides and amino acids. Some of these units combine in some manner with the antigen. M. postulates that the antibody synthesis occurs at the antigen surface. The chem. groupings undergoing synthesis must be adapted physically and chemically to the antigen surface at the site of coupling. Antibody specificity, on this hypothesis, is due to sp. stereochem. correspondence with the antigen. Dissocn. of antibody and antigen would be governed by equil conditions, and removal of the dissocd. antibody would leave the antigen free to incite further antibody production. E. R. LONG

**A quantitative study of the precipitin reaction with special reference to crystalline egg albumin and its antibody.** JAMES T. CULBERTSON. *J. Immunol.* **23**, 439–53 (1932).—Cryst egg albumin gives rise to but a single type of antibody. The amt. of precipitable antibody in a unit vol. of rabbit anti-cryst.-egg-albumin serum can be learned by detg. the amt. of antigen necessary to neutralize the precipitin of a small vol. of the antiserum. At the neutralization point antigen and antibody combine in const. ratio with max. pptn. Neither precipitinogen nor precipitin remains in the supernatant fluid at the neutralization point. Corresponding quant. relations are not found in the titration of antisera to horse serum. E. R. LONG

**A quantitative aspect of the hypothetical incorporation of injected antigen in resulting antibody.** SANFORD B HOOKER AND WM. C. BOYD. *J. Immunol.* **23**, 465–79 (1932).—From quant. interrelations of an immune serum prepd. by injection of an As-contg diazo protein, and, as test antigen, a heterologous similar protein, it was calcd. that the Buchnerian hypothesis demands the presence of 2.5–2500 times as much As in the immune serum as found there by chem. test. E. R. LONG

**Pathological calcification.** DAVID P. BARR. *Physiol. Rev.* **12**, 593–624(1932).—A general review with bibliography. E. R. LONG

**The rose bengal test of liver function.** W. PARKER STOWE, G. D. DELPRAT AND ALANSON WEEKS. *Am. J. Clin. Path.* **3**, 55–60(1933); cf. *C. A.* **19**, 330.—The technic of the test is described, and results obtained from the use of the test in pathol. conditions are discussed. E. R. MAIN

**Urea clearance in normal and in dehydrated infants. Renal function in intestinal intoxication.** LUDWIG SCHOENTHAL, DOROTHY LURIE AND MARGARET KELLY. *Am. J. Diseases Children* **45**, 41–53(1933).—The measurement of renal function by urea-clearance tests appears to be applicable to infants. The reduction in urea clearance observed in intestinal intoxication in infants appears to be due to dehydration and its effect upon the body fluids and renal tissue. E. R. MAIN

**Enteral administration of scarlatinal filtrate toxin.** JEAN V. COOKE. *Am. J. Diseases Children* **45**, 54–7(1933).—The sensitivity of the skin of children to scarlatinal toxin does not appear to be reduced following the oral administration of filtrate toxin or killed scarlatinal hemolytic streptococci. Following rectal instillation of a highly concd. toxin, the sensitivity becomes reduced, although the skin remains sensitive to larger quantities of the toxin. E. R. MAIN

**Birefringent bodies in renal lipoidosis.** CH. ACHARD AND A. CODOUNIS. *Bull. acad. méd.* **107**, 22–7(1932).—Only fresh urine should be used for the microscopic investigation of birefringent lipoids. The latter are concd. by centrifugalization. For the chem. detn. pour 10 cc. of urine into 120 cc. EtOH, boil, filter and ext. the ppt. with EtOH, evap., take up in $Et_2O$ and evap. The histological changes are described. A. E. MEYER

**Diabetes and pancreas lipase.** MARCO P. DEMURTAS. *Biochim. terap. sper.* **18**, 421–7(1932); cf. *C. A.* **25**, 1287.—An atoxyl-resistant lipase of pancreatic origin can be observed in diabetics. This proves an accompanying lesion of the glandular pancreas

tissue. Lesions can be demonstrated by this method, when signs for an impaired external function of the pancreas are missing. A. E. MEYER

**Azotemia caused by lack of salt, in general surgery.** MARIO TABANELLI. *Biochim. terap. sper.* **18**, 448–81(1932).—Hyperazotemia in combination with hypochloremia is observed in pyloric stenosis. The former is caused by an increased breakdown of protein, the latter by reduced absorption of NaCl, vomiting and fixation of the Cl in tissues in disintegration. The administration of hypertonic or physiol. NaCl soln., intravenously or subcutaneously, returns both conditions to normal. A. E. MEYER

**The purification of antitoxic sera in order to avoid serum shock.** E. SAVINO. *Rev. soc. argentina biol.* 7, 108(1932); *Rev. sudamericana endocrinol. immunol. quimioterap.* **16**, 77(1933); cf. *C. A.* **26**, 5331.—Sep. the globulins with $Na_2SO_4$, dialyze and ppt. at the isoelec. point. The final prepn. contains only pseudoglobulins and euglobulins. A. E. MEYER

**Three cases of calcium infarct in the kidneys with kidney insufficiency.** FOLKE KNUTSSON. *Acta Chirurgica Scand.* **72**, 36–46(1932). S. MORGULIS

**The so-called essential hematuria.** OTTO LÖFBERG. *Acta Chirurgica Scand.* **72**, 161–73(1932). S. MORGULIS

**Experiences with 1000 insulin-treated diabetics.** A. NORGAARD. *Acta Med. Scand.*, Suppl. **50**, 196–202(1932).—The insulin requirement of diabetics, which increases to an av. dose of 60 international units, is generally greater for men and less for women. Furthermore, young persons require more insulin than old persons. The mortality was least among patients doing light work, but the ages of 20–30 and over 50 years are crit. periods. Diabetes appears as a seasonal disease, the max. incidence being during the winter S. MORGULIS

**The presence of methylglyoxal in urine.** A. PI-SUÑER AND M FARRÁN. *Biochem Z.* **256**, 241–51(1932); cf. *C. A.* **26**, 4091.—Methylglyoxal has been satisfactorily demonstrated as a component of diabetic urine. S. MORGULIS

**Peptic ulcer. Early and late effects of parenteral injection of a non-specific foreign protein.** LAY MARTIN. *Ann. Internal Med* **6**, 622–31(1932). JOHN T. MYERS

**A new culture medium for the production of antigenic streptococcal hemolysin.** E. W. TODD AND L. F. HEWITT. *J. Path. Bact.* **35**, 973–4(1932). JOHN T. MYERS

**Methods for the purification of vaccine material with chemical substances. I. Purification with phenol.** N. A. KADLETZ AND A. A. LIMONOWA. *Zentr. Bakt. Parasitenk.*, 1 Abt. **126**, 102–11(1932). JOHN T. MYERS

**A non-specific complement-fixation reaction due to ion antagonism.** A. HAMBLETON. *Can. J. Research* **7**, 583–95(1932).—The complement-fixation test for tuberculosis gives a non-specific or falsely pos. reaction if a balanced physiol. saline, akin to Tyrode's soln., replaces the plain saline used in the test. The balanced saline must contain both Ca and Mg in appropriate concn The non-specific reaction is given most strongly by Petroff's whole bacillus antigen, and not at all by "fat-free" tubercle bacillus antigens. The main features of the reaction, and its relation to antagonistic effects of Na and Ca ions, are indicated. **Mechanism of complement fixation.** *Ibid* 596–605.—Examn. of the antigen in the non-specific reaction shows that it can assume the same complement-fixing power, cohesiveness and oil-wettability as antigen sensitized by immune serum, but not the same elec. potential. This indicates that fixation of complement is only a secondary effect due to the surface properties of suitably modified antigens and not a specific chem. affinity for complement on the part of antigen. J. W. SHIPLEY

**Effect of acids and other substances in the production of acute gastric ulcers.** JULIUS FRIEDENWALD, MAURICE FELDMAN AND SAMUEL MORRISON. *J. Exptl. Med.* 57, 203–13(1933).—Sterile $H_2O$, normal salt soln., 50% glucose, skimmed milk, whole milk, omnadin, lipiodol, Bi subcarbonate, pituitrin, aktivin, histamine, adrenaline and insulin, injected into the muscular coat of the stomach wall, did not have any significant relationship to the production of ulcer. Weak solns. of HCl had no corrosive effect upon the gastric mucosa and rarely produced ulcerations when injected into the muscular coat of the stomach; stronger solns. produced definite ulcerations. No relation could be demonstrated between the injection of various substances into the stomach wall and the production of hyperacidity. The prolonged use of histamine administered subcutaneously was not a factor in the production of chronic ulcers, even after 1% HCl was injected into the muscular coat of the stomach. C. J. WEST

**Typhoid toxin purified by adsorption with aluminum hydroxide. I. The toxin of typhoid bacilli.** M. YATO. *Japan. Z. Mikrobiol. Path.* **26**, 1015–32(1932).—The toxin of typhoid bacilli adsorbed and purified by $Al(OH)_3$ can produce immune bodies. I. S. YUN

**The effects of various non-specific adsorbents on the hemagglutinins of the rabbit immunized with goat red blood cells.** M. HOMMA. *Japan. Z. Mikrobiol. Path* 26,

1033–62(1932).—The hemagglutinins were adsorbed by kaolin or by $Al(OH)_3$. I. S. YUN

**Components of hemolytic complements.** B. MITSUSE *Japan. Z. Mikrobiol. Path.* **26,** 1702-51(1932).—A new, 5th component of hemolytic complement was obtained by extn. with petroleum benzine. This component is the most stable one and is not destroyed even by boiling at 100° for 120 min. I. S. YUN

**Gastric secretion during high intestinal obstruction.** SUNGCHIN KIM. *Korean Med. J.* **2,** 86–92(1932).—In dogs suffering from duodenal obstruction there was an increase in the amt. of gastric juice as well as increased acidity of the gastric juice and an increase in Cl. Similar changes in the gastric juice followed the injection of histamine; hence the ileus toxin may be histamine itself, or at least some histamine-like substance. I. S YUN

**Etiology of beriberi.** H. Y. OH. *Korean Med. J.* **2,** 113(1932).—A decrease of Ca was found in the blood serum of Korean beriberi patients. Treatment with Ca prepns. improved their condition. I. S. YUN

**Rabbit carcinoma produced by nicotine.** SEIZO KATSUNUMA *Trans. Japan. Path. Soc.* **21,** 244-7(1931).—Medullary carcinoma was produced in the rabbit stomach and cancroid on the rabbit ear after 225 days by the repeated application of nicotine. I. S. YUN

**Tissue respiration and its relation to morphological changes, oxidase reaction and the hydrogen-ion concentration in tissues.** HIROSHI NAKAMURA. *Trans. Japan. Path. Soc.* **21,** 282–95(1931).—N. investigated in rats the tissue respiration, oxidase reaction, $p_H$ concn. and morphological changes of liver and kidney tissue in conditions of decreased vitality due to exptl. acidosis and alkalosis, and intoxication. The tissue respiration and oxidase reaction decreased in dying or starved tissue, and also in tissues injected with HCl or $NaHCO_3$ solution. In U, sublimate, $K_2Cr_2O_7$, cantharidin, As and P intoxication, the tissue respiration and oxidase reaction decreased, and the $p_H$ values shifted to the alk. side, but there were greater or smaller differences between them. I. S. YUN

**Relation between degenerative changes and tissue respiration. Tissue respiration in cases of degenerative changes caused by various toxins.** MORIO NAKAMURA AND KENTARO SUZUKI. *Trans Japan. Path. Soc.* **21,** 298–302(1931).—The toxins of typhoid bacilli, dysentery bacilli and tetanus bacillus were used. The tissue respiration and the oxidizing granules were both decreased. **Degenerative changes caused by inorganic poisons and ligation of the excretory duct.** KENTARO SUZUKI AND MORIO NAKAMURA *Ibid* 302–5.—Tissue respiration in rats with degenerative changes caused by inorg. poisons, P, sublimate, Fowler's soln., U nitrate and cantharidin was generally decreased. In many cases, the decrease of tissue respiration runs parallel with the decrease of oxidase content. The change in tissue respiration has some relation to the appearance of fat; *viz.*, when the appearance of fat indicated degeneration the tissue respiration always decreased. I. S. YUN

**Effect of an extract of lymph nodule on agglutinin production.** HIROSI MATUO. *Trans. Japan. Path. Soc.* **21,** 347–50(1931).—Lymphatic tissue ext. accelerates the production of agglutinins against typhoid bacilli in immunized and India-ink-injected animals. I. S. YUN

**Atherosclerosis in chickens.** KANAMETARO TAMURA *Trans. Japan. Path. Soc* **21,** 528–9(1931).—Infiltration of fatty substances into the aorta was found in 154 out of 227 apparently normal chickens. The fatty substance was anisotropic lipoid substance. Such infiltration of anisotropic lipoid into the blood vessel wall of chickens was increased by feeding of lanolin. I. S. YUN

**The silver reaction of tumor tissue, especially testicular sarcoma.** YUTAKA KON AND KATSUO TAKEDA. *Trans. Japan. Path. Soc.* **21,** 700–2(1931).—Ag granules were found in the cells of sarcoma of the testis. The Ag reaction suggests that this tumor originated perhaps from interstitial cells. I. S. YUN

**Neoplasmatic changes in the fore stomach of albino rats produced by injection or feeding of tar.** IWATA TANI. *Trans. Japan. Path. Soc.* **21,** 715–17(1931).—Tumor-like changes or carcinomatous areas in the wall of the fore stomach resulted from oral application of tar, but such marked changes did not follow intragastric injection of tar. I. S. YUN

**Effect of a hormone on the growth of transplantable chicken myxosarcoma cultivated in vitro.** AKIRA SANO. *Trans. Japan. Path. Soc.* **21,** 805–7(1931).—The hormone of the adrenal gland markedly inhibited the growth of chicken sarcoma. I. S. YUN

## H—PHARMACOLOGY

A. N. RICHARDS

**The physiological action of cystinyl peptides and guanidine derivatives.** H. JAMES HARWOOD. *Iowa State Coll. J. Sci.* **6**, 431–3(1932).—*Guanidine derivatives.* Compounds not previously reported were prepd. and injected into starved rabbits to det. the possibility of their substitution for insulin with results as indicated: Compds. which had no effect on the blood sugar were: *(p-carboxyphenyl)guanidine, diacetoneguanidine, furylacrylylguanidine-HCl, cinnamylguanidine-HCl, formylguanidine, dibenzoylguanidine, anhydrodiacetylguanidine, γ-guanidinopropyl butyl sulfide sulfate, butylthiobarbituric acid, iminomethyluracil, N'-allyl-N''-guanylthiourea, dipiperidyl disulfide, dipiperidyl sulfone and diethylaminomethyl ethyl sulfide.* Compds which raised the blood sugar were: *1,3-diphenyl-3-guanidinopropan 1-one and its HCl salt, β-carboxypropionylguanidine, γ-guanidinopropyl cyclohexyl sulfide sulfate, malonylguanidine, thiobarbituric acid, benzimino phenylthioether* and its HCl salt, *diformidine disulfide-HCl* and *propionamidine-HCl.* Compds. which lowered the blood sugar were: *phenylguanidine, p-bromophenylguanidine nitrate, benzylguanidine nitrate, furfurylguanidine sulfate, β-phenylethylguanidine sulfate, guanidine benzoate, acetyldiacetoneguanidine, dicarbethoxyguanidine* and *γ-guanidinopropyl β-phenylethyl sulfate.* While these compds showed hypoglucemic action, the action in no case approached that of insulin or synthalin and in most cases was accompanied by toxic effects. None of the compds. studied could be recommended as a substitute for insulin. *Cystinyl peptides. Dicarboxytyrosylcystine di-Et ester* was prepd. by the action of dicarbethoxytyrosyl chloride on cystine di Et ester. *Dicarbethoxycystinyltyrosine Et ester* was prepd by the action of dicarbethoxycystinyl chloride on tyrosine Et ester. *Dicarbethoxycystinyl chloride* was obtained by the action of Et chlorocarbonate on an alk. soln. of cystine followed by treatment of the free acid with $PCl_5$. *Dicarbethoxycystinyltyrosine* was prepd. by hydrolysis of the ester and also by the action of dicarbethoxycystinyl chloride on an alk. solution of tyrosine. *Dicarbethoxycystinylhistidine Me ester* resulted from the action of dicarbethoxycystinyl chloride on histidine Me ester. *Dicarbethoxycystinylarginine* was formed by the action of dicarbethoxycystinyl chloride on an alk. soln. of arginine. The esters of tyrosine and histidine were prepd. by methods described in the literature. F. E. BROWN

**The effect of infection on the insulin content of the pancreas.** D. W. GORDON MURRAY AND E. T. WATERS. *Trans. Roy. Can. Soc.* Sect V, **26**, 169–72(1932).—Infection was induced in the dogs by ligating the appendix about 1 inch from the tip and surrounding it with omentum. In 4 infected dogs which were not acutely ill, the insulin content was only slightly lower than that of the normal controls. In 4 other infected animals which were acutely ill, a significant decrease in the insulin content of the pancreas occurred. The decrease was most pronounced in animals suffering from a spreading infection, whereas in those animals showing healing processes, the difference from the normal was only slight. LOUIS J. SOFFER

## I—ZOÖLOGY

R. A. GORTNER

**Influence of polarization on the potassium content of peripheral nerves.** GYULA MÉHES AND LAJOS CSIK. *Magyar Biol. Kutató Intézet Munkái* **4**, 451–3(in German, 453–8)(1931).—The ischiatic nerves of *Rana esculenta* were polarized with 10 v. for 6 hrs. The nerve died, but its K content migrated. With 6 v., migration was found after polarization for 5–6 hrs. S. S. DE FINÁLY

**Gas metabolism of tadpoles.** GYULA MÉHES AND KÁLMÁN SZEÖKE. *Magyar Biol. Kutató Intézet Munkái* **4**, 459–71(in German, 471–5)(1931).—The curve of O consumption is a paraboloid. A decrease was observed during metamorphosis, caused either by hunger or by some regulation process. Solns. of ephedrine and ephetonine decreased the O consumption in concns. of 1:50,000 to 1:300,000. Adrenaline also decreased it in concns. above 1:5,000,000; more dil. solns. increased it. S. S. DE FINÁLY

**The role of water in the physiology of excretion in insects.** V. B. WIGGLESWORTH. *Sci. J. Roy. Coll. Sci.* **2**, 91–107(1932); cf. *C. A.* **26**, 1984–5.—A review. E. H.

**Blood proteins and edema in Rana salata.** RODOLFO FERRARI. *Arch. fisiol.* **31**, 208–12(1932). A. E. MEYER

**Late formation of edema in Rana salata after perfusion with hypertonic liquids.** RODOLFO FERRARI. *Arch. fisiol.* **31**, 213–18(1932). A. E. MEYER

**Extensive melanism in the skeleton of Raia maculata.** W. F. HARPER. *J. Path. Bact.* **35**, 865–6(1932). JOHN T. MYERS

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

**Determination of benzoic acid in foods.** ULAUS HORDH. *Anales asoc. quím. Argentina* **20**, 176–80(1932).—With small quantities of BzOH in foods or complex mixts. of preservatives in foods, the detn. of BzOH is difficult. Macerate 100 g. of tomato ketchup contg. 0.3 g. BzONa per kg. with 100 cc. of alk. water, filter through cloth, repeat with 50 cc. of water, make the filtrate up to 200 cc., acidulate with $H_2SO_4$, ext. with 200 cc. $Et_2O$, allow the $Et_2O$ to evap., dissolve the residue in 30 cc. of boiling water, cool, filter, repeat with 20 cc. of boiling water, render the aq. filtrate slightly acid with $H_2SO_4$, ext. with an equal vol. of $Et_2O$, repeat with $^1/_2$ as much $Et_2O$, wash the $Et_2O$ ext. with water, evap. the $Et_2O$, dissolve the BzOH residue in sufficient water, and add drop by drop a 2.5% $FeCl_3$ soln. as long as Fe benzoate ppts. If salicylic acid is present, a violet color forms, and this acid must be removed by the Cazzani method (*C. A.* **24**, 5384). E. M. SYMMES

**Tests of wheats made in 1930-31 by the office of the Lower Seine Agricultural Department.** RENÉ BERGE. *Compt. rend. acad. agr. France* **18**, 1133–40(1932).—A summary. J. R. ADAMS

**The soluble glucides of grains of different wheat varieties and their relations to baking value.** A. DE CUGNAC. *Ann. Agron.* [N. S.], **2**, 375–83(1932).—A small amt. of sol. glucide with a neg. rotary power was extd. from white flour. In the by-products (brown flour and bran) sol. glucides were more abundant. Their initial rotary power was pos. but became neg. on hydrolysis. There seemed to be a correlation between good baking value and higher glucide contents at least when the gluten content was also higher. F. W. MARSH

**The glucides of wheat and flour.** R. GEOFFROY. *Bull. soc. chim.* **51**, 1491–2 (1932); cf. *C. A.* **17**, 3693; **25**, 5911.—The percentages of glucides remaining in flour after milling were detd. to decide whether they are capable of assuring regular and complete fermentation during bread making. The flour was boiled for a short time with alc. and the concd. soln. was dild. with $H_2O$ to ppt. nitrogenous material. The concd. soln. was defecated with $Pb(OAc)_2$ and was freed from levosin by extn. with alc. Flour

contains only 0.12% of reducing sugars consisting of glucose and fructose in the ratio 3:1. The non-reducing and fermentable glucides comprise 0.25% of sucrose and the same quantity of a levuloside very sol. in alc. but not fermentable under the conditions of panary fermentation. In industrial bread making 1.5% of fermentable sugars is necessary and it will be shown later that this deficiency is amply provided for by a diastatic action which increases the quantity of reducing sugars from 0.4 to 3% in the 6 hrs. separating the kneading and baking processes. C. R. ADDINALL

**Examination of flours in filtered ultra-violet light.** LÁSZLÓ KARÁCSONYI. *Mezőgazdasági Kutatások* **5**, 319–24(1932).—Cereal and leguminous flours were examd. in the light of a Hanau quartz lamp. The colors obtained are expressed in numbers of the Krüger triangle based on Ostwald's theory. No difference was found between wheat and rye flours of different degrees of finenesses. A slight difference could be observed on adding a few drops of alc. KOH to the ext., but positive differentiation could not be made. The use of a quartz lamp is helpful, but not an exact method. S. S. DE F.

**Determination of rye flour in milling products and bakery goods.** R. STROHECKER. *Z. Untersuch. Lebensm.* **63**, 514–22(1932).—Tillmans' method for sepn. of trifructosan (*C. A.* **23**, 912) was employed to develop a procedure which consists of inverting the carbohydrate and estg the reducing power of the fructose thus obtained against Fehling soln. The accuracy is 5–10% for flour and 10% for bread. Rye and wheat flour (60% milled) contained 2.4 and 0.32% trifructosan, resp. Approx. $^1/_3$ of it is destroyed in baking; its content increases with the milling grade in rye flour, while in wheat flour no noticeable increase was observed. S. LAUFER

**Biennial reviews of the progress of dairy science. Section A. The physiology of dairy cattle. I. Growth. II. Lactation. III. Nutrition. IV. Genetics.** G. L. PESKETT, J. D. STIRLING, S. MORRIS, J. MACKINTOSH, A. D. BUCHANAN SMITH AND OLIVE J. ROBISON. *J. Dairy Research* **4**, 754–76(1932).—A review. A. H. JOHNSON

**Flavor in dairy products.** L. M. THURSTON W. Va. Agr. Expt. Sta., *Bull.* **244**, 21(1931).—Fat-globule films impart to milk some of its characteristic flavor. C. R. FELLERS

**The milk supply of Paris. Necessity for hygienic control; methods; research on the coli bacillus in milk.** A. NEVOT. *Lait* **13**, 111–22(1933).—Chem. and bacteriol. methods used in milk-control work are discussed A. H. JOHNSON

**Milk of a typical herd of Shorthorn cows. I.** J. GOLDING, J. MACKINTOSH AND E. V. C. MATTICK. *J. Dairy Research* **4**, 48–73(1932).—The chem. compn. of the milk from dairy Shorthorn cows was studied over a period of 3 years. A tendency of the fat content to rise was noted when conditions operated to reduce the quantity of milk produced. The acidity of the milk throughout the 3-year period was very uniform, varying between 0.14 and 0.18% as lactic acid There were indications of a slightly lower acidity when the cows were on pasture. Formol N in the milks was also very uniform but on the av. the milks were slightly higher in formol N during the winter The rate of rennet coagulation was much slower in winter milk than in summer milk Milks were highest in total and casein N in the spring. This was thought to be assocd. with grazing on young grass of high N content. Ash, CaO, $P_2O_5$, lactose and f. p. of the milks were also detd. During the 3-year period the milks exhibited remarkable uniformity in these respects. A. H. JOHNSON

**Change of composition of milk according to the seasons.** JÁNOS TRAMBICS AND GYULA SZABADOS. *Kisérletügyi Közlemények* **35**, 148–54(1932).—In 1930 the minimum of fat-free dry matter was 8.88%. In 1931, a year of much less rain, the min. was 8.71% and the max. 9.20%. The refraction values and the content of milk sugar were not significantly different in the 2 years. In winter the refraction is smaller and the Cl content larger in the morning milks. In summer the evening milks have generally smaller refraction values and larger Cl contents than morning milks. S. S. DE F.

**Simplified molecular constant of certain milks.** A. LATAIX. *Lait* **12**, 931–8 (1932).—Milk from cows in heat and from cows which have aborted had the same simplified mol. const. as milk from normal healthy cows. A. H. JOHNSON

**The errors involved in certain methods of estimating the lactation yield of milk and butter fat.** JOHN HOUSTON AND ROBERT W. HALE. *J. Dairy Research* **4**, 37–47 (1932).—By basing the calcd. butter-fat yields on tests made at intervals of 1 to 8 weeks, the standard deviation of the errors in the calcd. butter-fat percentages for each interval, as well as the max. errors were found. As the time between the tests was lengthened, the errors increased. With tests made at intervals of 6 weeks most of the errors in the calcd. percentages were less than 8.5%. However, in order to insure that the errors in the calcd. butter fat do not exceed 10%, the interval between tests should not exceed 1 month. By basing the calcn. on a weekly weighing of the milk, results were obtained which closely approximated the true milk yield. A. H. JOHNSON

**The foam of milk.** G. GENIN. *Lait* **12,** 1079–88(1932).—Recent work on the structure of foam and the mechanism of foam formation is reviewed. A. H. JOHNSON

**Investigations on heated milks.** ORLA-JENSEN. *Lait* **13,** 82–5(1933).—Milk which has been pasteurized in bottles was considered to have the following advantages: (1) metallic flavor in the milk is prevented, as there is no contamination with metals from pasteurizing equipment; (2) loss of $CO_2$ from the milk and incorporation of air in the milk are prevented consequently there is less chance for destruction of vitamins; (3) there is less pumping of the milk through pipe lines and therefore the milk shows its full tendency to form a cream layer and (4) more effective destruction of bacteria. A. H. JOHNSON

**Adulterating milk with sugar solutions which are isotonic with the milk.** A. CASOLARI. *Ann. chim. applicata* **22,** 753–62(1932).—Samples of milk were adulterated with 20% of a soln. contg 0.28% NaCl and 3.40% glucose. The adulteration is detected by identifying the glucose, as with $(NH_4)_2MoO_4$. A. W. CONTIERI

**The refrigeration of the milk supply.** B. LICHTENBERGER. *Z. ges. Kälte-Ind.* **39,** 168–72, 185–7(1932). F. D. ROSSINI

**An easy method for estimating the protein content of milk.** B B. BRAHMACHARI. *Indian Med. Gaz.* **68,** 22–3(1933).—Phosphotungstic acid (Bogg's reagent) is a suitable precipitant for making this detn. Results are uniform. FREDERICK G. GERMUTH

**Titrimetric determination of sodium bicarbonate added to milk.** KÁROLY SARLÓ. *Kisérletugyi Kozlemények* **35,** 144–7(1932).—Evap. 10 cc. milk and ash the residue. Treat the ash in a special app. with 20% HCl and absorb the $CO_2$ in satd. lime water. The ash of a normal milk contains about 2% $CO_2$, from this the added $NaHCO_3$ can be calcd. S. S. DE FINÁLY

**The latent infection of the mammary gland and its appearance. Means of detection.** CH. PORCHER. *Lait* **12,** 687–703, 793–802, 914–22(1932).—Milk from cows with infected mammary glands was found to be salty and bitter in flavor. As compared with normal milk, such milk was low in lactose, $P_2O_5$, K, acidity, citrates, Cu and casein; it was high in NaCl and elec. cond. It also reacted differently to the alc. test and to coagulation with rennet and was higher in catalase activity. The f. p. and peroxidase activity of the milk from infected glands were no different from those of normal milk. A. H. JOHNSON

**The criteria by which one should be inspired and the methods which should be followed in the evaluation of a process for pasteurizing milk.** HENRI STASSANO. *Lait* **13,** 85–110(1933).—Aside from their effectiveness in destroying bacteria, processes of pasteurizing milk should be judged by the following criteria: (1) the extent to which they impart a cooked flavor to the milk, (2) the degree to which the albumin is coagulated, (3) the rate of increase of acidity for the first 3 to 5 hrs. of incubation, (4) the maintenance of the original acidity of the milk after pasteurization, (5) maintenance of the original $CO_2$ content of the milk, (6) the extent to which enzymes and vitamins are affected, (7) the retention of the ability to coagulate on the addn. of rennin, and (8) the degree to which the creaming ability of the milk is affected. A. H. JOHNSON

**The thermophilic bacteria of milk pasteurized at low temperature.** ROBERT S. BREED. *Lait* **13,** 60–81(1933).—Milk contg. thermophilic bacteria possesses an undesirable flavor and soon develops excess acidity and produces rennin which prematurely causes the milk to curdle. Conditions under which the thermophilic bacteria come to exist in the milk are discussed. A. H. JOHNSON

**Application of the Skar method for counting the number of bacteria in milk.** IRENA DOBERSKA-MAYOWA. *Med. Doświadczalna Społeczna* **15,** 247–51(in French 252) (1932).—This method was found to be rapid, convenient and not expensive; groups, however, should be counted and not single bacteria. The method is not suited for pasteurization control. S. LAUFER

**The influence of bacilli of the colon group on the production of acid by streptococci in milk.** H. R. WHITEHEAD AND G. A. COX. *J. Dairy Research* **4,** 74–80(1932).—Colon bacilli grown in milk for from 3 to 16 hrs. partially inhibit the subsequent formation of acid by lactic streptococci. The inhibition is not entirely accounted for by the increased H-ion concn. or by lactic acid produced by the colon bacilli. Other substances having a retarding influence on the streptococci are evidently formed in milk cultures of colon bacilli. The action of these substances is not significantly modified by heating at 75° for 1 hr. A. H. JOHNSON

**Escherichia coli in milk.** J. PIEN AND J. BACHIMONT. *Lait* **12,** 903–14, 1058–71 (1932).—*Es. coli* in milk yields lactic acid, H, $CO_2$ and a little $CH_4$. Milk cultured with *Es. coli* shows a neg. reaction for indole. The presence of lactose in milk appears to prevent the formation of indole by *Es. coli*. A. H. JOHNSON

**Fungi found in milk, cream and butter.** M. GRIMES, H. A. CUMMINS AND V. C. E. KENNELLY. *Lait* **12,** 894–903, 1071–9(1932).—Temp. and salt tolerance, liquefying

effect on gelatin, coagulating effect on milk and effect of the growth of the fungus on the H-ion concn. of the medium are given for many of the molds likely to be found in milk, cream and butter. A. H. JOHNSON

**Counting bacteria in ice cream.** C. F. HOYT. Calif. Dept. Agr., *Monthly Bull.* 21, 409–13(1932).—The sample is prepd. for analysis by heating to not over 46°, pipetting about 1 g. into a sterile Mojonnier butter boat, and transfering the boat asceptically to the 100 ml. diln. flask. The sample is weighed to 2 decimals. The Milk Analysis Methods, Am. Pub. Health Assoc. are used. C. R. FELLERS

**Important factors that affect quality in vanilla ice cream.** F. C. BUTTON. *Ice Cream Trade J.* 29, No. 2, 26–7(1933). A. H. JOHNSON

**The possibilities and limitations of fast hardening ice cream.** RIDGEWAY KENNEDY, JR. *Ice Cream Trade J.* 29, No. 1, 23–4(1933).—The crystn. of the various constituents of ice cream during freezing is discussed. A. H. JOHNSON

**A new method for the determination of butter fat.** A. CASOLARI. *Ann. chim. applicata* 22, 706–12(1932).—Weigh 50 g. butter into a tube, the lower end of which is closed by a stopper having a hole plugged by a glass rod. The upper end of the tube tapers and is also stoppered. Add 5–10 cc. EtOH (30%) and immerse the whole in a bath at 70–75°. When the layers have sepd., centrifuge to complete the sepn., chill the tube to solidify the fat and draw off the EtOH layer at the bottom by removing the glass rod. Rinse the tube with dil. EtOH, dry with filter paper (after removing the lower stopper) and reweigh. Results average 0.30% low in comparison with the official method. A. W. CONTIERI

**Bacteriological examination of butter.** F. DIÉNERT. *Lait* 12, 1055–8(1932).—The acidity of butter was found to be a factor affecting the *Escherichia coli* content Butter of high acidity was low in *E. coli*. A. H. JOHNSON

**Parchment paper as a source of mold spores.** J. GREGER. *Z. Untersuch. Lebensm* 63, 560–4(1932).—Parchment paper used for wrapping of butter should be free from sugar, and the count of mold germs per 100 sq. cm. should not be abnormally high. In fact, spoilage occurring in butter is to be attributed to chem. changes taking place in the butter itself rather than to infection from the wrapping paper. S. LAUFER

**The preparation of hard cheeses from pasteurized milk by means of bacterium cultures.** OTTÓ GRATZ. *Kisérletügyi Kozlemények* 35, 86–94(1932).—For Swiss-cheese making, 30-min. pasteurization at 60–63° is harmful. The casein colloids are adversely affected and the holes are not properly formed. Anaerobic bacteria multiply rapidly and cause improper ripening and swelling. The results agree with those observed by Van der Burg on Holland cheeses and by Moir and Veal on Cheddar cheeses S. S. DE FINÁLY

**Role of anaerobic spore-forming bacteria in the swelling of process cheeses.** JÓZSEF CSISZÁR. *Kisérletügyi Kozlemények* 35, 96–103(1932).—*B. sporogenes*, *B. putrificus* and *B. saccharobutyricus* were found in swollen process cheeses. Of the cases exam'd 94% was caused by *B. sporogenes*. S. S. DE FINÁLY

**Manufacture of sweet-curd rennet-coagulated cottage cheese.** L. M. THURSTON W. Va. Agr. Expt. Sta., *Bull.* 244, 22–3(1931).—The acidity of the whey at the time of cutting the curd is the most important single factor concerned in the mfg process Regardless of variations in other factors, a whey acidity of 0.35% lactic acid or more was necessary to produce curd with a desirable body. At lower acidities, rubbery curds developed. The av. acidity at cutting for the most desirable curds was 0.48%. The use of $CaCl_2$ to aid in coagulation or firming was of no value. No variation in effect was apparent when 1.33–3.33 cc. of rennet ext. per 1000 lb. of milk was used. Gassy curd was eliminated by pasteurization at 65–6° for 20 min. C. R. FELLERS

**Fresh cheese and undulant fever.** M. CARRIEU AND M. LAFENÊTRE. *Lait* 12, 779–85(1932). A. H. JOHNSON

**The effect of carbon dioxide on the color changes or bloom of lean meat.** J. BROOKS. *J. Soc. Chem. Ind.* 52, 17–19T(1933); cf. *C. A.* 26, 194.—The rate of oxidation of hemoglobin in muscle is not affected to a significant extent by concns. of $CO_2$ below 20%. If other conditions of storage are the same the color changes of lean meat in air and in air contg. 20% $CO_2$ should be the same. F. L. DUNLAP

**Methods for detecting initial decomposition in meat.** G. BROTZU. *Z. Untersuch. Lebensm.* 63, 503–14(1932).—The following methods are recommended: (1) detn of amino acid N by the method of Henriques and Gjaldbäk, of Grünhut or of Van Slyke (there should not be more than 500–600 mg. of amino acid N per 100 g. of meat); (2) $p_H$ detn. in the warm meat juice (a meat having $p_H$ 6.3 and above begins to decompose); (3) bacteriol. test (a high bacterial count per 0.1 cc. of the juice obtained from pressing the minced meat indicates commencing decompn.). S. LAUFER

**Composition of rabbit carcasses. I. White Angoras.** W. KING WILSON AND S. MORRIS. *J. Agr. Sci.* 22, 453–9(1932).—Investigation of the chem. compn. of the

total edible flesh of young and adult male and female rabbits showed marked differences between the sexes. This was most pronounced in the case of fat content, young females having approx. 4% more fat than young males. With adults the difference was approx. 6% in favor of the females. No pronounced differences in the ash constituents of adult males and females were shown. P. R. DAWSON

**The fast freezing of meat.** I. KUPRIANOFF. *Z. ges. Kälte-Ind.* **39**, 213–14(1932).—A discussion of the variation of freezing time with thickness of meat and with refrigerant. F. D. ROSSINI

**Chemical changes in the fat of frozen and chilled meat. IV. The protective influence of carbon dioxide on the fat of beef stored at 0°.** C. H. LEA. *J. Soc. Chem. Ind.* **52**, 9–12T(1933); cf. *C. A.* **26**, 780.—$CO_2$ has a marked effect in retarding the onset of taint in beef fat at 0°. In a satd. atm. the time required for the production of a perceptible "off" flavor was approx. doubled in the presence of 10% $CO_2$. At lower humidities the protection afforded by the gas was somewhat increased, but gas storage was less effective in delaying the appearance of taint when commenced 5 or 6 days after slaughter. For the purpose of protecting the fat comparatively little advantage results from increasing the $CO_2$ concn. beyond 15 or 20%. These (or higher) concns. of the gas appear to have no harmful effect on the flavor of the fat, or on its resistance to oxidation during a storage period of 50 days. F. L. DUNLAP

**The critical cooling time and the optimum storage temperature for the fast freezing of provisions.** W. LUDEWIG. *Z. ges. Kälte-Ind.* **39**, 176–9(1932). F. D. ROSSINI

**Chemical studies of frozen fruits.** T. A. PICKETT. Ga. Agr. Expt. Sta., *Annual Rept.* **1931**, 42; cf. *C. A.* **26**, 4386.—Peaches were frozen and stored in hypoisotonic and hyperisotonic solns. of sucrose and NaCl. Those in isotonic solns. were better preserved than those in higher or lower concns. Peaches stored in buffer solns. at different H-ion concns. showed no marked quality differences. When peaches were coated with shellac, collodion and paraffin and stored at 4.5° or at —15°, they were well preserved but had a disagreeable taste near the pit. The titratable acid had perceptibly increased during storage. Peaches frozen at —65° and stored at —15° had a lower respiration rate than those frozen and stored at —15°. The quick-frozen peaches had a lower percentage of sol. pectin and higher protopectin than those frozen at —15°. C. R FELLERS

**Titrimetric determination of formic acid in fruit juices and sirups.** GÉZA v. SZELÉNYI. *Z. Untersuch. Lebensm.* **63**, 534–41(1932).—Fincke's $HgCl_2$ method (*C. A.* **5**, 1300, 3705) gives accurate results if the $HgCl_2$ concn. in the reaction mixt. is at least 0.01% Two rapid and dependable oxidation methods were perfected: (1) Place an aliquot of the distillate obtained in the usual manner in a glass-stoppered bottle, add 5 cc of 10% $CH_3CO_2Na$ and 15–20 cc. of 0.1 *N* $CH_2BrCO_2H$ and keep for ½ hr. Then add 5 cc. of 10% KI and titrate the excess of Br with 0.1 *N* $Na_2S_2O_3$. (2) Add to the distillate in a 500-cc. Erlenmeyer flask 10 cc. of 10% $Na_2CO_3$, boil, let quickly run into the mixt. 20 cc. of 0.1 *N* $KMnO_4$, mix 1 min., add 1–2 cc. of 10% $ZnSO_4$, stir and titrate back with 0.1 *N* $As_2O_3$. The last method is not in all cases adapted for sirups. S. LAUFER

**Changes in raspberries after picking.** THEODORE RENDLE. *Analyst* **58**, 69–77 (1933).—The ripening process in raspberries is more rapid than in most other fruits. As the raspberries ripen, volatile org. compds. are formed without the aid of micro-organisms. The pectic substances present are subject to rapid change with loss of "gelling" power but this change is arrested by applying heat. The enzymic activity of raspberries appears to be greater than in most British fruits and is responsible for the above results. Considerable data are given to support these conclusions. W. T. H.

**Composition of California tomatoes.** L. G. SAYWELL AND W. V. CRUESS. *Fruit Products J.* **12**, 177–9(1933).—Analyses were made of the fresh whole ripe tomato fruits by the A. O. A. C. methods. All results are expressed on the basis of the fresh fruit. The av. compn. was total solids about 6.0–7.0, sucrose up to 0.05, reducing sugar 3.30–3.50, starch 0.01–0.06, total acid 0.35–0.40, protein 0.85–1.00, acid-hydrolyzable (carbohydrate) material 0.10–0.30%; the ratio of dextrose to levulose was 1.17–1.24; $p_H$ 4.0–4.2. Climate and locality, variety and seed selection may alter the compn. of the fruit considerably, even beyond the normal or av. ranges of compn. F. L. DUNLAP

**The composition of tomatoes grown on the Hungarian Plain.** ADOLF FALTIN. *Kisérletügyi Közlemények* **35**, 136–41(1932).—Av. values for 15 different varieties of tomatoes were dry matter 5.42, total sugar (as invert sugar) 3.23, acids (as oxalic acid) 0.29, and ash 0.55%. Seeds and peels averaged 1.01%. The above numbers calcd. on the basis of total dry matter gave total sugar 59.60, total acids 5.32, and total ash 10.20%. S. S. DE FINÁLY

**California standards for dried prunes.** W. F. ALLEWELT AND F. G. LOCAN. Calif. Dept. Agr., *Monthly Bull.* **21**, 422–7(1932).—Size and quality grades are given. The

av. sp. gr. of a fancy grade shall not be less than 1.29 for all varieties except Imperials which shall test not less than 1.28 The choice or second-grade prunes shall have an av. sp. gr. of not less than 1.18. The av. moisture content shall not exceed 24%.
C. R. FELLERS

**Relation of storage temperature of potatoes to their culinary quality.** MARION D. SWEETMAN. *Am. Potato J.* **8,** 174–6(1931); Maine Agr. Expt. Sta., *Bull.* **360,** 218; cf. *C. A.* **25,** 5717.—Frying quality of potatoes stored at temps. below 5° is greatly injured because of the development of a bitter flavor and dark color. These deleterious changes are due to caramelization of the sugars. Storage at warm temp. for several weeks will usually remove the sugar.
C. R. FELLERS

**Cooking quality of potatoes.** MARION D. SWEETMAN. Maine Agr. Expt. Sta., *Bull.* **360,** 194–5(1931).—Forty-five lots of potatoes including 20 varieties were tested for mealiness when boiled and baked, for amt. of starch, size of starch grains, viscosity of the starch, increase in vol. of the starch during heating, content of sol. pectin and protopectin, and amt. of sloughing when boiled. No one of these factors is correlated completely with mealiness, but it is likely that a combination of some of these accounts for the mealiness of some potatoes. Potatoes of high starch content are likely to be less mealy when cooked. Potato-storage temp. below 7.5° causes undesirable accumulations of sugar.
C. R. FELLERS

**Canning quality of pumpkins.** J. H MACGILLIVRAY. Ind. (Purdue) Agr. Expt Sta., *Rept. of the Director for Year Ending June 30, 1931,* 43–4, 54–5.—The sp. gr. of the raw stock varied from 0.535 for Connecticut Field variety to 0.738 for Delicious (squash). Delicious, Golden Hubbard and Golden Delicious produced a stiff product while pumpkin varieties and Boston Marrow squash lacked this characteristic Pumpkins yield a larger tonnage of raw stock, but the squash give a greater yield of canned product per ton of stock. Golden Delicious squash contained the highest percentage of starch and pectin at all stages of growth.
C R FELLERS

**Honey.** K. BRAUNSDORF. *Z Untersuch. Lebensm* **63,** 526–34(1932), cf. *C. A* **26,** 534.—Honeys heated under the same conditions of temp. and time differed widely in decrease of the diastatic activity, *e. g.*, at 81–3° for 1 hr. 54–91% It was noted that honeys stored for 10 months at 20° showed rather distinctly red resorcinol reactions Expts. performed as to the effect of heating on both the phloroglucinol and resorcinol tests have demonstrated that the latter is more sensitive, although both showed little change Heating for 1 hr. at 80° cannot, therefore, by means of these tests, be readily established
S LAUFER

**Examination of comb-honey. II.** K BRAUNSDORF. *Z. Untersuch Lebensm.* **63,** 522–6(1932); cf *C A.* **26,** 3309.—Further characteristics are given which enable one to distinguish between natural and artificial combs.
S. LAUFER

**The interpretation of the analysis of vanilla extract.** LESLIE O HILL *Spice Mill* **55,** 1300 3, 1316, 1326(1932).—A discussion The analytical methods used were the official ones prescribed by the Assoc of Official Agricultural Chemists F L D

**The preservation of fresh chestnuts.** G. MAURI AND C CALZOLARI *Ind ital conserve aliment.* **7,** 201–4(1932), *Chimie & industrie* **29,** 191.—$CHCl_3$ gives satisfactory results as regards the preservation of the chestnuts, but must be used in such quantities that it renders them unedible. Formic acid acts as a strong antiseptic toward ferments, and 2 g. per kg. of nuts is sufficient to produce perfect sterilization. A 2.5% formic acid soln. turns the outer skin brown, and the internal skin and the surface of the cotyledon is sometimes stained gray or blue; this can be prevented by treating the nuts with HCl gas before formic acid Treated nuts take longer to cook. Moldy or deteriorated nuts absorb more formic acid than sound nuts. Treated nuts acquire the characteristic flavor of formic acid; but it disappears to a large extent on cooking
A. P.-C

**Tea from Nyassland. III.** ANON. *Bull. Imp. Inst.* **30,** 434–40(1932); cf. *C. A* **27,** 349.—Analysis of 6 samples showed that they were all of normal compn.
A. P.-C

**Nutritive value of pasture. IX. The influence of the intensity of grazing on the yield, composition and nutritive value of pasture herbage. 4.** H. E WOODMAN AND D. B. NORMAN. *J. Agr. Sci.* **22,** 852–73(1932); cf. *C. A.* **26,** 3599.—Exptl. data show that during the quick-growing period of May and June, pasture grass under a 5-weekly rotational close-grazing system has a slightly lower feeding value than that of grass grazed down at monthly intervals, but that as the season progresses, the nutritive value of the herbage under the 2 systems of close-grazing tends to become equal. Over the whole season, the dry matter of the 5-weekly mown herbage contained, on an av., 63.9% of starch equiv., including 12.6% of digestible protein. The corresponding mean data for monthly grown grass were 67.0 and 14.1%, resp. The actual yield of starch equiv. and digestible protein per acre, over the season, may suffer no depression with mowing only every 5 weeks. The consequent increased growth of herbage may lead to a

definite increase in the yield of starch equiv. The 5-weekly mown herbage, even in the periods of lowest mineral content, contained ample supplies of CaO and $P_2O_5$ to meet the requirements of dairy cattle.

**A study of classification calculations.** HARRY W. NEWTON AND WM. H. NEWTON. *Rock Products* **35**, No. 16, 26–30(1932).—Formulas for efficiency and circulating load are developed. RAYMOND WILSON

**Studies in filtration. II. Fundamental axiom of constant-pressure filtration.** B. F. RUTH, G. H. MONTILLON AND R. E. MONTONNA. *Ind. Eng. Chem.* **25**, 153–61 (1933); cf. *C. A.* **27**, 789.—The irregularities observed in the $V^2$ *vs.* $\theta$ plots at the beginning of filtration are due to the resistance of the filter medium. If this resistance is expressed as units of cake resistance and considered as an integral part of the filtration cycle, the relation of vol. and time is shown to be parabolic throughout the whole course of the filtration. The equation $(V + C)^2 = K(\theta + \theta_0)$ is shown to hold throughout the whole course of the filtration cycle for different types of sludges varying in character from highly rigid to highly compressible particles. R. M. BOARTS, JR.

**Basic principles of distillation and rectification.** A. M. TREGUBOV. *Aznefteizdat* Issue **15**, 159 pp.(1932). A. A. BOEHTLINGK

**Agricultural wastes and their relation to industry.** C. A. BASORE. *Mfrs. Record* **100**, No. 19, 22–3(1931).—A review of the production of various compds., as xylose, cellulose, furfural, acetic and oxalic acids, and of fiberboard, etc., from cottonseed hulls, corn stalks and cobs, waste wood, waste straw, bagasse and peanut hulls. J. D. S

**Carbon dioxide in industry.** CHAS. L. JONES. *Chem. & Met Eng.* **40**, 76–9 (1933). E. H.

**Heat effects in salt solutions.** FRAN BOSNJAKOVIC. *Z. ges Kalte Ind.* **39**, 165–8, 181–5(1932).—A practical discussion of the thermodynamic properties of salt solns for refrigeration purposes. F. D. ROSSINI

**Altenkirch two-stage ammonia-absorption refrigerating machine.** M. GOMPERTZ AND W. NIEBERGALL. *Z. ges. Kälte-Ind.* **39**, 187–92, 205–7, 220–5(1932). F. D. ROSSINI

**Correction table for the performance meter, calibrated in normal calories, for the ammonia refrigeration plant.** KARL HEINZE. *Z. ges. Kälte-Ind* **39**, 200–4(1932). F. D. ROSSINI

**The development of the Elektrolux refrigerating machine.** C. G. MUNTERS. *Z. ges. Kälte-Ind.* **39**, 197–200, 216–20(1932). F. D. ROSSINI

**Chemical warfare in mob and crime control.** KENNETH A. KOBE. *Chem. & Met. Eng.* **40**, 60–1(1933). E. H.

**Toxic gases.** JÁNOS ERDÉLYI. *Természettud. Közlöny* **64**, 461–73, 510–23(1932). Known gases used for military purposes are reviewed and the history and future of the chem. warfare are discussed. S. S DE FINÁLY

**A summary of the year's insulation research.** J. B. WHITEHEAD. *Elec. Eng* 52, 99–100(1933).—Insulating oil and capillary action of oil as related to paper are discussed at the annual meeting of the Comm. on Insulation of the National Research Council. W. H. BOYNTON

**Thermal insulation with aluminum foil.** RALPH B. MASON. *Ind. Eng Chem* **25**, 245–54(1933).—The low thermal emissivity of Al foil and the low thermal cond of air are combined in an Al foil-air cell insulation, of the plain air-cell type, whose insulating value approaches that of still air. The best results are obtained when the distance between foils is from 0.25 to 0.33 in. KARL KAMMERMEYER

SCHROEDER, ALF.: **Entwicklung der Schleiftechnik bis zur Mitte des 19. Jahrhundert.** Thesis, Brunswick, 1930. 191 pp.

**Purifying gases.** LONDON POWER CO., LTD. Fr. 738,307, June 8, 1932. $SO_2$ is removed from gases by treating them with an alk. suspension of $Fe(OH)_3$, the soln. being kept alk. by the addn. of CaO. $CaSO_4$ is pptd. and removed.

**Separating gaseous mixtures.** BRITISH CELANESE, LTD., DONALD FINLAYSON and ALFRED J. SHARP. Brit. 365,092, Oct. 15, 1930. The mixts. are sepd. by adsorption in a substance such as active C or silica gel, followed by fractional desorption at successively descreased pressures. The fractions may be subjected to a repetition of the process. In an example water gas is sepd. into fractions suitable for (1) *$NH_3$ synthesis,* (2) *methanol synthesis* and (3) the *conversion of aliphatic alcs into acids.*

**Separating gaseous mixtures by liquefaction.** SOC. L'AIR LIQUIDE (SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE). Fr. 738,074, June 2, 1932.

**Washing gases.** W. E. GIBBS. Brit. 380,099, Mar. 27, 1931. Mech. construction.

**Washing gases.** ATELIERS J. HANREZ SOC. ANON. and A. MODAVE. Brit. 380,746, Mar. 17, 1932.

**Apparatus for allowing liquefied gases to gasify at ordinary temperature.** KENNETH S. MURRAY and THE BRITISH OXYGEN CO., LTD. Fr. 738,084, June 2, 1932.

**Purifying vapors such as those of distilled water.** EMIL TRUOG. U. S. 1,889,617, Nov. 29. Vapors formed by heating a liquid are passed through a dil. acid soln. such as $KHSO_4$ to remove basic impurities; the washed vapors are then passed around a body of charcoal to heat the charcoal and are then conducted into contact with the heated charcoal to remove phys. impurities without condensation of the vapors. App. is described. Soda lime also may be used.

**Distillations.** METALLGESELLSCHAFT A.-G. Fr. 738,205, June 6, 1932. In distg. mineral oils or other liquids or removing fatty acids from oils, etc., substances capable of being condensed by cooling with water or air, under a reduced abs. pressure, *e. g.*, corresponding to 3 mm. of Hg and less, are introduced below an upright tube extending from near the bottom to above the level of the liquid for causing the liquid to rise Thus, in the distn. of oil a lighter fraction may be introduced.

**Emulsions.** ERWIN MEYER and UDDEHOLMS AKTIEBOLAG. Brit 365,844, Feb. 25, 1931. Aq. emulsions are prepd. by using as the sole emulsifying agent turpentine oil, preferably that obtained from the sulfate cellulose or charcoal industries. In examples, colophony, liquid rosin, paraffin and bitumen-asphalt are emulsified with water. The products are usable for impregnating wood, paper, textiles, sizing paper, application as plasters to the skin in case of burns, and, in the case of the bitumen-asphalt emulsion, road making, coating wood, etc.

**Making and treating emulsions.** RAGNVALD HELLERUD, N. V. INTERNATIONALE GRADIN MAATSCHAPPIJ and VITACREAM, LTD. Brit. 365,586, Aug. 15, 1930. Emulsions, particularly those contg. protein material and fat, are treated to increase their stability and lower their viscosity by passing them through successive heads or valves of a homogenizing machine. At the first head a high pressure, *e. g.*, over 100 atm., is employed and at following heads substantially lower homogenizing pressures. In the case of fatty emulsions contg. casein or egg protein as emulsifying agents the first homogenization should be at not less than 60°.

**Colloidal solutions of oxides.** CURT GROPENGIESSER. Fr. 737,908, May 31, 1932. Colloidal aq. solns. are made by grinding oxides of metals such as Pb, Cu or Fe, in the presence of dextrin and gradually adding water. A small amt. of glycerol or glucose may be added to the dextrin.

**Removing colloidal silica from solutions.** GIAN A. BLANC. Brit. 366,002, Aug. 22, 1929. See Fr. 700,750 (*C. A.* **25,** 3745).

**Oxygen-producing compositions.** WALTER ZISCH (to Roessler & Hasslacher Chemical Co.). U. S. 1,890,875, Dec. 13. A compn. producing O when used in breathing app. is prepd. by hydrating an alkali metal peroxide while dissipating the heat of reaction by incorporation of water in the ratio of about 0.3–1 mol. of water per mol. of peroxide, and heating the resulting hydrated product to a temp. below 150° (suitably about 50°). Cf. *C. A.* **27,** 383.

**Heating granular materials; coking; drying.** A. P. E. BOURDET. Brit. 380,830, June 18, 1930.

**Transmitting heat produced in a fire box.** LUCIEN NEU. Brit. 363,684, June 24, 1929. Void. An intermediate liquid circulating in an enclosed space is used to transmit the heat to the fluid to be heated or vaporized.

**Refrigerant.** CHRISTIAN DANTSIZEN (to The British Thomson-Houston Co., Ltd.). Brit. 363,613, Sept. 19, 1930. A refrigerant consists of Me formate with a small proportion of a low-boiling alc., *e. g*, EtOH or MeOH.

**Refrigerants.** MICHEL B. TAILLANDIER. Fr. 737,534, July 25, 1931. Refrigerants are composed of a system of salts, the anion of which is strongly electroneg. and which are strongly hydrolyzed in soln. Examples contain (1) $KNO_3$, $NH_4OH$, $Na_2SO_4$ and water, (2) $Na_2SO_4$, HCl and water, (3) Rochelle salt, $NH_4OH$, $KNO_3$ and water and (4) $NH_4OH$, $KNO_3$ and water.

**Insulating materials.** GUSTAVE RISLER. Fr. 737,923, Sept. 23, 1931. Paper which is to be impregnated with an insulating mass is first opened up to receive the mass by treating it with a soln. of a gas in liquid, *e. g.*, $NH_3$ in water or MeOH and then heating rapidly to liberate the gas suddenly. For heating, the paper may be immersed in a liquid heated to above the b. p. of the liquid in which the gas is dissolved.

**Insulating coating material suitable for use on metal pipes, etc.** MAX DESENISS and ANDREAS NIELSEN (to New-York Hamburger Gummiwaaren Compagnie). U. S. 1,890,723, Dec. 13. See Fr. 714,805 (*C. A.* **26**, 1684).

**Weatherproof insulation on wire.** OTTO A. FREDERICKSON (to National Elec. Products Corp.). U. S. 1,890,253-4, Dec. 6. Various details of manuf. are described, involving wrappings formed of crinkled paper, asphalt, stearin pitch, etc.

**Insulating cables.** CHEMISCHE FABRIK VORM. SANDOZ. Brit. 363,435, July 8, 1930. Metallic conductors, condensers, etc., are insulated with layers of mono- or di-acetylated cellulose fibers prepd. by any acetylation process not altering the structure of the fibers.

**Apparatus for producing an electric cable having a covering of India rubber or like composition.** BRITISH INSULATED CABLES, LTD., WM. WHITELEY and CHARLES WILKINSON. Brit. 363,440, Oct. 3, 1930.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Water supply of Spartanburg, S. C., and its by-products.** R. B. SIMMS AND J. K. MARQUIS *J. Southeastern Section, Am. Water Works Assocn* **2**, 61–8(1932); *U. S. Pub. Health Eng. Abstracts* **12**, W, 142(Dec. 3, 1932) C. R. FELLERS

**Increasing efficiency of water purification at Valparaiso, Indiana.** CHAS. BROSSMAN. *Public Works*, **63**, No. 5, 15–17(1932).—The old filtration plant was modernized by the installation of new filter bottoms, control mechanism, Aer-O-Mix header tank, and dry-feed machines. Filter troubles have disappeared, settling basin efficiency has been increased and a saving of wash water and alum has been effected. C. C RUCHHOFT

**Water works improvements at Murfreesboro, Tenn.** C. N. HARRUB. *Public Works* **63**, No. 3, 24–6(1932).—In order to provide an adequate water-supply system the following units were constructed: a gravity-type filtration plant, replacement of old boilers, erection of a new power plant, construction of a half-million-gal. elevated steel storage tank and a belt line of 8" and 12" pipe to improve the distribution pressure. The filtration plant includes 2 sedimentation tanks having a capacity of 125,000 gal. each, 4 half-million-gal. rapid sand filters and a million-gal. filtered-water reservoir. C. C. RUCHHOFT

**Treatment of well waters.** M. J. DAVIS. *Water Works Eng.* **85**, 1414–15(1932).—Aeration is used to remove $H_2S$ and $CO_2$. Sedimentation followed by pressure filters and zeolite softeners complete the treatment. Reduction in hardness is 13 gr. per gal. 6 gr. per gal. This produces an estd. saving of $10,000 yearly to consumers; hence it justifies the $4,000 installation cost. G. L. KELSO

**Mineral springs of Chechnya [Caucasus].** G. A. MAKSIMOVICH. *J. Applied Chem.* (U. S. S. R.) **5**, 1066–77(1932).—Chem. analysis of waters from different springs and their locations on a map are given, as well as a bibliography of 12 references. V. KALICHEVSKY

**The solution content of surface waters.** KARL KREJCI-GRAF. *Chem. Erde* **7**, 609–15(1932).—Analyses taken from Clarke's Data of Geochemistry are plotted to show the interrelation between the carbonate, sulfate, chloride and basic ion contents of various types of waters. MICHAEL FLEISCHER

**Hydrological classification.** ANDREA VINAJ. *Chim. ind. agr. biol.* **8,** 416–19(1932).—Methods for the chem. and biol. classification of waters are examd., and it is proposed to classify waters by means of a chem.-medical method of practical utility. G. A. B.

**Mud from Lake Dapkhur [Russia].** V. I. NIKOLAEV, A. M. SOLOVOV AND M. A. FRISHMUT. *J. Applied Chem.* (U. S. S. R.) **5,** 809–14(1932).—Analytical data are given. V. KALICHEVSKY

**Comparing waters by data obtained by an incomplete analysis.** K. L. MALYAROV. *Neftyanoe Khozyaĭstvo* **20,** 374–86(1931).—Methods for the detn. of ingredients in borehole waters are discussed. The detn. can be carried out by comparison with a water of known compn. and by bringing the water under investigation up to the compn. of a known sample. A. A. BOEHTLINGK

**Taste and odor control in drinking water.** R. C. GRAHAM. *Southwest Water Works J.* **14,** No. 9, 12(1932).—Activated charcoal 0.05 to 2.2 gr. per gal. removed odors from river water at Brownsville, Texas. O. M. SMITH

**Powdered activated carbon used without filtration.** ARON B. HESS. *Public Works* **63,** No. 8, 13(1932).—Half of the water supply taken from a lake contg. about 40 million gal. is softened, mixed with an equal quantity of untreated water and pumped to a storage tank. The destruction of a heavy algae growth with Cu sulfate produced a bad taste and a heavy turbidity. The entire lake surface was treated with 1100 lb. activated C. The C settled out in 24 hrs., and the taste and turbidity disappeared. C. C. RUCHHOFT

**Ammonia-chlorine and activated-carbon treatment of waters.** A. PRESCOTT FOLWELL. *Public Works* **63,** No. 5, 18–21(1932).—$NH_3$-Cl treatment saves Cl, prevents tastes due to phenols and excess Cl, is stable and efficient in the presence of considerable org. matter and provides residual Cl which remains in the water for a long period. Activated C is useful in removing tastes and odors due to algae, swampy and vegetable matters, to phenols, $H_2S$, Cl and other sol. matters. Sludge accumulating in settling basins and in water-softening units is rendered inodorous by activated C. C. C. R.

**Some ammonia-chlorine experiences.** ANON. *Public Works* **63,** No. 7, 42–4 (1932).—Most reports agree that the treatment is effective in destroying algae, but in some cases it was necessary to supplement the treatment with activated C. C. C RUCHHOFT

**Specifications for filter.** WM. E. STANLEY. *J. Am. Water Works Assoc.* **25,** 105–12(1933).—Emphasis is placed on the points to consider in writing filter-plant specifications. D. K. FRENCH

**Filtering materials for water works.** WM. E. STANLEY. *Can. Engr.* **62,** No. 2, 11(1932). E. HURWITZ

**Gravel as a trickling-filter medium.** E. W. STEEL AND P. J. A. ZELLER. *Can. Engr.* **62,** No. 2, 36(1932).—Gravel 1.5–2.5 in. in size will produce an effluent equal in quality to that produced by crushed stone of the same size. Unloading characteristics of the two materials are equal. E. HURWITZ

**Coagulation methods applied on the treatment of highly turbid waters.** HERBERT A. HARTUNG. *Water Works Eng.* **85,** 1310–13(1932).—Missouri River water turbidity varies from 150 to 17,000, and hardness between 120 and 240. Changes are rapid This water is coagulated and softened to produce an effluent of turbidity not exceeding 5 and total hardness of 100. Lime added to raw water causes removal of 90% of turbidity in the first basin. Choice of treatment is detd. by jar tests and alky. reduction. Secondary coagulation is effected with $FeSO_4$ when $p_H$ is above 9.0. G. L. KELSO

**Iron removal without filtration.** E. T. ARCHER. *Can. Eng.* **62,** No. 22, 11–12 (1932); cf. *C. A.* **26,** 4395, 5361. E. HURWITZ

**Ferric chloride as a coagulant.** PAUL STEGEMAN. *Water Works Eng.* **85,** 1318–20(1932).—Several expts. using $FeCl_3$ and alum in parallel indicate equal turbidity removal with smaller doses of $FeCl_3$ than alum. Lab. tests were confirmed in plant operation. No effect was indicated on color removal or filter runs. G. L. KELSO

**Neutralizing the effects of manganese in impounded water.** ROBERT SPURR WESTON AND ATTMORE E. GRIFFIN. *Water Works Eng.* **85,** 1314–17(1932).—The presence of Mn in impounded water is generally due to the acid condition resulting from decompn. of org. vegetable matter in the bottom of the reservoir and subsequent soln. of Mn. Presence of $H_2S$ intensifies the condition. As a reservoir ages, the Mn dissolved from the bottom soil decreases. Mn troubles can be reduced by drawing off the "bottom water" during stagnation periods. "Overturning" of the reservoir as in the fall distributes the Mn from the bottom through the water. G. L. KELSO

**Destruction of bacteria under anaerobic conditions and its significance for water supplies.** HANS LEHMANN AND CARL REICHLE. *Gas. u. Wasserfach* **76,** 41–4(1933).—Bacteria die within a relatively few days in water from which O is excluded, because of consumption of the dissolved O. It is suggested that a water free from contamination

might be obtained from some water sources, previously highly contaminated, if a well were sunk at a point insuring a reasonably long time for the water to percolate to that point. Diagrams are given. R. W. RYAN

**Solubility of lead in water.** JULIUS ZINK. *Z. anal. Chem.* **91,** 246–58(1933).—A summary of the effects of various anions on soln. of Pb by running water in Pb pipes. W. T. H.

**Sterilizing mains and contaminated pipe.** WM. W. BRUSH. *Can. Eng.* **63,** No. 13, 13(1932).—New pipe lines are easily sterilized by introducing a small amt. of chloride of lime into each section as it is being laid. If chlorine gas is preferred a portable injector and a back-pressure valve are necessary. Time of contact should never be less than 4 hours. E. HURWITZ

**Jute causes trouble.** G. I. WHITE. *Water Works Eng.* **85,** 1420–1(1932).—7000 feet of new cement-lined 24″ cast-iron pipe connects the new 7,000,000-gal. covered distribution reservoir at Kalamazoo, Mich., with the distribution system. The new line was treated with water contg. 40 p. p. m. $Cl_2$ with 8 hrs. contact, the reservoir being thoroughly flushed down inside with water of the same $Cl_2$ concn. at 100 lb. pressure. *Es. coli* were recovered in 1-ml. samples after this treatment. Repeated treatment failed to remove colon organisms or reduce the counts. Selective sampling indicated the main as the source of contamination. Two kinds of untarred, unoiled jute had been used in construction of the main, one braided the other unbraided. 0.05-g. samples of the unbraided material yielded 3 types of aerobic lactose fermenters; *Es. coli, Aerobacter aerogenes* and an organism giving deep pink colonies on E. M. B. agar. The braided material gave neg. bacteriol. results. G. L. KELSO

**Water softening at Thomasville, Georgia, saves more than double its cost.** LOWELL CADY. *Public Works* **63,** No. 6, 20–2(1932).—The equipment includes 2 mech. agitators, 1 clarifier, 3 carbonating chambers, 1 settling basin and 2 gravity filters. To remove the Mg and produce a low final carbonate hardness the water is overtreated with lime to 40 p. p. m. caustic alky.; this is followed by carbonation and thin filtration to remove the excess carbonates. Dry-feed machines handle quicklime, soda ash and Al sulfate. $CO_2$ is obtained from the power-house stack. A wet and dry scrubber and a compressor complete the carbonating equipment. Savings in soap, salt and repairs have been calcd to be greater than total operating cost. C. C. R

**Water-softening plant for Marshall, Missouri.** BRANSFORD W. CRENSHAW. *Public Works* **63,** No. 5, 38–40(1932).—A zeolite-type plant to soften an av consumption of 381,000 gal. per day has been added to the municipal water system. Two units with space for a third are provided These are connected to receive water directly from the wells. Pulsations from well pumps are absorbed in a cushion tank. Automatic proportioning equipment permits a mixed water varying from 1 to 8 grains in hardness Approx. 55,000 lb. of rock salt will be used per month. This supply is placed in a concrete tank, and the concd brine flows into an underground tank where it is properly diluted before being pumped to the softeners. The zeolite units have a softening capacity of 4,500 grains of hardness per cubic foot of mineral. The salt consumption 0.35 lb. per thousand grains of hardness removed. C. C. RUCHHOFT
